

NetScaler 14.1

Contents

NetScaler release notes	63
Getting started with NetScaler	63
Where does a NetScaler appliance fit in the network?	68
How a NetScaler appliance communicates with clients and servers	70
Introduction to the NetScaler product line	77
Install the hardware	79
Access a NetScaler appliance	80
Configure the ADC for the first time	84
Secure your NetScaler deployment	84
Configure high availability	85
Change an RPC node password	89
Configure a FIPS appliance for the first time	91
Common network topologies	94
System management settings	99
System settings	100
Packet forwarding modes	101
Network interfaces	108
Clock synchronization	109
DNS configuration	110
SNMP configuration	111
Verify configuration	116
Load balance traffic on a NetScaler appliance	119
Load balancing	121

Persistence settings	125
Configure features to protect the load balancing configuration	130
A typical load balancing scenario	133
Use case: How to force Secure and HttpOnly cookie options for websites using the NetScaler appliance	136
Accelerate load balanced traffic by using compression	139
Secure load balanced traffic by using SSL	145
Features at a glance	163
Application switching and traffic management features	163
Application acceleration features	168
Application security and firewall features	169
Application visibility feature	171
NetScaler Solutions	173
Setting up NetScaler for Citrix Virtual Apps and Desktops	173
Global Server Load Balancing (GSLB) Powered Zone Preference	175
Anycast support in NetScaler	176
Deploy digital advertising platform on AWS with NetScaler	179
Enhancing Clickstream analytics in AWS using NetScaler	183
NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI	193
Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal)	195
Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal)	197
Deleting a NetScaler Load Balancer from the Network	200
NetScaler cloud native solution for microservices based on Kubernetes	202

Kubernetes Ingress solution	207
Service mesh	213
Solutions for observability	214
API gateway for Kubernetes	217
Use NetScaler Console to troubleshoot NetScaler cloud native networking	219
Deploy a NetScaler VPX instance	244
NetScaler VPX support matrix	245
Optimize NetScaler VPX performance on VMware ESX, Linux KVM, and Citrix Hypervisors	253
Support for increasing NetScaler VPX disk space	270
Apply NetScaler VPX configurations at the first boot of the NetScaler appliance in cloud	272
Improve SSL-TPS performance on public cloud platforms	307
Configure simultaneous multithreading for NetScaler VPX on public clouds	308
Install a NetScaler VPX instance on a bare metal server	312
Install a NetScaler VPX instance on Citrix Hypervisor	313
Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces	317
Install a NetScaler VPX instance on VMware ESX	322
Configure a NetScaler VPX instance to use VMXNET3 network interface	327
Configure a NetScaler VPX instance to use SR-IOV network interface	339
Configure a NetScaler VPX on ESX hypervisor to use Intel QAT for SSL acceleration in SR-IOV mode	357
Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces	361
Configure a NetScaler VPX instance to use PCI passthrough network interface	361
Apply NetScaler VPX configurations at the first boot of the NetScaler appliance on VMware ESX hypervisor	366
Install a NetScaler VPX instance on VMware cloud on AWS	375

Install a NetScaler VPX instance on Microsoft Hyper-V server	377
Install a NetScaler VPX instance on Linux-KVM platform	382
Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform	383
Provision the NetScaler VPX instance by using OpenStack	388
Provision the NetScaler VPX instance by using the Virtual Machine Manager	397
Configure a NetScaler VPX instance to use SR-IOV network interfaces	411
Configure a NetScaler VPX on the KVM hypervisor to use Intel QAT for SSL acceleration in SR-IOV mode	422
Configure a NetScaler VPX instance to use PCI passthrough network interfaces	427
Provision the NetScaler VPX instance by using the virsh program	431
Manage the NetScaler VPX guest VMs	435
Provision the NetScaler VPX instance with SR-IOV, on OpenStack	438
Configure a NetScaler VPX instance on KVM to use OVS DPDK-based host interfaces	444
Apply NetScaler VPX configurations at the first boot of the NetScaler appliance on the KVM hypervisor	454
NetScaler VPX on AWS	456
AWS terminology	459
AWS-VPX support matrix	462
Limitations and usage guidelines	465
Prerequisites	467
Configure AWS IAM roles on NetScaler VPX instance	469
How a NetScaler VPX instance on AWS works	480
Deploy a NetScaler VPX standalone instance on AWS	482
Scenario: standalone instance	488
Download a NetScaler VPX license	497

Load balancing servers in different availability zones	503
How high availability on AWS works	503
Deploy a VPX HA pair in the same AWS availability zone	506
High availability across different AWS availability zones	517
Deploy a VPX high-availability pair with elastic IP addresses across different AWS zones	518
Deploy a VPX high-availability pair with private IP addresses across different AWS zones	523
Deploy a NetScaler VPX instance on AWS Outposts	536
Protect AWS API Gateway using the NetScaler Web App Firewall	539
Add back-end AWS Autoscaling service	543
Deploy NetScaler GSLB on AWS	548
Deploy NetScaler Web App Firewall on AWS	567
Configure a NetScaler VPX instance to use SR-IOV network interface	589
Configure a NetScaler VPX instance to use Enhanced Networking with AWS ENA	592
Upgrade a NetScaler VPX instance on AWS	592
Troubleshoot a VPX instance on AWS	597
AWS FAQs	598
Deploy a NetScaler VPX instance on Microsoft Azure	601
Azure terminology	607
Network architecture for NetScaler VPX instances on Microsoft Azure	610
Configure a NetScaler VPX standalone instance	613
Configure multiple IP addresses for a NetScaler VPX standalone instance	628
Configure a high-availability setup with multiple IP addresses and NICs	634
Configure a high-availability setup with multiple IP addresses and NICs by using Power-Shell commands	644

Deploy a NetScaler high-availability pair on Azure with ALB in the floating IP-disabled mode	656
Deploy a NetScaler for Azure DNS private zone	677
Configure a NetScaler VPX instance to use Azure accelerated networking	696
Configure HA-INC nodes by using the NetScaler high availability template with Azure ILB	712
Configure HA-INC nodes by using the NetScaler high availability template for internet-facing applications	724
Configure a high-availability setup with Azure external and internal load balancers simultaneously	735
Install a NetScaler VPX instance on Azure VMware Solution	740
Configure a NetScaler VPX standalone instance on Azure VMware solution	756
Configure a NetScaler VPX high availability setup on Azure VMware solution	758
Configure Azure route server with NetScaler VPX HA pair	760
Add back-end Azure Autoscaling service	764
Azure tags for NetScaler VPX deployment	771
Configure GSLB on NetScaler VPX instances	777
Configure GSLB on an active-standby high-availability setup	786
Deploy NetScaler GSLB on Azure	790
Deploy NetScaler Web App Firewall on Azure	805
Configure address pools intranet IP for a NetScaler Gateway appliance	829
Configure multiple IP addresses for a NetScaler VPX standalone instance by using PowerShell commands	831
Additional PowerShell scripts for Azure deployment	838
Create a support ticket for the VPX instance on Azure	855
Azure FAQs	856
Deploy a NetScaler VPX instance on the Google Cloud Platform	857

Deploy a VPX high-availability pair on Google Cloud Platform	876
Deploy a VPX high-availability pair with external static IP address on the Google Cloud Platform	877
Deploy a single NIC VPX high-availability pair with private IP address on Google Cloud Platform	887
Deploy a VPX high-availability pair with private IP address on Google Cloud Platform	897
Install a NetScaler VPX instance on Google Cloud VMware Engine	906
Add back-end GCP Autoscaling service	925
VIP scaling support for NetScaler VPX instance on GCP	930
Troubleshoot a VPX instance on GCP	937
Jumbo frames on NetScaler VPX instances	938
Automate deployment and configurations of NetScaler	939
FAQs	943
Licensing overview	956
Allocate and apply a license	961
Data governance	973
Introduction to Console Advisory Connect for NetScaler appliances	977
Upgrade and downgrade a NetScaler appliance	981
Before you begin	981
Upgrade considerations for configurations with classic policies	984
Upgrade considerations for customized configuration files in the /etc directory	986
Upgrade considerations - SNMP configuration	990
Download a NetScaler release package	992
Upgrade a NetScaler standalone appliance	993
Downgrade a NetScaler standalone appliance	997

Upgrade a high availability pair	1001
In Service Software Upgrade support for high availability for performing zero downtime upgrade	1007
Downgrade a high availability pair	1013
Troubleshooting issues related to the installation, upgrade, and downgrade processes	1013
FAQs	1019
Solutions for Telecom Service Providers	1019
Large Scale NAT	1020
Points to Consider before Configuring LSN	1026
Configuration Steps for LSN	1027
Sample LSN Configurations	1046
Configuring Static LSN Maps	1054
Configuring Application Layer Gateways	1057
Application Layer Gateway for FTP, ICMP, and TFTP Protocols	1058
Application Layer Gateway for PPTP Protocol	1060
Application Layer Gateway for SIP Protocol	1062
Application Layer Gateway for RTSP Protocol	1076
Application Layer Gateway for IPSec Protocol	1079
Logging and Monitoring LSN	1084
TCP SYN Idle Timeout	1108
Overriding LSN configuration with Load Balancing Configuration	1109
Clearing LSN Sessions	1110
Load Balancing SYSLOG Servers	1112
Port Control Protocol	1115

LSN44 in a cluster setup	1117
Dual-Stack Lite	1118
Points to Consider before Configuring DS-Lite	1123
Configuring DS-Lite	1124
Configuring DS-Lite Static Maps	1133
Configuring Deterministic NAT Allocation for DS-Lite	1135
Configuring Application Layer Gateways for DS-Lite	1138
Application Layer Gateway for FTP, ICMP, and TFTP Protocols	1138
Application Layer Gateway for SIP Protocol	1139
Application Layer Gateway for RTSP Protocol	1141
Logging and Monitoring DS-Lite	1143
Port Control Protocol for DS-Lite	1152
Large Scale NAT64	1154
Points to Consider for Configuring Large Scale NAT64	1159
Configuring DNS64	1160
Configuring Large Scaler NAT64	1162
Configuring Application Layer Gateways for Large Scale NAT64	1168
Application Layer Gateway for FTP, ICMP, and TFTP Protocols	1168
Application Layer Gateway for SIP Protocol	1168
Application Layer Gateway for RTSP Protocol	1171
Configuring Static Large Scale NAT64 Maps	1173
Logging and Monitoring Large Scale NAT64	1175
Port Control Protocol for Large Scale NAT64	1188
LSN64 in a cluster setup	1190

Mapping Address and Port using Translation	1191
Telco subscriber management	1194
Subscriber aware traffic steering	1217
Subscriber aware service chaining	1223
Subscriber aware traffic steering with TCP optimization	1229
Policy based TCP profile selection	1234
Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols	1235
Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers	1236
Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider	1237
Bandwidth Utilization Using Cache Redirection Functionality	1238
NetScaler TCP Optimization	1238
Getting Started	1239
Management Network	1242
Licensing	1242
High Availability	1243
Gi-LAN Integration	1244
TCP optimization configuration	1250
Analytics and Reporting	1256
Real-time Statistics	1256
SNMP	1258
Technical Recipes	1261
Scalability	1263
Optimizing TCP Performance using TCP Nile	1270

Troubleshooting Guidelines	1279
Frequently Asked Questions	1282
NetScaler Video Optimization	1286
Getting Started	1286
Licensing	1290
Configuring Video Optimization over TCP	1291
Configuring Video Optimization over UDP	1301
NetScaler URL Filtering	1308
URL List	1309
URL Categorization	1318
FAQs	1332
Authentication, Authorization, and Auditing	1332
Admin Partition	1333
AppFlow	1336
Call Home	1338
Clustering	1340
Connection Management	1340
Content Switching	1345
Debugging	1349
Hardware	1350
High Availability	1350
Integrated Caching	1350
Install, upgrade, and downgrade	1359
Load Balancing	1369

GUI	1371
SSL	1372
Authentication, authorization, and auditing application traffic	1372
How authentication, authorization, and auditing works	1375
Basic components of authentication, authorization, and auditing configuration	1377
Authentication virtual server	1378
Authorization policies	1385
Authentication profiles	1388
Authentication policies	1390
Users and groups	1399
Authentication methods	1404
nFactor authentication	1405
nFactor concepts, entities, and terminology	1408
Configuring nFactor authentication	1412
nFactor Visualizer for simplified configuration	1438
nFactor Extensibility	1447
Set a cookie using nFactor	1463
Sample deployments using nFactor authentication	1465
How to articles	1466
SAML authentication	1467
NetScaler as a SAML SP	1469
NetScaler as a SAML IdP	1476
Configure SAML single sign-on	1483
Configure Microsoft Entra ID as SAML IdP and NetScaler as SAML SP	1487

More features supported for SAML	1493
OAuth authentication	1500
NetScaler as an OAuth SP	1503
NetScaler as an OAuth IdP	1506
API authentication with the NetScaler appliance	1513
LDAP authentication	1517
Configure LDAP authentication on the NetScaler appliance for management purposes	1528
Configure LDAP after offloading SSL to a load balancing virtual server	1534
RADIUS authentication	1538
RADIUS authentication using TCP or TLS	1543
TACACS authentication	1545
Client certificate authentication	1547
Negotiate authentication	1554
Web authentication	1556
Configure SMS OTP for Web authentication	1558
Forms based authentication	1562
401 based authentication	1564
re-Captcha configuration for nFactor authentication	1566
Native OTP support for authentication	1573
Store OTP secret data in an encrypted format	1587
OTP encryption tool	1589
Recommended native OTP configurations for device registration	1597
Push notification for OTP	1614
Email OTP authentication	1625

re-Captcha configuration for nFactor authentication	1634
Authentication, authorization, and auditing configuration for commonly used protocols	1640
Handling authentication, authorization and auditing with Kerberos/NTLM	1641
How NetScaler implements Kerberos for client authentication	1642
Configuring kerberos authentication on the NetScaler appliance	1645
Configure kerberos authentication on a client	1649
Offload Kerberos authentication from physical servers	1649
Single sign-on types	1653
NetScaler kerberos single sign-on	1653
An overview of NetScaler kerberos SSO	1654
Set up NetScaler SSO	1656
Configure single sign-on	1661
Generate the KCD keytab script	1672
SSO for Basic, Digest, and NTLM authentication	1672
Rewrite for NetScaler Gateway and authentication server generated responses	1677
Content Security Policy response header support for NetScaler Gateway and authentication virtual server-generated responses	1679
Self-service password reset	1682
Web Application Firewall protection for VPN virtual servers and authentication virtual servers	1704
Polling during authentication	1714
Session and traffic management	1718
Rate Limiting for NetScaler Gateway	1736
Authorizing user access to application resources	1742
Audit authenticated sessions	1743

NetScaler as an Active Directory Federation Services proxy	1745
Web Services Federation protocol	1749
Active Directory Federation Service Proxy Integration Protocol compliance	1754
Use an on-premises NetScaler Gateway as the identity provider for Citrix Cloud	1764
Support for active-active GSLB deployments on NetScaler Gateway	1769
Configuration support for SameSite cookie attribute	1770
Authentication, authorization, and auditing configuration for commonly used protocols	1773
Handling authentication, authorization and auditing with Kerberos/NTLM	1773
How NetScaler implements Kerberos for client authentication	1775
Configuring kerberos authentication on the NetScaler appliance	1778
Configure kerberos authentication on a client	1781
Offload Kerberos authentication from physical servers	1782
Troubleshoot authentication and authorization-related issues	1785
Admin partition	1785
NetScaler configurations support in admin partition	1792
Configure admin partitions	1797
VLAN configuration for admin partitions	1807
VXLAN support for admin partitions	1816
SNMP support for admin partitions	1818
Audit log support for admin partitions	1821
Display configured PMAC addresses for shared VLAN configuration	1823
AppExpert	1824
Action analytics	1825
Configure a selector	1826

Configure a stream identifier	1828
View statistics	1830
Group records on attribute values	1833
Clear a stream session	1836
Configure policy for optimizing traffic	1837
How to limit bandwidth consumption per user or client device	1838
AppExpert applications	1841
How AppExpert application works	1843
Customize AppExpert configuration	1844
Configure public endpoints	1845
Configure services and service groups for an application unit	1846
Create application units	1847
Configure application unit rules	1847
Configure policies for application units	1848
Configure application units	1853
Configure public endpoints for an application	1854
Specify the order of evaluation of application units	1855
Configure persistency groups for application units	1856
View AppExpert applications and configure entities by using the application visualizer	1857
Configure user authentication, authorization, and auditing	1857
Monitor a NetScaler application	1858
Delete an AppExpert application	1859
Configure application authentication, authorization, and auditing	1860
Set up a custom NetScaler application	1863

NetScaler Gateway applications	1867
Add intranet subnets	1869
Add other resources	1870
Configure authorization policies	1870
Configure traffic policies	1871
Configure clientless access policies	1872
Configure TCP compression policies	1873
Configure bookmarks	1874
AppQoE	1874
Enable AppQoE	1875
AppQoE actions	1876
AppQoE parameters	1880
AppQoE policies	1881
Entity templates	1884
HTTP callouts	1892
How an HTTP callout works	1892
Notes on the format of HTTP requests and responses	1893
Configure an HTTP callout	1895
Verify the configuration	1903
Invoke an HTTP callout	1904
Avoid HTTP callout recursion	1906
Cache HTTP callout responses	1907
Use Case: Filter clients by using an IP blacklist	1908
Use Case: ESI support for fetching and updating content dynamically	1911

Use Case: Access control and authentication	1914
Use Case: OWA-based spam filtering	1917
Use Case: Dynamiccontent switching	1921
Pattern sets and data sets	1922
How string matching works with pattern sets and data sets	1923
Configure a pattern set	1925
Configure a data set	1931
Use pattern sets and data sets	1937
Sample usage	1937
Variables	1939
Configure and use variables	1940
Use case for caching user privileges	1944
Use case for limiting the number of sessions	1946
Policies and expressions	1947
Introduction to policies and expressions	1949
Advanced policy infrastructure	1949
Advanced policy expressions	1957
Convert policy expressions using the NSPEPI tool	1958
NSPEPI tool unsupported features	1971
Preconfiguration check tool	1974
Classic policy deprecation FAQs	1979
Before you proceed	1980
Configure advanced policy infrastructure	1980
Rules for names in identifiers used in policies	1981

Create or modify a policy	1982
Policy configuration examples	1984
Configure and bind policies with the policy manager	1984
Unbind a policy	1987
Create policy labels	1990
Configure a policy label or virtual server policy bank	1994
Invoke or remove a policy label or virtual server policy bank	2000
Configure advanced policy expression: Getting started	2005
Basic elements of an advanced policy expression	2006
Compound advanced policy expressions	2011
Specify the character set in expressions	2020
Configure advanced policy expressions in a policy	2023
Configure named advanced policy expressions	2027
Configure advanced policy expressions outside the context of a policy	2029
Advanced policy expressions: Evaluating text	2030
About text expressions	2031
Expression prefixes for text in HTTP requests and responses	2034
Expression prefixes for VPNs and clientless VPNs	2034
Basic operations on text	2035
Complex operations on text	2039
Advanced policy expressions: Working with dates, times, and numbers	2054
Format of dates and times in an expression	2054
Expressions for the NetScaler system time	2055
Expressions for SSL certificate dates	2059

Expressions for HTTP request and response dates	2068
Generate the day of the week, as a string, in short and long formats	2069
Expression prefixes for numeric data other than date and time	2069
Convert numbers to text	2070
Virtual server based expressions	2071
Advanced policy expressions: Parsing HTTP, TCP, and UDP data	2073
About evaluating HTTP and TCP payload	2073
Expressions for identifying the protocol in an incoming IP packet	2074
Expressions for HTTP and cache-control headers	2076
Expressions for extracting segments of URLs	2079
Expressions for HTTP status codes and numeric HTTP payload data other than dates	2081
SIP expressions	2081
Operations for HTTP, HTML, and XML encoding and “safe” characters	2092
Expressions for TCP, UDP, and VLAN data	2095
Expressions for evaluating a DNS message and identifying its carrier protocol	2099
XPath and HTML, XML, or JSON expressions	2102
Encrypt and decrypt XML payloads	2106
Advanced policy expressions: Parsing SSL certificates	2108
Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs	2114
Advanced policy expressions: Stream analytics functions	2120
Advanced policy expressions: DataStream	2121
Typecasting data	2133
Regular expressions	2134
Basic characteristics of regular expressions	2135

Operations for regular expressions	2136
Summary examples of advanced policy expressions and policies	2137
Tutorial examples of advanced policies for rewrite	2145
Rewrite and responder policy examples	2151
Rate limiting	2154
Configure a stream selector	2155
Configure a traffic rate limit identifier	2156
Configure and bind a traffic rate policy	2158
View the traffic rate	2160
Testing a rate-based policy	2160
Examples of rate-based policies	2162
Sample use cases for rate-based policies	2164
Rate limiting for traffic domains	2166
Configure rate limit at packet level	2167
Responder	2170
Enable the responder feature	2171
Configure a responder action	2172
Configure a responder policy	2180
Bind a responder policy	2181
Set the default action for a responder policy	2184
Responder action and policy examples	2186
Diameter support for responder	2188
RADIUS support for responder	2190
DNS support for the responder feature	2193

MQTT support for responder	2195
How to redirect HTTP request to HTTPS using responder	2198
Troubleshooting	2203
Rewrite	2204
Content-length header behavior in a streaming rewrite action	2238
Rewrite action and policy examples	2241
Example 1: Delete Old X-Forwarded-For and client-IP headers	2242
Example 2: Add a local client-IP header	2244
Example 3: Tag secure and insecure connections	2245
Example 4: Mask the HTTP server type	2246
Example 5: Redirect an external URL to an internal URL	2247
Example 6: Migrate Apache rewrite module rules	2248
Example 7: Marketing keyword redirection	2249
Example 8: Redirect queries to the queried server	2250
Example 9: Home Page Redirection	2251
Example 10: Policy-based RSA encryption	2253
Example 11: Policy-based RSA encryption with no padding operation	2257
Example 12: Configure rewrite to change the host name and URL in client request on NetScaler appliance	2258
URL transformation	2260
Configure URL transformation profiles	2260
Configure URL transformation policies	2264
Globally binding URL transformation policies	2267
RADIUS support for the rewrite feature	2269

Diameter support for rewrite	2275
DNS support for rewrite	2276
MQTT support for rewrite	2279
String maps	2283
URL sets	2286
Getting started	2286
Advanced policy expressions for URL evaluation	2287
Configure URL set	2288
URL pattern semantics	2294
URL Categories	2294
AppFlow	2301
Configuring the AppFlow feature	2305
Exporting performance data of webpages to AppFlow collector	2320
Session reliability on NetScaler high availability pair	2322
API security	2325
Import API Specification	2325
API specification validation	2328
Advanced policy expressions using API specification	2333
API traffic visibility using API specification validation	2337
NetScaler Web App Firewall	2338
FAQs and Deployment Guide	2341
Introduction to NetScaler Web App Firewall	2350
Configuring the Web App Firewall	2364
Enable NetScaler Web App Firewall	2367

The Web App Firewall wizard	2368
Manual configuration	2375
Manual configuration by using the NetScaler GUI	2376
Manual configuration By using the command line interface	2387
Signatures	2390
Manually configuring the signatures feature	2394
Adding or removing a signature object	2394
Configuring or modifying a signatures object	2397
Protecting JSON applications using signatures	2401
Updating a signature object	2409
Signature auto update	2412
Snort rule integration	2418
Exporting a signatures object to a file	2421
Edit signatures to add or modify rules	2422
Add a signature rule category	2424
Add signature rule patterns	2424
Import and merge rules	2429
Signature updates in high availability deployment and build upgrades	2430
Overview of security checks	2431
Top level protections	2433
HTML cross-site scripting check	2434
HTML SQL injection check	2447
SQL grammar-based protection for HTML and JSON payload	2461
Command injection grammar-based protection for HTML payload	2466

Relaxation and deny rules for handling HTML SQL injection attacks	2469
HTML command injection protection check	2472
Custom keyword support for HTML payload	2480
XML external entities (XXE) Attack Protection	2483
Buffer overflow check	2485
Web App Firewall support for Google web toolkit	2492
Cookie Protection	2496
Cookie consistency check	2497
Cookie hijacking protection	2500
SameSite cookie attribute	2509
Data leak prevention checks	2511
Credit card check	2512
Safe object check	2519
Advanced form protection checks	2523
Field formats check	2523
Form field consistency check	2536
CSRF form tagging check	2540
Managing CSRF form tagging check relaxations	2542
URL protection checks	2543
Start URL check	2544
Deny URL check	2548
XML protection checks	2550
XML format check	2550
XML Denial-of-Service check	2551

XML cross-site scripting check	2553
XML SQL injection check	2561
XML attachment check	2570
Web services interoperability check	2571
XML message validation check	2575
XML SOAP fault filtering check	2576
JSON Protection Checks	2576
JSON Denial-of-Service protection check	2577
JSON SQL Injection protection check	2586
JSON Cross-Site Scripting protection check	2591
JSON command injection protection check	2596
Managing content types	2607
Profiles	2612
Creating Web App Firewall profiles	2614
Enforce HTTP RFC compliance	2619
Configuring Web App Firewall profiles	2622
Web Application Firewall profile settings	2626
Changing an Web App Firewall profile type	2631
Exporting and importing an Web App Firewall profile	2632

Cache Redirection	2965
Cache redirection policies	2966
Built-in cache redirection policies	2966
Configure a cache redirection policy	2969
Cache redirection configurations	2977
Configure transparent redirection	2977
Enable cache redirection and load balancing	2978
Configure edge mode	2979
Configure a cache redirection virtual server	2980
Bind policies to the cache redirection virtual server	2982
Unbind a policy from a cache redirection virtual server	2983
Create a load balancing virtual server	2984
Configure an HTTP service	2986
Bind/unbind a service to/from a load balancing virtual server	2987
Disable the use the proxy port setting for transparent caching	2989
Assign a port range to the NetScaler appliance	2989

Enable load balancing virtual servers to redirect requests to cache	2990
Configure forward proxy redirection	2991
Create a DNS service	2992
Create a DNS load balancing virtual server	2994
Bind the DNS service to the virtual server	2995
Configure a client web browser to use a forward proxy	2996
Configure reverse proxy redirection	2996
Selective cache redirection	3000
Enable content switching	3002
Configure a load balancing virtual server for the cache	3003
Configure policies for content switching	3003
Configure precedence for policy evaluation	3007
Administer a cache redirection virtual server	3009
View cache redirection virtual server statistics	3009
Enable or disable a cache redirection virtual server	3010
Direct policy requests to cache instead of origin web server	3012
Back up a cache redirection virtual server	3013
Manage client connections for a virtual server	3014
Enable external health check for UDP and non-HTTP TCP virtual servers	3019
N-Tier cache redirection	3021
Configure the upper-tier NetScaler appliances	3026
Configure the lower-tier NetScaler appliances	3028
Translate destination IP address of a request to origin IP address	3029
Clustering	3032

Supportability matrix for NetScaler cluster	3032
Prerequisites	3040
Cluster overview	3041
Synchronization across cluster nodes	3042
Striped, partially striped, and spotted configurations	3044
Communication in a cluster setup	3048
Traffic distribution in a cluster setup	3051
Cluster node groups	3053
Cluster and node states	3054
Routing in a cluster	3054
IP addressing for a cluster	3059
Configuring layer 3 clustering	3061
Setting up a NetScaler cluster	3071
Setting up inter-node communication	3072
Creating a NetScaler cluster	3076
Adding a node to the cluster	3081
Viewing the details of a cluster	3086
Distributing traffic across cluster nodes	3087
Using the Equal Cost Multiple Path (ECMP)	3088
Use Case: ECMP with BGP routing	3093
Configuration of cluster ECMP by using Cisco Nexus 7000 switch with routing Protocol	3094
Using cluster link aggregation	3099
Static cluster link aggregation	3103
Dynamic cluster link aggregation	3104

Link redundancy in a cluster with LACP	3106
Using USIP mode in cluster	3107
Managing the NetScaler cluster	3110
Configuring linksets	3111
Node groups for spotted and partially striped configurations	3115
Behavior of node groups	3116
Configuring node groups for spotted and partially striped configurations	3117
Configuring redundancy for node groups	3120
Disabling steering on the cluster backplane	3122
Synchronizing cluster configurations	3123
Synchronizing time across cluster nodes	3125
Synchronizing cluster files	3125
Viewing the statistics of a cluster	3127
Discovering NetScaler appliances	3128
Disabling a cluster node	3129
Removing a cluster node	3130
Removing a node from a cluster deployed using cluster link aggregation	3131
Detecting jumbo probe on a cluster	3132
Route monitoring for dynamic routes in cluster	3133
Monitoring cluster setup using SNMP MIB with SNMP link	3134
Monitoring command propagation failures in a cluster deployment	3136
Graceful shutdown of nodes	3136
Graceful shutdown of services	3140
IPv6 ready logo support for clusters	3143

Managing cluster heartbeat messages	3148
Configure secure heartbeats	3149
Configuring owner node response status	3151
Monitor static route (MSR) support for inactive nodes in a spotted cluster configuration	3152
VRRP interface binding in a single node active cluster	3152
Cluster setup and usage scenarios	3153
Creating a two-node cluster	3153
Migrating an HA setup to a cluster setup	3154
Transitioning between a L2 and L3 Cluster	3157
Setting up GSLB in a cluster	3158
Using cache redirection in a cluster	3163
Using L2 mode in a cluster setup	3163
Using cluster LA channel with linksets	3164
Backplane on LA channel	3165
Common interfaces for client and server and dedicated interfaces for backplane	3167
Common switch for client, server, and backplane	3169
Common switch for client and server and dedicated switch for backplane	3172
Different switch for every node	3175
Sample cluster configurations	3176
Using VRRP in a cluster setup	3180
Monitoring services in a cluster using path monitoring	3184
Backup and restore of cluster setup	3188
Upgrading or downgrading the NetScaler cluster	3192
Operations supported on individual cluster nodes	3195

Support for heterogeneous cluster	3197
FAQs	3198
Troubleshooting the NetScaler cluster	3207
Tracing the packets of a NetScaler cluster	3208
Troubleshooting common issues	3212
Content Switching	3216
Configure basic content switching	3219
Customizing the basic content switching configuration	3237
Content Switching for Diameter Protocol	3241
Protecting the content switching setup against failure	3242
Managing a content switching setup	3248
Managing client connections	3252
Persistence support for content switching virtual server	3256
Troubleshooting	3262
DataStream	3264
Configure database users	3266
Configure a database profile	3268
Configure load balancing for DataStream	3269
Configure content switching for DataStream	3270
Configure monitors for DataStream	3272
Use Case 1: Configure DataStream for a primary/secondary database architecture	3273
Use Case 2: Configure the token method of load balancing for DataStream	3276
Use Case 3: Log MSSQL transactions in transparent mode	3278
Use Case 4: Database specific load balancing	3281

DataStream reference	3292
Domain Name System	3295
Configure DNS resource records	3301
Create SRV records for a service	3302
Create AAAA records for a domain name	3304
Create address records for a domain name	3305
Create MX records for a mail exchange server	3306
Create NS Records for an authoritative server	3307
Create CNAME records for a subdomain	3308
Create NAPTR records for telecommunications domain	3309
Create PTR records for IPv4 and IPv6 addresses	3310
Create SOA records for authoritative information	3311
Create TXT records for holding descriptive text	3312
Create CAA records for a domain name	3314
View DNS statistics	3316
Configure a DNS zone	3317
Configure the NetScaler as an ADNS server	3319
Configure the NetScaler appliance as a DNS proxy server	3323
Configure the NetScaler as an end resolver	3329
Configure the NetScaler appliance as a forwarder	3334
Configure NetScaler as a non-validating security aware stub-resolver	3338
Jumbo frames support for DNS to handle responses of large sizes	3339
Configure DNS logging	3340
Configuring DNS suffixes	3353

DNS ANY query	3355
Configure negative caching of DNS records	3356
Cache EDNS0 client subnet data when the NetScaler appliance is in proxy mode	3359
Domain name system security extensions	3361
Configure DNSSEC	3361
Configure DNSSEC when the NetScaler is authoritative for a zone	3374
Configure DNSSEC for a zone for which the NetScaler is a DNS proxy server	3374
Configure DNSSEC for global server load balancing (GSLB) domain names	3376
Zone maintenance	3377
Offload DNSSEC operations to the NetScaler	3383
Admin partition support for DNSSEC	3384
Supporting wildcard DNS domains	3385
Mitigate DNS DDoS attacks	3386
Use case: Configure the automatic DNSSEC key management feature	3391
Use case: Configure the automatic DNSSEC key management on GSLB deployment	3393
Use case: How to revoke a compromised active key	3396
Firewall Load Balancing	3397

Connection failover	3802
Flush the surge queue	3807
Manage a load balancing setup	3809
Manage server objects	3810
Manage services	3811
Manage a load balancing virtual server	3813

Load balancing visualizer	3815
Manage client traffic	3817
Configure sessionless load balancing virtual servers	3818
Redirect HTTP requests to a cache	3821
Enable cleanup of virtual server connections	3822
Rewrite ports and protocols for HTTP redirection	3824
Insert IP address and port of a virtual server in the request header	3829
Use a specified source IP for back-end communication	3830
Set a time-out value for idle client connections	3837
Manage RTSP connections	3837
Manage client traffic based on traffic rate	3838
Identify a connection with layer 2 parameters	3839
Configure the Prefer Direct Route option	3840
Use a source port from a specified port range for back-end communication	3840
Configure source IP persistency for back-end communication	3842
Use IPv6 link local addresses on the server side of a load balancing setup	3843
Advanced load balancing settings	3844
Gradually step up the load on a new service with virtual server–level slow start	3845
The no-monitor option for services	3851
Protect applications on protected servers against traffic surges	3854
Enable cleanup of virtual server and service connections	3854
Graceful shutdown of services	3857
Enable or disable persistence session on TROFS services	3861
Direct requests to a custom webpage	3862

Enable access to services when down	3862
Enable TCP buffering of responses	3863
Enable compression	3864
Enable external health check for UDP and non-HTTP virtual servers	3865
Maintain client connection for multiple client requests	3866
Insert the IP address of the client in the request header	3867
Retrieve location details from user IP address using geolocation database	3868
Use the source IP address of the client when connecting to the server	3873
Use client source IP address for back end communication in a v4-v6 load balancing configuration	3874
Configure the source port for server-side connections	3875
Set a limit on the number of client connections	3877
Set a limit on the number of requests per connection to the server	3878
Set a threshold value for the monitors bound to a service	3879
Set a timeout value for idle client connections	3880
Set a timeout value for idle server connections	3880
Set a limit on the bandwidth usage by clients	3881
Redirect client requests to a cache	3882
Retain the VLAN identifier for VLAN transparency	3882
Configure automatic state transition based on percentage health of bound services	3883
Static proximity based on NetScaler location	3884
Built-in monitors	3885
TCP-based application monitoring	3886
SSL service monitoring	3888

HTTP/2 service monitoring	3890
Proxy protocol service monitoring	3891
FTP service monitoring	3894

NetScaler release notes

April 22, 2024

Release notes describe how the software has changed in a particular build, and the issues known to exist in the build.

The release notes document includes all or some of the following sections:

- **What's New:** The enhancements and other changes released in the build.
- **Fixed Issues:** The issues that are fixed in the build.
- **Known Issues:** The issues that exist in the build.
- **Points to Note:** The important aspects to keep in mind while using the build.
- **Limitations:** The limitations that exist in the build.

Note

- The [# XXXXXX] labels under the issue descriptions are internal tracking IDs used by the NetScaler team.
- These release notes do not document security related fixes. For a list of security related fixes and advisories, see the security bulletin.

To view the release notes document for a specific build of release 14.1, click the corresponding link in the following table. When the release notes are updated for a build, the version number of the release notes and the publish date are also updated. The release notes publish date might not be the same as the build GA date.

Release notes for NetScaler

software version 14.1	Publish date	Version
Build 14.1-21.57	Apr 23, 2024	1.0
Build 14.1-17.38	Mar 05, 2024	3.0
Build 14.1-12.35	Mar 05, 2024	2.0
Build 14.1-8.50	Mar 05, 2024	4.0
Build 14.1-4.42	Mar 05, 2024	3.0

Getting started with NetScaler

July 18, 2023

This topic describes the basic features and configuration details of a NetScaler appliance. System and network administrators who install and configure network equipment can refer to the content.

Understanding NetScaler

The NetScaler appliance is an application switch which performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4–Layer 7 (L4–L7) network traffic for web applications. For example, a NetScaler appliance load balances decisions on individual HTTP requests instead of long-lived TCP connections. The load balancing feature helps slowing down the failure of a server with less disruption to clients. The ADC features can be broadly classified as:

1. Data switching
2. Firewall security
3. Optimization
4. Policy infrastructure
5. Packet flow

Data switching

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by how it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and based on L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Firewall security

The NetScaler security and protection protect web applications from Application Layer attacks. An ADC appliance allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization

Optimization offloads resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. An ADC appliance supports several transparent TCP optimizations which mitigate problems caused by high latency and congested network links. Thereby accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Policy infrastructure

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the ADC appliance what to do when a request matches the expression. For example, the expression might be to match a specific URL pattern for a security attack with the configured to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When an ADC appliance receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except rewrite, the appliance implements only the first policy that has a request match. For Rewrite policies, the ADC appliance evaluates the policies in order and performs the associated actions in the same order. Policy priority is important for getting the results you want.

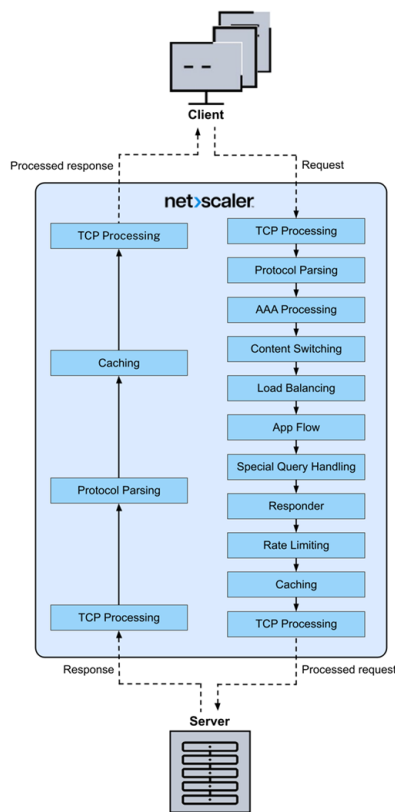

Packet flow

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the HTTP2 packet flow in the NetScaler appliance.

The following figure shows the data stream query processing flow in the NetScaler appliance. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see DataStream.

Note: If the traffic is for a content switching virtual server, the appliance evaluates policies in the following order:

1. bound to global override.
2. bound to load balancing virtual server.
3. bound to content switching virtual server.
4. bound to global default.

This way, if a policy rule is true and gotpriorityexpression is END, we stop further policy evaluation.

In content switching, if no load balancing virtual server is selected or bound to the content switching virtual server, then we evaluate responder policies bound only to the content switching virtual server.

System limitation

There are system limitations for each NetScaler feature when you install NetScaler software 9.2 or later. For more information, see Citrix article, [CTX118716](#).

Where does a NetScaler appliance fit in the network?

August 29, 2023

NetScaler resides between the clients and servers in the network. It plays the role of an intermediary, processing the traffic flowing between the client and server. For the traffic coming from the clients, NetScaler acts as a server and receives the requests. After receiving the client request, NetScaler sends a new request on behalf of the client to the server. In sending the request to the server, NetScaler acts as a client.

The following are a few common network deployments where the NetScaler fits:

- **Gateway** - You can use NetScaler as a gateway at the perimeter of your organization's internal network (or intranet) to provide a secure single point of access to the servers, applications, and other network resources that reside in the internal network.
- **Application firewall** - You can use NetScaler as an application firewall to prevent security breaches, data loss, and possible unauthorized modifications to websites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking requests that exhibit such activity.
- **Load balancer** - You can use the NetScaler to operate as a load balancer where it distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to many clients, a server can become overloaded and degrade the performance of the server farm. A NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.
- **Global server load balancer** - You can configure NetScaler as a global server load balancer (GSLB) to provide disaster recovery and ensure continuous availability of applications against points of failure in a WAN. GSLB balances the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers if there is an outage.
- **Packet forwarder** - You can use NetScaler as a packet forwarder to forward packets to an IP not owned by it. NetScaler behaves like a router, looking at the routes it has learned or that has been configured to forward packets.

Physical deployment modes

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes:

- Inline or Two-arm mode
- One-arm mode

In inline mode, the appliance uses multiple network interfaces to connect to different Ethernet segments, positioning itself between clients and servers. It can connect to the server network with one or more redundant interfaces, and both the appliance and servers can be on separate subnets. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see [Understanding Common Network Topologies](#).

How a NetScaler appliance communicates with clients and servers

August 4, 2023

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-owned IP addresses

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

- NetScaler IP (NSIP) address

The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

- Virtual server IP (VIP) address

A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.

- Subnet IP (SNIP) address

A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

- IP Set

An IP set is a set of IP addresses, which are configured on the appliance as SNIP. An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

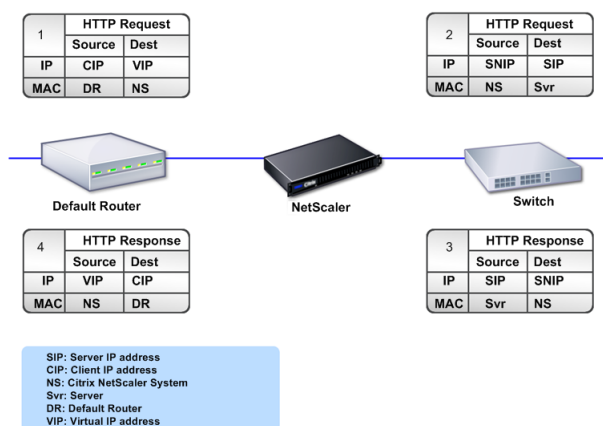

- Net Profile

A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

How Traffic flows are managed

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler appliance instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 1. Virtual Server Based Connections

In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

Traffic management building blocks

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application.

You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How traffic management building blocks work

A simple load balancing configuration

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load balancing virtual server, services, and monitors

In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding virtual servers

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol. The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL

offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address

The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

- Load balancing virtual server

Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

- Cache redirection virtual server

Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

- Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

- Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

- SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding services

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the source IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of

the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state. If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

For more information about configuring load balancing virtual servers, services, and monitors, see [NetScaler Load balancing](#).

Introduction to the NetScaler product line

August 11, 2023

The NetScaler product line optimizes delivery of applications over the internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You can install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler appliance can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

This topic includes the following sections:

- NetScaler Hardware Platforms
- NetScaler Editions
- Supported Releases on ADC Hardware
- Supported Browsers

NetScaler Hardware Platforms

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications:

[NetScaler MPX hardware platform](#)

[NetScaler SDX hardware platform](#)

NetScaler Editions

The NetScaler operating system is available in two editions:

- Advanced
- Premium

Features are enabled based on the license.

For more information about NetScaler software editions, see the [NetScaler Editions data sheet](#).

Supported releases on NetScaler hardware

See the following compatibility matrix tables for all NetScaler hardware platforms and the software releases supported on these platforms:

[NetScaler MPX Hardware-Software Compatibility Matrix](#)

[NetScaler SDX Hardware-Software Compatibility Matrix](#)

Compatible browsers

To access the NetScaler GUI, your workstation must have a compatible web browser.

The following table lists the compatible browsers for NetScaler GUI version 12.0, 12.1, and 13.0:

Operating System	Browser	Versions
Windows 7 and later	Internet Explorer	11, Edge, and later
Windows 7 and later	Mozilla Firefox	45 and later
Windows 7 and later	Chrome	60 and later
MAC	Mozilla Firefox	45 and later
MAC	Safari	10.1.1 and later

The compatible browser versions for NetScaler 11.1 are as follows:

Operating System	Browser	Versions
Windows 7 and later	Internet Explorer	8, 9, 10, 11, Edge
Windows 7 and later	Mozilla Firefox	45 and later
Windows 7 and later	Chrome	60 and later
MAC	Mozilla Firefox	45 and later
MAC	Safari	10.1.1 and later

Install the hardware

May 2, 2023

Before installing a NetScaler appliance, review the pre-installation checklist.

To use the SDX appliance, you must complete the following tasks by following the instructions given in the resources provided in table. Complete the tasks in the sequence given.

Task

Description

1. Read safety, cautions, warnings, and other information

Read the caution and danger information you need to know, before installing the product.

2. Prepare for installation

Unpack your appliance and ensure all parts were delivered, prepare the site and rack, and follow basic electrical safety precautions before you install your new appliance.

3. Install the hardware

Rack mount the appliance, install transceivers (if available), and connect the appliance to the network and a power source.

4. Configure the appliance.

Configure the initial settings of the NetScaler appliance by using the GUI or the serial console.

Follow the steps given in the following documentations to complete these tasks:

- [NetScaler MPX hardware documentation](#)
- [NetScaler SDX hardware documentation](#)

Access a NetScaler appliance

May 2, 2023

A NetScaler appliance has both a command line interface (CLI) and a GUI. The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and the default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?
- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

Access Method	Port	Default IP Address Required? (Y/N)
CLI	Console	N
CLI and GUI	Ethernet	Y

Command line interface

Access the CLI locally by connecting a workstation to the console port, or remotely by connecting through the secure shell (SSH) from any workstation on the same network.

Log on to the Command Line Interface through the Console Port

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port, follow these steps:

1. Connect the console port to a serial port on the workstation. For more information, see [Connect the console cable](#).

2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you might have to press ENTER one or more times to display it.
3. In User Name, type `nsroot`. In Password, type `nsroot` and if that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

Log on to the Command Line Interface by using SSH

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- PuTTY

Open Source software supported on multiple platforms. Available at:

<http://www.chiark.greenend.org.uk/~sgtatham/putty/>

- Vandyke Software SecureCRT

Commercial software supported on the Windows platform. Available at:

<http://www.vandyke.com/products/securecrt/>

These programs are tested by the NetScaler team, who have verified that they work correctly with a NetScaler appliance. Other programs might also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler appliance by using an SSH client, follow these steps:

1. On your workstation, start the SSH client.
2. For initial configuration, use the default IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.
3. In User Name, type `nsroot`. In Password, type `nsroot` and if that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance. For example.

```
1 login as: nsroot
2
3
4 Using keyboard-interactive authentication.
5
6
```

```
7 Password:
8
9
10 Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9

```

NetScaler GUI

Important:

A certificate-key pair is required for HTTPS access to the Citrix ADC GUI. On the ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Also, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on the appliance for HTTPS access to the GUI. Also, install an appropriate license before starting the appliance.

The GUI includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance.

The system requirements for the workstation running the GUI are as follows:

- For Windows-based workstations, a Pentium 166 MHz or faster processor.
- For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and `glibc` version 2.12–11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation must support 16-bit color mode, KDE, and KWM window managers used in conjunction, with displays set to local hosts.
- For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8.

Your workstation must have a supported web browser to access the configuration utility and Dashboard.

The following table lists the compatible browsers for NetScaler GUI version 12.1, 13.0, and 13.1:

Operating System	Browser	Versions
Windows 10 and later	Edge	110.1587.63 and later
Windows 10 and later	Mozilla Firefox	102 and later
Windows 10 and later	Chrome	108 and later
MAC	Mozilla Firefox	110.0.1 and later
MAC	Safari	15.5 and later

Use the NetScaler GUI

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

To log on to the GUI, follow these steps:

1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (<http://192.168.100.1>). The NetScaler logon page appears.

Note: If you have two NetScaler appliances in a high availability setup, do not access the GUI by entering the IP address of the secondary NetScaler appliance. If you do so and use the GUI to configure the secondary appliance, your configuration changes are not applied to the primary NetScaler appliance.

2. In the User Name text box, type `nsroot`.
3. In the Password text box, type the administrative password you assigned to the `nsroot` account during initial configuration and click **Login**. If that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

To access the online help, select Help from the Help menu at the top right corner.

Use the Statistical Utility

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler appliance.

To log on to Dashboard, follow these steps:

1. Open your web browser and enter the NSIP as an HTTP address. The NetScaler logon page appears.

2. In the User Name text box, type `nsroot`.
3. In the Password text box, type the administrative password you assigned to the `nsroot` account during initial configuration. If that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

Configure the ADC for the first time

May 22, 2023

For initial configuration of a NetScaler MPX appliance, see [Initial Configuration of a NetScaler MPX appliance](#).

For initial configuration of a NetScaler SDX appliance, see [Initial Configuration of a NetScaler SDX appliance](#).

NITRO API

You can use the NITRO API to configure the NetScaler appliance. NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs). For more information, see [NITRO API](#).

Secure your NetScaler deployment

May 2, 2023

To maintain security through the deployment life cycle of NetScaler appliance, Citrix recommends you to consider the following security aspects:

- Physical Security
- Appliance Security
- Network Security
- Administration and Management

Different deployments might require different security considerations. The NetScaler secure deployment guidelines provide general security guidance to help you decide on an appropriate secure deployment based on your specific security requirements.

For more information on guidelines for securely deploying the NetScaler appliance, see [NetScaler secure deployment guidelines](#).

Configure high availability

May 2, 2023

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler appliance that is actively accepting connections and managing the servers is called a primary unit and the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each NetScaler appliance in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see [High Availability](#). If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

Figure 1. High availability in one-arm mode

Figure 2. High availability in two-arm mode

In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one ADC appliance as primary and another as secondary. Perform the following tasks on each of the ADC appliances:

- Add a node.
- Disable high availability monitoring for unused interfaces.

Add a Node

A node is a logical representation of a peer NetScaler appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

Through CLI

To add a node by using the command line interface, follow these steps:

At the command prompt, type the following commands to add a node and verify that the node has been added:

- add HA node <id> <IPAddress>

- show HA node <id>

Example

```
1  add HA node 0 10.102.29.170
2  Done
3  > show HA node 0
4  1) Node ID: 0
5     IP: 10.102.29.200 (NS200)
6     Node State: UP
7     Master State: Primary
8     SSL Card Status: UP
9     Hello Interval: 200 msec
10    Dead Interval: 3 sec
11    Node in this Master State for: 1:0:41:50 (days:hrs:min:
12    sec)
12  <!--NeedCopy-->
```

Through GUI

To add a node by using the GUI, follow these steps:

1. Navigate to **System > High Availability**.
2. Click **Add** on the **Nodes** tab.
3. On the **Create HA Node** page, in the **Remote Node IP Address** text box, type the NSIP Address (for example, 10.102.29.170) of the remote node.
4. Ensure that the **Configure remote system to participate in High Availability setup** check box is selected. Provide the login credentials of the remote node in the text boxes under **Remote System Login Credentials**.
5. Select the **Turn off HA monitor on interfaces/channels that are down** check box to disable the HA monitor on interfaces that are down.

Verify that the node you added appears in the list of nodes in the Nodes tab.

Disable high availability monitoring for unused interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly

Through CLI

To disable the high availability monitor for an unused interface by using the command line interface, follow these steps:

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- set interface <id> -haMonitor OFF
- show interface <id>

Example

```
1 > set interface 1/8 -haMonitor OFF
2 Done
3 > show interface 1/8
4 Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
5 flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
6 MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime
7 238h55m44s
8 Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF,
9 throughput 0
10 RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
11 TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
12 NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)
13 Muted(0)
14 Bandwidth thresholds are not set.
15 <!--NeedCopy-->
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include “HAMON.”

Through GUI

To disable the high availability monitor for unused interfaces by using the GUI, follow these steps:

1. Navigate to System > Network > Interfaces.
2. Select the interface for which the monitor must be disabled.
3. Click Open. The Modify Interface dialog box appears.
4. In HA Monitoring, select the OFF option.
5. Click OK.
6. Verify that, when the interface is selected, “HA Monitoring: OFF” appears in the details at the bottom of the page.

Change an RPC node password

September 6, 2023

To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on NetScaler appliance. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each NetScaler appliance and stores information, such as the IP addresses of the other NetScaler appliance and the passwords used for authentication. The NetScaler appliance that contacts the other NetScaler appliance checks the password within the RPC node.

Note:

After you upgrade a NetScaler appliance to release 13.1 build 33.x or later from one of the following builds, the `secure` option for the RPC node is enabled or disabled on the basis of the TLS 1.2 setting (enabled or disabled) present for the internal RPCS and KRPCS services.

- Release 13.0 build 64.35 or earlier
- Release 12.1 build 61.18 or earlier

The RPC communication is encrypted between the NetScaler nodes of the following setups if the `secure` option is enabled:

- High availability
- Cluster
- GSLB

The `secure` option uses secure protocol TLS1.2 and port numbers 3008 and 3009 for the RPC connection between the NetScaler nodes.

For ensuring secure RPC communication, Citrix recommends performing the following operations before upgrading these setups:

- TLS 1.2 must be enabled for the internal RPCS and KRPCS services:
 - `nsrpcs-127.0.0.1-3008`
 - `nskrpcs-127.0.0.1-3009`
 - `nsrpcs-:::11-3008`
- 3008 and 3009 must be unblocked in firewalls between the NetScaler nodes.

You can enable or disable the `secure` option using the NetScaler CLI or the GUI.

To change an RPC node password by using the GUI

1. Navigate to **System > Network > RPC**.
2. In the **RPC** pane, select the node and then click **Edit**.
3. In **Configure RPC Node**, type the new password.
4. In **Source IP Address**, type the existing node's IP address to be used to communicate with the peer system node.

← Configure RPC Node

5. Select **Secure** and then click **OK**.

Note

For enhanced security, Citrix recommends you to enable the **Secure** option on RPC nodes. When you enable the **Secure** option, the appliance encrypts all the RPC communication sent from one ADC node to other ADC nodes thus securing the RPC communication. This secure communication uses the port number 3008. If the firewall between the ADC nodes blocks the port number 3008, unblock it and proceed. Otherwise, configuration synchronization and configuration propagation might fail.

To change an RPC node password by using the CLI

At the command line, type the following commands:

```
1 set ns rpcNode <IPAddress> {
2   -password }
3   [-secure ( YES | NO )]
4 show ns rpcNode
5 <!--NeedCopy-->
```

Example:

```
1 > set ns rpcNode 192.0.2.4 -password mypassword -secure YES
2   Done
3 > show rpcNode
```

```
4 .
5 .
6 .
7   IPAddress: 192.0.2.4 Password: d336004164d4352ce39e
8     SrcIP: *           Secure: ON
9 Done
10 >
11
12 <!--NeedCopy-->
```

Configure a FIPS appliance for the first time

May 2, 2023

Note

- FIPS FAQ can be found here: [FIPS FAQ](#).

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other NetScaler appliances and the passwords used to authenticate on each.

On a NetScaler MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

Configure secure HTTPS by using the CLI

To configure secure HTTPS by using the CLI, follow these steps

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see one of the following links:
 - For MPX: [Configure the HSM](#).
 - For SDX: [Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance](#).

2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see [Configure FIPS appliances in a high availability setup](#).

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

```
import ssl fipskey serverkey -key ns-server.key -inform PEM
```

4. Add a certificate-key pair. At the command prompt, type:

```
add certkey server -cert ns-server.cert -fipskey serverkey
```

5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:

```
bind ssl service nshttps-127.0.0.1-443 -certkeyname server
```

```
bind ssl service nshttps-::11-443 -certkeyname server
```

Configure secure HTTPS by using the GUI

To configure secure HTTPS by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see one of the following links:
 - For MPX: [Configure the HSM](#).
 - For SDX: [Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance](#).
2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see [Configure FIPS appliances in a high availability setup](#).
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see the [Import an existing FIPS key](#) section.
4. Navigate to **Traffic Management > SSL > Certificates**.
5. In the details pane, click Install.
6. In the Install Certificate dialog box, type the certificate details.
7. Click Create, and then click Close.
8. Navigate to **Traffic Management > Load Balancing > Services**.
9. In the details pane, on the Action tab, click Internal Services.
10. Select `nshttps-127.0.0.1-443` from the list, and then click Open.
11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
12. Select `nshttps-::11-443` from the list, and then click Open.

13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
14. Click OK.

Configure secure RPC by using the CLI

To configure secure RPC by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see one of the following links:
 - For MPX: [Configure the HSM](#).
 - For SDX: [Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance](#).
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see [Configure FIPS appliances in a high availability setup](#).
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

```
import ssl fipskey serverkey -key ns-server.key -inform PEM
```

4. Add a certificate-key pair. At the command prompt, type:

```
add certkey server -cert ns-server.cert -fipskey serverkey
```
5. Bind the certificate-key pair to the following internal services. At the command prompt, type:

```
bind ssl service nsrpcs-127.0.0.1-3008 -certkeyname server
bind ssl service nskrpcs-127.0.0.1-3009 -certkeyname server
bind ssl service nsrpcs-::1l-3008 -certkeyname server
```
6. Enable secure RPC mode. At the command prompt, type:

```
set ns rpcnode \<IP address\> -secure YES
```

For more information about changing an RPC node password, see [Change an RPC node password](#).

Configure secure RPC by using the GUI

To configure secure RPC by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see one of the following links:
 - For MPX: [Configure the HSM](#).

- For SDX: [Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance](#).
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, [Configure FIPS appliances in a high availability setup](#).
 3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, the [Import an existing FIPS key](#) section.
 4. Navigate to **Traffic Management > SSL > Certificates**.
 5. In the details pane, click Install.
 6. In the Install Certificate dialog box, type the certificate details.
 7. Click Create, and then click Close.
 8. Navigate to **Traffic Management > Load Balancing > Services**.
 9. In the details pane, on the Action tab, click Internal Services.
 10. Select nsrpcs-127.0.0.1-3008 from the list, and then click Open.
 11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
 12. Select nskrpcs-127.0.0.1-3009 from the list, and then click Open.
 13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
 14. Select nsrpcs- : : 11-3008 from the list, and then click Open.
 15. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
 16. Click OK.
 17. Navigate to **System > Network > RPC**.
 18. In the details pane, select the IP address, and click Open.
 19. In the Configure RPC Node dialog box, select Secure.
 20. Click OK.

Common network topologies

May 2, 2023

As described in the “Physical deployment mode” section in [Where does a NetScaler appliance fit in the network?](#), you can deploy the NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Set up a common two-arm topology

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

Set up a simple two-arm multiple subnet topology

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in two-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and default gateway, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Configure the SNIP, as described in [Configuring Subnet IP Addresses](#).
3. Enable the USNIP option, as described in [To enable or disable USNIP mode](#) section.
4. Configure the virtual server and the services, as described in [Creating a Virtual Server](#) section and [Configuring Services](#) section.
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

Set up a simple two-arm transparent topology

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode

To deploy a NetScaler appliance in two-arm, transparent mode, follow these steps

1. Configure the NSIP and default gateway, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Enable L2 mode, as described in [Enabling and Disabling Layer 2 Mode](#).
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

Set up common one-arm topologies

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

Set up a simple one-arm single subnet topology

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on an ADC appliance, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet

To deploy a NetScaler appliance in one-arm mode with a single subnet, follow these steps:

1. Configure the NSIP and the default gateway, as described in, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Configure the virtual server and the services, as described in [Creating a Virtual Server](#) section and [Configuring Services](#) section.
3. Connect one of the network interfaces to the switch.

Set up a simple one-arm multiple subnet topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in one-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and the default gateway, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Configure the SNIP and enable the USNIP option, as described in [Configuring Subnet IP Addresses](#).
3. Configure the virtual server and the services, as described in [Creating a Virtual Server](#) section and [Configuring Services](#) section.
4. Connect one of the network interfaces to the switch.

System management settings

May 2, 2023

Once your initial configuration is in place, you can configure settings to define the behavior of the NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler appliance. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the Citrix clock with a Network Time Protocol (NTP) server. The NetScaler appliance can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

System settings

May 2, 2023

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler GUI.

You can modify the types of HTTP parameters described in the following table.

Parameter Type: HTTP Port Information

Specifies: The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port.

Note: If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.

Parameter Type: Limits

Specifies: The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set Max Connections to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set Max Requests to 0.

Note: If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.

Parameter Type: Client IP Insertion

Specifies: Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a subnet IP address, the server identifies it as the client's IP address. Some applications need the client's IP address for logging purposes or to dynamically determine the content to be served by the web server.

You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).

Parameter Type: Cookie Version

Specifies: The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

Parameter Type: Requests/Responses

Specifies: Options for handling certain types of requests, and enable/disable logging of HTTP error responses.

Parameter Type: Server Header Insertion

Specifies: Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

To set the FTP port range by using the GUI, follow these steps:

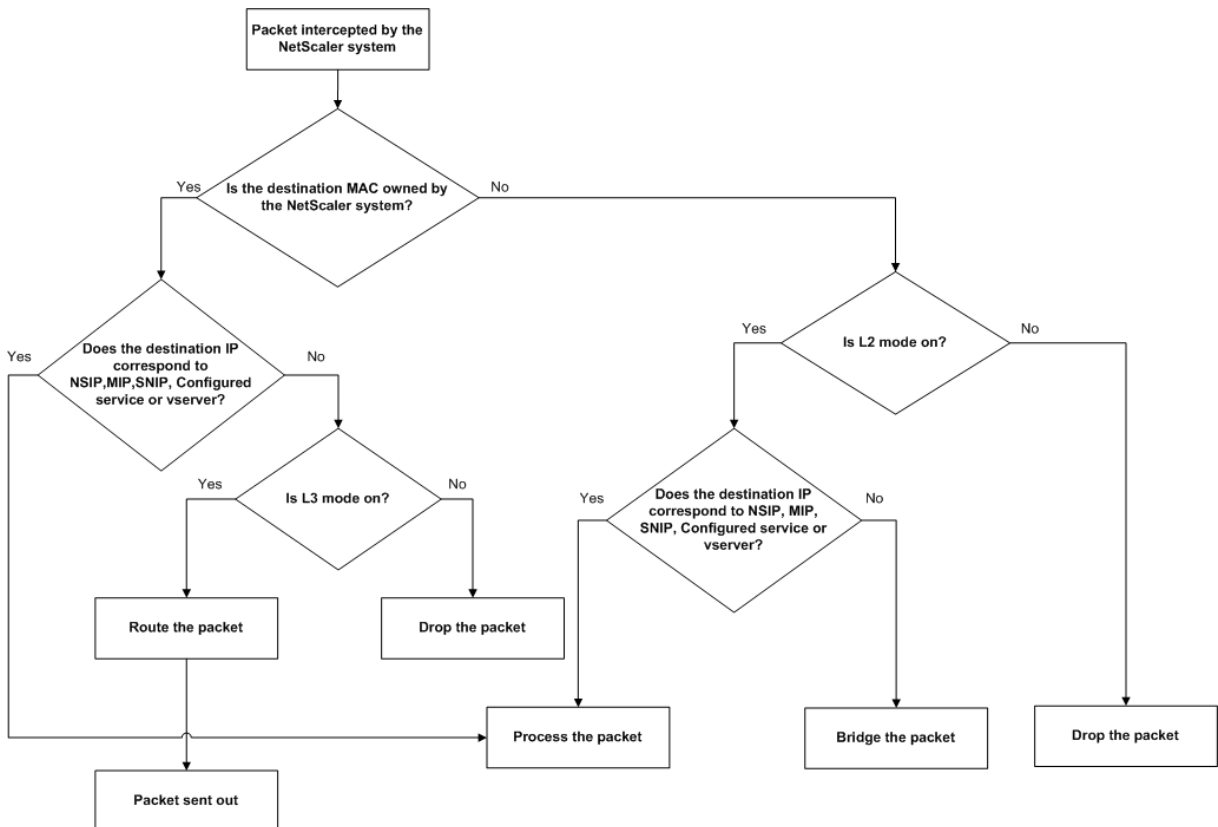

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

Packet forwarding modes

May 2, 2023

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes

An appliance can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Enable and disable layer 2 mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined

for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support the Spanning Tree Protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

To enable or disable Layer 2 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

Examples

```
1 > enable ns mode l2
2 Done
3 > show ns mode
4
5 Mode Acronym Status
6 -----
7 1) Fast Ramp FR ON
8 2) Layer 2 mode L2 ON
9 .
10 .
11 .
12 Done
13 >
14
15 > disable ns mode l2
16 Done
17 > show ns mode
18
19 Mode Acronym Status
20 -----
21 1) Fast Ramp FR ON
22 2) Layer 2 mode L2 OFF
23 .
24 .
25 .
26 Done
27 >
28 <!--NeedCopy-->
```

To enable or disable Layer 2 mode by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes** and **Features**, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Enable and disable layer 3 mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

Enable or disable Layer 3 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

Examples

```
1 > enable ns mode l3
2 Done
3 > show ns mode
4
5 Mode Acronym Status
6 -----
7 1) Fast Ramp FR ON
8 2) Layer 2 mode L2 OFF
9 .
10 .
11 .
12 9) Layer 3 mode (ip forwarding) L3 ON
13 .
14 .
15 .
16 Done
17 >
18
19 > disable ns mode l3
```

```
20 Done
21 > show ns mode
22
23 Mode Acronym Status
24 -----
25 1) Fast Ramp FR ON
26 2) Layer 2 mode L2 OFF
27 .
28 .
29 .
30 9) Layer 3 mode (ip forwarding) L3 OFF
31 .
32 .
33 .
34 Done
35 >
36 <!--NeedCopy-->
```

Enable or disable Layer 3 mode by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Configure Modes**.
3. In the **Configure Modes** dialog box, to enable Layer 3 mode, select the **Layer 3 Mode (IP Forwarding)** check box. To disable Layer 3 mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

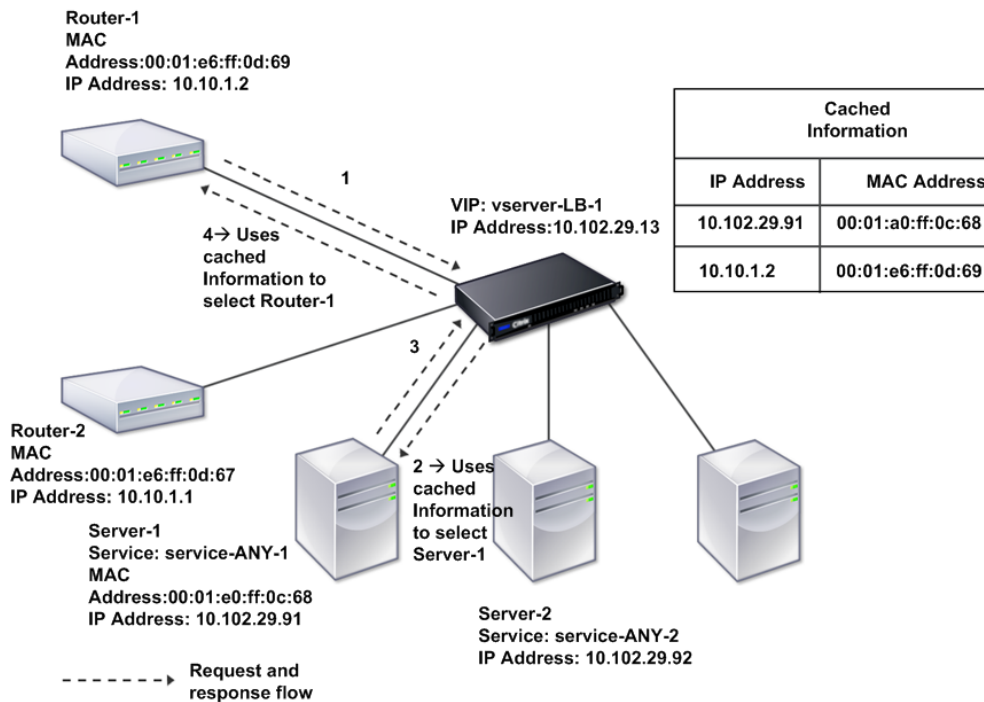

Enable and disable MAC-based forwarding mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

Figure 2. MAC-based Forwarding Process

When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance’s default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

Enable or disable MAC-based forwarding by using the CLI

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- <enable ns mode <Mode>
- <disable ns mode <Mode>
- <show ns mode

Example

““ pre codeblock

```
enable ns mode mbf
Done
show ns mode
```

1	Mode	Acronym	Status	1)	Fast
2	-----	-----	-----	2)	Layer 2
	Ramp mode	FR	ON	.	.
	MAC-based forwarding	L2	OFF	.	6)
	Done >	MBF	ON	.	.

```
disable ns mode mbf
Done
show ns mode
```

1	Mode	Acronym	Status	1)	Fast
2	-----	-----	-----	2)	Layer 2
	Ramp mode	FR	ON	.	.
	MAC-based forwarding	L2	OFF	.	6)
	Done >	MBF	OFF	.	.

To enable or disable MAC-based forwarding by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Network interfaces

May 2, 2023

The NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

Virtual LANs

The NetScaler appliance supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The ADC appliance (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs.

The NetScaler appliance supports the following types of VLANs.

- Default VLAN

By default, the network interfaces on a NetScaler appliance are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

- Port-Based VLANs

A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

- Tagged VLAN

A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the ADC appliance and therefore must be done during initial network configuration.

Link aggregate channels

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler appliance and other connected devices. An aggregated link is also referred to as a channel.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see [Configuring Link Aggregation by Using the Link Aggregation Control Protocol](#).

Clock synchronization

May 2, 2023

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. Add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at <http://www.ntp.org>.

To configure clock synchronization on your appliance, follow these steps:

1. Log on to the command line and enter the shell command.
2. At the shell prompt, copy the `ntp.conf` file from the `/etc` directory to the `/nsconfig` directory. If the file already exists in the `/nsconfig` directory, make sure that you remove the following entries from the `ntp.conf` file:

```
restrict localhost
restrict 127.0.0.2
```

These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler appliance.

3. Edit `/nsconfig/ntp.conf` by typing the IP address for the desired NTP server under the file's `server` and `restrict` entries.
4. Create a file named `rc.netscaler` in the `/nsconfig` directory, if the file does not already exist in the directory.
5. Edit `/nsconfig/rc.netscaler` by adding the following entry: `/bin/sh /etc/ntpd_ctl full_start`.

This entry starts the `ntpd` service, and checks the `ntp.conf` file.

If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start `ntpd` again. You can check the time difference between the appliance and the time server, by running the following command in the shell:

```
1 ntpdate -q <IP address or domain name of the NTP server>
2 <!--NeedCopy-->
```

6. Reboot the appliance to enable clock synchronization.

Note: If you want to start time synchronization without restarting the appliance, enter one of the following commands at the shell prompt:

```
1 /usr/sbin/ntpd -c /nsconfig/ntp.conf -g -p /var/run/ntpd.pid -l /
  var/log/ntpd.log &
2
3 or
4
5 /bin/sh /etc/ntpd_ctl full_start
6
7 <!--NeedCopy-->
```

DNS configuration

May 2, 2023

You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.

Add a name server by using the CLI

At the command prompt, type the following commands to add a name server and verify the configuration:

- `<add dns nameServer \<IP\>`
- `<show dns nameServer \<IP\>`

Example

```
1 > add dns nameServer 10.102.29.10
2 Done
3 > show dns nameServer 10.102.29.10
4 1)      10.102.29.10 - State: DOWN
5 Done
6
7 <!--NeedCopy-->
```

Add a name server by using the GUI

1. Navigate to **Traffic Management > DNS > Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, 10.102.29.10).
If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

SNMP configuration

May 2, 2023

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler appliance. The agent searches the

management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler appliance that has SNMP enabled and configured.

Figure 1. SNMP on the NetScaler appliance

The SNMP agent on a NetScaler appliance supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the ADC appliance) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler appliance supports the following enterprise-specific MIBs:

- A subset of standard MIB-2 groups. Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- A system enterprise MIB. Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Add SNMP managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks. To add an SNMP manager by using the CLI

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

```
add snmp manager <IPAddress> ... [-netmask <netmask>]
show snmp manager <IPAddress>
```

Example:

```
1 add snmp manager 10.102.29.5 -netmask 255.255.255.255
2 Done
3 show snmp manager 10.102.29.5
4 10.102.29.5 255.255.255.255
5 Done
6 <!--NeedCopy-->
```

To add an SNMP manager by using the GUI:

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

Add SNMP traps listeners

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the CLI

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- `add snmp trap specific <IP>`
- `show snmp trap`

Example:

```
1 Trap type: SPECIFIC
2 Destination IP: 10.102.29.3
3 TD: 0
4 Destination Port: 162
5 Source IP: NetScaler IP
6 Version: V2
7 Min-Severity: -
8 AllPartition: DISABLED
9 Community: public
10 <!--NeedCopy-->
```

To add an SNMP trap listener by using the GUI

1. In the navigation pane, expand System, expand **SNMP**, and then click **Traps**.
2. In the details pane, click **Add**.
3. In the **Create SNMP Trap Destination** dialog box, in the **Destination IP Address** text box, type the IP address (for example, 10.102.29.3).
4. Click **Create** and then click **Close**.
5. Verify that the SNMP trap you added appears in the **Details** section at the bottom of the pane.

Configure SNMP alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the CLI

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

```
set snmp alarm [-state ENABLED                DISABLED ]
```

-
- show snmp alarm <trapName>

Example

```
1 set snmp alarm LOGIN-FAILURE -state ENABLED
2 Done
3 show snmp alarm LOGIN-FAILURE
4 Alarm Alarm Threshold Normal Threshold Time State Severity Logging
5 \-----
6 LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
7 Done
8 <!--NeedCopy-->
```

To set the severity of the alarm by using the CLI

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- set snmp alarm <trapName> [-severity <severity>]
- show snmp alarm <trapName>

Example:

```
1 set snmp alarm LOGIN-FAILURE -severity Major
2 Done
3 show snmp alarm LOGIN-FAILURE
4 Alarm Alarm Threshold Normal Threshold Time State Severity Logging
5 \-----
6 LOGIN-FAILURE N/A N/A N/A ENABLED Major ENABLED
7 Done
8 <!--NeedCopy-->
```

To configure alarms by using the GUI

1. In the navigation pane, expand **System**, expand SNMP, and then click **Alarms**.

2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click **Open**.
3. In the **Configure SNMP Alarm** dialog box, to enable the alarm, select Enabled in the **State** drop-down list. To disable the alarm, select Disabled.
4. In the **Severity** drop-down list, select a severity option (for example, Major).
5. Click **OK**, and then click **Close**.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the **Details** section at the bottom of the pane.

Verify configuration

May 2, 2023

After you've finished configuring your system, complete the following checklists to verify your configuration.

Configuration checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough SNIP IP addresses have been configured to support all server-side connections during peak times.
 - The number of configured SNIP IP addresses is:_____
 - The expected number of simultaneous server connections is:
[] 62,000 [] 124,000 [] Other_____

Topology configuration checklist

The routes have been used to resolve servers on other subnets.

The routes entered are:

- If the NetScaler appliance is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the ADC appliance resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

- If the ADC appliance is placed behind an external load balancer, then the load balancing policy on the external load balancer is not “least connection”.

The load balancing policy configured on the external load balancer is:

- If the ADC appliance is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

The value configured for the session time-out is: _____

Server configuration checklist

- “Keep-alive” has been enabled on all the servers.

The value configured for the keep-alive time-out is: _____

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler appliance or upstream router.) The default gateway is:

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.
- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler appliance.

The MaxConn (maximum number of connections) value that has been set is:

- If a Netscape Enterprise Server is used, the maximum requests per connection parameter is set on the NetScaler appliance. The maximum requests per connection value that has been set is:

Software features configuration checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler appliance.)

Reason for enabling or disabling:

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)

Reason for enabling or disabling:

- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)

Reason for enabling or disabling:

- Do the default settings of the surge protection feature need to be changed?

Reason for changing or not changing:

Access checklist

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)

- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load balance traffic on a NetScaler appliance

May 2, 2023

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.

When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture

The entities function as follows:

- **Virtual server.** An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service.** A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object.** An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.
- **Monitor.** An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

Load balancing

March 22, 2024

To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the NetScaler appliance binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the `stat lb vserver <vserverName>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing

Enable load balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the CLI

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- enable feature lb
- show feature

Example

```
1 > enable feature lb
2 Done
3 > show feature
4
5     Feature                Acronym    Status
6     -----                -
7 1) Web Logging            WL         OFF
8 2) Surge Protection       SP         OFF
9 3) Load Balancing        LB         ON
10 .
11 .
12 .
13 9) SSL Offloading        SSL        ON
14 .
15 .
16 .
17 Done
18 <!--NeedCopy-->
```

To enable load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click OK.
4. In the Enable/Disable Feature(s)? message, click Yes.

Configure services and a virtual server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and

binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the CLI

At the command prompt, type the following commands to implement and verify the initial configuration:

- `<add service <name> <IPAddress> <serviceType> <port>`
- `<add lb vserver <vServerName> <serviceType> [<IPAddress> <port>]`
- `<bind lb vserver <name> <serviceName>`
- `<show service bindings <serviceName>`

Example

```
1 > add service service-HTTP-1 10.102.29.5 HTTP 80
2 Done
3 > add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
4 Done
5 > bind lb vserver vserver-LB-1 service-HTTP-1
6 Done
7 > show service bindings service-HTTP-1
8     service-HTTP-1 (10.102.29.5:80) - State : DOWN
9
10     1)          vserver-LB-1 (10.102.29.60:80) - State : DOWN
11 Done
12 <!--NeedCopy-->
```

To implement the initial load balancing configuration by using the GUI

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.

Persistence settings

May 2, 2023

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K*
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

The * in the preceding table refers to the following:

250K sessions per core is the default per packet engine. To configure 1 million session entries per packet engine, run the following command:

```
set lb parameter -sessionsthreshold <1000000*number of PE>
```

For a 3 PE system, run the following command:

```
set lb parameter -sessionsthreshold 3000000
```

Table 1. Limitations on Number of Simultaneous Persistent Connections

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

Persistence					
TypeHeader	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
1					
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom	YES	YES	NO	NO	NO
Server ID					
Rule	YES	YES	NO	NO	NO
SRCIPDESTIP	N/A	N/A	YES	YES	N/A
DESTIP	N/A	N/A	YES	YES	N/A

Table 2. Persistence Types Available for Each Type of Virtual Server

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs.

Configure persistence based on cookies

When you enable persistence based on cookies, the NetScaler appliance adds an HTTP cookie into the **Set-Cookie header** field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the ADC uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler appliance inserts the cookie `<NSC_XXXX>= <ServiceIP> <ServicePort>`

where:

- «NSC_XXXX» is the virtual server ID that is derived from the virtual server name.
- «ServiceIP» is the hexadecimal value of the IP address of the service.
- «ServicePort» is the hexadecimal value of the port of the service.

If the `useEncryptedPersistenceCookie` option is enabled, the ADC encrypts ServiceIP and ServicePort using the SHA2 hash algorithm when it inserts a cookie and decrypts when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the ADC appliance sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler appliance inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the `expires` attribute of the HTTP cookie), calculated as the sum of the current GMT time on an ADC appliance, and the timeout value.
- If an HTTP cookie version 1 is used, the ADC appliance inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can change the HTTP cookie version.

To change the HTTP cookie version by using the CLI

At the command prompt, type;

```
1 set ns param [-cookieversion ( 0 | 1 )]  
2 <!--NeedCopy-->
```

Example:

```
1 set ns param -cookieversion 1  
2 <!--NeedCopy-->
```

To change the HTTP cookie version by using the GUI

1. Navigate to **System > Settings**.

2. In the details pane, click Change HTTP Parameters.
3. In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see Configure persistence based on cookies.

To configure persistence based on cookies by using the CLI

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

```
1 set lb vserver <name> -persistenceType COOKIEINSERT
2
3 show lb vserver <name>
4 <!--NeedCopy-->
```

Example:

```
1 set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
2 Done
3 show lb vserver vserver-LB-1
4     vserver-LB-1 (10.102.29.60:80) - HTTP    Type: ADDRESS
5     .
6     .
7     .
8     Persistence: COOKIEINSERT (version 0)
9     Persistence Timeout: 2 min
10    .
11    .
12    .
13 Done
14 <!--NeedCopy-->
```

To configure persistence based on cookies by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure persistence based on server IDs in URLs

The NetScaler appliance can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the ADC extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and the port specified as a hexadecimal number. The ADC extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see [Policy Configuration and Reference](#).

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching the token sid=. Thus, a request with the URL <http://www.citrix.com/index.asp?\\&sid;=c0a864100050> is directed to the server with the IP address 10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see [Load Balancing](#).

To configure persistence based on server IDs in URLs by using the CLI

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

```
1 set lb vserver <name> -persistenceType URLPASSIVE
2
3 <show lb vserver <name>
4 <!--NeedCopy-->
```

Example:

```
1 set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
2 Done
3 show lb vserver vserver-LB-1
4     vserver-LB-1 (10.102.29.60:80) - HTTP    Type: ADDRESS
5     .
6     .
7     .
```

```
8 Persistence: URLPASSIVE
9 Persistence Timeout: 2 min
10 .
11 .
12 .
13 Done
14 <!--NeedCopy-->
```

To configure persistence based on server IDs in URLs by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure features to protect the load balancing configuration

September 21, 2020

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Configure URL redirection

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the CLI

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:

```
1 set lb vsrver <name> -redirectURL <URL>
2
3 show lb vsrver <name>
4 <!--NeedCopy-->
```

Example:

```
1 > set lb vsrver vsrver-LB-1 -redirectURL <http://www.newdomain.
   com/mysite/maintenance>
2 Done
3 > show lb vsrver vsrver-LB-1
4 vsrver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
5 State: DOWN
6 Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)
7 .
8 .
9 .
10 Redirect URL: <http://www.newdomain.com/mysite/maintenance>
11 .
12 .
13 .
14 Done
15 >
16 <!--NeedCopy-->
```

To configure a virtual server to redirect client requests to a URL by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure URL redirection (for example, vsrver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, <http://www.newdomain.com/mysite/maintenance>), and then click OK.
4. Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

Configure backup virtual servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.

You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

To configure a backup virtual server by using the CLI

At the command prompt, type the following commands to configure a backup server and verify the configuration:

```
1 set lb vsrver <name> [-backupVserver <string>]
2
3 show lb vsrver <name>
4 <!--NeedCopy-->
```

Example:

```
1 > set lb vsrver vsrver-LB-1 -backupVserver vsrver-LB-2
2 Done
3 > show lb vsrver vsrver-LB-1
4 vsrver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
5 State: DOWN
6 Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
7 .
8 .
9 .
10 Backup: vsrver-LB-2
11 .
12 .
13 .
14 Done
15 >
16 <!--NeedCopy-->
```

To set up a backup virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2), and then click OK.
4. Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.

Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the Disable Primary When Down check box.

A typical load balancing scenario

May 2, 2023

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology

The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 1. LB Configuration Parameter Values

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model

The following tables list the commands used to configure this load balancing setup by using the command line interface.

Task	Command
To enable load balancing	enable feature lb
To create a service named service-HTTP-1	add service service-HTTP-1 10.102.29.5 HTTP 80

Task	Command
To create a service named service-HTTP-2	<code>add service service-HTTP-2 10.102.29.6 HTTP 80</code>
To create a virtual server named vserver-LB-1	<code>add lb vserver vserver-LB-1 HTTP 10.102.29.60 80</code>
To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1	<code>bind lb vserver vserver-LB-1 service-HTTP-1</code>
To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1	<code>bind lb vserver vserver-LB-1 service-HTTP-2</code>

Table 2. Initial Configuration Tasks

For more information about the initial configuration tasks, see [Setting Up Basic Load Balancing](#).

Task	Command
To view the properties of a virtual server named vserver-LB-1	<code>show lb vserver vserver-LB-1</code>
To view the statistics of a virtual server named vserver-LB-1	<code>stat lb vserver vserver-LB-1</code>
To view the properties of a service named service-HTTP-1	<code>show service service-HTTP-1</code>
To view the statistics of a service named service-HTTP-1	<code>stat service service-HTTP-1</code>
To view the bindings of a service named service-HTTP-1	<code>show service bindings service-HTTP-1</code>

Table 3. Verification Tasks

Task	Command
To configure persistence on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2</code>
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT</code>
To configure URLPassive persistence on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -persistenceType URLPASSIVE</code>

Task	Command
To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance</code>
To set a backup virtual server on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -backupVserver vserver-LB-2</code>

Table 4. Customization Tasks

For more information about configuring persistence, see [Choosing and Configuring Persistence Settings](#). For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see [Configuring Features to Protect the Load Balancing Configuration](#).

Use case: How to force Secure and HttpOnly cookie options for websites using the NetScaler appliance

May 2, 2023

The web administrators may force the Secure, or HttpOnly, or both the flags on the Session ID and the authentication cookies that are generated by the web applications. You can modify the Set-cookie headers to include these two options by using an HTTP load balancing virtual server and rewrite policies on a NetScaler appliance.

- **HttpOnly** - This option on a cookie causes the web browsers to return the cookie using the HTTP or HTTPS protocol only. The non-HTTP methods such as JavaScript document.cookie references cannot access the cookie. This option helps in preventing cookie theft due to cross-site scripting.

NOTE

You cannot use the HttpOnly option when a web application requires access to Cookie contents by using a client-side script, such as JavaScript or a client-side Java Applet. You can use the method mentioned in this document to rewrite only the server-generated cookies and not the cookies generated by NetScaler appliance. For example, AppFirewall, persistence, VPN session cookies and so on.

- **Secure** - This option on a cookie causes the web browsers to return only the cookie value when the transmission is encrypted by SSL. This option can be used to prevent cookie theft through connection eavesdropping.

NOTE

The following procedure is not applicable for VPN virtual servers.

To configure the NetScaler appliance to force the Secure and HttpOnly flags for an existing HTTP virtual server by using CLI

1. Create a rewrite action.

This example is configured to set both Secure and HttpOnly flags. If either one is missing, modify it as necessary for other combinations.

```
1 add rewrite action act_cookie_Secure replace_all http.RES.
  full_Header "\"Secure; HttpOnly; path=/" -search "regex(re!(
  path=/\\; Secure; HttpOnly)|(path=/\\; Secure)|(path=/\\;
  HttpOnly)|(path=/)!)"
2 <!--NeedCopy-->
```

This policy replaces all instances of “path=/”, “path=/; Secure”, “path=/; Secure; HttpOnly” and “path=/; HttpOnly” with “Secure; HttpOnly; path=/”. This regular expression (regex) fails if the case doesn’t match.

2. Create a rewrite policy to trigger the action.

```
1 add rewrite policy rw_force_secure_cookie "http.RES.HEADER(\"Set-
  Cookie\").EXISTS" act_cookie_Secure
2 <!--NeedCopy-->
```

3. Bind the rewrite policy to the virtual server to be secured. If `Secure` option is used, an SSL virtual server must be used.

```
1 bind lb vserver mySSLVServer -policyName rw_force_secure_cookie -
  priority 100 -gotoPriorityExpression NEXT -type RESPONSE
2 <!--NeedCopy-->
```

Examples:

The following example shows the cookie before setting the httpOnly flag

```
1 Set-Cookie: CtxsAuthId=C5614491; path=/Citrix/ProdWeb
2 <!--NeedCopy-->
```

The following example shows the cookie after setting the httpOnly flag

```
1 Set-Cookie: CtxsAuthId=C5614491; Secure; HttpOnly; path=/Citrix/ProdWeb
  /
2 <!--NeedCopy-->
```

To configure the NetScaler appliance to force the Secure and HttpOnly flags for an existing HTTP virtual server by using GUI

1. Navigate to **AppExpert > Rewrite > Actions**, and click **Add** to add a new rewrite action.

← Create Rewrite Action

Name*
act_cookie_Secure

Type*
REPLACE_ALL

Use this action type to replace all references of specified text with custom text in request/response.

Expression to choose target location*
Http.RES.FULL_HEADER

Expression to Replace with
path=/secure/HttpOnly

Search
Regular Expression
^(path=/secure/)(path=/)(httpOnly);(httpOnly);

Refine Search
Press Control+Space to start the expression and then type "" to get the next set of options

In string expressions, string constants and expressions can be concatenated with "*" operator. Please make sure that string constants are enclosed in double quotes.

Comments

Create Close

2. Navigate to **AppExpert > Rewrite > Policies**, and click **Add** to add a new rewrite policy.

← Create Rewrite Policy

Name*
rw_force_secure_cookie

Action*
act_cookie_Secure

Configure Assignments

Configure Rewrite Actions

Log Action
Add Edit

Undefined-Result Action*
Global-undefined-resub-action

Expression*
http.RES.HEADER("Set-Cookie").EXISTS

Comments

Create Close

3. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and then bind the rewrite (response) policy to the corresponding SSL virtual server.

Load Balancing Virtual Server Rewrite Policy Binding

Add Binding Unbind Regenerate Priorities Bind NOPOLICY-REWRITE No action

Click here to search or you can enter

PRIORITY	POLICY NAME	EXPRESSION	ACTION	GOTO EXPRESSION	INVOKE
100	rw_force_secure_cookie	http.RES.HEADER("Set-Cookie").EXISTS	act_cookie_Secure	END

Accelerate load balanced traffic by using compression

May 2, 2023

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

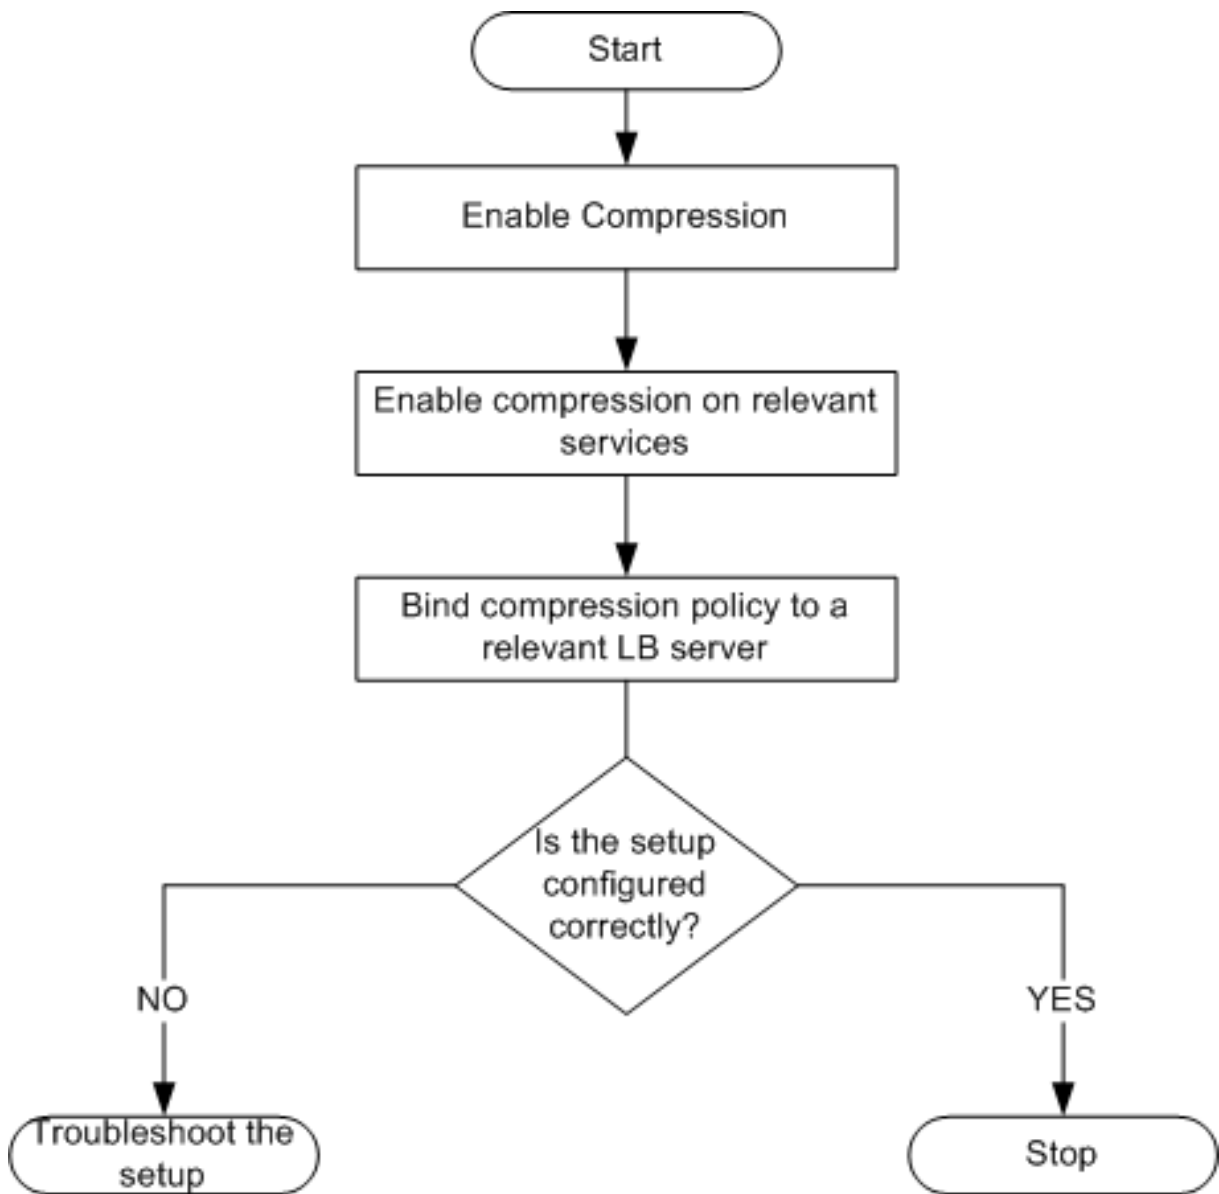

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the policies to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

Compression configuration task sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression

Note: The steps in the above figure assume that load balancing has already been configured.

Enable compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the CLI

At the command prompt, type the following commands to enable compression and verify the configuration:

- enable ns feature CMP
- show ns feature

```
1 > enable ns feature CMP
2
3
4
5
6 Done
7
8
9 > show ns feature

29
30 7) Compression Control CMP ON
31
32 .
33
34
35 Done
36
37 <!--NeedCopy-->
```

To enable compression by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

Configure services to compress data

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

To enable compression on a service by using the CLI

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- `set service <name> -CMP YES`
- `show service <name>`

```
1 > show service SVC_HTTP1

To enable compression on a service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the **Details** section at the bottom of the pane.

Bind a compression policy to a virtual server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box.

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

```
(bind)                               (unbind) lb vserver -policyName
```

-
- show lb vserver <name>

Example:

```
1 > bind lb vserver lbvip -policyName ns_cmp_msapp
2 Done
3 > showlbvserverlbvip
4

```

To bind or unbind a compression policy to a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
 - To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.
 - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

Secure load balanced traffic by using SSL

May 2, 2023

The NetScaler SSL offload feature transparently improves the performance of websites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

For detailed information about SSL offloading, see [SSL offload and acceleration](#).

SSL configuration task sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler appliance. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler appliance for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading

Enable SSL offload

First enable the SSL feature. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

Enable SSL by using the CLI

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

```
1 - enable ns feature SSL
2 - show ns feature
3 <!--NeedCopy-->
```

Example:

```
1 > enable ns feature ssl
2
3 Done
4
5
6 > show ns feature
7
8
9 Feature Acronym Status
10

25
26
27 10) Global Server Load Balancing GSLB ON . .
28
29
30 Done >
31 <!--NeedCopy-->
```

Enable SSL by using the GUI

Follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. Select the **SSL Offloading** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message box, click **Yes**.

Create HTTP services

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the following procedures, but create TCP services instead of HTTP services.

Add an HTTP service by using the CLI

At the command prompt, type the following commands to add an HTTP service and verify the configuration:

```
1 - add service <name> (<IP> | <serverName>) <serviceType> <port>
2 - show service <name>
3 <!--NeedCopy-->
```

Example:

```
1 > add service SVC_HTTP1 10.102.29.18 HTTP 80
2
3
4 Done
5
6
7 > show service SVC_HTTP1

70              State: UP      Weight: 1
71
```

```
72
73         Probes: 4         Failed [Total: 0 Current: 0]
74
75
76         Last response: Success - TCP syn+ack received.
77
78
79         Response Time: N/A
80
81
82     Done
83 <!--NeedCopy-->
```

Add an HTTP service by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Services**.
2. In the details pane, click **Add**.
3. In the **Create Service** dialog box, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the **Protocol** list, select the type of the service (for example, HTTP).
5. Click **Create**, and then click **Close**. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

Add an SSL based virtual server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

```
1 - add lb vserver <name> <serviceType> [<IPAddress> <port>]
2 - show lb vserver <name>
3 <!--NeedCopy-->
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Example:

```
1 > add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
2   Done
3
4
5 > show lb vserver vserver-SSL-1
6
7

```

Add an SSL-based virtual server by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. In the details pane, click **Add**.
3. In the **Create Virtual Server (SSL Offload)** dialog box, type the name of the virtual server, IP address, and port.
4. In the **Protocol** list, select the type of the virtual server, for example, SSL.
5. Click **Create**, and then click **Close**.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Bind services to the SSL virtual server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see [SSL offload and acceleration](#).

Bind a service to a virtual server by using the CLI

At the command prompt, type the following commands to bind a service to the SSL virtual server and verify the configuration:

```
1 - bind lb vserver <name> <serviceName>
2 - show lb vserver <name>
3 <!--NeedCopy-->
```

Example:

```
1 > bind lb vserver vserver-SSL-1 SVC_HTTP1

49 <!--NeedCopy-->
```

Bind a service to a virtual server by using the GUI

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. In the details pane, select a virtual server, and then click **Open**.
3. On the **Services** tab, in the **Active** column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click **OK**.

5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Add a certificate-key pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during an SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA certificates of up to 4096 bits.

ECDSA certificates with only the following curves are supported:

- prime256v1 (P_256 on the ADC)
- secp384r1 (P_384 on the ADC)
- secp521r1 (P_521 on the ADC; supported on VPX only)
- secp224r1 (P_224 on the ADC; supported on VPX only)

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

Add a certificate key pair by using the CLI

Note: For information about creating an ECDSA certificate-key pair, see [Create an ECDSA certificate-key pair](#).

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

```
1 - add ssl certKey <certkeyName> -cert <string> [-key <string>]
2 - show sslcertkey <name>
3 <!--NeedCopy-->
```

Example:

```
1 > add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
2
3 Done
4
5
6 > show sslcertkey CertKey-SSL-1
7
```

```

Add a certificate key pair by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL > Certificates**.
2. In the details pane, click **Add**.
3. In the **Install Certificate** dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under **Details**, in Certificate File Name, click **Browse (Appliance)** to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.
5. Select the certificate you want to use, and then click **Select**.
6. In Private Key File Name, click **Browse (Appliance)** to locate the private key file. To use a private key present on the local system, select Local.
7. Select the key you want to use and click **Select**. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.

8. Click **Install**.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

Bind an SSL certificate key pair to the virtual server

After you pairing an SSL certificate with its corresponding key, bind the certificate-key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

Bind an SSL certificate key pair to a virtual server by using the CLI

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

```
1 - bind ssl vserver <vServerName> -certkeyName <string>
2 - show ssl vserver <name>
3 <!--NeedCopy-->
```

Example:

```
1 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
2
3 Done
4
5
6 > show ssl vserver Vserver-SSL-1
7

Bind an SSL certificate key pair to a virtual server by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, on the **SSL Settings** tab, under **Available**, select the certificate key pair that you want to bind to the virtual server. Then click **Add**.
4. Click **OK**.
5. Verify that the certificate key pair that you selected appears in the Configured area.

Configure support for Outlook web access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as `https://` instead of `http://`.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

Create an SSL action to enable OWA support

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

Create an SSL action to enable OWA support by using the CLI

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

```
1 - add ssl action <name> -OWASupport ENABLED
2 - show SSL action <name>
3 <!--NeedCopy-->
```

Example:

```
1 > add ssl action Action-SSL-OWA -OWASupport enabled
2
3
4
5
6 Done
7
8
9 > show SSL action Action-SSL-OWA
10
11
12 Name: Action-SSL-OWA
13
14
15 Data Insertion Action: OWA
```

```

16
17
18     Support: ENABLED
19
20
21     Done
22 <!--NeedCopy-->

```

Create an SSL action to enable OWA support by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL > Policies**.
2. In the details pane, on the **Actions** tab, click **Add**.
3. In the **Create SSL Action** dialog box, in the Name text box, type Action-SSL-OWA.
4. Under Outlook Web Access, select **Enabled**.
5. Click **Create**, and then click **Close**.
6. Verify that Action-SSL-OWA appears in the **SSL Actions** page.

Create SSL policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

Create an SSL policy by using the CLI

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

```

1 - add ssl policy <name> -rule <expression> -reqAction <string>
2 - show ssl policy <name>
3 <!--NeedCopy-->

```

Example:

```

1 > add ssl policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
2
3 Done
4
5 > show ssl policy-SSL-1
6
7 Name: Policy-SSL-1 Rule: ns_true
8
9 Action: Action-SSL-OWA Hits: 0

```

```
10
11 Policy is bound to following entities
12
13 1) PRIORITY : 0
14
15 Done
16 <!--NeedCopy-->
```

Create an SSL policy by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL > Policies**.
2. In the details pane, click **Add**.
3. In the **Create SSL Policy** dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In **Request Action**, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see [SSL actions and policies](#).
5. In **Named Expressions**, choose the built-in general expression ns_true and click **Add Expression**. The expression ns_true now appears in the Expression text box.
6. Click **Create**, and then click **Close**.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

Bind the SSL policy to the SSL virtual server

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

Bind an SSL policy to an SSL virtual server by using the CLI

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

```
1 - bind ssl vserver <vServerName> -policyName <string>
2 - show ssl vserver <name>
3 <!--NeedCopy-->
```

Example:

```
1 > bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
2
3 Done
4
5 > show ssl vserver Vserver-SSL-1
6
7 Advanced SSL configuration for VServer Vserver-SSL-1:
8
9 DH: DISABLED
10
11 Ephemeral RSA: ENABLED
12
13 Refresh Count: 0
14
15 Session Reuse: ENABLED
16
17 Timeout: 120 seconds
18
19 Cipher Redirect: ENABLED
20
21 SSLv2 Redirect: ENABLED
22
23 ClearText Port: 0
24
25 Client Auth: DISABLED
26
27 SSL Redirect: DISABLED
28
29 Non FIPS Ciphers: DISABLED
30
31 SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
32
33 1) CertKey Name: CertKey-SSL-1 Server Certificate
34
35 1) Policy Name: Policy-SSL-1 Priority: 0
36
37 1) Cipher Name: DEFAULT Description: Predefined Cipher Alias
38
39 Done
40 <!--NeedCopy-->
```

Bind an SSL policy to an SSL virtual server by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, click **Insert Policy**, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the

Priority field and type a new priority level.

4. Click **OK**.

Features at a glance

May 2, 2023

NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see [Processing Order of Features](#) section.

Application switching and traffic management features

May 2, 2023

Below are the application switching and traffic management features.

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see [SSL offload and acceleration](#).

Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler appliance to compare incoming packets against them. If an ACL is not required to be a part

of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. An ADC appliance does not compare incoming packets to disabled ACLs.

For more information, see [Access Control List](#).

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler appliance can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the ADC appliance can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.

To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see [Load Balancing](#).

Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic, within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an address is not duplicated within the same domain.

For more information, see [Traffic Domains](#).

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from

a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler appliance.

The NetScaler appliance supports the following types of network address translation:

INAT: In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the ADC replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

RNAT: In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

Stateless NAT46 Translation: Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

Stateful NAT64 Translation: The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see [Configuring Network Address Translation](#).

Multipath TCP Support

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

For more information, see [MPTCP \(Multi-Path TCP\)](#).

Content Switching

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see [Content Switching](#).

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see [Global Server Load Balancing](#).

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see [Configuring Dynamic Routes](#).

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

For more information, see [Link Load Balancing](#).

TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)—Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling—Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see [Configuring TCP Profiles](#).

CloudBridge Connector

The NetScaler CloudBridge Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see [CloudBridge](#).

DataStream

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see [DataStream](#).

Application acceleration features

May 2, 2023

- AppCompress

Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

- Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see [Cache Redirection](#).

- AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent

requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see [Integrated Caching](#).

- TCP Buffering

Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites.

Application security and firewall features

May 2, 2023

Below are the security and firewall features.

Denial of service (DoS) attack defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see [AppQoE](#).

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see [Content Filtering](#).

Responder

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see [Responder](#).

Rewrite

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.

When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see [Rewrite](#).

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see [Surge Protection](#).

NetScaler Gateway

NetScaler Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today’s mobile workforce.

For more information, see [NetScaler Gateway](#).

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see [Application Firewall](#).

Application visibility feature

May 2, 2023

- NetScaler Application Delivery Management

NetScaler Application Delivery Management (ADM) is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Console provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.

HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird’s eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

- Enhanced Application Visibility Using AppFlow

The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see [AppFlow](#).

- Stream Analytics

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you must be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources must be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources based on the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics based on the criteria that you define.

When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see [Action Analytics](#).

NetScaler Solutions

May 2, 2023

NetScaler solutions simplify the task of setting up frequently deployed configurations. Check this space from time to time for additional solutions.

This section includes the following solutions.

- [Setting up NetScaler for Citrix Virtual Apps and Desktops](#)
- [Global Server Load Balancing \(GSLB\) Powered Zone Preference](#)
- [Anycast support in NetScaler](#)
- [Deploy digital advertising platform on AWS with NetScaler](#)
- [Enhancing Clickstream analytics in AWS using NetScaler](#)

Setting up NetScaler for Citrix Virtual Apps and Desktops

May 2, 2023

A NetScaler appliance can provide load balanced, secure remote access to your Citrix Virtual Apps and Desktops applications. You can use the NetScaler load balancing feature to distribute traffic across the Citrix Virtual Apps and Desktops server. You can use the NetScaler Gateway feature to provide secure remote access to the servers.

NetScaler can also accelerate and optimize the traffic flow and offer visibility features that are useful for Citrix Virtual Apps and Desktops deployments.

Figure 1. NetScaler appliance in Citrix Virtual Apps and Desktops setup

The preceding figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.
- **NetScaler load balancing virtual server.** Load balances the traffic for the StoreFront servers. You can also deploy a load balancing virtual server in front of the Citrix Virtual Apps and Desktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.
- **Citrix Virtual Apps and Desktops.** Provides the applications that your users want to access.

To set up the NetScaler for Citrix Virtual Apps and Desktops by using the NetScaler GUI

Prerequisites

- Citrix Virtual Apps and Desktop servers are configured and available.
- You have a working knowledge of NetScaler Gateway, NetScaler, Citrix Virtual Apps and Desktops, and StoreFront
- Make sure that you have configured a virtual server and a service and bound the service to the virtual server. For more information, see:
 - [Load balance Citrix Virtual Apps and Desktops](#)
 - [Load balance Citrix Virtual Apps and Desktops](#)

Procedure:

1. Log on to the NetScaler appliance and on the **Configuration** tab click **XenApp and XenDesktop**.
2. On the **Details** pane, click **Get Started**. If the setup exists on the NetScaler, click the **Edit** link corresponding to each of the section that you want to modify.
3. Select the product (StoreFront) that in your deployment provides the interface for access to the Citrix Virtual Apps and Desktops applications.
4. Set up secure remote access.
 - a) In the **NetScaler Gateway Settings** section, specify the details for the VPN virtual server and click **Continue**.
 - b) In the **Server Certificate** section, choose an existing certificate or install a new certificate and click **Continue**.
 - c) In the **Authentication** section, configure the primary authentication mechanism to be used and specify the server details or use an existing server and click **Continue**.
 - d) In the **StoreFront** section, specify the details of the server that provides the interface for accessing the applications and click **Continue**.
 - e) You can use LB virtual server pointing to multiple SF servers as your StoreFront server.
5. Click **Done** to complete the configuration.

Global Server Load Balancing (GSLB) Powered Zone Preference

May 2, 2023

GSLB powered zone preference is a feature that integrates Citrix Virtual Apps and Desktops, StoreFront, and NetScaler to provide clients access to the most optimized data center based on the client location.

In a distributed Citrix Virtual Apps and Desktops deployment, StoreFront might not select an optimal data center when multiple equivalent resources are available from multiple data centers. In such cases, StoreFront randomly selects a data center. It can send the request to any of the Citrix Virtual Apps and Desktops servers in any data center, regardless of proximity to the client making the request.

The client IP address is examined when an HTTP request arrives at the NetScaler Gateway appliance. The real client IP address is used to create the data center preference list that is forwarded to StoreFront. If the NetScaler appliance is configured to insert the zone preference header, StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers and connect to an optimal delivery controller in the same zone as the client. StoreFront selects the optimal gateway VPN virtual server for the selected data center zone, adds this information to the ICA

file with appropriate IP addresses, and sends it to the client. StoreFront then tries to launch applications hosted on the preferred data center's delivery controllers before trying to contact equivalent controllers in other data centers.

For more information about configuring this solution, click [here](#).

Anycast support in NetScaler

May 2, 2023

Anycast is a type of network where a set of servers shares an IP address. The client request is directed to the topographically closest server based on their routing tables. This routing reduces latency issues, ensures high availability, and minimizes downtime.

NetScaler supports anycast network with Global Server Load Balancing (GSLB) and DNS features.

The following diagram illustrates a topology diagram of Anycast in NetScaler.

Anycast GSLB

The NetScaler GSLB feature provides load balancing across globally distributed sites along with disaster recovery and ensures continuous availability of applications.

During an outage, GSLB provides immediate disaster recovery by routing traffic to the closest or the best performing data center. However, GSLB cannot control the following:

- How the DNS traffic is routed to GSLB nodes in different geographical locations.
- How much latency is getting added while DNS queries get routed to GSLB nodes.

In a typical GSLB setup, each data center has a GSLB node configured with the site-specific Authoritative Domain Name Server (ADNS) to receive DNS queries. Each site's ADNS is configured as the nameserver in the DNS resolver. As the number of GSLB nodes increases, the number of nameserver records also increase. In such cases, if there is a failure of a data center, LDNS has to retry resolution with a different nameserver. This retry adds to the latency in DNS resolution.

Also, every time a GSLB node is added, the nameserver records must be updated.

To overcome these drawbacks, you can use Anycast ADNS. In Anycast ADNS, a single ADNS IP address is used for all GSLB nodes and the DNS traffic is routed to GSLB nodes using dynamic routing.

For example, if a GSLB site is DOWN, the routing table is updated and route to this site is removed. As a result, The DNS queries are not sent to the sites that are DOWN. As a result, there are no retries.

If a new GSLB node is added, the new node is assigned the same ADNS IP address. The dynamic routing automatically updates the routing tables with routes to new sites based on the routing algorithms. Hence, you do not have to update the DNS name server records. The rollout of new GSLB sites is made simpler and faster with Anycast.

How to configure an ADNS IP address in an anycast mode

Enable host routing on the ADNS IP in a NetScaler appliance, and set the appropriate Route Health Injection (RHI) level. Mostly, there would not be any virtual servers on the ADNS IP and therefore RHI level must be selected as NONE. Enabling host route on the ADNS IP makes it a kernel route. You can then enable the dynamic routing of choice and configure the routing protocol to redistribute the kernel routes.

ADNS IP configuration –Example

At the command prompt, type;

```
1 add service adns_public 5.5.5.5 ADNS 53
2
3 set ip 5.5.5.5 -hostRoute ENABLED -vserverRHILevel ALL_VSERVERS
4 <!--NeedCopy-->
```

BGP configuration in GSLB site –Example

```
1 Site1#sh run
2 !
3 hostname Site1
4 !
5 log syslog
```

```

6 log record-priority
7 !
8 ns route-install bgp
9 !
10 interface lo0
11 ip address 127.0.0.1/8
12 ipv6 address fe80::1/64
13 ipv6 address ::1/128
14 !
15 interface vlan0
16 ip address 10.102.148.94/25
17 ipv6 address fe80::e84c:f4ff:fe74:4588/64
18 !
19 interface vlan2
20 ip address 172.18.30.15/24
21 !
22 router bgp 5
23 redistribute kernel -----> redistributing the kernel routes
24 neighbor 172.18.30.30 remote-as 4
25 neighbor 172.18.30.30 advertisement-interval 1
26 neighbor 172.18.30.30 timers 4 16
27 !
28 End
29
30 Site1#
31 <!--NeedCopy-->

```

GSLB site routing table - Example

```

1 Site1#sh ip route
2 Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
3         O - OSPF, IA - OSPF inter area
4         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
5         E1 - OSPF external type 1, E2 - OSPF external type 2
6         i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2
7         ia - IS-IS inter area, I - Intranet
8         * - candidate default
9
10 K      5.5.5.5/32 via 0.0.0.0 ----->
11      Kernel Route for ADNS
12 C      10.102.148.0/25 is directly connected, vlan0
13 C      127.0.0.0/8 is directly connected, lo0
14 B      172.18.10.0/24 [20/0] via 172.18.30.30, vlan2, 01w5d22h
15 B      172.18.20.0/24 [20/0] via 172.18.30.30, vlan2, 01w5d22h
16 C      172.18.30.0/24 is directly connected, vlan2
17 B      192.168.3.0/24 [20/0] via 172.18.30.30, vlan2, 01w5d22h
18 B      192.168.5.0/24 [20/0] via 172.18.30.30, vlan2, 01w5d22h
19 B      192.168.10.0/24 [20/0] via 172.18.30.30, vlan2, 01w5d22h
20 Gateway of last resort is not set
21 Site1#

```

```
22 <!--NeedCopy-->
```

Anycast DNS

You can use Anycast DNS for DNS proxy virtual servers on NetScaler. When there are multiple DNS name servers configured, the DNS resolver responds based on round robin method. For example, if the resolver does not receive any response from the first server, it switches to the second server after the configured timeout value expires. The switching from first server to second server adds to the latency in DNS resolution. If the DNS resolvers are configured with Anycast, then this latency can be eliminated.

DNS configuration –Example

At the command prompt, type;

```
1 add lb vserver dns DNS 5.5.5.50 53
2
3 set ip 5.5.5.50 -hostRoute ENABLED -vserverRHILevel ALL_VSERVERS
4 <!--NeedCopy-->
```

Deploy digital advertising platform on AWS with NetScaler

May 2, 2023

With the evolving nature of digital platforms, a wide range of advertising applications are available. For example, social media, direct mail, videos, banners, pops, interstitials, rich media and so on. Advertisers are embracing video advertising networks at a fast pace, constituting nearly 40% of the advertisement traffic. But with more usage of mobiles by the modern users, running video ads on the mobile platform has seen considerable surge.

The digital advertising platforms face several challenges. Some of the challenges are:

- Security threats
- High operational costs
- Wide range of devices are available to send traffic over the internet. The different protocols for real-time communication pose the following challenges:
 - webRTC
 - Adaptive streaming
 - UDP for video, where WebRTC uses UDP over HTTP

To deal with the complex behavior of advertising platforms, NetScaler solution with its whole suite of capabilities and features well integrated with AWS, provides an instant, secure, and reliable access to digital advertisement inventory, anywhere and anytime. NetScaler plays a critical role in delivering the SaaS and web apps for digital platforms.

Digital advertising platform integration with NetScaler

Digital advertising platform overview

The digital advertising platform consists of the following key components:

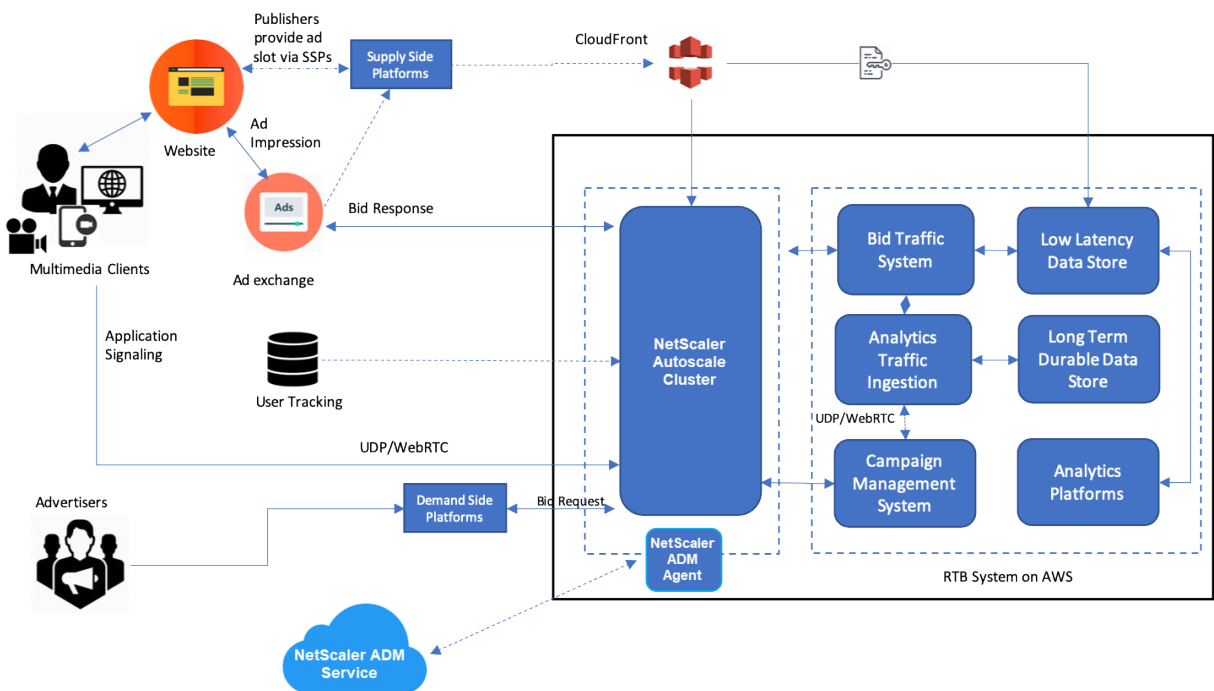

- Ad exchange
- Ad network
- Demand side platform (DSP)
- Supply side platform (SSP)
- Real time bidding (RTB) systems

An overview of the process followed in an advertising system is as follows.

- The first transaction happens when the user visits the website.
- This triggers a bid/advertisement request (including user's demographic information) that is sent to the ad server or publisher contacting an ad exchange.
- The Ad publishers send the advertisement request to an Ad exchange through SSPs.
- The Ad exchange submits this request and the accompanying data to DSP telling there is an impression or advertisement request available. Therefore, multiple advertisers can automatically submit bids in real time to place their advertisements.
- Meanwhile, the advertisers must set up their campaigns in DSP. Use the information about the user from Data Management Platform (DMP) to assess the amount they are willing to pay for delivering an advertisement to the user.
- DSPs submit these real-time bids on each advertisement impression because it is served to the advertisement exchange.
- Whichever bidder bids the most within a time period set by the Ad exchange or SSPs, gets an advertisement slot by the publishers to serve their advertisements. Otherwise, they lose the opportunity to get the right advertisement for their key demographic.

How digital advertising platform is integrated with NetScaler

The following diagram illustrates how the different components of advertising platform communicate with NetScaler and NetScaler Application Delivery Management (ADM) to serve online advertisements.

How NetScaler contributes In the advertisement publishing process, NetScaler solution helps in handling and processing the inconsistent influx of bid traffic. It acts as an entry point for all traffic to ensure scalability and availability across the availability zones. To cater to the elastic nature of advertising traffic, it is deployed in an autoscaling group in front of web applications and database servers.

The advertising platform on AWS with NetScaler solution allows you to get the real-time performance, high scalability, and high availability across the globe. You can buy and sell rich media, video, mobile, and native advertisements in real time. It reduces the overall operational cost and latency involved in running an Advertising platform. It is the best performing proxy with the rich capabilities of gracefully removing the back-end servers during Autoscale, connection multiplexing, and ensuring that the end-user traffic never gets impacted. NetScaler supports load balancing the HTTP, UDP, WebRTC, and RTSP protocols that are used in the advertising platforms.

NetScaler fits coherently into the AWS environment with the following key attributes:

- Content switching –Switch to the right platform based on host name.
- Security protection –Use web application firewall (WAF) functionality, rate limiting (through Client IP), and protection against DDoS attacks.
- Autoscaling of both front-end and back-end traffic.
- End-to-end visibility, and anomaly detection across ADC appliances by utilizing ADM.
- Low latency.

How NetScaler Console contributes NetScaler utilizes NetScaler Console to overcome the following challenges faced by the digital advertising platforms:

- Identify the trend deviations from expected performance
- Real-time application performance analysis
- Capacity monitoring

Advantages of advertising platform integration with NetScaler and ADM

The NetScaler solution offers the following capabilities and benefits to a digital advertising platform vendor.

Low cost

- Integrated with AWS Autoscaling service, the NetScaler VPX instance can scale up or down your front-end and back-end resources automatically. This provides a zero-touch configuration catering to the elasticity of advertising platforms.
- Consolidation of delivering all types of traffic from a single point.

For more information on AWS autoscaling, see [Add back-end AWS Autoscaling service](#).

High availability

- If one Availability Zone becomes unavailable, NetScaler applies its fault tolerance ability to autodetect the servers in another availability zone, without any traffic interruption.
- Also, It gracefully terminates servers avoiding the loss of client connections.

For more information, see [How high availability on AWS works](#).

Application performance analytics NetScaler Console intelligent analytics and application performance analytics ensures to:

- Gain visibility into the issues (server response anomalies, 5XX errors, and so on) plaguing the end user experience.
- Alert the administrator to take corrective actions immediately.

For more information, see [Performance indicators for application analytics](#).

Rich firewall security Most common security vulnerabilities occur in web applications rather in networks. It is vital to protect your web applications from unauthorized access such as bots, data thefts, and application layer attacks.

NetScaler provides comprehensive and integrated Layer 4 to Layer 7 security that includes:

- Web App Firewall (WAF) to protect your web applications, identify, and mitigate malicious bots with regularly updated bot signatures and behaviour-based detection.
- Rate limiting to prevent an advertising platform from being overwhelmed.

For more information, see [NetScaler Web App Firewall](#).

Select the right AWS instance type for advertising platform

Choose the right AWS instance type for ADC depending on the following two factors:

- Number of users simultaneously accessing the advertising platform.
- Average number of users on the platform.

The NetScaler can be deployed in various EC2 instances, which include c5, c5n, m5, and so on. For advertising platforms, use the following AWS instance types:

- c5 or c5n is appropriate for handling SSL heavy traffic.
- c5.large can handle up to 1000 SSL TPS.

For more information, see [VPX-AWS support matrix](#).

Enhancing Clickstream analytics in AWS using NetScaler

May 2, 2023

Customers are increasingly accessing the company products through various applications such as Mobile apps, SaaS apps and so on. Therefore, applications can become a landmine of customer experience data. To track customer behavior online, customer-centric companies form data-driven profiles for each of their customers using this customer behavior data.

A clickstream is a sequence or stream of events that represent user actions (clicks) on a website or a mobile application. However, the scope of clickstream extends beyond clicks. It includes product searches, impressions, purchases, and any such events that might be of relevance to the business. Mere collecting and storing the customer experience data is not of much value. There is a need to distribute the highly complex data seamlessly to the right vendors at the right time. Businesses can derive value from the data and quickly take conscious decisions to improve upon their strategies. Therefore companies increasingly use clickstream analytics to glean insights into the customer experience journey of the apps.

This document provides you a good understanding on why Clickstream data is of utmost importance, how it is collected, stored, distributed, and transformed into meaningful and actionable analytics.

NetScaler integrates with NetScaler Console, and adds value to AWS services such as Amazon Kinesis Data Firehose to equip businesses with the best-in-class analytics solution that revolves around user's Clickstreams.

This NetScaler solution helps you to solve complex business issues efficiently and with extreme simplicity. NetScaler and AWS Kinesis help to capture the issues with the poorly designed workflow. NetScaler Console helps to capture web app and network performance related issues by applying relevant filters. Conjunction of NetScaler with NetScaler Console and AWS Kinesis helps you to manage and analyze the huge influx of clickstream data in each phase. This solution is highly available, scalable, robust, and ensures the delivery is continuous and secure. Thus, you can derive actionable insights.

Why businesses opt for Clickstream analytics?

Businesses opt for clickstream primarily to understand how users interact with the application, and to get insights on improving the goals of the application. Clickstream Analytics is an information retrieval use case that tracks your user's behavior, navigation habits, and so on. Clickstream analytics gives you information on:

- Which link your customers are clicking more often and at what point in time.
- Where was the visitor before reaching my website?
- How much time did the visitor spend on each page?
- When and where did the visitor click the “back” button on the web browser?
- What items did the visitor add to (or remove from) their shopping cart?
- From which page did the visitor exit my website?

Analytics service to manage Clickstream data using Amazon Kinesis

You can use [Amazon Kinesis](#) to perform clickstream analytics. Amazon Kinesis enables clickstream analytics with the following services:

- [Amazon Kinesis Data Firehose](#)
- [Amazon Kinesis Data Analytics](#)
- [Amazon Kinesis Data Streams](#)

With Amazon Kinesis, you can collect and analyze your huge data sets at any scale. AWS Kinesis can handle data from various sources, such as:

- Mobile and web applications (for example, Gaming, ecommerce)
- IoT devices
- Social networking applications
- Financial trading services

- Geospatial services

How NetScaler enables Clickstream analytics

The NetScaler solution collates and delivers information securely on the activities of users, such as, websites visited, the bandwidth spent, navigation flow. Companies analyze this high throughput and continuous clickstream data to corroborate the effectiveness of the following:

- Site layout
- Marketing campaigns
- New application features

With the NetScaler’s ability to provide a resilient network protection for enterprise environments, the server cost is reduced manifold by offloading computationally intensive tasks, and running sessions on this data. Thereby helping companies to identify events in real-time with high availability, security, and low latency always.

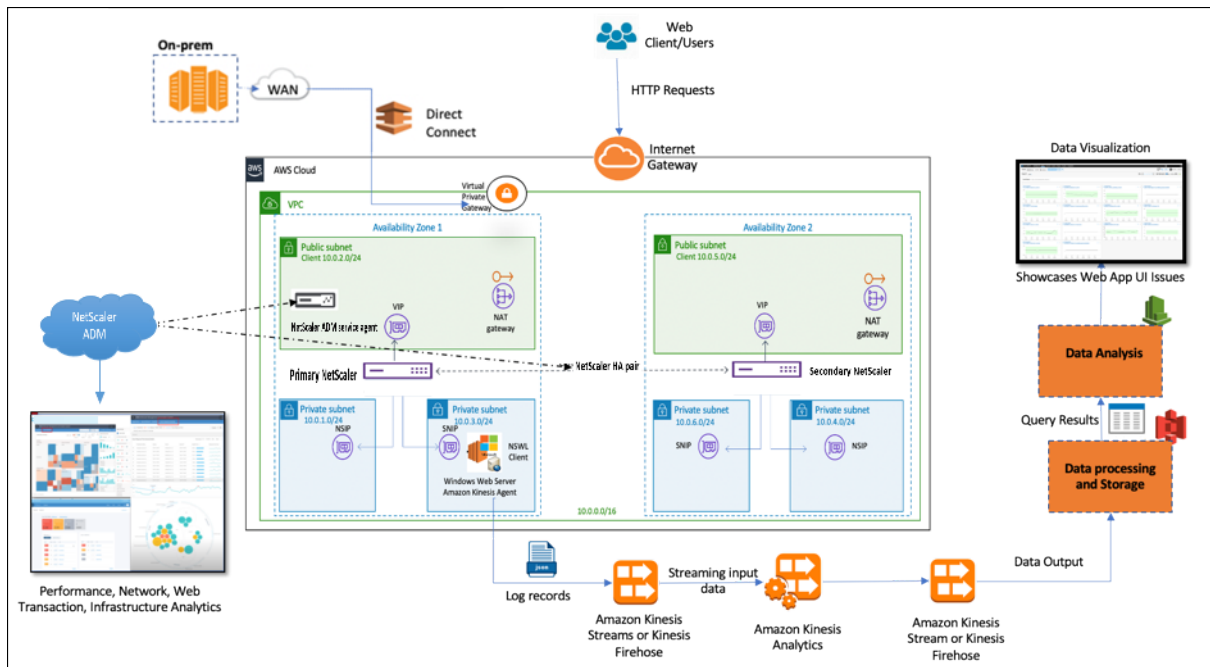

For configuration information, see [Configure the NetScaler solution for clickstream analytics](#).

How NetScaler and NetScaler Console complement the AWS environment

The following diagram illustrates the end-to-end user workflow to perform Clickstream analytics in AWS infrastructure. This diagram helps you understand the following processes:

- How user interacts with NetScaler

- How NetScaler captures user’s actions and generates clickstream data
- How the clickstream data is delivered to AWS services (Amazon Kinesis)
- How Amazon Kinesis processes the data logs and stores them to produce meaningful click-stream analytics

The NetScaler seamlessly integrates into the AWS environment and NetScaler Console that helps businesses to be compatible with variable volume and diverse nature of the clickstream data. It provides services to load and analyze streaming knowledge with simplicity. You can also create custom streaming knowledge applications for specialized desires.

Amazon Kinesis

The AWS environment has different services that perform analytics on the user events, logs, and metrics captured by NetScaler. The data can be website clickstreams, financial transactions, social media feeds, IT logs, and location-tracking events.

- Amazon Kinesis Data Streams perform analytics in scenarios that involve scalable and durable real-time data streaming that can continuously capture GB of data per second from several sources.
- Amazon Kinesis Data Analytics can be used for scenarios with lower latency between the session generation because it takes less time to aggregate various data sets.
- Amazon Kinesis Agent for Microsoft Windows collects, parses, filters, and streams input data to Kinesis data streams.
- Once the data is up in the cloud, you can implement the exact data pipeline to get the results you

want. For example, you can use this information in Amazon Quick Sight, which is a visualization tool that is used to build dashboards.

The AWS Kinesis dashboard provides the following offerings:

- Showcases web apps UI issues
- Near real-time visualizations of web usage metrics such as events per hour, visitor count, and referrers.
- Session-wise analysis

NetScaler Console Analytics

By utilizing NetScaler Console with NetScaler, you can get a single-pane-of-glass view across all the business environments. NetScaler captured logs are fed into NetScaler Console, that treats your individual applications as a single entity. You can gain valuable insights and effectively troubleshoot issues with the following ADM capabilities:

- Intelligent analytics
- Web transaction analytics
- Anomaly detection
- Performance and network-related issues

The following ADM service dashboard helps you gain valuable insights to effectively troubleshoot the issues.

How NetScaler Console correlates with Clickstream analytics

Clickstream analytics data can be correlated with ADM analytics to describe, predict, and improve application's performance.

For more information on NetScaler Console, see [NetScaler Console](#)

For example, an organization while analyzing their logs notice that most of the users are abandoning their sites. But to find the root cause behind this user behavior, they need to find out which part of their application is performing bad. With clickstream analytics data and ADM analytics, you can derive the following insights to analyze the reason behind users abandoning a site:

- Is the user abandoning due to latency, 5xx errors?
- Are there any SSL Handshake errors?
- Is there some part of the application that has performance or network related issues?
- Is there a 404 error, or the page loading time takes forever to respond, and so on.
- Are customers facing server response anomalies?

NetScaler Console service provides Web Insights that allow IT administrators to speed up solving issues with the following features:

- Provides integrated and real-time monitoring of all web applications that served by the NetScaler.
- Get a holistic view on the application performance w.r.t. time, latency, and the usual user's behavior through observability tools (such as global service graph).
- Perform intelligent analytics to understand server response anomalies.
- SSL insights contribute towards resolving 5xx and 4xx errors.
- To maintain records of all web sessions that include:
 - Detailed logs of every web transaction
 - Search capability to find relevant logs
 - Ability to isolate an ADC-to-end user vs. ADC-to-server problem

Types of data exported by ADC for Clickstream analytics

NetScaler captures the different sources that generate varied forms of data, which are as follows:

- Web server logs

Web server logging feature sends logs of HTTP and HTTPS requests to a client system for storage and retrieval. These logs contain huge amount of data, which is difficult to comprehend and make sense out of it. Analytical tools help in understanding and bring value from it. For configuration details, see the **Web logging configuration section** in this document.

- Syslogs

The primary use of syslogs is for systems management. Proactive syslog monitoring pays off because it significantly reduces downtime of servers and other devices in your infrastructure. Syslog identifies critical network issues and reports them proactively.

- Access logs

The access logs store information about events that occurred on your web server. For instance, when someone visits your website, a log is recorded and stored to provide the web server administrator with information such as the IP address of the visitor, what pages they were viewing, status codes, browser used. To access logs might be overwhelming, if there is lack of appropriate knowledge to understand them.

You can program your system to integrate with:

- NetScaler for seamless delivery
- Kinesis for actionable insights that is useful for businesses

- Audit logs

The Audit Logging feature enables you to log the NetScaler states and status information collected by various modules in the kernel and in the user-level daemons.

- Error logs

The error logs file is an aid for administrators to provide more information regarding a specific error that has occurred on the web server.

Configure the NetScaler solution for clickstream analytics

The Web server logging feature enables you to send logs of HTTP and HTTPS requests to a client system for storage and retrieval.

To configure the NetScaler for web server logging you must:

- Enable web logging feature
- Configure the size of the buffer to temporarily store the log entries because the Web log server runs on the NetScaler.

To configure web server logging by using CLI:

1. Enable the web server logging feature.

```
1 enable ns feature WL
2 <!--NeedCopy-->
```

2. [Optional] Modify/Configure the buffer size for storing the logged information.

```
1 set ns weblogparam -bufferSizeMB 60
2 <!--NeedCopy-->
```

3. Install the NetScaler web logging (NSWL) client. For more information, see [Installing the NetScaler web logging \(NSWL\) client](#)
4. Install the NSWL client on Windows by performing the following operations on the system where you downloaded the package.

- a) Extract and copy the nswl_win-< release number >-< build number >.zip file from the package to a Windows system on which you want to install the NSWL client.
- b) On the Windows system, unzip the file in a directory (referred as < NSWL-HOME>). Bin, samples, and other directories are extracted.
- c) At the command prompt, run the following command from the < NSWL-HOME >\bin directory:

```
1 nswl -install -f < path of the log.conf file >\log.conf
2 <!--NeedCopy-->
```

Note:

To uninstall the NSWL client, at the command prompt, run the following command from the < NSWL-HOME >\bin directory:

```
1 nswl -remove
2 <!--NeedCopy-->
```

5. After you install the NSWL client, configure the NSWL client using the NSWL executable. These configurations are stored in the NSWL client configuration file (log.conf).

Run the following commands from the directory in which the NSWL executable is located:

```
1 \ns\bin
2 <!--NeedCopy-->
```

6. In the NSWL client configuration file (log.conf), add the NetScaler IP address (NSIP) from which the NSWL client collects logs by running the following in the client system command prompt:

```
1 nswl -addns -f < Path to the configuration(log.conf) file >\log.conf
2 <!--NeedCopy-->
```

7. Input the NetScaler appliance's NSIP (IP address), user name as `nsroot` and password as "the instance id/your set password" so that:
 - NSWL client connects to the ADC after you add the NetScaler IP address (NSIP) to the NSWL configuration file
 - ADC buffers the HTTP and HTTPS request log entries before sending them to the client.
 - The client can filter the entries (by modifying log.conf file) before storing them.

Note

Change the default password for NetScaler and then proceed with the configuration. Type the following command to change the password:

```
1 set system user nsroot -password <your password>
2 <!--NeedCopy-->
```

Configuring the Amazon Kinesis agent

Perform the following steps in the AWS web console to configure the Amazon Kinesis agent:

1. Create a configuration file (appsettings.json) and deploy it. Configuration files define sets of sources, sinks, and pipes that connect sources to sinks, along with optional transformations.

The following example is a complete `appsettings.json` configuration file that configures Kinesis Agent to stream Windows application log events to Kinesis Data Firehose.

```
1 {
2
3 "Sources": [
4   {
5
6     "Id": "NSWLog",
7     "SourceType": "DirectorySource",
8     "Directory": "C:\\Users\\Administrator\\Downloads\\
9       nswl_win-13.0-52.24\\bin",
10    "FileNameFilter": "*.log"
11    "RecordParser": "TimeStamp",
12    "TimestampFormat": "yyyy-MM-dddd HH:mm:ss.ffff", //
13      Optional parameter required only by the timestamp
14      record parser
15    "TimeZoneKind": "UTC", //Local or UTC
16    "SkipLines": 0 //Skip a number of lines at the beginning
17      of each file
18  }
19 ],
20 "Sinks": [
21   {
22     "Id": "ApplicationLogKinesisFirehoseSink",
23     "SinkType": "KinesisFirehose",
24     "StreamName": "Delivery-ik-logs",
25     "AccessKey": "Your Access Key",
26     "SecretKey": "YourSecretKey",
27     "Region": "ap-south-1"
28   }
29 ],
30 "Pipes": [
31   {
32     "Id": "ApplicationLogSourceToApplicationLogKinesisFirehoseSink",
33     "SourceRef": "ApplicationLogSource",
34     "SinkRef": "ApplicationLogKinesisFirehoseSink"
35   }
36 ],
37 "Telemetry":
38 {
39   "off": "true"
40 }
41 }
42 <!--NeedCopy-->
```

2. Set up a Kinesis Agent on data sources to collect data and send it continuously to Amazon Ki-

nessis Firehose/Kinesis Data Analytics. For more information, see [Getting Started with Amazon Kinesis Agent for Microsoft Windows](#).

3. Create an end-to-end data delivery stream using [Amazon Kinesis Firehose](#). The delivery stream transmits your data from the agent to the destination. The destination includes Amazon Kinesis Analytics, Amazon Redshift, Amazon Elasticsearch service, and Amazon S3. For the Source, choose **Direct PUT or other sources** to create a Kinesis Data Firehose delivery stream.
4. Process the incoming log data using SQL queries in Amazon Kinesis Analytics.
5. Load processed data from Kinesis Analytics to Amazon Elasticsearch Service to index the data.
6. Analyze and visualize the processed data using Visualization tools, such as Kibana and AWS QuickInsight Services.

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

March 15, 2024

You can use a NetScaler appliance for load balancing in a private cloud that is managed through Microsoft Windows Azure Pack. The network for the private cloud is automated by using Cisco ACI and NetScaler.

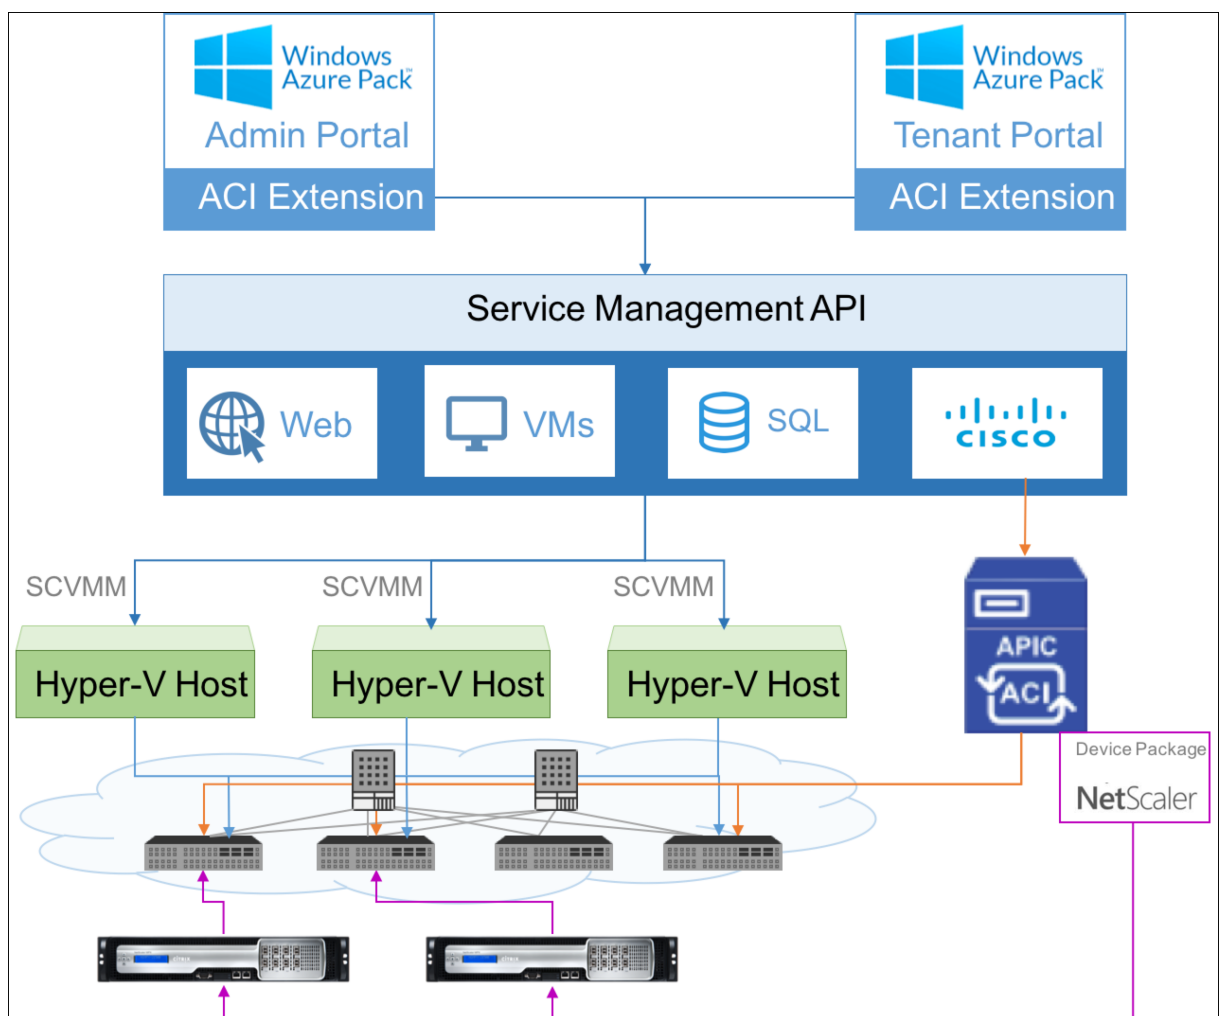

This solution involves many integration points, such as Windows Azure Pack (WAP) to Cisco APIC, Cisco APIC to System Center Virtual Machine Manager (SCVMM), and Cisco APIC to NetScaler. As a tenant in the private cloud, you can enable NAT, provision network services, and add a load balancer.

WAP supports tenant and administrator portals where an administrator can perform administrative tasks such as ACI registration, VIP range, NetScaler device association with virtual machine cloud, tenant user account creation. Tenants can log on to the WAP Tenant Portal and configure the network, bridge domains, and Virtual Routing and Forwarding (VRFs), and make use of the NetScaler load balancing and RNAT features.

Important

- In this solution, the NetScaler appliance provides only basic load balancing.
- Tenants can deploy multiple VIP addresses with different ports for the same network, but must ensure that the IP and port combination is unique.
- The NetScaler device package supports only single-context deployment. Each Tenant gets a dedicated NetScaler instance.
- WAP supports NetScaler MPX appliances and NetScaler VPX virtual appliances, including NetScaler VPX instances deployed on the NetScaler SDX platform.

The following illustration provides an overview of the solution:

Prerequisites

Make sure that:

- You have conceptual knowledge of Cisco ACI components and NetScalers.

- For more information about Cisco ACI and its components, see the product documentation at: <http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html>.
- For more information about the NetScalers, see the NetScaler product documentation at <https://docs.netScaler.com/>.
- All the required components of Cisco ACI, including Cisco APIC in the data center, are set up and configured. For more information about Cisco ACI and its components, see the product documentation at: <http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html>.
- You know how to integrate Cisco ACI with Microsoft Windows Azure Pack. See the product documentation at: http://www.cisco.com/c/en/us/td/docs/switches/datacenter/aci/apic/sw/2-x/virtualization/b_ACI_Virtualization_Guide_2_2_1.html.
- You have conceptual knowledge of Microsoft Windows Azure Pack. See the product documentation at: <https://www.microsoft.com/en-in/cloud-platform/windows-azure-pack>.
- You have installed NetScaler software release 11.1 or later.
- You configure NetScalers in Cisco ACI, so that they can be managed by using Cisco APIC.
- From Cisco APIC, make sure that:
 - Management connectivity of Cisco APIC to NetScaler is established.
 - You upload the NetScaler device package version 11.1–52.3 and register the NetScaler device in Cisco ACI by using Cisco APIC.
 - You configure the NetScaler appliance in Cisco APIC’s common tenant and make sure that there are no faults in Cisco APIC.
 - You have configured all the APIC specific configurations such as, VLAN pool, L3OutServicesDom, L3ExtOUT, resource pool. For more information, see *Cisco documentation*.

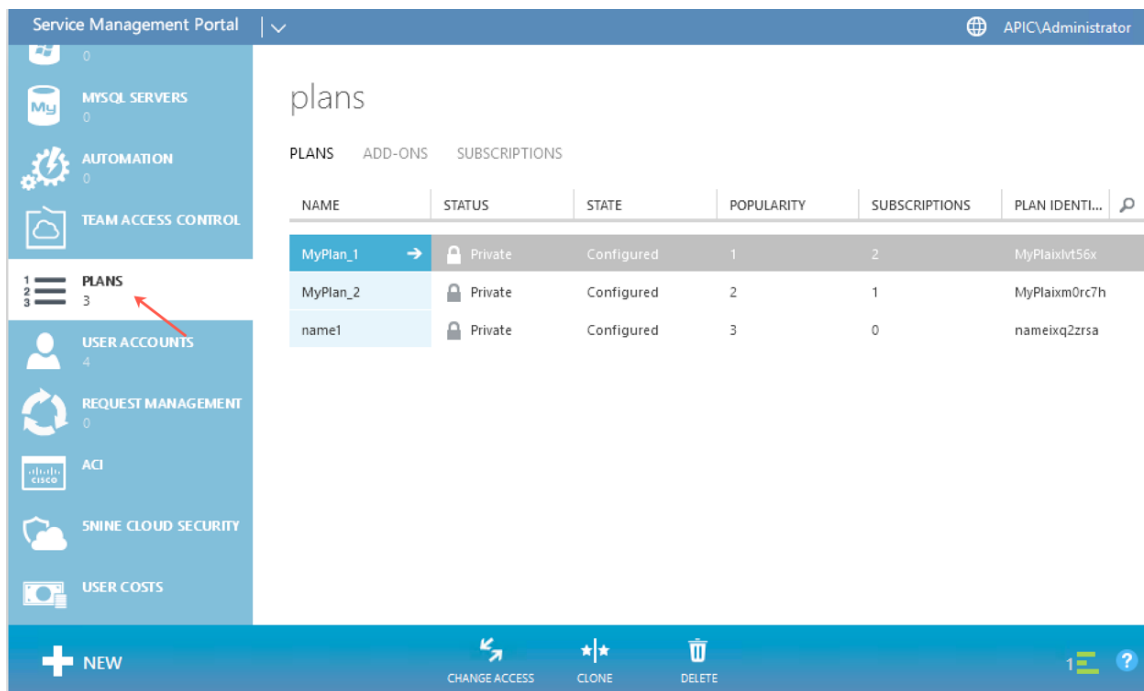

Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal)

May 2, 2023

The Service Management Portal in WAP allows an administrator to register Cisco APIC with WAP and also create a hosting plan. As part of the plan, you can specify the VIP range, associate the NetScaler load balancer with the plan, and create tenant user accounts.

To create a NetScaler Load Balancer in a Plan in the Admin Portal:

1. Log in to the Service Management Portal (Admin Portal).
2. In the Navigation pane, select **PLANS**.

3. In the plans pane, select the plan that you want to add a load balancer.
4. In the selected plan's pane, select **Networking (ACI)**.
5. On the **Networking (ACI)** pane, in the **L4-L7 SERVICE POOL** drop-down list, select the L4-L7 resource pool that you had created in Cisco APIC.

6. Create a tenant user account and associate the user with the plan you have created.

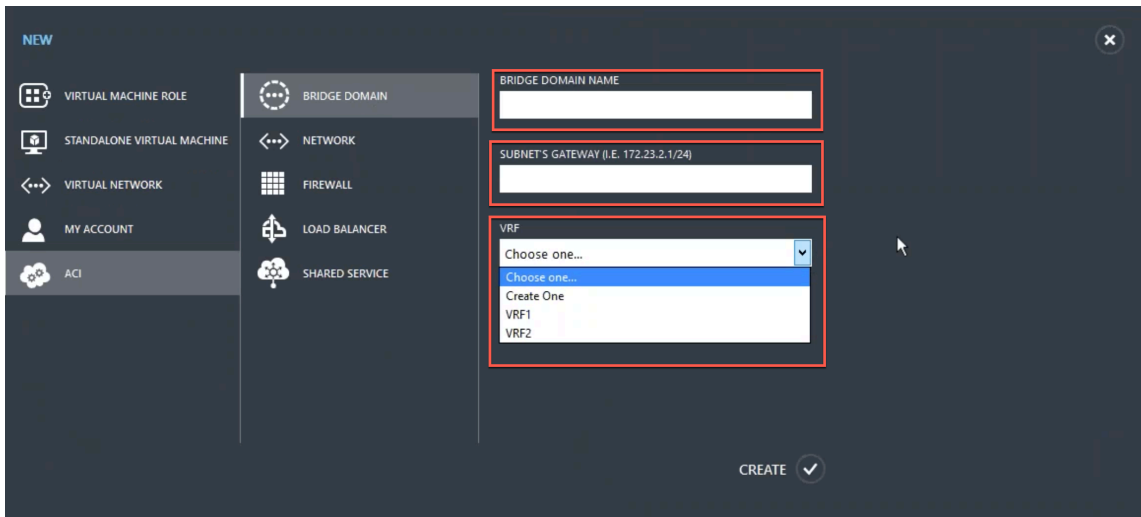

Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal)

May 2, 2023

In WAP, once the Tenant creates the Bridge Domain (BD), VRF, and a Network, the Tenant can configure a NetScaler Load Balancer through the Service Management Portal (Tenant Portal).

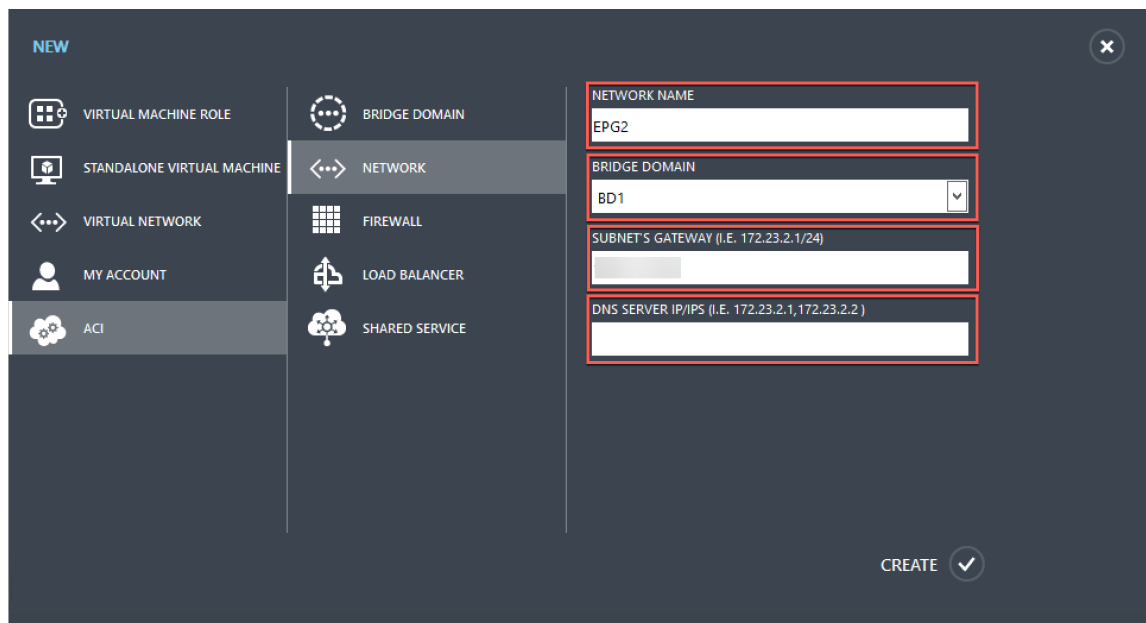

To configure NetScaler Load Balancer in Service Management Portal (Tenant Portal)

1. Log on to the Service Management Portal (Tenant Portal).
2. Create a bridge domain and VRF, as follows:
 - a. In the navigation pane, select **ACI**.
 - b. Click **NEW**.
 - c. In the **NEW** pane, select **BRIDGE DOMAIN**.

- d. In the **BRIDGE DOMAIN** field, enter the bridge domain name (for example, BD01).
 - e. (Optional) In the **SUBNET'S GATEWAY** field, enter the subnet's gateway (for example, 192.168.1.1/24).
 - f. In the **VRF** field, select a VRF that is already part of the subscription or select **Create One** to create a VRF.
 - g. Click **CREATE**.
3. Create a network and associate it with the bridge domain that you created. Do the following:
 - a. In the navigation pane, select **ACI**.
 - b. Click **NEW**.

c. In the **NEW** pane, select **NETWORK**.

d. In the **NETWORK NAME** field, enter the network name (for example, S01).

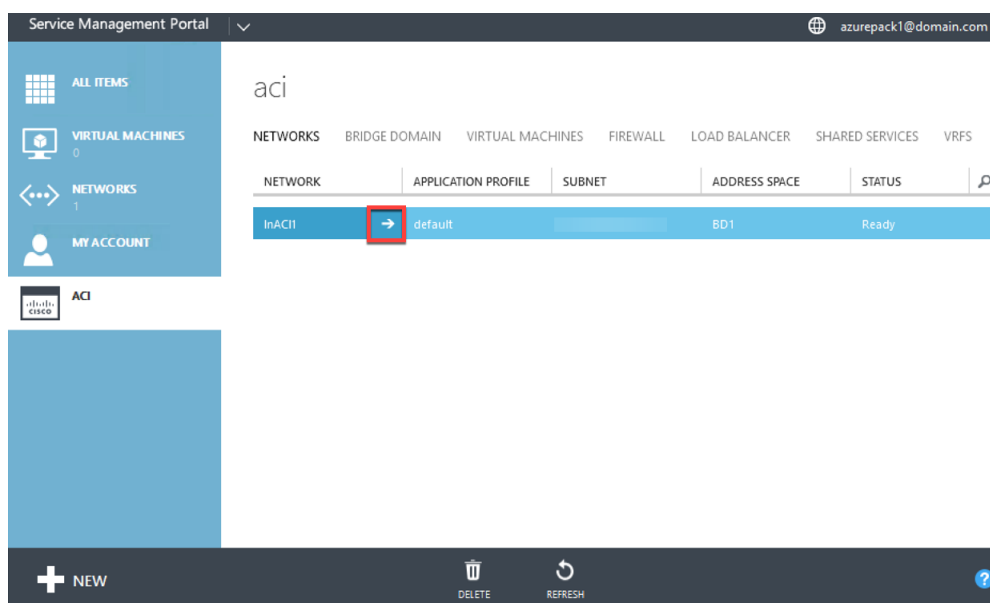

e. In the **BRIDGE DOMAIN** drop-down list, select the bridge domain you have created. (for example, BD01).

f. In the subnet's **GATEWAY** field, enter the subnet's gateway address (for example, 172.23.2.1/24).

g. (Optional) In the **DNS SERVER IP/IPS** field, enter the DNS server details.

h. Click **CREATE**.

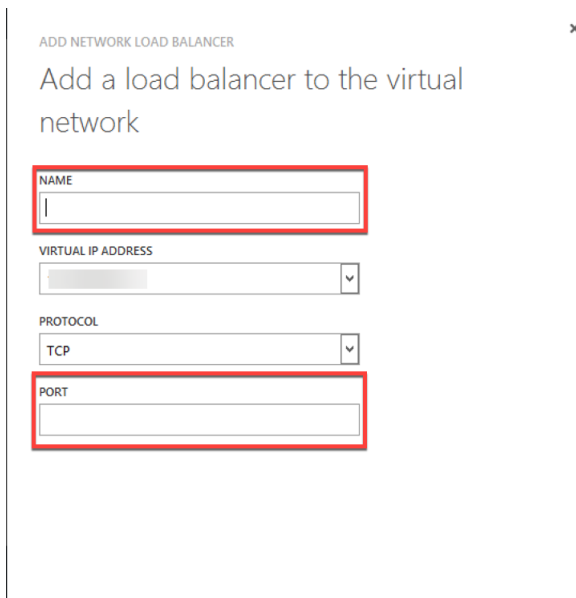

4. In the **ACI** pane, select **NETWORKS**.

5. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler Load Balancer in a Plan in the Service Management Portal \(Admin Portal\)](#).
6. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler Load Balancer in a Plan in the Service Management Portal \(Admin Portal\)](#).

7. In the network pane, select the **Load Balancers** tab, and click **ADD**.

8. In the **ADD NETWORK LOAD BALANCER** pane, do the following:
 - a. In the **NAME** field, enter the name for the load balancer.

- b. Optionally, in the **VIRTUAL IP ADDRESS** field, assign the load balancer a VIP address from the VIP range that you defined earlier.
- c. Optionally, in the **PROTOCOL** field, select **TCP**.
- d. In the **PORT** field, enter the port number.

9. Click **CREATE**.

The NetScaler Load Balancer is displayed in the **LOAD BALANCERS** tab and the NetScaler Load Balancer is data path ready.

Deleting a NetScaler Load Balancer from the Network

May 2, 2023

Using the Service Management Portal (Tenant Portal), from the Network, you can delete the NetScaler load balancer that you created.

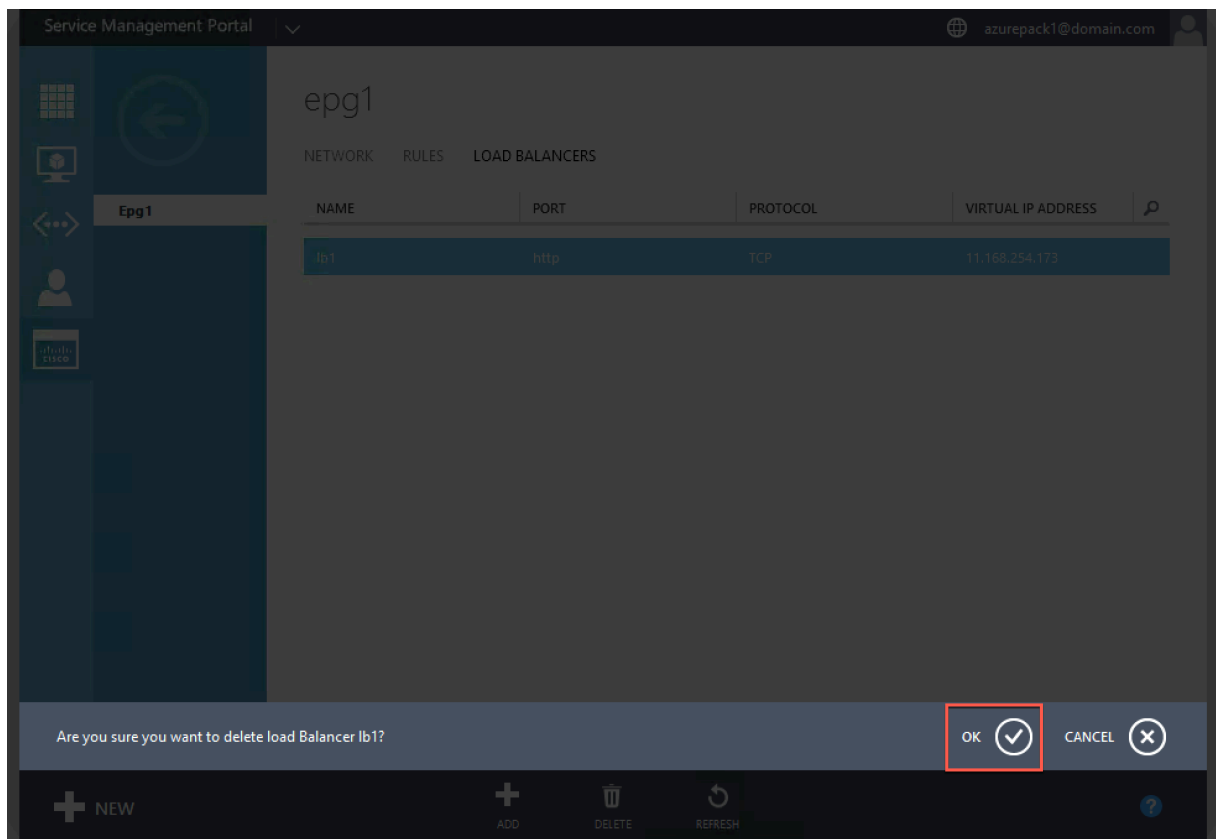

To delete a NetScaler load balancer from the Network:

1. Log on to the Service Management Portal (Tenant Portal).

2. In the navigation pane, select **ACI**.
3. In the **ACI** pane, on the **NETWORKS** tab, click the network that you created.
4. In the selected network's pane, select the NetScaler load balancer and click **DELETE**.

5. Click **OK** to delete the NetScaler load balancer.

NetScaler cloud native solution for microservices based on Kubernetes

April 17, 2024

As companies transform to innovate faster and get closer to customers, they are rearchitecting their internal process and breaking down boundaries within their organization. They are removing silos to pull together the right skill sets in the same team. One of the goals is to create and deliver software applications with speed, agility, and efficiency. In this regard, modern application architectures based on microservices are being adopted by a growing number of enterprises.

Using a microservices architecture, you can create applications as sets of loosely coupled services which can be deployed, updated, and scaled independently.

Cloud native is an approach that relies on the microservices architecture for building and deploying applications with the following key attributes:

- Deploys applications as loosely coupled microservices or containers
- Involves a very high degree of automation
- Implements agile DevOps processes and continuous delivery workflows
- Centers around APIs for interaction and collaboration

How does Kubernetes help in the cloud native journey?

To provide the desired levels of agility and stability, cloud native applications require high levels of infrastructure automation, security, networking, and monitoring. You need a container orchestration system that can efficiently manage containers at a large scale. [Kubernetes](#) has emerged as the most popular platform for container deployment and orchestration. Kubernetes abstracts the complex task of running, deploying, and managing containers from developers and operators and automatically schedules containers among a cluster of nodes. Kubernetes and the cloud native computing foundation (CNCF) ecosystem helps you to build a platform for cloud native solutions.

Some of the key benefits of using Kubernetes:

- Simplifies application deployment be it on-premises, hybrid, or public cloud infrastructure
- Accelerates application development and deployment
- Increases agility, flexibility, and scalability of applications

What is NetScaler cloud native solution?

To maximize the benefits of using Kubernetes in production, you need to integrate Kubernetes with several tools, vendor-sourced, and open-source components. Ensuring production grade reliability and security for their cloud native application is a challenge faced by many organizations.

As the provider of industry-leading NetScalers, NetScaler offers a NetScaler cloud native solution to address the challenges in a Kubernetes production environment.

NetScaler cloud native solution leverages the advanced traffic management, observability, and comprehensive security features of NetScalers to ensure enterprise grade reliability and security. It can provide complete visibility to application traffic in your Kubernetes environment, render immediate feedback, and help gain meaningful insights about the application performance.

The following table lists the key requirements of different stakeholders while implementing an Ingress solution.

Stakeholders	Job function	Needs
Platform administrators	Ensure availability of Kubernetes clusters	Simpler ways to manage applications deployed across multiple clusters, operation, and platform life cycle management

Stakeholders	Job function	Needs
DevOps	Accelerate the deployment of applications to production	Integration with CI/CD pipeline, support for deployment techniques like Canary and blue-green for faster deployment
Developers	Develop and test microservices	Ways to bring traffic into the Kubernetes cluster, tracing and debugging, rate limiting for applications, and authentication for applications
SREs	Ensure availability of applications to meet service level agreements	Advanced telemetry for applications and infrastructure
SecOps	Ensure security compliance	Secure Ingress traffic, API protection, service mesh for secure communication between microservices inside the Kubernetes cluster

The following diagram explains the NetScaler cloud native solution and how it addresses the various challenges faced by stakeholders in their cloud native journey.

NetScaler cloud native solution provides the following key benefits:

- Provides an advanced Kubernetes Ingress solution that caters to the needs of developers, SREs, devOps, and network or cluster administrators.
- Eliminates the need to rewrite legacy applications based on TCP or UDP traffic while moving them into a Kubernetes environment.
- Secures applications with NetScaler policies exposed as Kubernetes APIs.
- Helps to deploy high performing microservices for North-South traffic and East-West traffic.
- Provides an all-in-one view of all microservices using NetScaler Console service graph.
- Enables faster troubleshooting of microservices across different kinds of traffic including TCP, UDP, HTTP, HTTPS, and SSL.
- Secures APIs.
- Automates CI/CD pipeline for Canary deployments.
- Provides out of the box integrations with CNCF open-source tools.

For more information on the various cloud native solutions offered by Citrix, see the following links:

- [Kubernetes Ingress solution](#)
- [Service mesh](#)
- [Solutions for observability](#)
- [API gateway for Kubernetes](#)

Components of NetScaler cloud native solution

The following table explains the major components of NetScaler cloud native solution:

Component	Description
NetScaler Ingress Controller	This container is an implementation of the Kubernetes Ingress Controller to manage and route traffic into your Kubernetes cluster using NetScalers (NetScaler CPX, BLX, VPX, or MPX). Using NetScaler Ingress Controller, you can configure NetScaler CPX, BLX, VPX, or MPX according to the Ingress rules and integrate your NetScalers with the Kubernetes environment.
NetScaler Observability Exporter	NetScaler Observability Exporter is a container which collects metrics and transactions from NetScalers and transforms them to suitable formats (such as JSON, AVRO) for supported endpoints. You can export the data collected by NetScaler Observability Exporter to the desired endpoint. By analyzing the data exported to the endpoint, you can get valuable insights at a microservices level for applications proxied by NetScalers.
NetScaler xDS adapter	NetScaler xDS adapter is a container for integrating NetScaler with service mesh control plane implementations based on xDS APIs (Istio, Consul, and so on). It communicates with the service mesh control plane and listens for updates by acting as a gRPC client to the control plane API server. Based on the updates from the control plane, the NetScaler xDS-Adaptor generates the equivalent NetScaler configuration.

Component	Description
NetScaler CPX	NetScaler CPX is a container-based application delivery controller that can be provisioned on a Docker host. NetScaler CPX enables customers to leverage Docker engine capabilities and use NetScaler load balancing and traffic management features for container-based applications. You can deploy one or more NetScaler CPX instances as standalone instances on a Docker host.

Kubernetes Ingress solution

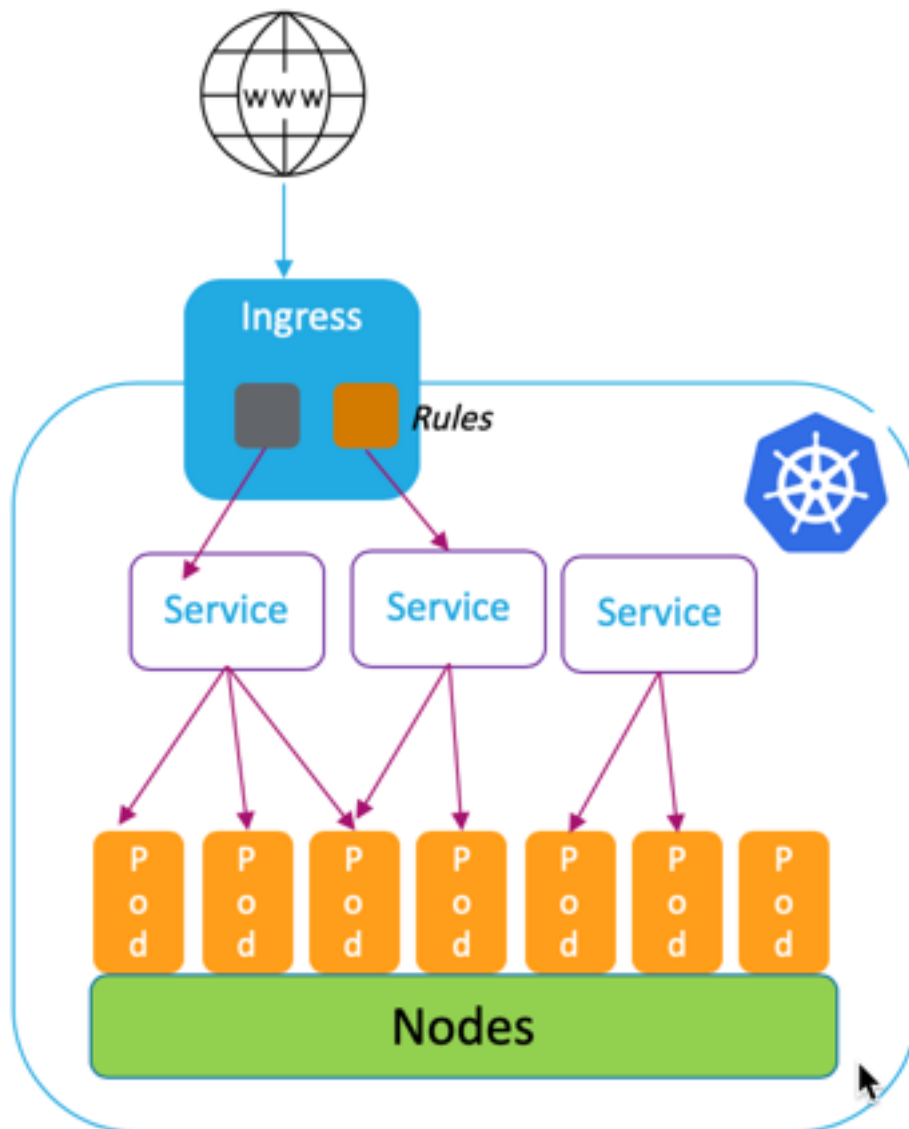

May 2, 2023

This topic provides an overview of the Kubernetes Ingress solution provided by NetScaler and explains the benefits.

What is Kubernetes Ingress?

When you are running an application inside a Kubernetes cluster, you need to provide a way for external users to access the applications from outside the Kubernetes cluster. Kubernetes provides an object called Ingress that provides the most effective way to expose multiple services using a stable IP address. A Kubernetes ingress object is always associated with one or more services and acts as a single-entry point for external users to access services running inside the cluster.

The following diagram explains how Kubernetes Ingress works.

Kubernetes Ingress implementation consists of the following components:

- **Ingress resource.** An Ingress resource allows you to define rules for accessing the applications from outside of the cluster.
- **Ingress controller.** An Ingress controller is an application deployed inside the cluster that interprets rules defined in the Ingress. Ingress controller converts the Ingress rules into configuration instructions for a load balancing application integrated with the cluster. The load balancer can be a software application running inside your Kubernetes cluster or a hardware appliance running outside the cluster.
- **Ingress device.** An Ingress device is a load balancing application like NetScaler CPX, VPX, or

MPX which performs load balancing according to the configuration instructions provided by the Ingress controller.

What is the Kubernetes Ingress solution from Citrix?

In this solution, NetScaler provides an implementation of Kubernetes Ingress controller to manage and route traffic into your Kubernetes cluster using NetScalers (NetScaler CPX, VPX, or MPX). [The NetScaler Ingress Controller](#) integrates NetScalers with your Kubernetes environment and configures NetScaler CPX, VPX, or MPX according to the Ingress rules.

Standard Kubernetes Ingress solutions provide load balancing only at layer 7 (HTTP or HTTPS traffic). Some times, you need to expose many legacy applications which rely on TCP or UDP or applications and need a way to load balance those applications. NetScaler Ingress Controller solution provides TCP, TCP-SSL, and UDP traffic support apart from the standard HTTP or HTTPS Ingress. Also, it works seamlessly across multiple clouds or on-premises data centers.

NetScaler provides enterprise-grade traffic management policies like rewrite and responder policies for efficiently load balancing traffic at layer 7. However, Kubernetes Ingress lacks such enterprise-grade traffic management policies. With the Kubernetes Ingress solution from Citrix, you can apply rewrite and responder policies for application traffic in a Kubernetes environment using CRDs provided by NetScaler.

The Kubernetes Ingress solution from Citrix also supports automated canary deployment for your CI/CD application pipeline. In this solution, NetScaler is integrated with the Spinnaker platform and acts as a source for providing accurate metrics for analyzing Canary deployment using Kayenta. After analyzing the metrics, Kayenta generates an aggregate score for the canary and decides to promote or fail the Canary version. You can also regulate traffic distribution to the Canary version using the NetScaler policy infrastructure.

The following table summarizes the benefits offered by the Ingress solution from Citrix over Kubernetes Ingress.

Features	Kubernetes Ingress	Ingress Solution from Citrix
HTTP and HTTPs support	Yes	Yes
URL routing	Yes	Yes
TLS	Yes	Yes
Load balancing	Yes	Yes
TCP, TCP-SSL	No	Yes
UDP	No	Yes

Features	Kubernetes Ingress	Ingress Solution from Citrix
HTTP/2	Yes	Yes
Automated canary deployment support with CI/CD tools	No	Yes
Support for applying NetScaler rewrite and responder policies	No	Yes
Authentication (Open Authorization (OAuth), mutual TLS (mTLS))	No	Yes
Support for applying Citrix Rate Limiting policies	No	Yes

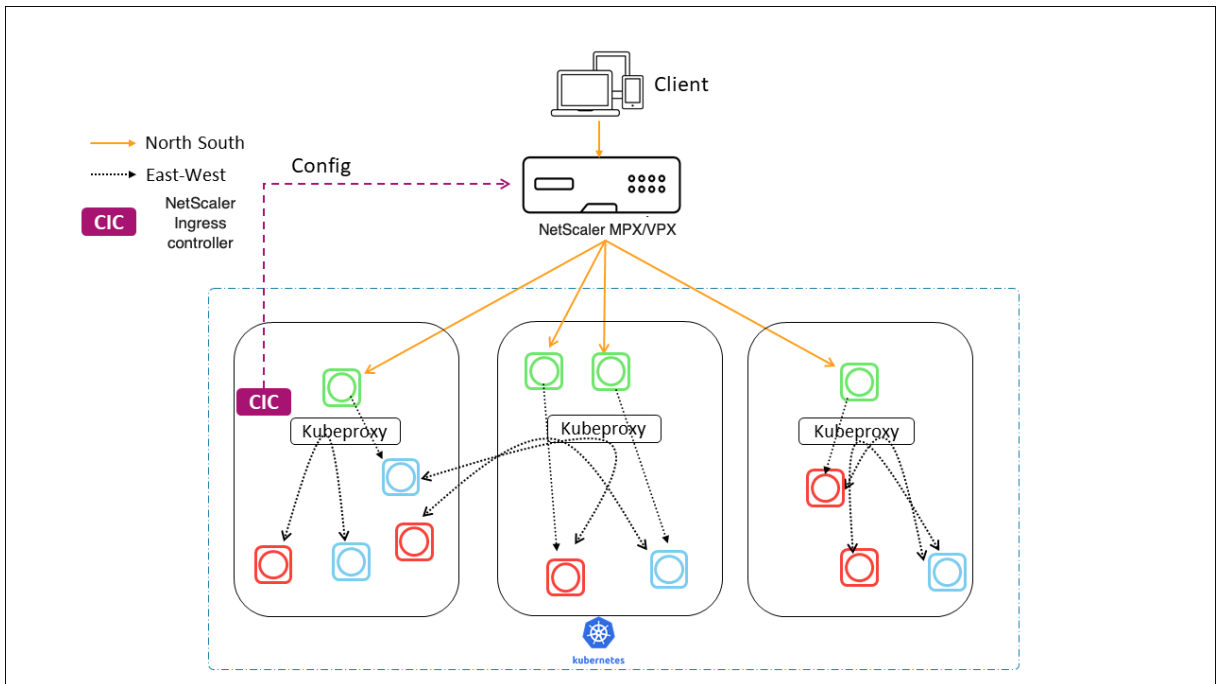

Deployment options for Kubernetes Ingress solution

Kubernetes Ingress solution from NetScaler provides you flexible architecture depending on how you want to manage your NetScalers and Kubernetes environment.

Unified Ingress (single-tier)

In a unified Ingress (single-tier) architecture, a NetScaler MPX or VPX device deployed outside the Kubernetes cluster is integrated with the Kubernetes environment using the NetScaler Ingress Controller. The NetScaler Ingress Controller is deployed as a pod in the Kubernetes cluster and automates the configuration of NetScalers based on changes to the microservices or the Ingress resources. The NetScaler device performs functions like load balancing, TLS termination, and HTTP or TCP protocol optimizations on inbound traffic and then routes the traffic to the correct microservice within a Kubernetes cluster. This architecture suits best in scenarios where the same team manages the Kubernetes platform and other networking infrastructure including application delivery controllers (ADCs).

The following diagram shows a deployment using the unified Ingress architecture.

A unified Ingress solution provides the following key benefits:

- Provides a way to extend the capabilities of your existing NetScaler infrastructure to the Kubernetes environment
- Enables you to apply traffic management policies for inbound traffic
- Provides a simplified architecture suitable for network-savvy DevOps teams
- Supports multitenancy

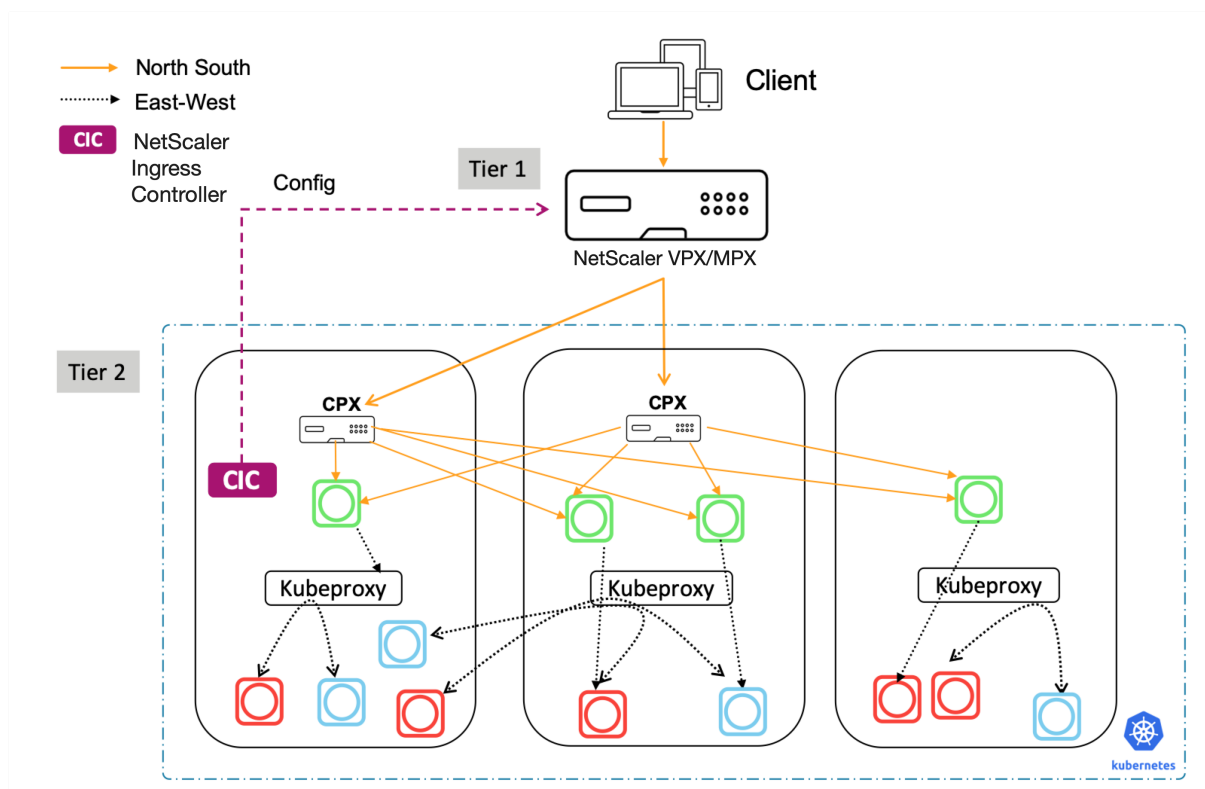

Dual-tier Ingress

In a dual-tier architecture, NetScaler (MPX or VPX) deployed outside the Kubernetes cluster acts at tier 1 and load balances North-South traffic to NetScaler CPXs running inside the cluster. NetScaler CPX acts at tier 2 and performs load balancing for microservices inside the Kubernetes cluster.

In scenarios where separate teams manage the Kubernetes platform and the network infrastructure, the dual-tier architecture is most suitable.

Networking teams use tier 1 NetScaler for use cases such as GSLB, TLS termination on the hardware platform, and TCP load balancing. Kubernetes platform teams can use tier 2 NetScaler (CPX) for Layer 7 (HTTP/HTTPS) load balancing, mutual TLS, and observability or monitoring of microservices. The tier 2 NetScaler (CPX) can have a different software release version than the tier 1 NetScaler to accommodate newly available capabilities.

The following diagram shows a deployment with dual-tier architecture.

A dual-tier Ingress provides the following key benefits:

- Ensures high velocity of application development for developers or platform teams
- Enables applying developer driven traffic management policies for microservices inside the Kubernetes cluster
- Enables cloud scale and multitenancy

For more information, see the [NetScaler Ingress Controller documentation](#).

Getting started

To get started with the Kubernetes Ingress solution from Citrix, you can try out the following examples:

- [Load balance Ingress traffic with NetScaler CPX in Minikube](#)
- [Load balance North-South Ingress traffic using NetScaler CPX proxy](#)
- [Load balance East-West microservice traffic using NetScaler CPX proxy](#)

Service mesh

May 2, 2023

A service mesh is an infrastructure layer for handling service-to-service communication for cloud-native applications using APIs. It provides a way to connect, secure, and monitor your microservices. NetScaler provides two solutions to meet your service mesh requirements:

- Service mesh lite
- Service mesh (NetScaler integration with Istio)

Service mesh lite

A full-fledged service-mesh implementation is complex and requires a steep learning curve. If you are looking for a simplified implementation of a service mesh with similar benefits, NetScaler offers a solution called service mesh lite with lesser complexity. In this solution, a NetScaler CPX runs as a centralized load balancer in the Kubernetes cluster and load balances East-West traffic among microservices. NetScaler CPX enforces policies for inbound and inter-container traffic.

The following diagram shows a service mesh lite architecture.

For information, see the [service mesh lite documentation](#).

Service mesh (NetScaler integration with Istio)

NetScaler provides a service mesh solution by integrating NetScaler with Istio. Istio, an open source and platform-independent service mesh, is one of the most popular service mesh implementations. By integrating NetScaler with Istio, you can take advantage of the NetScaler features to secure and optimize the traffic for applications in the service mesh.

NetScaler can be integrated with Istio in the following ways:

- NetScaler MPX, VPX, or CPX as an Istio Ingress Gateway to the service mesh to expose traffic to the Kubernetes cluster.
- NetScaler CPX as a sidecar proxy with application containers in the service mesh to control communication between applications.

You can use either integration independently or you can combine both ways to have a unified data plane solution.

The following diagram shows a service mesh architecture.

Service mesh is ideal for highly secure applications and also offers the following benefits.

- Offers fine-grained (modularized) traffic management per container
- Ensures richer observability, analytics, and security (Mutual TLS) due to sidecar implementation
- Enables automated canary deployment for each container with embedded NetScaler CPX
- Supports cloud portability
- Allows offloading of some of the functions performed by applications to the sidecar
- Provides lower sidecar latency
- Provides integrations with open-source tools
- Offers scalability

For more information, see the [NetScaler integration with Istio documentation](#).

Solutions for observability

May 2, 2023

In a microservices based architecture, visibility into service to service communications is critical to build an efficient and resilient architecture. Traditional ways for logging and monitoring is not capa-

ble of addressing the challenges of a microservices architecture. Observability solutions from Citrix provide you the ability to see what is happening when your services interact with each other and get meaningful insights about your system.

NetScaler provides the following solutions to address the observability needs of your microservices architecture:

- NetScaler Console service graph and analytics
- NetScaler Observability Exporter

NetScaler Console service graph and analytics

[NetScaler Application Delivery Management \(ADM\)](#) is a centralized management solution that provides enterprise-wide visibility and automation for management jobs that need to be run across multiple instances.

In a microservice architecture, troubleshooting is challenging because a single end-user request may span across multiple microservices.

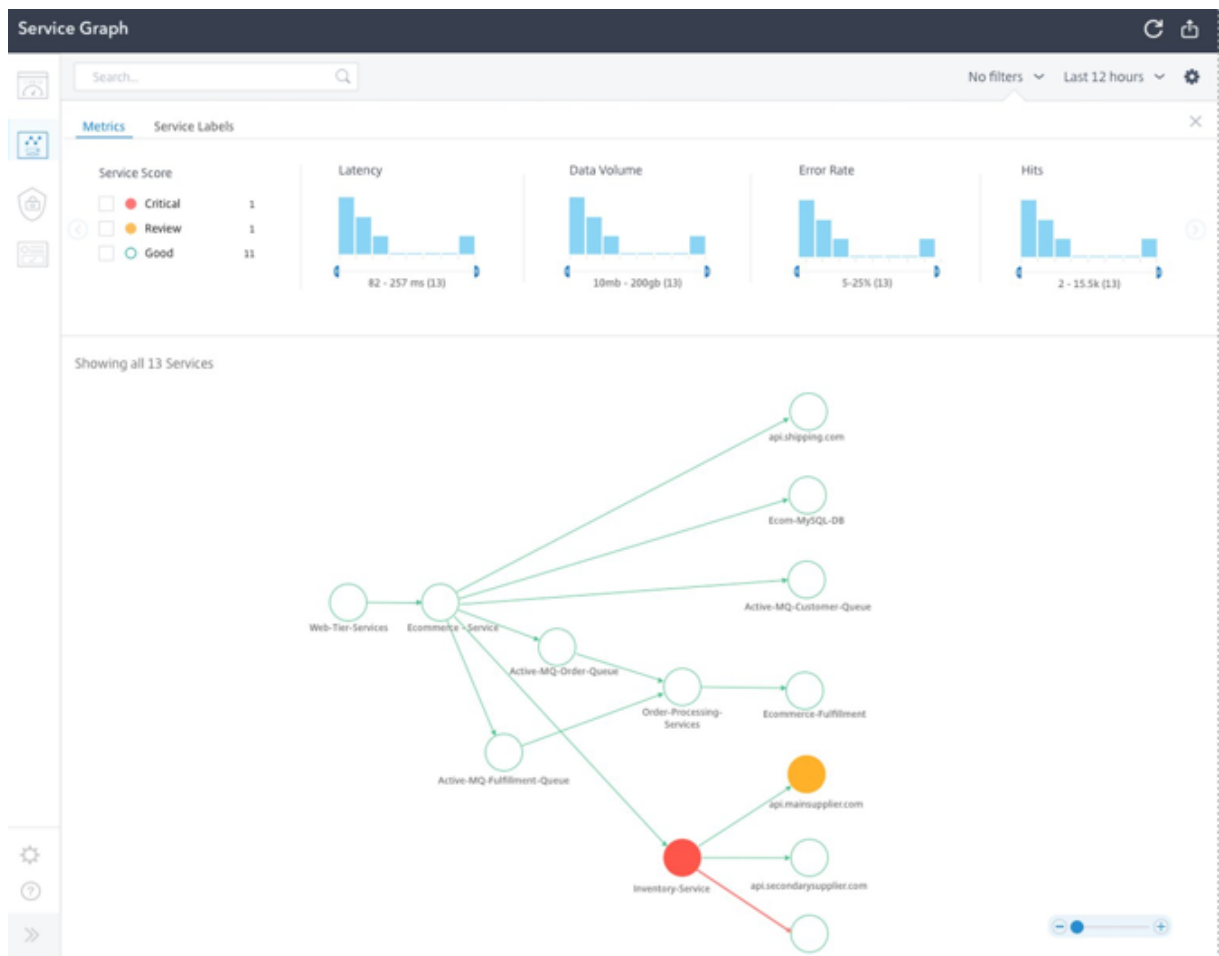

NetScaler Console service graph and analytics provides visibility into interactions between microservices and helps to identify and fix issues based on various metrics such as latency and HTTP errors.

NetScaler Console also provides advanced analytics based on metrics and transaction logs collected from NetScaler.

NetScaler Console solution provides the following benefits:

- Provides a single pane of glass for applications across containers, on-premises, or cloud
- Provides better observability and faster troubleshooting for microservices
- Supports Canary deployment

The following diagram shows a sample service graph for an application which contains multiple microservices.

For more information on how to set up NetScaler Console service graph and analytics, see the [Service graph](#) documentation.

NetScaler Observability Exporter

NetScaler Observability Exporter is a container which collects metrics and transactions from NetScalers and transforms them to suitable formats (such as JSON, AVRO) for supported endpoints. You can export the data collected by NetScaler Observability Exporter to the desired endpoint. By analyzing the data, you can get valuable insights at a microservices level for applications proxied by NetScalers.

Distributed tracing support

Distributed tracers allow you to visualize the data flow between your microservices and helps to identify the bottlenecks in your microservices architecture. [OpenTracing](#) is a specification and standard set of APIs for designing and implementing distributed tracing.

NetScaler Observability Exporter implements distributed tracing for NetScaler and currently supports Zipkin as the distributed tracer.

You can enhance the trace analysis by using [Elasticsearch](#) and [Kibana](#) with Zipkin. Elasticsearch provides long-term retention of the trace data. Kibana allows you to get much deeper insight into the data by providing a tool to explore, and visualize log messages.

Transaction collection and streaming support

NetScaler Observability Exporter supports collecting transactions and streaming them to endpoints. Currently, NetScaler Observability Exporter supports Elasticsearch and Kafka as transaction endpoints.

For more information, see the [NetScaler Observability Exporter documentation](#).

Enable analytics using annotations in the NetScaler Ingress Controller YAML file

You can enable analytics using the analytics profile which is defined as a smart annotation in Ingress or service of type LoadBalancer configuration. You can define the specific parameters you need to monitor by specifying them in the Ingress or service configuration of the application. For more information about enabling analytics using annotations, see [Analytics using annotations](#).

API gateway for Kubernetes

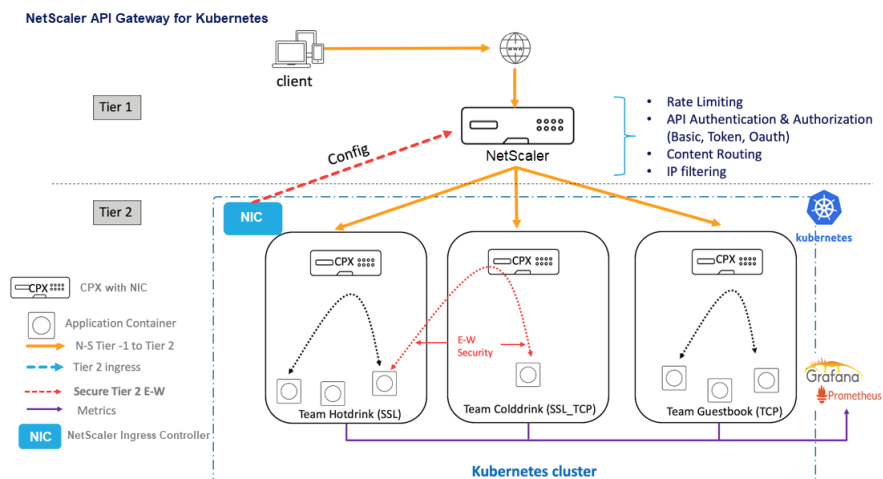

May 2, 2023

An API gateway acts as the single entry point for your APIs and ensures secure and reliable access to multiple APIs and microservices in your system.

NetScaler provides an enterprise grade API gateway for North-South API traffic into the Kubernetes cluster. The

API gateway integrates with Kubernetes through the NetScaler Ingress Controller and the NetScaler (NetScaler MPX, VPX, or CPX) deployed as the Ingress Gateway for on-premises or cloud deployments.

The following diagram shows a dual-tier topology for the API gateway.

Using the API gateway offered by Citrix, you can perform the following functionalities:

- Enforce authentication policies
- Rate limit access to services
- Advanced content routing
- Flexible and comprehensive transformation of HTTP transactions using the rewrite and responder policies
- Enforce web application firewall policies

How does the API gateway work

The API gateway is built on top of the NetScaler Ingress Gateway and uses Kubernetes API extensions such as custom resource definitions (CRDs). Using CRDs, you can automatically configure the NetScaler and API gateway in the same instance.

NetScaler provides the following CRDs for the API gateway:

- [Auth CRD](#)
- [Rate limit CRD](#)
- [Content routing CRD](#)
- [Rewrite and responder CRD](#)
- [WAF CRD](#)

Key benefits of using the API gateway

Following are the key benefits of the API gateway offered by Citrix:

- Uses the advanced traffic management and comprehensive security features of NetScaler.
- Optimizes your deployments by consolidating multiple network functions into a single component of the NetScaler Ingress Gateway.

- Reduces the operational complexity and cost involved in deploying multiple components.
- Ensures better performance for your application traffic by reducing multiple hops of TCP or TLS decryption while using separate components.
- Simplifies deploy and integrate in your Kubernetes environments either by directly using YAMLS or helm charts.

Deploying the API gateway

For more information on how to configure the API gateway features using CRDs, see the NetScaler Ingress Controller documentation:

- [Authentication](#)
- [Rate limiting](#)
- [Advanced content routing](#)
- [Rewrite and responder policies](#)
- [Web application firewall policies](#)

Use NetScaler Console to troubleshoot NetScaler cloud native networking

May 2, 2023

Overview

This document provides information about how you can use NetScaler Console to deliver and monitor Kubernetes microservice applications. You also dive into using the CLI, service graphs, and tracing to allow the platform and SRE teams to troubleshoot.

Application performance and latency overview

TLS encryption

TLS is an encryption protocol designed to secure Internet communications. A TLS handshake is the process that begins a communication session that uses TLS encryption. During a TLS handshake, the two communicating sides exchange messages to acknowledge each other, verify each other, establish the encryption algorithms they use, and agree on session keys. TLS handshakes are a foundational part of how HTTPS works.

TLS vs SSL handshakes

SSL (Secure Sockets Layer), was the original encryption protocol developed for HTTP. TLS (Transport Layer Security) replaced SSL some time ago. SSL handshakes are now called TLS handshakes, although the “SSL” name is still in wide use.

When does a TLS handshake occur?

A TLS handshake takes place whenever a user navigates to a website over HTTPS and the browser first begins to query the website’s origin server. A TLS handshake also happens whenever any other communications use HTTPS, including API calls and DNS over HTTPS queries.

TLS handshakes occur after a TCP connection has been opened via a TCP handshake.

What happens during a TLS handshake?

- During a TLS handshake, the client and server together do the following:
 - Specify which version of TLS (TLS 1.0, 1.2, 1.3, and so forth) they use.
 - Decide on which cipher suites (see the following section) they use.
 - Authenticate the identity of the server via the server’s public key and the SSL certificate authority’s digital signature.
 - Generate session keys to use symmetric encryption after the handshake is complete.

What are the steps of a TLS handshake?

- TLS handshakes are a series of datagrams, or messages, exchanged by a client and a server. A TLS handshake involves multiple steps, as the client and server exchange the information necessary for completing the handshake and making further conversation possible.

The exact steps within a TLS handshake vary depending upon the kind of key exchange algorithm used and the cipher suites supported by both sides. The RSA key exchange algorithm is used most often. It goes as follows:

1. The ‘client hello’ message: The client initiates the handshake by sending a “hello” message to the server. The message includes which TLS version the client supports, the cipher suites supported, and a string of random bytes known as the “client random.”
2. The ‘server hello’ message: In reply to the client hello message, the server sends a message containing the server’s SSL certificate, the server’s chosen cipher suite, and the “server random,” another random string of bytes that’s generated by the server.
3. Authentication: The client verifies the server’s SSL certificate with the certificate authority that issued it. This confirms that the server is who it says it is, and that the client is interacting with the actual owner of the domain.
4. The premaster secret: The client sends one more random string of bytes, the “premaster secret.” The premaster secret is encrypted with the public key and can only be decrypted with the private key by the server. (The client gets the public key from the server’s SSL certificate.)

5. Private key used: The server decrypts the premaster secret.
6. Session keys created: Both client and server generate session keys from the client random, the server random, and the premaster secret. They should arrive at the same results.
7. Client is ready: The client sends a “finished” message that is encrypted with a session key.
8. Server is ready: The server sends a “finished” message encrypted with a session key.
9. Secure symmetric encryption achieved: The handshake is completed, and communication continues using the session keys.

All TLS handshakes use asymmetric encryption (the public and private key), but not all use the private key in the process of generating session keys. For instance, an ephemeral Diffie-Hellman handshake proceeds as follows:

1. Client hello: The client sends a client hello message with the protocol version, the client random, and a list of cipher suites.
2. Server hello: The server replies with its SSL certificate, its selected cipher suite, and the server random. In contrast to the RSA handshake described in the previous section, in this message the server also includes the following (step 3).
3. Server’s digital signature: The server uses its private key to encrypt the client random, the server random, and its DH parameter*. This encrypted data functions as the server’s digital signature, establishing that the server has the private key that matches with the public key from the SSL certificate.
4. Digital signature confirmed: The client decrypts the server’s digital signature with the public key, verifying that the server controls the private key and is who it says it is. Client DH parameter: The client sends its DH parameter to the server.
5. Client and server calculate the premaster secret: Instead of the client generating the premaster secret and sending it to the server, as in an RSA handshake, the client and the server use the DH parameters they exchanged to calculate a matching premaster secret separately.
6. Session keys created: Now, the client and server calculate session keys from the premaster secret, client random, and server random, just like in an RSA handshake.
 - Client is ready:
Same as an RSA handshake
 - Server is ready
 - Secure symmetric encryption achieved

*DH parameter: DH stands for Diffie-Hellman. The Diffie-Hellman algorithm uses exponential calculations to arrive at the same premaster secret. The server and client each provide a parameter for the calculation, and when combined they result in a different calculation on each side, with results that are equal.

To read more about the contrast between ephemeral Diffie-Hellman handshakes and other kinds of handshakes, and how they achieve forward secrecy, see this [TLS Protocol Documentation](#).

What is a cipher suite?

- A cipher suite is a set of encryption algorithms for use in establishing a secure communications connection. (An encryption algorithm is a set of mathematical operations performed on data for making the data appear random.) There are various cipher suites in wide use, and an essential part of the TLS handshake is agreeing upon which cipher suite is used for that handshake.

To get started, see Reference: [TLS Protocol Documentation](#).

NetScaler Application Delivery Management SSL dashboard

NetScaler Application Delivery Management (ADM) now streamlines every aspect of certificate management for you. Through a single console, you can establish automated policies to ensure the right issuer, key strength, and correct algorithms, while keeping close tabs on certificates that are unused or soon to expire. To begin using NetScaler Console SSL dashboard and its functionalities, you must understand what an SSL certificate is and how you can use NetScaler Console to track your SSL certificates.

A Secure Socket Layer (SSL) certificate, which is a part of any SSL transaction, is a digital data form (X509) that identifies a company (domain) or an individual. The certificate has a public key component that is visible to any client that wants to initiate a secure transaction with the server. The corresponding private key, which resides securely on the Citrix Application Delivery Controller (ADC) appliance, is used to complete asymmetric key (or public key) encryption and decryption.

You can obtain an SSL certificate and key in either of the following ways:

- From an authorized certificate authority (CA)
- By generating a new SSL certificate and key on the NetScaler appliance

NetScaler Console provides a centralized view of SSL certificates installed across all managed NetScaler instances. On the SSL Dashboard, you can view graphs that help you track certificate issuers, key strengths, signature algorithms, expired or unused certificates and so on. You can also see the distribution of SSL protocols that are running on your virtual servers and the keys that are enabled on them.

You can also set up notifications to inform you when certificates are about to expire and include information about which NetScaler instances use those certificates.

You can link a NetScaler instance's certificates to a CA certificate. However, make sure that the certificates that you link to the same CA certificate have the same source and the same issuer. After you have linked the certificates to a CA certificate, you can unlink them.

To get started, see the [SSL Dashboard Documentation](#).

Third party integrations

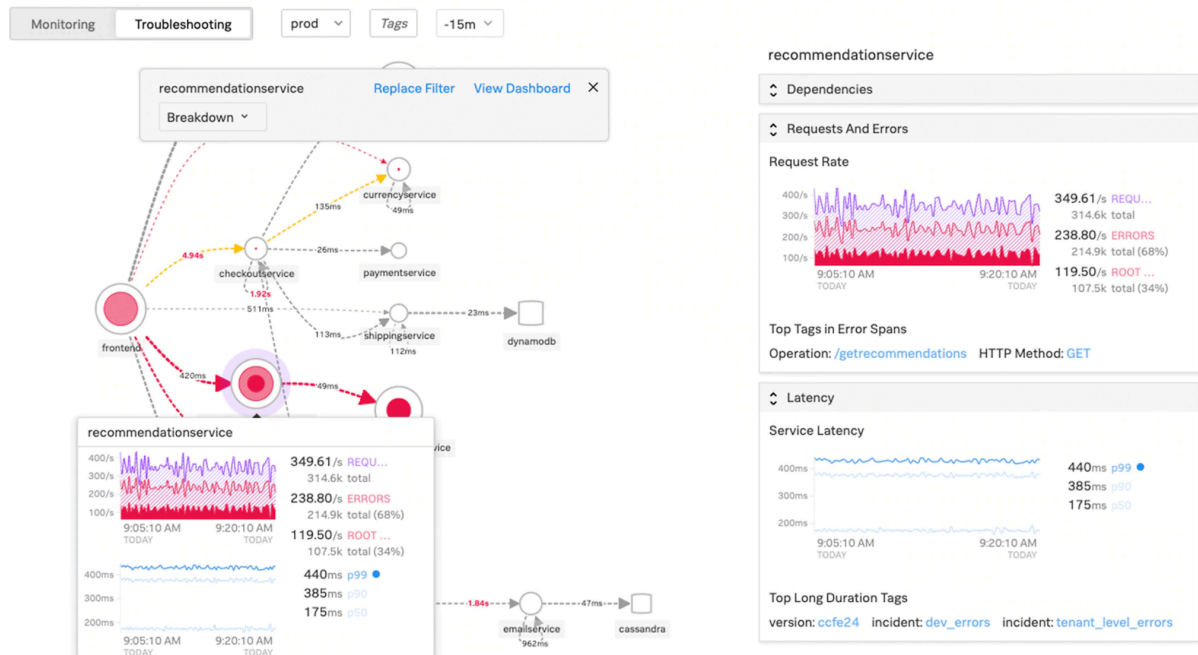

Application latency is measured in milliseconds, and it can indicate one of two things depending on the metric used. The more common way of measuring latency is called “round-trip time”(or RTT). RTT calculates the time it takes for a data packet to travel from one point to another on the network, and for a response to be sent back to the source. The other measurement is called “time to first byte”(or TTFB), which records the time it takes from the moment a packet departs a point on the network to the moment it arrives at its destination. RTT is more commonly used to measure latency because it can be run from a single point on the network and does not require data collection software to be installed on the destination point (as TTFB does).

By monitoring your Application bandwidth usage and performance in real time, the ADM service makes it easy to identify issues and to preemptively address potential problems before they manifest and affect users on your network. This flow-based solution tracks usage by interface, application, and conversation, giving you detailed information about activity across your network.

Using Splunk tools

Infrastructure and application performance are interdependent. To see the full picture, SignalFx provides seamless correlation between cloud infrastructure and the microservices running on top of it. If your application acts out because of memory leakage, a noisy neighbor container or any other

infrastructure-related issue, SignalFx lets you know. To complete the picture, in-context access to Splunk logs and events enable deeper troubleshooting and root cause analysis.

For more information on SignalFx Microservices APM and troubleshooting with Splunk, view [Splunk for DevOps](#) information.

MongoDB support

MongoDB stores data in flexible, JSON-like documents. Meaning fields can vary from document to document and data structure can be changed over time.

The document model maps to the objects in your application code, making data easy to work with.

On-demand queries, indexing, and real time aggregation provide powerful ways to access and analyze your data.

MongoDB is a distributed database at its core, so high availability, horizontal scaling, and geographic distribution are built in and easy to use.

MongoDB is designed to meet the demands of modern apps with a technology foundation that enables you through:

- The document data model –presenting you the best way to work with data.
- A distributed systems design –allowing you to intelligently put data where you want it.
- A unified experience that gives you the freedom to run anywhere –allowing you to future-proof your work and eliminate vendor lock-in.

With these capabilities, you can build an Intelligent Operational Data Platform, underpinned by MongoDB. For more information, see [MongoDB Documentation](#).

How to load balance Ingress traffic to TCP or UDP based application

In a Kubernetes environment, an Ingress is an object that allows access to the Kubernetes services from outside the Kubernetes cluster. Standard Kubernetes Ingress resources assume that all the traffic is HTTP-based and does not cater to non-HTTP based protocols such as, TCP, TCP-SSL, and UDP. Hence, critical applications based on L7 protocols such as DNS, FTP, LDAP, cannot be exposed using standard Kubernetes Ingress.

The standard Kubernetes solution is to create a service of type LoadBalancer. See [Service Type Load-Balancer in NetScaler](#) for more information.

The second option is to annotate the ingress object. NetScaler Ingress Controller enables you to load balance TCP or UDP based Ingress traffic. It provides the following [annotations](#) that you can use in your Kubernetes Ingress resource definition to load balance the TCP or UDP based Ingress traffic:

- `ingress.citrix.com/insecure-service-type`: The annotation enables L4 load balancing with TCP, UDP, or ANY as protocol for NetScaler.
- `ingress.citrix.com/insecure-port`: The annotation configures the TCP port. The annotation is helpful when micro service access is required on a non-standard port. By default, port 80 is configured.

For more information, see [How to load balance Ingress traffic to TCP or UDP based application](#).

Monitor and improve the performance of your TCP or UDP based applications

Application developers can closely monitor the health of TCP or UDP based applications through rich monitors (such as TCP-ECV, UDP-ECV) in NetScaler. The ECV (extended content validation) monitors help in checking whether the application is returning expected content or not.

Also, the application performance can be improved by using persistence methods such as source IP. You can use these NetScaler features through [Smart Annotations](#) in Kubernetes. The following is one such example:

```
1 apiVersion: extensions/v1beta1
2 kind: Ingress
3 metadata:
4   name: mongodb
5   annotations:
6     ingress.citrix.com/insecure-port: " 80 "
7     ingress.citrix.com/frontend-ip: " 192.168.1.1 "
8     ingress.citrix.com/csvservers: ' {
9   "l2conn" : " on " }
```

```
10  '
11      ingress.citrix.com/lbvserver: '{
12  "mongodb-svc" :{
13  "lbmethod" : "SRCIPDESTIPHASH" }
14  }
15  '
16      ingress.citrix.com/monitor: '{
17  "mongodbsvc" :{
18  "type" : "tcp-ecv" }
19  }
20  '
21  Spec:
22      rules:
23      - host: mongodb.beverages.com
24        http:
25          paths:
26          - path: /
27            backend:
28              serviceName: mongodb-svc
29              servicePort: 80
30  <!--NeedCopy-->
```

NetScaler Application Delivery Management (ADM) Service

NetScaler Console Service provides the following benefits:

- **Agile** –Easy to operate, update, and consume. The service model of NetScaler Console Service is available over the cloud, making it is easy to operate, update, and use the features provided. The frequency of updates, combined with the automated update feature, quickly enhances your NetScaler deployment.
- **Faster time to value** –Quicker business goals achievement. Unlike the traditional on-premises deployment, you can use your NetScaler Console Service with a few clicks. You not only save on installation and configuration time, but also avoid wasting time and resources on potential errors.
- **Multi-Site Management** –Single Pane of Glass for instances across Multi-Site data centers. With the NetScaler Console Service, you can manage and monitor NetScalers that are in various types of deployments. You have one-stop management for NetScalers deployed on-premises and in the cloud.
- **Operational Efficiency** –Optimized and automated way to achieve higher operational productivity. With the NetScaler Console Service, your operational costs are reduced by saving your time, money, and resources on maintaining and upgrading the traditional hardware deployments.

Service graph for Kubernetes applications

Using the service graph for the cloud-native application feature in NetScaler Console, you can:

- Ensure end-to-end application overall performance
- Identify bottlenecks created by the interdependency of different components of your applications
- Gather insights into the dependencies of different components of your applications
- Monitor services within the Kubernetes cluster
- Monitor which service has issues
- Check the factors contributing to performance issues
- View detailed visibility of service HTTP transactions
- Analyze the HTTP, TCP, and SSL metrics

By visualizing these metrics in NetScaler Console, you can analyze the root cause of issues and take necessary troubleshooting actions faster. Service graph displays your applications in various component services. These services running inside the Kubernetes cluster can communicate with various components within and outside the application.

To get started, see [Setting up service graph](#).

Service graph for 3-tier web applications

Using the service graph feature from the application dashboard, you can view:

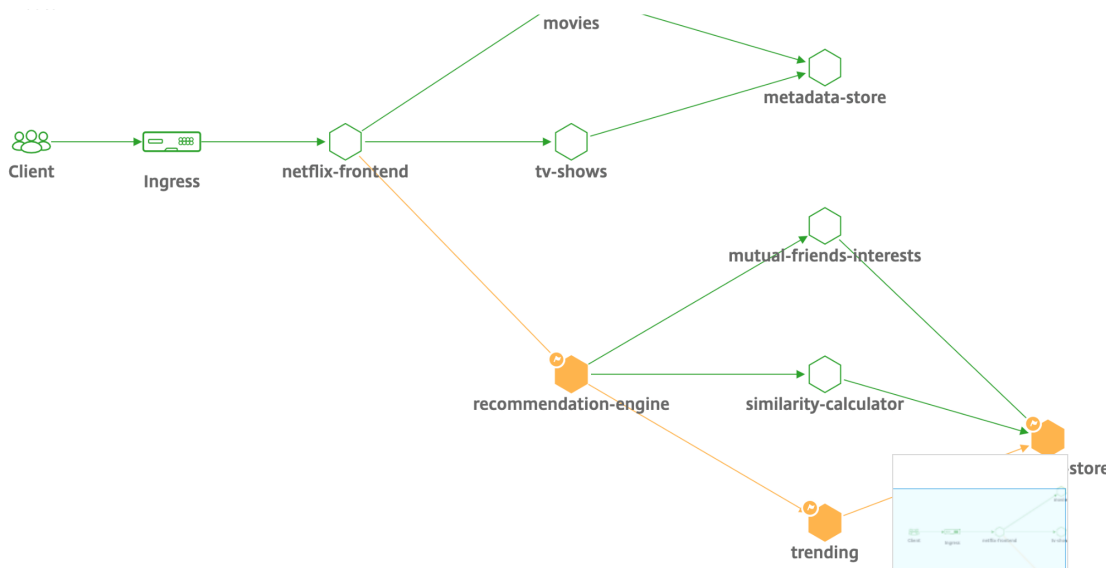

- Details on how the application is configured (with content switching virtual server and load balancing virtual server)
 - For GSLB applications, you can view data center, ADC instance, CS, and LB virtual servers
- End-to-end transactions from client to service
- The location from where the client is accessing the application
- The data center name where the client requests are processed and the associated data center NetScaler metrics (only for GSLB applications)
- Metrics details for client, service, and virtual servers
- If the errors are from the client or from the service
- The service status such as **Critical**, **Review**, and **Good**. NetScaler Console displays the service status based on service response time and error count.
 - **Critical (red)** - Indicates when average service response time > 200 ms AND error count > 0
 - **Review (orange)** - Indicates when average service response time > 200 ms OR error count > 0

- **Good (green)** - Indicates no error and average service response time < 200 ms
- The client status such as **Critical**, **Review**, and **Good**. NetScaler Console displays the client status based on client network latency and error count.
 - **Critical (red)**- Indicates when average client network latency > 200 ms AND error count > 0
 - **Review (orange)** - Indicates when average client network latency > 200 ms OR error count > 0
 - **Good (green)** - Indicates no error and average client network latency < 200 ms
- The virtual server status such as **Critical**, **Review**, and **Good**. NetScaler Console displays the virtual server status based on the app score.
 - **Critical (red)** - Indicates when app score < 40
 - **Review (orange)** - Indicates when app score is between 40 and 75
 - **Good (green)** - Indicates when app score is > 75

Points to note:

- Only Load Balancing, Content Switching, and GSLB virtual servers are displayed in the service graph.
- If no virtual server is bound to a custom application, the details are not visible in the service graph for the application.
- You can view metrics for clients and services in the service graph only if active transactions occur between virtual servers and web application.
- If no active transactions are available between virtual servers and web application, you can only view details in the service graph based on the configuration data such as load balancing, content switching, GSLB virtual servers, and services.
- Updates in the application configuration might take 10 minutes to reflect in the service graph.

For more information, see [Service graph for applications](#).

To get started, see [Service Graph Documentation](#).

Troubleshooting for NetScaler teams

Let’s discuss some of the most common attributes for troubleshooting the NetScaler platform and how these troubleshooting techniques apply to the Tier-1 deployments for microservices topologies.

The NetScaler has a command line interface (CLI) that shows commands in real-time and is useful for determining runtime configurations, statics, and policy configuration. This is facilitated via the “**SHOW**” command.

SHOW - perform ADC CLI operations:

```

1 >Show running config (-summary -fullValues)
2
3 Ability to search (grep command)
4 > “ sh running config | -i grep vserver ”
5
6 Check the version.
7 >Show license
8 “ sh license”
9 <!--NeedCopy-->
    
```

Show SSL Statistics

```

1 >Sh ssl
2 System
3 Frontend
4 Backend
5 Encryption
6 <!--NeedCopy-->
    
```

```

```

The NetScaler has a command for enumerating statistics for all objects based on a seven (7) second counter interval. This is facilitated via the “STAT” command.

Highly granular L3-L7 telemetry by NetScaler

- System Level: CPU and memory utilization of ADC.
- HTTP Protocol: #Requests/Responses, GET/POST split, HTTP errors for N-S and E-W (for service mesh lite only, sidecar soon).
- SSL: #Sessions and #Handshakes for N-S and E-W traffic for service mesh lite only.
- IP Protocol: #Packets received/sent, #Bytes received/sent, #Truncated packets, and #IP address lookup.
- NetScaler AAA: #Active Sessions
- Interface: #Total multicast packets, #Total transferred bytes, and #Jumbo packets received/sent.
- Load balancing virtual server and content switching virtual server: #Packets, #Hits, and #Bytes received/sent.

STAT - perform ADC CLI operations:

```

1 >Statistics
2 “ stat ssl ”
3 <!--NeedCopy-->

```

```

> stat ns

```

The NetScaler has a log archive structure that allows for the searching of statistics and counters when troubleshooting specific errors via the “**NSCONMSG**” command.

NSCONMSG - main log file (ns data format)

```

1      Cd/var/nslog
2
3      “ Mac Moves ”
4      nsconmsg -d current -g nic_err
5 <!--NeedCopy-->

```

Nstcpdump

You can use `nstcpdump` for low-level troubleshooting. `nstcpdump` collects less detailed information than `nstrace`. Open the ADC CLI and type `shell`. You can use filters with `nstcpdump` but cannot use filters specific to ADC resources. The dump output can be viewed directly within the CLI screen.

CTRL + C – Press these keys simultaneously to stop an `nstcpdump`.

`nstcpdump .sh dst host x.x.x.x` – Shows traffic sent to the destination host.

`nstcpdump .sh -n src host x.x.x.x` – Shows traffic from specified host and don't convert IP addresses to names (-n).

`nstcpdump .sh host x.x.x.x` – Shows traffic to and from specified host IP.

```

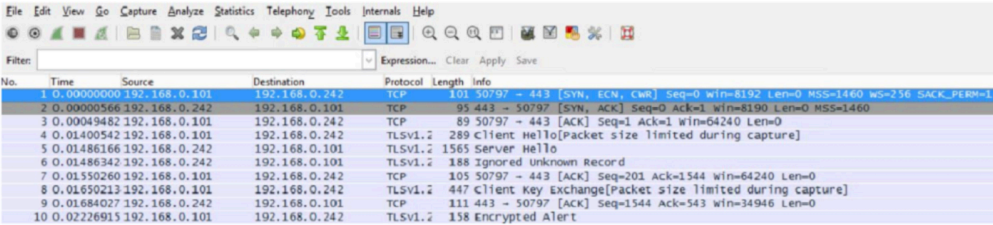

root@Netscaler1# nstcpdump.sh -c 10 dst host 192.168.0.242

NSTRACE - packet trace file

NSTRACE is a low-level packet debugging tool for troubleshooting networks. It allows you to store capture files that you can analyze further using the analyzer tools. Two common tools are Network Analyzer and Wireshark.

NSTRACE

Packet capture tool, analyzed with WireShark

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000000	192.168.0.101	192.168.0.242	TCP	40	50797 → 443 [SYN, ECN, CWB] Seq=0 win=8192 Len=0 MSS=1460 WS=256 SACK_PERM=1

VServer Traffic

IP Specific Traffic

Port Specific Traffic

VLAN 205 Traffic

SSL Traffic

Ping Requests

And More!

```
> start nstrace -size 0
Done
> stop nstrace
Done
```

Once the NSTRACE capture file is created in /var/nstrace on the ADC, you can import the capture file into Wireshark for packet capture and network analysis.

SYSCTL - Detailed ADC info: Description, Model, Platform, CPUs, and so on

```
1 sysctl -a grep hw.physmem
2
3 hw.physmem: 862306304
4 netScaler.hw.physmem_mb: 822
5 <!--NeedCopy-->
```

aaad.debug - Open Pipe for authentication debug info

```
process_radius Got RADIUS event
process_radius Received BAD_ACCESS_REJECT for: <username>
process_radius Sending reject.
send_reject_with_code Rejecting with error code 4001.
```

For more information on how to troubleshoot authentication issues through ADC or ADC Gateway with the aaad.debug module, see [aaad.debug Support Article](#).

There is also the ability to obtain performance statistics and event logs directly for the ADC. For more information on this, see [ADC Support Document](#).

Troubleshooting for SRE and platforms teams

Kubernetes traffic flows

North/South:

- North/south traffic is traffic flowing from the user into the cluster, through the ingress.

East/West:

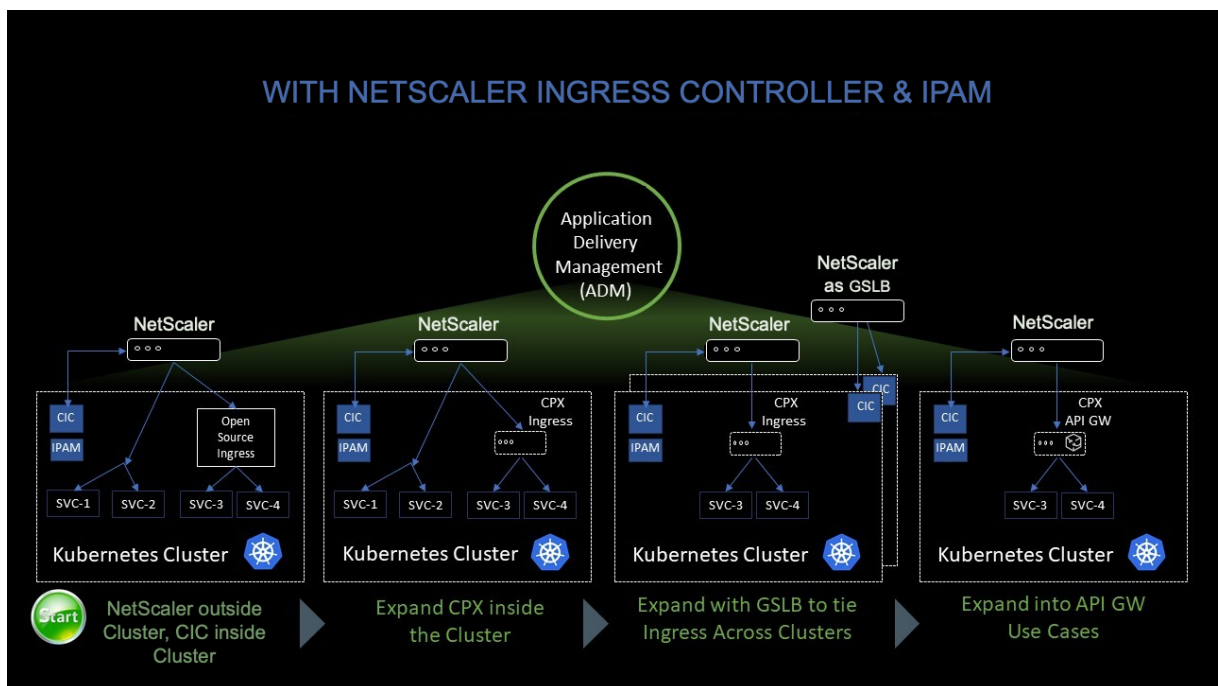

- East/west traffic is traffic flowing around the Kubernetes cluster: service-to-service or service-to-datastore.

How NetScaler CPX load balances east-west traffic flow in a Kubernetes environment

After you have deployed the Kubernetes cluster, you must integrate the cluster with ADM by providing the details of the Kubernetes environment in ADM. ADM monitors the changes in Kubernetes resources, such as services, endpoints, and Ingress rules.

When you deploy a NetScaler CPX instance in the Kubernetes cluster, it automatically registers with ADM. As part of the registration process, ADM learns about the CPX instance IP address and the port on which it can reach the instance to configure it by using NITRO REST APIs.

The following figure shows how NetScaler CPX load balances east-west traffic flow in a Kubernetes cluster.

In this example,

Node 1 and Node 2 of the Kubernetes clusters contains instances of a front-end service and a back-end service. When the NetScaler CPX instances are deployed in Node 1 and Node 2, the NetScaler CPX instances are automatically registered with ADM. You must manually integrate the Kubernetes cluster with ADM by configuring the Kubernetes cluster details in ADM.

When a client requests the front-end service, the ingress resource load balances the request between the instances of the front-end service on the two nodes. When an instance of the front-end service needs information from the back-end services in the cluster, it directs the requests to the NetScaler CPX instance in its node. That NetScaler CPX instance load balances the requests between the back-end services in the cluster, providing east-west traffic flow.

ADM service graph for applications

The service graph feature in NetScaler Console enables you to monitor all services in a graphical representation. This feature also provides a detailed analysis and useful metrics. You can view service graphs for:

- [Applications configured across all NetScaler instances](#)
- [Kubernetes applications](#)
- [3-tier Web applications](#)

To get started, see the [details in service graph](#).

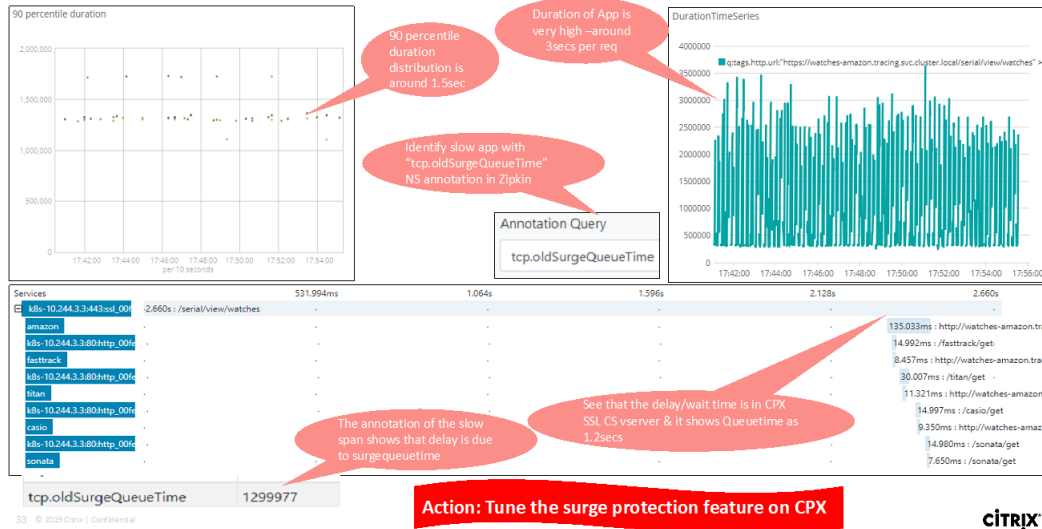

View microservice applications counters

The service graph also displays all microservice applications that belong to the Kubernetes clusters. However, the mouse pointer on a service to view the metrics details.

You can view:

- The service name
- The protocol used by the service such as SSL, HTTP, TCP, SSL over HTTP
- **Hits** –The total number of hits received by the service
- **Service Response Time** –The average response time taken from the service.
(Response time = Client RTT + request last byte –request first byte)
- **Errors** –The total errors such as 4xx, 5xx, and so on
- **Data Volume** –The total volume of data processed by the service
- **Namespace** –The namespace of the service
- **Cluster Name** –The cluster name where the service is hosted
- **SSL Server Errors** –The total SSL errors from the service

Usecase: Troubleshooting slow application

These specific counters and transaction logs can be extracted through the NetScaler Observability Exporter (COE) using a range of supported endpoints. For more information on COE, see the following sections.

Exporter for NetScaler stats

This is a simple server that scrapes NetScaler stats and exports them via HTTP to Prometheus. Prometheus can then be added as a data source to Grafana to view the NetScaler stats graphically.

To monitor the stats and counters of NetScaler instances, `citrix-adc-metric-exporter` can be run as a container or script. The exporter collects NetScaler stats such as total hits to a virtual server, HTTP request rate, SSL encryption-decryption rate, and so on from the NetScaler instances and holds them until the Prometheus server pulls the stats and stores them with a timestamp. Grafana can then be pointed to the Prometheus server to fetch the stats, plot them, set alarms, create heat maps, generate tables, and so forth as needed to analyze the NetScaler stats.

Details about setting up the exporter to work in an environment as given in the figure is provided in the following sections. A note on which NetScaler entities/metrics the exporter scrapes by default and how to modify it is also explained.

For more information on Exporter for NetScaler, see the [Metrics Exporter GitHub](#).

ADM service distributed tracing

In the service graph, you can use the distributed tracing view to:

- Analyze the overall service performance.

- Visualize the communication flow between the selected service and its inter-dependent services.
- Identify which service indicates errors and troubleshoot the erroneous service
- View transaction details between the selected service and each interdependent service.

ADM distributed tracing prerequisites

To view the trace information for the service, you must:

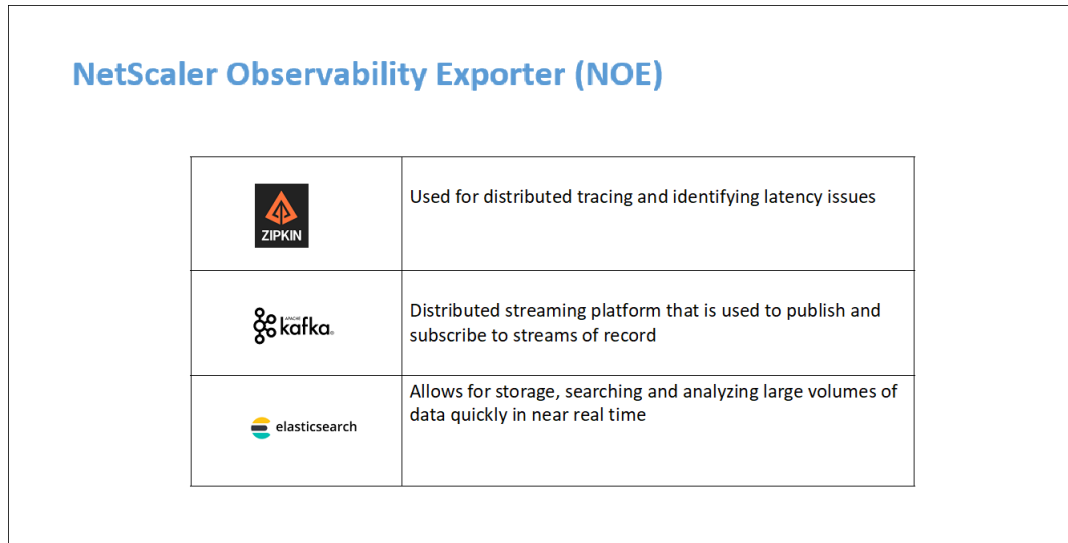

- Ensure that an application maintains the following trace headers, while sending any east-west traffic:
 - `x-request-id`
 - `x-b3-traceid`
 - `x-b3-spanid`
 - `x-b3-parentspanid`
 - `x-b3-sampled`
 - `x-b3-flags`
 - `x-ot-span-context`
- Update the CPX YAML file with `NS_DISTRIBUTED_TRACING` and the value as YES.
To get started, see [Distributed Tracing](#).

NetScaler Observability Exporter (COE) parsing

NetScaler Observability Exporter is a container which collects metrics and transactions from NetScalers and transforms them to suitable formats (such as JSON, AVRO) for supported endpoints. You can export the data collected by the NetScaler Observability Exporter to the desired endpoint. By analyzing the data exported to the endpoint, you can get valuable insights at a microservices level for applications proxied by NetScalers.

For more information on COE, see the [COE GitHub](#).

COE with Elasticsearch as the transaction endpoint

When Elasticsearch is specified as the transaction endpoint, NetScaler Observability Exporter converts the data to JSON format. On the Elasticsearch server, NetScaler Observability Exporter creates Elasticsearch indexes for each ADC on an hourly basis. These indexes are based on data, hour, UUID of the ADC, and the type of HTTP data (http_event or http_error). Then, the NetScaler Observability Exporter uploads the data in JSON format under Elastic search indexes for each ADC. All regular transactions are placed into the http_event index and any anomalies are placed into the http_error index.

Distributed tracing support with Zipkin

In a microservice architecture, a single end-user request may span across multiple microservices making tracking a transaction and fixing sources of errors challenging. In such cases, traditional ways for performance monitoring cannot accurately pinpoint where failures occur and what is the reason behind poor performance. You need a way to capture data points specific to each microservice handling a request and analyze them to get meaningful insights.

Distributed tracing addresses this challenge by providing a way to track a transaction end-to-end and understand how it is being handled across multiple microservices.

[OpenTracing](#) is a specification and standard set of APIs for designing and implementing distributed tracing. Distributed tracers allow you to visualize the data flow between your microservices and helps to identify the bottlenecks in your microservices architecture.

NetScaler Observability Exporter implements distributed tracing for NetScaler and currently supports [Zipkin](#) as the distributed tracer.

Currently, you can monitor performance at the application level using NetScaler. Using NetScaler Observability Exporter with NetScaler, you can get tracing data for microservices of each application proxied by your NetScaler CPX, MPX, or VPX.

To get started, see the [GitHub Observability Exporter](#).

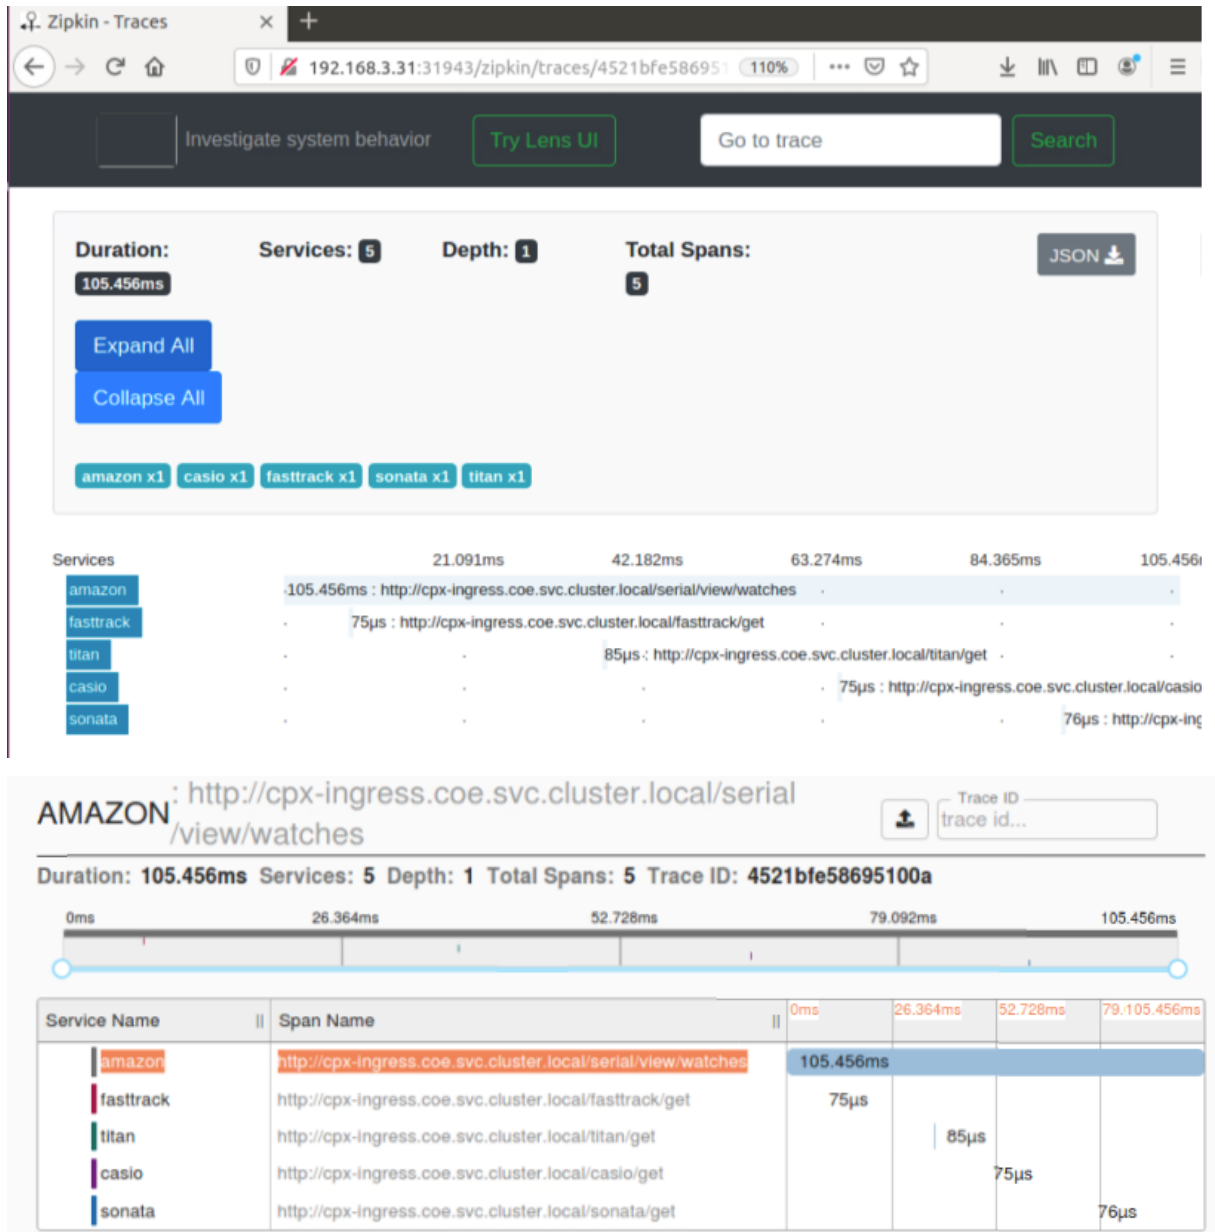

Zipkin for application debugging

Zipkin is an [open source](#) distributed tracing system based on [Dapper's paper from Google](#). Dapper is Google's system for its system distributed tracing in production. Google explains this in their paper -

“We built Dapper to provide Google’s developers with more information about the behavior of complex distributed systems”. Observing the system from different angles is critical when troubleshooting, especially when a system is complex and distributed.

The following Zipkin trace data identifies a total of 5 spans and 5 services related to the Watches sample application. The trace data shows the specific span data across the 5 microservices.

To get started, see [Zipkin](#).

Sample Zipkin span showing application latency for initial page load request:

Services: amazon			
Date Time	Relative Time	Annotation	Address
7/15/2020, 2:14:24 PM		Server Start	10.10.235.179:1719 (amazon)
7/15/2020, 2:14:24 PM	105.456ms	Server Finish	10.10.235.179:1719 (amazon)

component	py_zipkin
http.host	amazon:1719
http.method	GET
http.path	/serial/view/watches
http.url	http://cpx-ingress.coe.svc.cluster.local/serial/view/watches
Local Component	amazon
peer.address	10.10.235.190

Kibana for viewing data

Kibana is an open user interface that lets you visualize your Elasticsearch data and navigate the Elastic Stack. Do anything from tracking query load to understanding the way requests flow through your apps.

Whether you're an analyst or an admin, Kibana makes your data actionable by providing the following three key functions:

- **An open-source analytics and visualization platform.** Use Kibana to explore your Elasticsearch data, and then build beautiful visualizations and dashboards.
- **A UI for managing the Elastic Stack.** Manage your security settings, assign user roles, take snapshots, roll up your data, and more—all from the convenience of a Kibana UI.

- **A centralized hub for Elastic's solutions.** From log analytics to document discovery to SIEM, Kibana is the portal for accessing these and other capabilities.

Kibana is designed to use Elasticsearch as a data source. Think of Elasticsearch as the engine that stores and processes the data, with Kibana sitting on top.

From the home page, Kibana provides these options for adding data:

- Import data using the [File Data visualizer](#).
- Set up a data flow to Elasticsearch using our built-in tutorials. If a tutorial doesn't exist for your data, go to the [Beats Overview](#) to learn about other data shippers in the Beats family.
- [Add a sample data set](#) and take Kibana for a test drive without loading data yourself.
- Index your data into Elasticsearch with [REST APIs](#) or [Client Libraries](#).

Kibana uses an [index pattern](#) to tell it which Elasticsearch indices to explore. If you upload a file, run a built-in tutorial, or add sample data you get an index pattern for free and are good to start exploring. If you load your own data you can create an index pattern in [Stack Management](#).

Step 1: Configure Index Pattern for Logstash

Step 2: Select the index and generate traffic to populate.

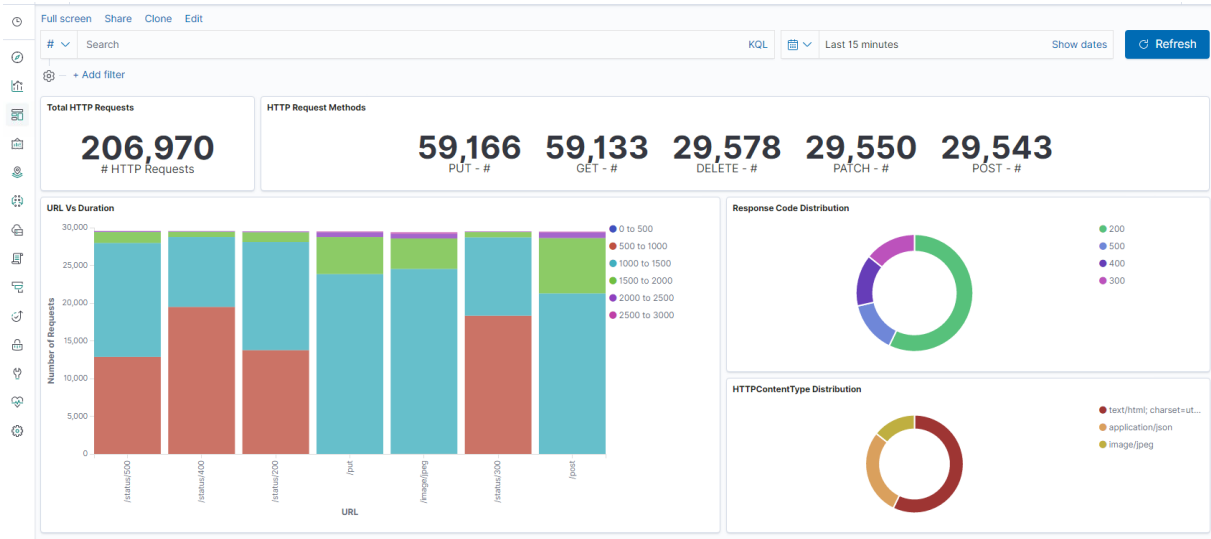

Step 3: generate application from the unstructured data from log feeds.

Step 4: Kibana formats the Logstash input to create reports and dashboards.

- Time Range
- Tabular View
- Hit counts based on the application.
 - Time IP, Agent, Machine.OS, Response Code (200), URL
 - Filter on values

Step 5: Visualize the data in a report of aggregations.

- Result Aggregation in a chart report (pie, graph, and so forth)

Deploy a NetScaler VPX instance

February 22, 2024

Note

Console Advisory Connect is enabled by default, after you install or upgrade NetScaler or NetScaler Gateway to release 13.0 build 61.xx and above. For more information see, [Data governance](#) and [Console Advisory Connect](#).

The NetScaler VPX product is a virtual appliance that can be hosted on a wide variety of virtualization and cloud platforms:

- [Citrix Hypervisor](#)
- [VMware ESX](#)
- [Microsoft Hyper-V](#)
- [Linux KVM](#)
- [Amazon Web Services](#)
- [Microsoft Azure](#)
- [Google Cloud Platform](#)

For more information, see the [NetScaler VPX data sheet](#).

For more information about provisioning a NetScaler VPX instance on an SDX appliance, see [Provisioning NetScaler instances](#).

NetScaler Application Delivery Management for NetScaler VPX

NetScaler Application Delivery Management software is a centralized management solution that simplifies operations by providing administrators with enterprise-wide visibility and automating management jobs that need to be run across multiple instances.

You can manage and monitor NetScaler VPX instances in addition to other NetScaler products such as NetScaler Gateway, NetScaler SDX, NetScaler CPX, and Citrix SD-WAN. You can use the Application Delivery Management software to manage, monitor, and troubleshoot the entire global application delivery infrastructure from a single, unified console.

For more information, see [NetScaler Application Delivery Management documentation](#).

NetScaler VPX support matrix

May 13, 2024

This document lists the different hypervisors and features supported on a NetScaler VPX instance. The document also describes their usage guidelines and known limitations.

VPX instance on VMware ESX hypervisor

The following VPX models with 450010 (Sys ID) supports the VMware ESX versions listed in the table.

VPX models: VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, and VPX 100G.

NetScaler 14.1

ESXi version	ESXi release date (YYYY/MM/DD)	ESXi build number	NetScaler VPX version
ESXi 8.0 update 2	2023/09/21	22380479	14.1-17.x and higher builds
ESXi 8.0 update 1	2023/04/18	21495797	14.1-4.x and higher builds
ESXi 8.0c	2023/03/30	21493926	14.1-4.x and higher builds
ESXi 8.0	2022/10/11	20513097	14.1-4.x and higher builds
ESXi 7.0 update 3p	2024/03/05	23307199	14.1-17.x and higher builds
ESXi 7.0 update 3o	2023/09/28	22348816	14.1-12.x and higher builds
ESXi 7.0 update 3n	2023/07/06	21930508	14.1-8.x and higher builds
ESXi 7.0 update 3m	2023/05/03	21686933	14.1-4.x and higher builds

Note:

Each ESXi patch support is validated on the NetScaler VPX version specified in the preceding table and is applicable for all the higher builds of NetScaler VPX 14.1 version.

For more information on usage guidelines, see [Usage guidelines for VMware ESXi hypervisor](#).

VPX instance on XenServer or Citrix Hypervisor

XenServer or Citrix Hypervisor version	SysID	VPX models
8.4, supported from NetScaler VPX version 14.1 build 17.x onwards	450000	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G
8.2, supported from NetScaler VPX version 13.0 build 64.x onwards		
8.0, 7.6, 7.1		

VPX instance on Microsoft Hyper-V

Hyper-V version	SysID	VPX models
2016, 2019	450020	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000

VPX instance on Nutanix AHV

NetScaler VPX is supported on Nutanix AHV through the [Citrix Ready partnership](#). Citrix Ready is a technology partner program that helps software and hardware vendors develop and integrate their products with NetScaler technology for digital workspace, networking, and analytics.

For more information on a step-by-step method to deploy a NetScaler VPX instance on Nutanix AHV, see [Deploying a NetScaler VPX on Nutanix AHV](#).

Third-party support:

If you experience any issues with a particular third-party (Nutanix AHV) integration on a NetScaler environment, open a support incident directly with the third-party partner (Nutanix).

If the partner determines that the issue appears to be with NetScaler, the partner can approach NetScaler support for further assistance. A dedicated technical resource from partners works with the NetScaler support team until the issue is resolved.

For more information, see the [Citrix Ready Partner Program FAQs](#).

VPX instance on generic KVM

Generic KVM version	SysID	VPX models
RHEL 7.4, RHEL 7.5 (from NetScaler version 12.1 50.x onwards), RHEL 7.6, RHEL 8.0, Ubuntu 16.04, Ubuntu 18.04, RHV 4.2	450070	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G

Points to note:

Consider the following points while using KVM hypervisors.

- The VPX instance is qualified for hypervisor release versions mentioned in table 1–4, and not for patch releases within a version. However, the VPX instance is expected to work seamlessly with patch releases of a supported version. If it does not, log a support case for troubleshooting and debugging.
- Before using RHEL 7.6, complete the following steps on the KVM host:
 1. Edit `/etc/default/grub` and append `"kvm_intel.preemption_timer=0"` to `GRUB_CMDLINE_LINUX` variable.
 2. Regenerate `grub.cfg` with the command `"# grub2-mkconfig -o /boot/grub2/grub.cfg"`.
 3. Restart the host machine.
- Before using Ubuntu 18.04, complete the following steps on the KVM host:
 1. Edit `/etc/default/grub` and append `"kvm_intel.preemption_timer=0"` to `GRUB_CMDLINE_LINUX` variable.
 2. Regenerate `grub.cfg` with the command `"# grub-mkconfig -o /boot/grub/grub.cfg"`.
 3. Restart the host machine.

VPX instance on AWS

AWS version	SysID	VPX models
N/A	450040	VPX 10, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX BYOL, VPX 8000, VPX 10G, VPX 15G, and VPX 25G are available only with BYOL with EC2 instance types (C5, M5, and C5n)

Note:

The VPX 25G offering doesn't give the 25G throughput in AWS but can give a higher SSL transactions rate compared to the VPX 15G offering.

VPX instance on Azure

Azure version	SysID	VPX models
N/A	450020	VPX 10, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX BYOL

VPX features supported on hypervisors

VPX features supported on public clouds

Public clouds →	VPX on AWS	VPX on Azure	VPX on GCP
Multi-PE Support	Yes	Yes	Yes
Clustering Support	No	No	No
VLAN Tagging	No	No	No
Detecting Link Events/HAMon	No ²	No ²	No ²
Interface Parameter Configuration	No	No	No
Static LA	No	No	No
LACP	No	No	No
Static CLAG	No	No	No
LACP CLAG	No	No	No
Hot-plug	Yes	No	No

The superscript numbers (1, 2, 3) used in the two preceding tables refers to the following points with respective numbering:

1. Clustering support is available on SRIOV for client-facing and server-facing interfaces, and not for the backplane.
2. Interface DOWN events are not recorded in NetScaler VPX instances.

3. For Static LA, traffic might still be sent on the interface whose physical status is DOWN.

The following points apply to the respective features captured in the two preceding tables:

- For LACP, the peer device knows the interface DOWN event based on the LACP timeout mechanism.
 - Short timeout: 3 seconds
 - Long timeout: 90 seconds
- For LACP, do not share interfaces across VMs.
- For Dynamic routing, convergence time depends on the Routing Protocol since link events aren't detected.
- Monitored static Route functionality fails if you do not bind monitors to static routes because the Route state depends on the VLAN status. The VLAN status depends on the link status.
- Partial failure detection does not happen in high availability if there's link failure. High availability-split brain condition might happen if there's link failure.
 - When any link event (disable/enable, reset) is generated from a VPX instance, the physical status of the link does not change. For static LA, any traffic initiated by the peer gets dropped on the instance.
 - For the VLAN tagging feature to work, do the following:

On the VMware ESX, set the port group's VLAN ID to 1–4095 on the vSwitch of the VMware ESX server. For more information about setting a VLAN ID on the vSwitch of the VMware ESX server, see [VMware ESX Server 3 802.1Q VLAN Solutions](#).
- Hot-plug is not supported on VPX instances with ENA interfaces, and the behavior of the instances can be unpredictable if hot-plugging is attempted. Hot adding is supported only for PV and SRIOV interfaces with NetScaler on AWS.
- Hot removing either through the AWS Web console or AWS CLI interface is not supported with the PV, SRIOV, and ENA interfaces for NetScaler. The behavior of the instances can be unpredictable if hot-removal is attempted.

Supported browsers

Operating system	Browser and versions
Windows 7	Internet Explorer- 8, 9, 10, and 11; Mozilla Firefox 3.6.25 and above; Google Chrome- 15 and above

Operating system	Browser and versions
Windows 64 bit	Internet Explorer - 8, 9; Google Chrome - 15 and above
MAC	Mozilla Firefox - 12 and above; Safari - 5.1.3; Google Chrome - 15 and above

AMD processor support for VPX instances

From NetScaler release 13.1, the VPX instance supports both the Intel and AMD processors. VPX virtual appliances can be deployed on any instance type that has two or more virtualized cores and more than 2 GB memory. For more information on system requirements, see [NetScaler VPX data sheet](#).

VPX platform vs. NIC matrix table

The following table lists the NICs supported on a VPX platform or cloud.

NICs → Platforms ↓	Mellanox CX-3	Mellanox CX-4	Mellanox CX-5	Intel 82599 SRIOV VF	Intel X710/X722/XL710/ SRIOV VF	Intel X710/XL710 PCI-
VPX (ESXi)	No	Yes	No	Yes	No	Passthrough Yes
VPX (Citrix Hypervisor)	NA	NA	NA	Yes	Yes	No
VPX (KVM)	No	Yes	Yes	Yes	Yes	Yes
VPX (Hyper-V)	NA	NA	NA	No	No	No

Optimize NetScaler VPX performance on VMware ESX, Linux KVM, and Citrix Hypervisors

April 12, 2024

The NetScaler VPX performance greatly varies depending on the hypervisor, allocated system resources, and the host configurations. To achieve the desired performance, first follow the recommendations in the VPX data sheet, and then further optimize it using the best practices provided in this document.

NetScaler VPX instance on VMware ESX hypervisors

This section contains details of configurable options and settings, and other suggestions that help you achieve optimal performance of NetScaler VPX instance on VMware ESX hypervisors.

- [Recommended configuration on ESX hosts](#)
- [NetScaler VPX with E1000 network interfaces](#)
- [NetScaler VPX with VMXNET3 network interfaces](#)
- [NetScaler VPX with SR-IOV and PCI passthrough network interfaces](#)

Recommended configuration on ESX hosts

To achieve high performance for VPX with E1000, VMXNET3, SR-IOV, and PCI passthrough network interfaces, follow these recommendations:

- The total number of virtual CPUs (vCPUs) provisioned on the ESX host must be less than or equal to the total number of physical CPUs (pCPUs) on the ESX host.
- Non-uniform Memory Access (NUMA) affinity and CPU affinity must be set for the ESX host to achieve good results.

–To find the NUMA affinity of a Vmnic, log in to the host locally or remotely, and type:

```
1 #vsish -e get /net/pNics/vmnic7/properties | grep NUMA
2 Device NUMA Node: 0
3 <!--NeedCopy-->
```

- To set NUMA and vCPU affinity for a VM, see [VMware documentation](#).

NetScaler VPX with E1000 network interfaces

Perform the following settings on the VMware ESX host:

- On the VMware ESX host, create two vNICs from one pNIC vSwitch. Multiple vNICs create multiple Receive (Rx) threads in the ESX host. This increases the Rx throughput of the pNIC interface.
- Enable VLANs on the vSwitch port group level for each vNIC that you have created.
- To increase vNIC transmit (Tx) throughput, use a separate Tx thread in the ESX host per vNIC. Use the following ESX command:

- For ESX version 5.5:

```
1 esxcli system settings advanced set -o /Net/NetTxWorldlet -i 1
2 <!--NeedCopy-->
```

- For ESX version 6.0 onwards:

```
1 esxcli system settings advanced set -o /Net/NetVMTxType -i 1
2 <!--NeedCopy-->
```

- To further increase the vNIC Tx throughput, use a separate Tx completion thread and Rx threads per device (NIC) queue. Use the following ESX command:

```
1 esxcli system settings advanced set -o /Net/NetNetqRxQueueFeatPairEnable -i 0
2 <!--NeedCopy-->
```

Note:

Make sure that you reboot the VMware ESX host to apply the updated settings.

Two vNICs per pNIC deployment

The following is a sample topology and configuration commands for the **Two vNICs per pNIC** model of deployment that delivers better network performance.

NetScaler VPX sample configuration:

To achieve the deployment shown in the preceding sample topology, perform the following configuration on the NetScaler VPX instance:

- On the client side, bind the SNIP (1.1.1.2) to network interface 1/1 and enable the VLAN tag mode.

```
1 bind vlan 2 -ifnum 1/1 -tagged
2 bind vlan 2 -IPAddress 1.1.1.2 255.255.255.0
3 <!--NeedCopy-->
```

- On the server side, bind the SNIP (2.2.2.2) to network interface 1/1 and enable the VLAN tag mode.

```
1 bind vlan 3 -ifnum 1/2 -tagged
2 bind vlan 3 -IPAddress 2.2.2.2 255.255.255.0
3 <!--NeedCopy-->
```

- Add an HTTP virtual server (1.1.1.100) and bind it to a service (2.2.2.100).

```
1 add lb vserver v1 HTTP 1.1.1.100 80 -persistenceType NONE -
  Listenpolicy None -cltTimeout 180
2 add service s1 2.2.2.100 HTTP 80 -gslb NONE -maxClient 0 -maxReq
  0 -cip DISABLED -usip NO -useproxyport YES -sp ON -cltTimeout
  180 -svrTimeout 360 -CKA NO -TCPB NO -CMP NO
3 bind lb vserver v1 s1
4 <!--NeedCopy-->
```

Note:

Make sure that you include the following two entries in the route table:

- 1.1.1.0/24 subnet with gateway pointing to SNIP 1.1.1.2
- 2.2.2.0/24 subnet with gateway pointing to SNIP 2.2.2.2

NetScaler VPX with VMXNET3 network interfaces

To achieve high performance for VPX with VMXNET3 network interfaces, do the following settings on the VMware ESX host:

- Create two vNICs from one pNIC vSwitch. Multiple vNICs create multiple Rx threads in the ESX host. This increases the Rx throughput of the pNIC interface.
- Enable VLANs on the vSwitch port group level for each vNIC that you have created.
- To increase vNIC transmit (Tx) throughput, use a separate Tx thread in the ESX host per vNIC. Use the following ESX commands:

- For ESX version 5.5:

```
1 esxcli system settings advanced set -o /Net/NetTxWorldlet -i
2 <!--NeedCopy-->
```

- For ESX version 6.0 onwards:

```
1 esxcli system settings advanced set -o /Net/NetVMTxType -i 1
2 <!--NeedCopy-->
```

On the VMware ESX host, perform the following configuration:

- On the VMware ESX host, create two vNICs from 1 pNIC vSwitch. Multiple vNICs create multiple Tx and Rx threads in the ESX host. This increases the Tx and Rx throughput of the pNIC interface.
- Enable VLANs on the vSwitch port group level for each vNIC that you have created.
- To increase Tx throughput of a vNIC, use a separate Tx completion thread and Rx threads per device (NIC) queue. Use the following command:

```
1 esxcli system settings advanced set -o /Net/
  NetNetqRxQueueFeatPairEnable -i 0
2 <!--NeedCopy-->
```

- Configure a VM to use one transmit thread per vNIC, by adding the following setting to the VM's configuration:

```
1 ethernetX.ctxPerDev = "1"
2 <!--NeedCopy-->
```

- Configure a VM to use up to 8 transmit thread per vNIC, by adding the following setting to the VM's configuration:

```
1 ethernetX.ctxPerDev = "3"  
2 <!--NeedCopy-->
```

Note:

Increasing the transmit threads per vNIC requires more CPU resources (up to 8) on the ESX host. Ensure that sufficient CPU resources are available before making the preceding settings.

For more information, see [Best Practices for Performance Tuning of Telco and NFV Workloads in vSphere](#)

Note:

Make sure that you reboot the VMware ESX host to apply the updated settings.

You can configure VMXNET3 as a **Two vNICs per pNIC** deployment. For more information, see [Two vNICs per pNIC deployment](#).

Configure multi-queue and RSS support on VMware ESX for VMXNET3 devices By default, the VMXNET3 device supports only 8 Rx and Tx queues. When the number of vCPUs on the VPX goes beyond 8, the number of Rx and Tx queues configured for a VMXNET3 interface switches to 1 by default. You can configure up to 19 Rx and Tx queues for VMXNET3 devices by changing certain configurations on ESX. This option increases the performance and uniform distribution of packets across the vCPUs of the VPX instance.

Note:

Starting from NetScaler release 13.1 build 48.x, the NetScaler VPX supports up to 19 Rx and Tx queues on ESX for VMXNET3 devices.

Prerequisites:

To configure up to 19 Rx and Tx queues on ESX for VMXNET3 devices, make sure that the following prerequisites are met:

- NetScaler VPX version is 13.1 build 48.X and later.
- NetScaler VPX is configured with a virtual machine of hardware version 17 and later, which is supported by VMware ESX 7.0 and later.

Configure VMXNET3 interfaces to support more than 8 Rx and Tx queues:

1. Open the virtual machine configuration file (.vmx) file.

2. Specify the number of Rx and TX queues by configuring the `ethernetX.maxTxQueues` and `ethernetX.maxRxQueues` values (where X is the number of the virtual NICs to configure). The maximum number of queues configured must not be greater than the number of vCPUs in the virtual machine.

Note:

Increasing the number of queues also increases the processor overhead on the ESX host. Therefore, ensure that sufficient CPU resources are available in the ESX host before increasing the queues. You can increase the maximum number of queues supported, in scenarios, where the number of queues are identified as a bottleneck for performance. In these situations, we recommend increasing the number of queues gradually. For example, from 8 to 12, then to 16, then to 20, and so on. Evaluate the performance at each setting, rather than increasing directly to the maximum limit.

NetScaler VPX with SR-IOV and PCI passthrough network interfaces

To achieve high performance for VPX with SR-IOV and PCI passthrough network interfaces, see [Recommended configuration on ESX hosts](#).

Usage guidelines for VMware ESXi hypervisor

- We recommend you deploy a VPX instance on local disks of the server or SAN-based storage volumes.

See the **VMware ESXi CPU Considerations** section in the [Performance Best Practices for VMware vSphere 6.5](#) document. Here's an extract:

- It isn't recommended to deploy virtual machines with high CPU or memory demand on a over-committed host or cluster.
- In most environments, ESXi allows significant levels of CPU overcommitment without impacting virtual machine performance. On a host, you can run more vCPUs than the total number of physical processor cores in that host.
- If an ESXi host becomes CPU saturated, that is, the virtual machines and other loads on the host demand all the CPU resources the host has, latency-sensitive workloads might not perform well. In this case, reduce the CPU load for example, by powering off some virtual machines or migrating them to a different host (or allowing DRS to migrate them automatically).
- NetScaler recommends using the latest hardware compatibility version to avail the latest feature sets of the ESXi hypervisor for the virtual machine. For more information about the hardware and ESXi version compatibility, see the [VMware documentation](#).

- The NetScaler VPX is a latency-sensitive, high-performance virtual appliance. To deliver its expected performance, the appliance requires vCPU reservation, memory reservation, and vCPU pinning on the host. Also, hyper threading must be disabled on the host. If the host does not meet these requirements, the following issues might occur:
 - High-availability failover
 - CPU spike within the VPX instance
 - Sluggishness in accessing the VPX CLI
 - Pit boss daemon crash
 - Packet drops
 - Low throughput
- A hypervisor is considered over-provisioned if one of the following two conditions is met:
 - The total number of virtual cores (vCPU) provisioned on the host is greater than the total number of physical cores (pCPUs).
 - The total number of provisioned VMs consume more vCPUs than the total number of pCPUs.

If an instance is over-provisioned, the hypervisor might not guarantee the resources reserved (such as CPU, memory, and others) for the instance due to hypervisor scheduling over-heads, bugs, or limitations with the hypervisor. This behavior can cause lack of CPU resources for NetScaler and might lead to the issues mentioned in the first point under **Usage guidelines**. We recommend that the administrators reduce the host's tenancy so that the total number of vCPUs provisioned on the host is lesser or equal to the total number of pCPUs.

Example:

For ESX hypervisor, if the `%RDY%` parameter of a VPX vCPU is greater than 0 in the `esx top` command output, the ESX host is said to have scheduling overheads, which can cause latency related issues for the VPX instance.

In such a situation, reduce the tenancy on the host so that `%RDY%` returns to 0 always. Alternatively, contact the hypervisor vendor to triage the reason for not honoring the resource reservation.

Commands to control the packet engine CPU usage

You can use two commands (`set ns vpxparam` and `show ns vpxparam`) to control the packet engine (non-management) CPU usage behavior of VPX instances in hypervisor and cloud environments:

- `set ns vpxparam [-cpuyield (YES | NO | DEFAULT)] [-masterclockcpu1 (YES | NO)]`

Allow each VM to use the CPU resources allocated to another VM but are not being used.

Set `ns vpxparam` parameters:

-cpuyield: Release or do not release of allocated but unused CPU resources.

- **YES:** Allow allocated but unused CPU resources to be used by another VM.
- **NO:** Reserve all CPU resources for the VM to which they've been allocated. This option shows a higher percentage in hypervisor and cloud environments for VPX CPU usage.
- **DEFAULT:** No.

Note:

On all the NetScaler VPX platforms, the vCPU usage on the host system is 100 percent. Use the `set ns vpxparam -cpuyield YES` command to override this usage.

If you want to set the cluster nodes to “yield”, you must perform the following extra configurations on CCO:

- If a cluster is formed, all the nodes are set to “yield=DEFAULT”.
- If a cluster is formed using the nodes that are already set to “yield=YES”, then the nodes are added to cluster using the “DEFAULT” yield.

Note:

If you want to set the cluster nodes to “yield=YES”, you can configure only after forming the cluster but not before the cluster is formed.

-masterclockcpu1: You can move the main clock source from CPU0 (management CPU) to CPU1. This parameter has the following options:

- **YES:** Allow the VM to move the main clock source from CPU0 to CPU1.
- **NO:** VM uses CPU0 for the main clock source. By default, CPU0 is the main clock source.

- `show ns vpxparam`

This command displays the current `vpxparam` settings.

NetScaler VPX instance on Linux-KVM platform

This section contains details of configurable options and settings, and other suggestions that help you achieve optimal performance of NetScaler VPX instance on Linux-KVM platform.

- Performance settings for KVM
- NetScaler VPX with PV network interfaces
- NetScaler VPX with SR-IOV and Fortville PCIe passthrough network interfaces

Performance settings for KVM

Perform the following settings on the KVM host:

Find the NUMA domain of the NIC using the `lsstopo` command:

Make sure that memory for the VPX and the CPU is pinned to the same location.

In the following output, the 10G NIC “ens2” is tied to NUMA domain #1.

```
[root@localhost ~]# lsstopo-no-graphics
Machine (128GB)
  NUMANode L#0 (P#0 64GB)
    Socket L#0 + L3 L#0 (20MB)
      L2 L#0 (256KB) + L1d L#0 (32KB) + L1i L#0 (32KB) + Core L#0 + PU L#0 (P#0)
      L2 L#1 (256KB) + L1d L#1 (32KB) + L1i L#1 (32KB) + Core L#1 + PU L#1 (P#1)
      L2 L#2 (256KB) + L1d L#2 (32KB) + L1i L#2 (32KB) + Core L#2 + PU L#2 (P#2)

        NUMANode L#1 (P#1 64GB)
          Socket L#1 + L3 L#1 (20MB)
            L2 L#8 (256KB) + L1d L#8 (32KB) + L1i L#8 (32KB) + Core L#8 + PU L#8 (P#8)
            L2 L#9 (256KB) + L1d L#9 (32KB) + L1i L#9 (32KB) + Core L#9 + PU L#9 (P#9)
            L2 L#10 (256KB) + L1d L#10 (32KB) + L1i L#10 (32KB) + Core L#10 + PU L#10 (P#10)
            L2 L#11 (256KB) + L1d L#11 (32KB) + L1i L#11 (32KB) + Core L#11 + PU L#11 (P#11)
            L2 L#12 (256KB) + L1d L#12 (32KB) + L1i L#12 (32KB) + Core L#12 + PU L#12 (P#12)
            L2 L#13 (256KB) + L1d L#13 (32KB) + L1i L#13 (32KB) + Core L#13 + PU L#13 (P#13)
            L2 L#14 (256KB) + L1d L#14 (32KB) + L1i L#14 (32KB) + Core L#14 + PU L#14 (P#14)
            L2 L#15 (256KB) + L1d L#15 (32KB) + L1i L#15 (32KB) + Core L#15 + PU L#15 (P#15)
          HostBridge L#6
            PCI 8086:1584
              Net L#8 "ens2"
          PCI 8086:10fb
            Net L#9 "ens1f0"
          PCI 8086:10fb
            Net L#10 "ens1f1"
          PCI ffff:ffff
            Net L#11 "enp131s16"
  [root@localhost ~]# modprobe kvm-intel acpienv=N
```

Allocate the VPX memory from the NUMA domain.

The `numactl` command indicates the NUMA domain from which the memory is allocated. In the following output, around 10 GB RAM is allocated from NUMA node #0.

```
[root@localhost ~]# numactl --hardware
available: 2 nodes (0-1)
node 0 cpus: 0 1 2 3 4 5 6 7
node 0 size: 65429 MB
node 0 free: 55854 MB
node 1 cpus: 8 9 10 11 12 13 14 15
node 1 size: 65536 MB
node 1 free: 52388 MB
node distances:
node  0  1
  0:  10  21
  1:  21  10
[root@localhost ~]#
```

To change the NUMA node mapping, follow these steps.

1. Edit the .xml of the VPX on the host.

```
1 /etc/libvirt/qemu/<VPX_name>.xml
2 <!--NeedCopy-->
```

2. Add the following tag:

```
1 <numatune>
2 <memory mode="strict" nodeset="1"/>   ☒ This is the NUMA domain
   name
3 </numatune>
4 <!--NeedCopy-->
```

3. Shut down the VPX.
4. Run the following command:

```
1 virsh define /etc/libvirt/qemu/<VPX_name>.xml
2 <!--NeedCopy-->
```

This command updates the configuration information for the VM with the NUMA node mappings.

5. Power on the VPX. Then check the `numactl --hardware` command output on the host to see the updated memory allocations for the VPX.

```
[root@localhost ~]# numactl --hardware
available: 2 nodes (0-1)
node 0 cpus: 0 1 2 3 4 5 6 7
node 0 size: 65429 MB
node 0 free: 65429 MB
node 1 cpus: 8 9 10 11 12 13 14 15
node 1 size: 65536 MB
node 1 free: 55854 MB
node distances:
node  0  1
  0:  10  21
  1:  21  10
[root@localhost ~]#
```

Pin vCPUs of VPX to physical cores.

- To view the vCPU to pCPU mappings of a VPX, type the following command

```
1 virsh vcpupin <VPX name>
2 <!--NeedCopy-->
```

```
root@localhost qemu]# virsh vcpupin NS-VPX-DVR
CPU: CPU Affinity
-----
0: 8
1: 9
2: 10
3: 11
```

The vCPUs 0–4 are mapped to physical cores 8–11.

- To view the current pCPU usage, type the following command:

```
1 mpstat -P ALL 5
2 <!--NeedCopy-->
```

```
[root@localhost qemu]# mpstat -P ALL 5
Linux 3.10.0-123.el7.x86_64 (localhost.localdomain) 05/17/2016 _x86_64_ (16 CPU)

02:26:20 PM CPU    %usr   %nice    %sys %iowait    %irq   %soft  %steal   %guest   %gnice   %idle

02:26:25 PM 8     0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00  100.00
02:26:25 PM 9     0.00    0.00    7.60    0.00    0.00    0.00    0.00    92.40    0.00    0.00
02:26:25 PM 10    0.20    0.00    7.00    0.00    0.00    0.00    0.00    92.80    0.00    0.00
02:26:25 PM 11    0.00    0.00    8.60    0.00    0.00    0.00    0.00    91.40    0.00    0.00
02:26:25 PM 12    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00  100.00
02:26:25 PM 13    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00  100.00
02:26:25 PM 14    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00  100.00
02:26:25 PM 15    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00    0.00  100.00
```

In this output, 8 is management CPU, and 9–11 are packet engines.

- To change the vCPU to pCPU pinning, there are two options.
 - Change it at runtime after the VPX boots up using the following command:

```
1 virsh vcpupin <VPX name> <vCPU id> <pCPU number>
2 virsh vcpupin NetScaler-VPX-XML 0 8
3 virsh vcpupin NetScaler-VPX-XML 1 9
4 virsh vcpupin NetScaler-VPX-XML 2 10
5 virsh vcpupin NetScaler-VPX-XML 3 11
6 <!--NeedCopy-->
```

- To make static changes to the VPX, edit the `.xml` file as before with the following tags:

1. Edit the `.xml` file of the VPX on the host

```
1 /etc/libvirt/qemu/<VPX_name>.xml
2 <!--NeedCopy-->
```

2. Add the following tag:

```
1 <vcpu placement='static' cpuset='8-11'>4</vcpu>
2   <cputune>
3     <vcpupin vcpu='0' cpuset='8'>/>
4     <vcpupin vcpu='1' cpuset='9'>/>
5     <vcpupin vcpu='2' cpuset='10'>/>
6     <vcpupin vcpu='3' cpuset='11'>/>
7   </cputune>
8 <!--NeedCopy-->
```

3. Shut down the VPX.
4. Update the configuration information for the VM with the NUMA node mappings using the following command:

```
1 virsh define /etc/libvirt/qemu/ <VPX_name>.xml
2 <!--NeedCopy-->
```

5. Power on the VPX. Then check the `virsh vcpupin <VPX name>` command output on the host to see the updated CPU pinning.

Eliminate host interrupt overhead.

- Detect VM_EXITS using the `kvm_stat` command.

At the hypervisor level, host interrupts are mapped to the same pCPUs on which the vCPUs of the VPX are pinned. This might cause vCPUs on the VPX to get kicked out periodically.

To find the VM exits done by VMs running the host, use the `kvm_stat` command.

```
1 [root@localhost ~]# kvm_stat -1 | grep EXTERNAL
2 kvm_exit(EXTERNAL_INTERRUPT) 1728349 27738
```

```
3 [root@localhost ~]#
4 <!--NeedCopy-->
```

A higher value in the order of 1+M indicates an issue.

If a single VM is present, the expected value is 30–100 K. Anything more than that can indicate that there are one or more host interrupt vectors mapped to the same pCPU.

- Detect host interrupts and migrate host interrupts.

When you run the `concatenate` command for the “/proc/interrupts” file, it displays all the host interrupt mappings. If one or more active IRQs map to the same pCPU, its corresponding counter increments.

Move any interrupts that overlap with your NetScaler VPX’s pCPUs to unused pCPUs:

```
1 echo 0000000f > /proc/irq/55/smp_affinity
2 0000000f - - > it is a bitmap, LSBs indicates that IRQ 55 can
   only be scheduled on pCPUs 0 - 3
3 <!--NeedCopy-->
```

- Disable IRQ balance.

Disable IRQ balance daemon, so that no rescheduling happens on the fly.

```
1 service irqbalance stop
2 service irqbalance show - To check the status
3 service irqbalance start - Enable if needed
4 <!--NeedCopy-->
```

Make sure you run the `kvm_stat` command to ensure that there are not many counters.

NetScaler VPX with PV network interfaces

You can configure para-virtualization (PV), SR-IOV, and PCIe passthrough network interfaces as a **Two vNICs per pNIC** deployment. For more information, see [Two vNICs per pNIC deployment](#).

For optimal performance of PV (virtio) interfaces, follow these steps:

- Identify the NUMA domain to which the PCIe slot/NIC belongs.
- The memory and vCPU for the VPX must be pinned to the same NUMA domain.
- Vhost thread must be bound to the CPUs in the same NUMA domain.

Bind the virtual host threads to the corresponding CPUs:

1. Once the traffic is started, run the `top` command on the host.

2. Identify the virtual host process (named as `vhost-<pid-of-qemu>`) affinity.
3. Bind the vHost processes to the physical cores in the NUMA domain identified earlier using the following command:

```

1 taskset -pc <core-id> <process-id>
2 <!--NeedCopy-->
    
```

Example:

```

1 taskset -pc 12 29838
2 <!--NeedCopy-->
    
```

4. The processor cores corresponding to the NUMA domain can be identified with the following command:

```

1 [root@localhost ~]# virsh capabilities | grep cpu
2 <cpu>
3   </cpu>
4   <cpus num='8'>
5     <cpu id='0' socket_id='0' core_id='0' siblings='0'/>
6     <cpu id='1' socket_id='0' core_id='1' siblings='1'/>
7     <cpu id='2' socket_id='0' core_id='2' siblings='2'/>
8     <cpu id='3' socket_id='0' core_id='3' siblings='3'/>
9     <cpu id='4' socket_id='0' core_id='4' siblings='4'/>
10    <cpu id='5' socket_id='0' core_id='5' siblings='5'/>
11    <cpu id='6' socket_id='0' core_id='6' siblings='6'/>
12    <cpu id='7' socket_id='0' core_id='7' siblings='7'/>
13  </cpus>
14
15  <cpus num='8'>
16    <cpu id='8' socket_id='1' core_id='0' siblings='8'/>
17    <cpu id='9' socket_id='1' core_id='1' siblings='9'/>
    
```

```

18     <cpu id='10' socket_id='1' core_id='2' siblings='10' />
19     <cpu id='11' socket_id='1' core_id='3' siblings='11' />
20     <cpu id='12' socket_id='1' core_id='4' siblings='12' />
21     <cpu id='13' socket_id='1' core_id='5' siblings='13' />
22     <cpu id='14' socket_id='1' core_id='6' siblings='14' />
23     <cpu id='15' socket_id='1' core_id='7' siblings='15' />
24     </cpus>
25
26     <cpuselection />
27     <cpuselection />
28
29 <!--NeedCopy-->

```

Bind the QEMU process to the corresponding physical core:

1. Identify the physical cores on which the QEMU process is running. For more information, see the preceding output.
2. Bind the QEMU process to the same physical cores to which you bind the vCPUs, using the following command:

```

1 taskset -pc 8-11 29824
2 <!--NeedCopy-->

```

NetScaler VPX with SR-IOV and Fortville PCIe passthrough network interfaces

For optimal performance of the SR-IOV and Fortville PCIe passthrough network interfaces, follow these steps:

- Identify the NUMA domain to which the PCIe slot/NIC belongs.
- The Memory and vCPU for the VPX must be pinned to the same NUMA domain.

Sample VPX XML file for vCPU and memory pinning for Linux KVM:

```

1     <domain type='kvm'>
2         <name>NetScaler-VPX</name>
3         <uuid>138f7782-1cd3-484b-8b6d-7604f35b14f4</uuid>
4         <memory unit='KiB'>8097152</memory>
5         <currentMemory unit='KiB'>8097152</currentMemory>
6         <vcpu placement='static'>4</vcpu>
7
8     <cputune>
9         <vcpupin vcpu='0' cpuset='8' />
10        <vcpupin vcpu='1' cpuset='9' />
11        <vcpupin vcpu='2' cpuset='10' />
12        <vcpupin vcpu='3' cpuset='11' />
13    </cputune>
14
15    <numatune>
16    <memory mode='strict' nodeset='1' />

```

```
17     </numatune>
18
19     </domain>
20 <!--NeedCopy-->
```

NetScaler VPX instance on Citrix Hypervisors

This section contains details of configurable options and settings, and other suggestions that help you achieve optimal performance of NetScaler VPX instance on Citrix Hypervisors.

- [Performance settings for Citrix Hypervisors](#)
- [NetScaler VPX with SR-IOV network interfaces](#)
- [NetScaler VPX with para-virtualized interfaces](#)

Performance settings for Citrix Hypervisors

Find the NUMA domain of the NIC using the “xl” command:

```
1 xl info -n
2 <!--NeedCopy-->
```

Pin vCPUs of VPX to physical cores.

```
1 xl vcpu-pin <Netsclaer VM Name> <vCPU id> <physical CPU id>
2 <!--NeedCopy-->
```

Check binding of vCPUs.

```
1 xl vcpu-list
2 <!--NeedCopy-->
```

Allocate more than 8 vCPUs to NetScaler VMs.

For configuring more than 8 vCPUs, run the following commands from the Citrix Hypervisor console:

```
1 xe vm-param-set uuid=your_vms_uuid VCPUs-max=16
2 xe vm-param-set uuid=your_vms_uuid VCPUs-at-startup=16
3 <!--NeedCopy-->
```

NetScaler VPX with SR-IOV network interfaces

For optimal performance of the SR-IOV network interfaces, follow these steps:

- Identify the NUMA domain to which the PCIe slot or NIC is tied to.
- Pin the Memory and vCPU for the VPX to the same NUMA domain.
- Bind the Domain-0 vCPU to the remaining CPU.

NetScaler VPX with para-virtualized interfaces

For optimal performance, two vNICs per pNIC and one vNIC per pNIC configurations are advised, as in other PV environments.

To achieve optimal performance of para-virtualized (netfront) interfaces, follow these steps:

- Identify the NUMA domain to which the PCIe slot or NIC belongs.
- Pin the memory and vCPU for the VPX to the same NUMA domain.
- Bind the Domain-0 vCPU to the remaining CPU of the same NUMA domain.
- Pin host Rx/Tx threads of vNIC to Domain-0 vCPUs.

Pin host threads to Domain-0 vCPUs:

1. Find Xen-ID of the VPX by using the `xl list` command on the Citrix Hypervisor host shell.
2. Identify host threads by using the following command:

```
1 ps -ax | grep vif <Xen-ID>
2 <!--NeedCopy-->
```

In the following example, these values indicate:

- **vif5.0** - The threads for the first interface allocated to VPX in XenCenter (management interface).
- **vif5.1** - The threads for the second interface assigned to VPX and so on.

```
[root@xenserver-uuffyqlx ~]# xl list
Name                               ID   Mem VCPUs   State   Time(s)
Domain-0                            0   4092    8   r----- 633321.0
Sai_VPX                              5   8192    4   r----- 1529471.0
[root@xenserver-uuffyqlx ~]#
[root@xenserver-uuffyqlx ~]#
[root@xenserver-uuffyqlx ~]# ps -ax | grep "vif5"
Warning: bad syntax, perhaps a bogus '-'? See /usr/share/doc/procps-3.2.7/FAQ
20447 pts/6    S+      0:00 grep vif5
29187 ?          S        1:09 [vif5.0-guest-rx]
29188 ?          S        0:00 [vif5.0-dealloc]
29189 ?          S       201:33 [vif5.1-guest-rx]
29190 ?          S       80:51 [vif5.1-dealloc]
29191 ?          S        0:20 [vif5.2-guest-rx]
29192 ?          S        0:00 [vif5.2-dealloc]
[root@xenserver-uuffyqlx ~]#
```

3. Pin the threads to Domain-0 vCPUs using the following command:

```
1 taskset -pc <core-id> <process-id>
2 <!--NeedCopy-->
```

Example:

```
1 taskset -pc 1 29189
2 <!--NeedCopy-->
```

Support for increasing NetScaler VPX disk space

April 8, 2024

NetScaler VPX supports a default disk space of 20 GB. If you encounter disk size constraints for various reasons, the following options are available to increase VPX disk space:

- Manually increase the primary disk size
- Dynamically increase the primary disk size
- Add a secondary disk

Note:

Increasing the NetScaler VPX disk space features are supported for both VPX on-premises and VPX cloud.

Manually increase the primary disk size on NetScaler VPX

Steps to manually increase the VPX primary disk size from Hypervisor or Cloud.

1. Shutdown the VM.
2. Extend the default disk size of 20 GB to a higher value. For example, 20 GB to 30 GB or 40 GB. For Azure, extend the default disk size of 32 GB to 64 GB.
3. Power on the VM and enter the boot prompt.
4. Log into single user mode using the “boot -s” command.
5. Verify the disk space. You can check the newly allocated disk space using “gpart show” command.
6. Note the partition name. For example, the VM partition is da0.
7. Resize the disk partition using the “gpart resize” command.

Example:

Let's resize the da0 MBR partition to include 10 GB free space by running the following command.

```
gpart resize -i 1 da0
```

8. Merge the free space to the last partition.

Example:

```
gpart resize -i 5 da0s1
```

9. Extend the filesystem to include newly allocated free space using the “growfs” command.

Example:

```
growfs /dev/ada0s1e
```

10. Reboot the VM and verify the increased disk space using the “df -h” command on shell prompt.

Dynamically increase the primary disk size on NetScaler VPX

Starting from NetScaler release 14.1 build 21.x, admins can dynamically increase the primary disk size on NetScaler VPX from 20 GB up to 1 TB at once. And the subsequent time, you can again increase up to 1 TB. To increase the disk space, extend the primary disk size to a minimum of 1 GB in the respective cloud or hypervisor UI.

Note:

You can only increase the size of the disks. Once the new size is allocated, you cannot decrease it later. Therefore, increase the disk size only if it is essential.

Add a secondary disk

Starting from NetScaler release 13.1 build 21.x, you can increase disk space on the NetScaler VPX instance by adding a second disk. When you attach the second disk, the “/var/crash” directory is automatically mounted on to this disk. The second disk is used for storing core files and logging. Existing directories that are used to store core files and log files continue to work as earlier.

Note:

Take external backup on downgrade of the NetScaler appliance to avoid loss of data.

For information on how to attach a new hard disk drive (HDD) to a NetScaler VPX instance on a cloud, see the following:

- [Azure documentation](#)

Note:

To attach a secondary disk on VPX instances deployed on Azure, ensure that the Azure VM sizes have a local temporary disk. For more information, see [Azure VM sizes with no local temporary disk](#).

- [AWS documentation](#)
- [GCP documentation](#)

Warning:

After you add a new HDD to VPX, some of the scripts that work on files, which are moved to the new HDD might fail under the following conditions:

If you use the “link” shell command to create hard links to the files, which were moved to a new HDD.

Replace all such commands with “ln -s” to use a symbolic link. Also, modify the failing scripts accordingly.

Apply NetScaler VPX configurations at the first boot of the NetScaler appliance in cloud

June 12, 2023

You can apply the NetScaler VPX configurations during the first boot of the NetScaler appliance in a cloud environment. This stage is addressed as the **preboot** stage in this document. Therefore in certain cases like ADC pooled licensing, a specific VPX instance is brought up in much lesser time. This feature is available in Microsoft Azure, Google Cloud platform, and AWS clouds.

What is user data

When you provision a VPX instance in a cloud environment, you have the option of passing user data to the instance. The user data allows you to perform common automated configuration tasks, customize the startup behaviors of instances, and run scripts after the instance starts. At the first boot, the NetScaler VPX instance performs the following tasks:

- Reads the user data.
- Interprets the configuration provided in user data.
- Applies the newly added configuration as it boots up.

How to provide preboot user data in cloud instance

You can provide preboot user data to the cloud instance in XML format. Different clouds have different interfaces for providing user data.

Provide preboot user data using the AWS console

When you provision a NetScaler VPX instance using the AWS console, navigate to **Configure Instance Details > Advanced Details**, and provide the preboot user data configuration in the **User data** field.

For detailed instructions on each of the steps, see [Deploy a NetScaler VPX instance on AWS by using the AWS web console](#).

For more information, see AWS documentation on [Launching an instance](#).

The screenshot shows the AWS Management Console interface for configuring an EC2 instance. The 'Step 3: Configure Instance Details' page is displayed, with the 'Advanced Details' section expanded. The 'User data' field is highlighted with a yellow box, indicating where to enter preboot user data. The 'User data' field is set to 'As text' and contains '(Optional)'. Other fields in the 'Advanced Details' section include 'Metadata accessible' (Enabled), 'Metadata version' (V1 and V2 (token optional)), and 'Metadata token response hop limit' (1).

Note:

AWS IMDSv2 only mode for the preboot user data feature is supported from NetScaler VPX release 13.1.48.x and later releases.

Provide preboot user data using AWS CLI

Type the following command in the AWS CLI:

```
1 aws ec2 run-instances \
2   --image-id ami-0abcdef1234567890 \
```

```
3 --instance-type t2.micro \  
4 --count 1 \  
5 --subnet-id subnet-08fc749671b2d077c \  
6 --key-name MyKeyPair \  
7 --security-group-ids sg-0b0384b66d7d692f9 \  
8 --user-data file://my_script.txt \  
9 <!--NeedCopy-->
```

For more information, see AWS documentation on [Running instances](#).

For more information, see AWS documentation on [Using instance user data](#)

Provide preboot user data using the Azure console

When you provision a NetScaler VPX instance using Azure console, navigate to **Create a virtual machine > Advanced** tab. In the **Custom data** field, provide preboot user data configuration.

[Home](#) > [Virtual machines](#) >

Create a virtual machine

Basics Disks Networking Management **Advanced** Tags Review + create

Add additional configuration, agents, scripts or applications via virtual machine extensions or cloud-init.

Extensions

Extensions provide post-deployment configuration and automation.

Extensions ⓘ

[Select an extension to install](#)

Custom data

Pass a script, configuration file, or other data into the virtual machine while it is being provisioned. The data will be saved on the VM in a known location. [Learn more about custom data for VMs](#) ⓘ

Custom data

i Custom data on the selected image will be processed by cloud-init. [Learn more about custom data and cloud init](#) ⓘ

Host

Azure Dedicated Hosts allow you to provision and manage a physical server within our data centers that are dedicated to your Azure subscription. A dedicated host gives you assurance that only VMs from your subscription are on the host, flexibility to choose VMs from your subscription that will be provisioned on the host, and the control of platform maintenance at the level of the host. [Learn more](#)

Host group ⓘ

No host group found

Provide preboot user data using the Azure CLI

Type the following command in the Azure CLI:

```
1 az vm create \  
2   --resource-group myResourceGroup \  
3   --name MyVm \  
4   --image debian \  
5   --custom-data MyCloudInitScript.txt \  
6 <!--NeedCopy-->
```

Example:

```
1 az vm create --resource-group MyResourceGroup -name MyVm --image debian  
  --custom-data MyCloudInitScript.txt  
2 <!--NeedCopy-->
```

You can pass your custom data or preboot configuration as a file to “--custom-data”parameter. In this example, the file name is **MyCloudInitScript.txt**.

For more information, see [Azure CLI documentation](#).

Provide preboot user data using the GCP console

When you provision a NetScaler VPX instance using GCP console, fill in the properties of instance. Expand **Management, security, disks, networking, sole tenancy**. Navigate to the **Management** tab. In the **Automation** section, provide preboot user data configuration in the **Startup Script** field.

For detailed information on creating the VPX instance using GCP, see [Deploy a NetScaler VPX instance on Google Cloud Platform](#).

Management Security Disks Networking Sole Tenancy

Description (Optional)

Deletion protection

Enable deletion protection
When deletion protection is enabled, instance cannot be deleted. [Learn more](#)

Reservations

Use an existing reservation when creating this VM instance

Automatically use created reservation

Automation

Startup script (Optional)
You can choose to specify a startup script that will run when your instance boots up or restarts. Startup scripts can be used to install software and updates, and to ensure that services are running within the virtual machine. [Learn more](#)

Metadata (Optional)
You can set custom metadata for an instance or project outside of the server-defined metadata. This is useful for passing in arbitrary values to your project or instance that can be queried by your code on the instance. [Learn more](#)

+ Add item

Provide preboot user data using the gcloud CLI

Type the following command in the GCP CLI:

```
1 gcloud compute instances create INSTANCE_NAMES --metadata-from-file=
  startup-script=LOCAL_FILE_PATH
2 <!--NeedCopy-->
```

metadata-from-file - Reads the value or user data from a file stored at the .

For more information, see [gcloud CLI documentation](#)

Preboot user data format

The preboot user data must be provided to the cloud instance in XML format. The NetScaler preboot user data that you provide through the cloud infrastructure during boot can comprise the following four sections:

- NetScaler configuration represented with the <NS-CONFIG> tag.

- Custom bootstrapping the NetScaler represented with the `<NS-BOOTSTRAP>` tag.
- Storing user-scripts in NetScaler represented with the `<NS-SCRIPTS>` tag.
- Pooled licensing configuration represented with the `<NS-LICENSE-CONFIG>` tag.

You can provide the preceding four sections in any order within the ADC preboot configuration. Ensure to strictly follow the formatting shown in the following sections while providing the preboot user data.

Note:

The entire preboot user data configuration must be enclosed in the `<NS-PRE-BOOT-CONFIG>` tag as shown in the following examples.

Example 1:

```

1 <NS-PRE-BOOT-CONFIG>
2     <NS-CONFIG>           </NS-CONFIG>
3     <NS-BOOTSTRAP>       </NS-BOOTSTRAP>
4     <NS-SCRIPTS>         </NS-SCRIPTS>
5     <NS-LICENSE-CONFIG>  </NS-LICENSE-CONFIG>
6 </NS-PRE-BOOT-CONFIG>
7 <!--NeedCopy-->
```

Example 2:

```

1 <NS-PRE-BOOT-CONFIG>
2     <NS-LICENSE-CONFIG> </NS-LICENSE-CONFIG>
3     <NS-SCRIPTS>       </NS-SCRIPTS>
4     <NS-BOOTSTRAP>     </NS-BOOTSTRAP>
5     <NS-CONFIG>        </NS-CONFIG>
6 </NS-PRE-BOOT-CONFIG>
7 <!--NeedCopy-->
```

Use the `<NS-CONFIG>` tag to provide the specific NetScaler VPX configurations that needs to be applied to the VPX instance at the preboot stage.

NOTE:

The `<NS-CONFIG>` section must have valid ADC CLI commands. The CLIs are not verified for the syntactic errors or format.

NetScaler configurations

Use the `<NS-CONFIG>` tag to provide the specific NetScaler VPX configurations that needs to be applied to the VPX instance at the preboot stage.

NOTE:

The `<NS-CONFIG>` section must have valid ADC CLI commands. The CLIs are not verified for the syntactic errors or format.

Example:

In the following example, the `<NS-CONFIG>` section has the details of the configurations. A VLAN of ID '5' is configured and bound to the SNIP (5.0.0.1). A load balancing virtual server (4.0.0.101) is also configured.

```

<NS-PRE-BOOT-CONFIG>

<NS-CONFIG>
  add vlan 5
  add ns ip 5.0.0.1 255.255.255.0

  bind vlan 5 -IPAddress 5.0.0.1 255.255.255.0
  enable ns feature WL SP LB RESPONDER
  add server 5.0.0.201 5.0.0.201
  add service preboot_s5_201 5.0.0.201 HTTP 80 -gslb NONE -maxClient 0 -maxReq 0 -cip
DISABLED -usip
NO -useproxyport YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO -CMP NO
  add lb vserver preboot_v4_101 HTTP 4.0.0.101 80 -persistenceType NONE -cltTimeout 180
</NS-CONFIG>

</NS-PRE-BOOT-CONFIG>

```

You can copy the configuration shown in the preceding screenshot from here:

```

1 <NS-PRE-BOOT-CONFIG>
2   <NS-CONFIG>
3     add vlan 5
4     add ns ip 5.0.0.1 255.255.255.0
5     bind vlan 5 -IPAddress 5.0.0.1 255.255.255.0
6     enable ns feature WL SP LB RESPONDER
7     add server 5.0.0.201 5.0.0.201
8     add service preboot_s5_201 5.0.0.201 HTTP 80 -gslb NONE -
9     maxClient 0 -maxReq 0 -cip DISABLED -usip
10    NO -useproxyport YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -
11    TCPB NO -CMP NO
12    add lb vserver preboot_v4_101 HTTP 4.0.0.101 80 -
13    persistenceType NONE -cltTimeout 180
14  </NS-CONFIG>
15 </NS-PRE-BOOT-CONFIG>
16 <!--NeedCopy-->

```

The NetScaler VPX instance comes up with the configuration applied in the `<NS-CONFIG>` section as

shown in the following illustrations.

```
> sh ns ip
  Ippress      Traffic Domain  Type          Mode  Arp  Icmp  Vserver  State

User scripts

Use the `<NS-SCRIPTS>` tag to provide any script that must be stored and ran in NetScaler VPX instance.

You can include many scripts within the `<NS-SCRIPTS>` tag. Each script must be included within the `<SCRIPT>` tag.

Each `<SCRIPT>` section corresponds to one script and contains all the details of the script using the following sub tags.

- **<SCRIPT-NAME>**: Indicates the name of the script file that must be stored.
- **<SCRIPT-CONTENT>**: Indicates the content of the file that must be stored.
- **<SCRIPT-TARGET-LOCATION>**: Indicates the designated target location where this file must be stored. If the target location is not provided, by default, the file, or script is saved in the “/nsconfig” directory.
- **<SCRIPT-NS-BOOTUP>**: Specify the commands that you use to run the script.
 - If you use the `<SCRIPT-NS-BOOTUP>` section, the commands provided in the section are stored in “/nsconfig/nsafter.sh”, and the commands are run after the packet engine boots up as part of “nsafter.sh” execution.
 - If you do not use the `<SCRIPT-NS-BOOTUP>` section, the script file is stored in the target location that you specify.

Example 1:

In this example, the `<NS-SCRIPTS>` tag contains details of only one script: script-1.sh. The “script-1.sh” script is saved at the “/var” directory. The script is populated with the specified contents, and is run with the “sh /var/script-1.sh” command after packet engine boots up.

```

<NS-PRE-BOOT-CONFIG>
  <NS-SCRIPTS>
    <SCRIPT>
      <SCRIPT-CONTENT>
        #Shell script
        echo "Running script 1" > /var/script-1.output
        date >> /var/script-1.output
      </SCRIPT-CONTENT>
      <SCRIPT-NAME> script-1.sh </SCRIPT-NAME>
      <SCRIPT-TARGET-LOCATION> /var/ </SCRIPT-TARGET-LOCATION>
      <SCRIPT-NS-BOOTUP>sh /var/script-1.sh</SCRIPT-NS-BOOTUP>
    </SCRIPT>
  </NS-SCRIPTS>
</NS-PRE-BOOT-CONFIG>

```

You can copy the configuration shown in the preceding screenshot from here:

```

1 <NS-PRE-BOOT-CONFIG>
2   <NS-SCRIPTS>
3     <SCRIPT>
4       <SCRIPT-CONTENT>
5         #Shell script
6         echo "Running script 1" > /var/script-1.output
7         date >> /var/script-1.output
8       </SCRIPT-CONTENT>
9
10      <SCRIPT-NAME> script-1.sh </SCRIPT-NAME>
11      <SCRIPT-TARGET-LOCATION> /var/ </SCRIPT-TARGET-LOCATION>
12      <SCRIPT-NS-BOOTUP>sh /var/script-1.sh</SCRIPT-NS-BOOTUP>
13    </SCRIPT>
14  </NS-SCRIPTS>
15 </NS-PRE-BOOT-CONFIG>
16 <!--NeedCopy-->

```

In the following snapshot, you can verify that “script-1.sh” script is saved in the “/var/” directory. The “Script-1.sh” script is run, and the output file is created appropriately.

```

root@ns#
root@ns# ls /var/
.monit.id          core               gui                nsinstall          pubkey
.monit.state      crash             install           nslog              python
.snap             cron              krb               nsproflog          run
AAA               db                learnt_data       nssynclog          safenet
app_catalog       dev              log               nstemplates       script-1.output
cloudhadaemon     download         mastools          nstmp              script-1.sh
cloudhadaemon.tgz empty            netscaler         nstrace            tmp
clusterd          file-2.txt       ns_gui           opt                vpn
configdb          gofl             ns_sys_backup    osr_compliance     vpns
root@ns#
root@ns# cat /var/script-1.sh
#Shell script
echo "Running script 1" > /var/script-1.output
date >> /var/script-1.output
root@ns#
root@ns# cat /var/script-1.output
Running script 1
Wed Jan  6 05:25:33 UTC 2021
root@ns#
root@ns#

```

Example 2:

In the following example, the <NS-SCRIPTS> tag contains details of two scripts.

- The first script is saved as “script-1.sh” at the “/var” directory. The script is populated with the specified contents, and is run with command “sh /var/script-1.sh” after packet engine boots up.
- The second script is saved as “file-2.txt” at the “/var” directory. This file is populated with the specified contents. But it is not run because the bootup execution command <SCRIPT-NS-BOOTUP> is not provided.

```

<NS-PRE-BOOT-CONFIG>
  <NS-SCRIPTS>
    <SCRIPT>
      <SCRIPT-CONTENT>
      #Shell script
      echo "Running script 1" > /var/script-1.output
      date >> /var/script-1.output
      </SCRIPT-CONTENT>
      <SCRIPT-NAME> script-1.sh </SCRIPT-NAME>
      <SCRIPT-TARGET-LOCATION> /var/ </SCRIPT-TARGET-LOCATION>
      <SCRIPT-NS-BOOTUP>sh /var/script-1.sh</SCRIPT-NS-BOOTUP>
    </SCRIPT>
    <SCRIPT>
      <SCRIPT-CONTENT>
      This script has no execution point. It will just be saved at the target location. NS Consumer module should consume this
      script/file.
      </SCRIPT-CONTENT>
      <SCRIPT-NAME>file-2.txt</SCRIPT-NAME>
      <SCRIPT-TARGET-LOCATION>/var/</SCRIPT-TARGET-LOCATION>
    </SCRIPT>
  </NS-SCRIPTS>
</NS-PRE-BOOT-CONFIG>

```

You can copy the configuration shown in the preceding screenshot from here:

```

1 <NS-PRE-BOOT-CONFIG>
2   <NS-SCRIPTS>
3     <SCRIPT>
4       <SCRIPT-CONTENT>
5         #Shell script
6         echo "Running script 1" > /var/script-1.output
7         date >> /var/script-1.output
8       </SCRIPT-CONTENT>
9
10      <SCRIPT-NAME> script-1.sh </SCRIPT-NAME>
11      <SCRIPT-TARGET-LOCATION> /var/ </SCRIPT-TARGET-LOCATION>
12      <SCRIPT-NS-BOOTUP>sh /var/script-1.sh</SCRIPT-NS-BOOTUP>
13    </SCRIPT>
14
15    <SCRIPT>
16      <SCRIPT-CONTENT>
17        This script has no execution point.
18        It will just be saved at the target location
19        NS Consumer module should consume this script/file
20      </SCRIPT-CONTENT>
21      <SCRIPT-NAME>file-2.txt</SCRIPT-NAME>
22      <SCRIPT-TARGET-LOCATION>/var/</SCRIPT-TARGET-LOCATION>
23    </SCRIPT>
24  </NS-SCRIPTS>
25 </NS-PRE-BOOT-CONFIG>

```

26 <!--NeedCopy-->

In the following snapshot, you can verify that script-1.sh and file-2.txt are created in the “/var/” directory. The Script-1.sh is run, and the output file is created appropriately.

```

root@ns# ls /var/
.monit.id          core               gui                nsinstall          pubkey

Running script 1
Wed Jan  6 05:08:56 UTC 2021
root@ns#
root@ns#
root@ns# cat /var/file-2.txt
This script has no execution point.
It will just be saved at the target location
NS Consumer module should consume this script/file
root@ns#
root@ns#

```

Licensing

Use the <NS-LICENSE-CONFIG> tag to apply NetScaler pooled licensing while booting up the VPX instance. Use the <LICENSE-COMMANDS> tag within <NS-LICENSE-CONFIG> section to provide the pooled license commands. These commands must be syntactically valid.

You can specify the pooled licensing details such as, license type, capacity, and license server in the <LICENSE-COMMANDS> section using the standard pooled licensing commands. For more information, see [Configure NetScaler pooled capacity licensing](#).

After applying the <NS-LICENSE-CONFIG>, the VPX comes up with the requested edition upon boot, and VPX tries to check out the configured licenses from the license server.

- If the license checkout is successful, the configured bandwidth is applied to VPX.
- If the license checkout fails, the license is not retrieved from license server within 10–12 minutes approximately. As a result, the system reboots and enters an unlicensed state.

Example:

In the following example, after applying the <NS-LICENSE-CONFIG>, the VPX comes up with the Premium edition upon boot, and VPX tries to check out the configured licenses from the license server (10.102.38.214).

```

<NS-PRE-BOOT-CONFIG>
  <NS-LICENSE-CONFIG>
    <LICENSE-COMMANDS>

    add ns licenseserver 10.102.38.214 -port 2800
    set ns capacity -unit gbps -bandwidth 3 edition platinum

    </LICENSE-COMMANDS>
  </NS-LICENSE-CONFIG>
</NS-PRE-BOOT-CONFIG>

```

You can copy the configuration shown in the preceding screenshot from here:

```

1 <NS-PRE-BOOT-CONFIG>
2   <NS-LICENSE-CONFIG>
3     <LICENSE-COMMANDS>
4       add ns licenseserver 10.102.38.214 -port 2800
5       set ns capacity -unit gbps -bandwidth 3 edition platinum
6     </LICENSE-COMMANDS>
7   </NS-LICENSE-CONFIG>
8 </NS-PRE-BOOT-CONFIG>
9 <!--NeedCopy-->

```

As shown in the following illustration, you can run the “show license server” command, and verify that the license server (10.102.38.214) is added to the VPX.

```

Done
> sh licenseserver
      License Server: 10.102.38.214      Port: 2800      Status:
Done
>
>

```

Bootstrapping

Use the `<NS-BOOTSTRAP>` tag to provide the custom bootstrapping information. You can use the `<SKIP-DEFAULT-BOOTSTRAP>` and `<NEW-BOOTSTRAP-SEQUENCE>` tags within the `<NS-BOOTSTRAP>` section. This section informs NetScaler appliance whether to avoid the default bootstrap or not. If the default bootstrapping is avoided, this section provides you an option to provide a new bootstrapping sequence.

Default bootstrap configuration

The default bootstrap configuration in NetScaler appliance follows these interface assignments:

- **Eth0** - Management interface with a certain NSIP address.
- **Eth1** - Client-facing interface with a certain VIP address.
- **Eth2** - Server-facing interface with a certain SNIP address.

Customize bootstrap configuration

You can skip the default bootstrap sequence and provide a new bootstrap sequence for the NetScaler VPX instance. Use the `<NS-BOOTSTRAP>` tag to provide the custom bootstrapping information. For example, you can change the default bootstrapping, where the Management interface (NSIP), Client-facing interface (VIP), and server-facing interface (SNIP) are always provided in certain order.

The following table indicates the bootstrapping behavior with the different values that are allowed for `<SKIP-DEFAULT-BOOTSTRAP>` and `<NEW-BOOTSTRAP-SEQUENCE>` tags.

<code>SKIP-DEFAULT-BOOTSTRAP</code>	<code>NEW-BOOTSTRAP-SEQUENCE</code>	Bootstrap behavior
YES	YES	The default bootstrapping behavior is skipped, and a new custom bootstrap sequence provided in the <code><NS-BOOTSTRAP></code> section is run.
YES	NO	The default bootstrapping behavior is skipped. The bootstrap commands provided in the <code><NS-CONFIG></code> section is run.

You can customize the bootstrap configuration by the following three methods:

- Provide only the interface details
- Provide the interface details along with IP addresses and subnet mask
- Provide bootstrap related commands in the `<NS-CONFIG>` section

Method 1: Custom bootstrap by specifying only the interface details

You specify the management, client-facing and server-facing interfaces but not their IP addresses and subnet masks. The IP addresses and subnet masks are populated by querying the cloud infrastructure.

Custom bootstrap example for AWS

You provide the custom bootstrap sequence as shown in the following example. For more information, see [How to provide preboot user data in cloud instance](#). Eth1 interface is assigned as the management

interface (NSIP), Eth0 interface as the client interface (VIP), and Eth2 interface as the server interface (SNIP). The `<NS-BOOTSTRAP>` section contains only the interface details and not the details of IP addresses and subnet masks.

```

<NS-PRE-BOOT-CONFIG>
  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth1</INTERFACE-NUM>
    </MGMT-INTERFACE-CONFIG>

    <CLIENT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth0</INTERFACE-NUM>
    </CLIENT-INTERFACE-CONFIG>

    <SERVER-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth2</INTERFACE-NUM>
    </SERVER-INTERFACE-CONFIG>

  </NS-BOOT STRAP>
</NS-PRE-BOOT-CONFIG>

```

After the VM instance is created, in the AWS portal, you can verify the network interface properties as follows:

1. Navigate to the **AWS Portal > EC2 instances**, and select the instance that you have created by providing the custom bootstrap information.
2. In the **Description** tab, you can verify the properties of each network interface as shown in the following illustrations.

Network Interface eth1	
Interface ID	eni-021961099be6815eb
VPC ID	vpc-6b258c02

```

Custom bootstrap example for Azure

You provide the custom bootstrap sequence as shown in the following example. For more information, see [How to provide preboot user data in cloud instance](#). Eth2 interface is assigned as the management interface (NSIP), Eth1 interface as the client interface (VIP), and Eth0 interface as the server interface (SNIP). The `<NS-BOOTSTRAP>` section contains only the interface details and not the details of IP addresses and subnet masks.

```

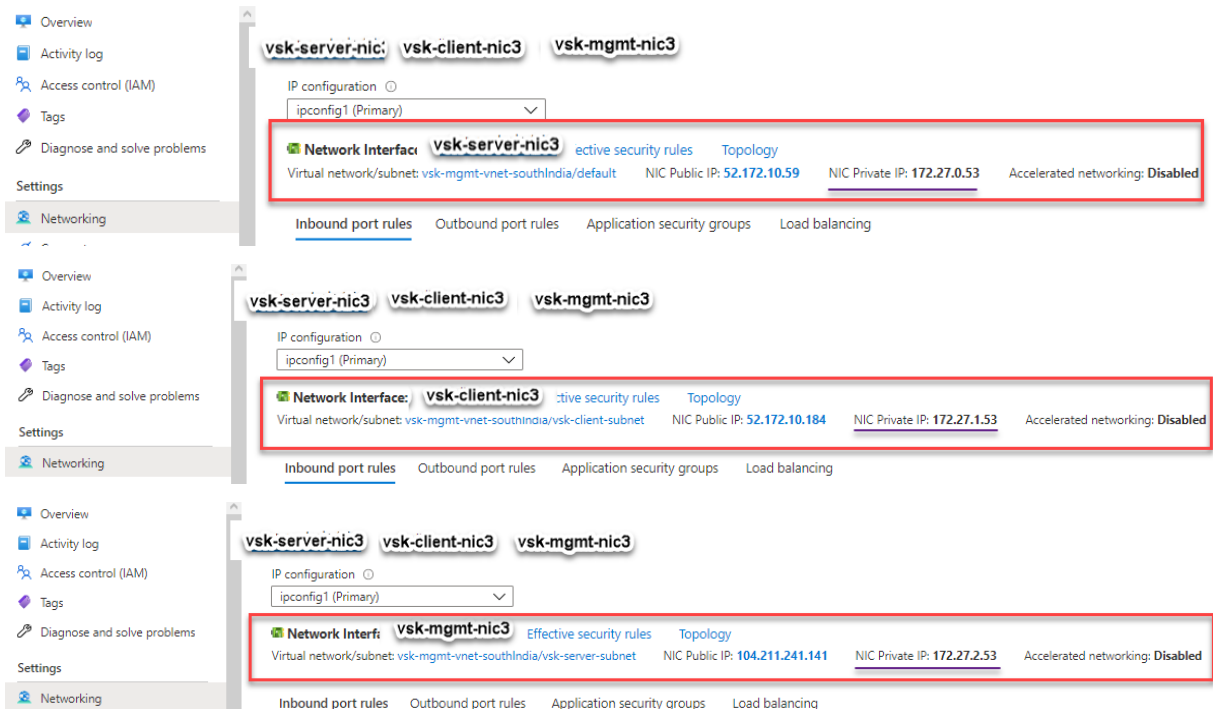

<NS-PRE-BOOT-CONFIG>
  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth2</INTERFACE-NUM>
    </MGMT-INTERFACE-CONFIG>

    <CLIENT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth1</INTERFACE-NUM>
    </CLIENT-INTERFACE-CONFIG>

    <SERVER-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth0</INTERFACE-NUM>
    </SERVER-INTERFACE-CONFIG>
  </NS-BOOTSTRAP>
</NS-PRE-BOOT-CONFIG>
  
```

You can see that the NetScaler VPX instance is created with three network interfaces. Navigate to the **Azure portal > VM instance > Networking**, and verify the networking properties of the three NICs as shown in the following illustrations.

You can run the “show nsip” command in the ADC CLI, and verify that the new bootstrap sequence

specified in the <NS-BOOTSTRAP> section is applied. You can run the “show route” command to verify the subnet mask.

```
> sh ns ip
      Ippaddress      Traffic Domain  Type
-----
1)    172.27.2.53      0              NetScaler IP
2)    172.27.0.53      0              SNIP
3)    172.27.1.53      0              VIP
      Mode      Arp      Icmp      Vserver      State
-----
1)    Active    Enabled  Enabled    NA            Enabled
2)    Active    Enabled  Enabled    NA            Enabled
3)    Active    Enabled  Enabled    Enabled       Enabled
Done
> sh vlan
1)    VLAN ID: 1
      Link-local IPv6 addr: fe80::20d:3aff:fec9:c26c/64
      Interfaces : 0/1 1/1 LO/1
2)    VLAN ID: 10      VLAN Alias Name:
      Interfaces : 1/2
      IPs :
          172.27.2.53      Mask: 255.255.255.0
Done
> sh route
      Network      Netmask      Gateway/OwnedIP  VLAN  State  Traffic Domain  Type
-----
1)    0.0.0.0        0.0.0.0      172.27.2.1       0      UP     0               STATIC
2)    127.0.0.0      255.0.0.0    127.0.0.1        0      UP     0               PERMANENT

Done
>
```

Custom bootstrap examples for GCP

You provide the custom bootstrap sequence as shown in the following example. For more information, see [How to provide preboot user data in cloud instance](#). Eth1 interface is assigned as the management interface (NSIP), Eth0 interface as the client interface (VIP), and Eth2 interface as the server interface (SNIP). The <NS-BOOTSTRAP> section contains only the interface details and not the details of IP addresses and subnet masks.

```

<NS-PRE-BOOT-CONFIG>
  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth1</INTERFACE-NUM>
    </MGMT-INTERFACE-CONFIG>

    <CLIENT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth0</INTERFACE-NUM>
    </CLIENT-INTERFACE-CONFIG>

    <SERVER-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth2</INTERFACE-NUM>
    </SERVER-INTERFACE-CONFIG>

  </NS-BOOT STRAP>
</NS-PRE-BOOT-CONFIG>
  
```

After the VM instance is created in the GCP portal, you can verify the network interface properties as follows:

1. Select the instance that you have created by providing the custom bootstrap information.
2. Navigate to the Network interface properties and verify the NIC details as follows:

Network interfaces									
Name	Network	Subnetwork	Primary internal IP	Alias IP ranges	External IP	Network Tier	IP forwarding	Network details	
nic0	default	default	10.160.0.71	–	35.244.56.180 (ephemeral)	Premium	Off	View details	
nic1	vsk-vpc-network-1	asia-south1-subnet-1	10.128.0.40	–	35.244.40.113 (ephemeral)	Premium		View details	
nic2	vsk-vpc-network-2	asia-south1-subnet-5	10.128.4.27	–	34.93.241.147 (ephemeral)	Premium		View details	
Public DNS PTR Record									
None									

You can run the `show nsip` command in **ADC CLI**, and verify the network interfaces applied to the NetScaler VPX instance during the first boot of the ADC appliance.

```

> sh ns ip
      Ippaddress      Traffic Domain  Type           Mode   Arp   Icmp   Vserver  State
      -----
1)    10.128.4.27      0              NetScaler IP   Active Enabled Enabled NA      Enabled
2)    10.160.0.71      0              SNIP           Active Enabled Enabled NA      Enabled
3)    10.128.0.40      0              VIP            Active Enabled Enabled Enabled Enabled
Done
> sh vlan
1)    VLAN ID: 1
      Link-local IPv6 addr: fe80::4001:aff:fea0:47/64
      Interfaces : 0/1 1/1 LO/1
2)    VLAN ID: 10     VLAN Alias Name:
      Interfaces : 1/2
      IPs :
          10.128.4.27      Mask: 255.255.255.0
Done
> sh route

      -----
1)    0.0.0.0        0.0.0.0      10.128.4.1       0      UP     0               STATIC
2)    127.0.0.0      255.0.0.0    127.0.0.1        0      UP     0               PERMANENT
3)    10.128.0.0      255.255.255.0 10.128.0.40      0      UP     0               DIRECT
4)    10.128.4.0      255.255.255.0 10.128.4.27      0      UP     0               DIRECT
5)    10.160.0.0      255.255.240.0 10.160.0.71      0      UP     0               DIRECT
Done
> █

```

Method 2: Custom bootstrap by specifying the interfaces, IP addresses, and subnet masks

You specify the management, client-facing and server-facing interfaces along with their IP addresses and subnet mask.

Custom bootstrap examples for AWS

In the following example, you skip the default bootstrap and run a new bootstrap sequence for the NetScaler appliance. For the new bootstrap sequence, you specify the following details:

- **Management interface:** Interface - Eth1, NSIP - 172.31.52.88, and subnet mask - 255.255.240.0
- **Client facing interface:** Interface - Eth0, VIP - 172.31.5.155, and subnet mask - 255.255.240.0.
- **Server facing interface:** Interface - Eth2, SNIP - 172.31.76.177, and subnet mask - 255.255.240.0.

```
<NS-PRE-BOOT-CONFIG>
  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>
    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth1 </INTERFACE-NUM>
      <IP>172.31.52.88 </IP>
      <SUBNET-MASK>255.255.240.0 </SUBNET-MASK>
    </MGMT-INTERFACE-CONFIG>
    <CLIENT-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth0 </INTERFACE-NUM>
      <IP>172.31.5.155 </IP>
      <SUBNET-MASK>255.255.240.0 </SUBNET-MASK>
    </CLIENT-INTERFACE-CONFIG>
    <SERVER-INTERFACE-CONFIG>
      <INTERFACE-NUM>eth2 </INTERFACE-NUM>
      <IP>172.31.76.177 </IP>
      <SUBNET-MASK>255.255.240.0 </SUBNET-MASK>
    </SERVER-INTERFACE-CONFIG>
  </NS-BOOTSTRAP>
</NS-PRE-BOOT-CONFIG>
```

You can run the `show ns ip` command in the ADC CLI, and verify that the new bootstrap sequence specified in the `<NS-BOOTSTRAP>` section is applied. You can run the “show route” command to verify the subnet mask.

```

> sh ns ip
-----
Ipaddress      Traffic Domain  Type           Mode   Arp   Icmp   Vserver  State
-----
1) 172.31.52.88   0              NetScaler IP   Active Enabled Enabled NA       Enabled
2) 172.31.76.177 0              SNIP           Passive Enabled Enabled NA       Enabled
3) 172.31.5.155  0              VIP            Passive Enabled Enabled Enabled Enabled
Done
> sh vlan
1)  VLAN ID: 1
   Link-local IPv6 addr: fe80::839:e2ff:feaf:4a9e/64
   Interfaces : 1/1 1/3 LO/1
2)  VLAN ID: 10   VLAN Alias Name:
   Interfaces : 1/2
   IPs :
      172.31.52.88      Mask: 255.255.240.0
Done
> sh route
-----
Network        Netmask        Gateway/OwnedIP  VLAN  State  Traffic Domain  Type
-----
1) 0.0.0.0      0.0.0.0        172.31.48.1     0     UP     0               STATIC
2) 127.0.0.0   255.0.0.0      127.0.0.1       0     UP     0               PERMANENT
3) 172.31.0.0   255.255.240.0  172.31.5.155    0     UP     0               DIRECT
4) 172.31.48.0  255.255.240.0  172.31.52.88    0     UP     0               DIRECT
5) 172.31.64.0  255.255.240.0  172.31.76.177   0     UP     0               DIRECT
6) 172.31.0.2   255.255.255.255 172.31.48.1     0     UP     0               STATIC
Done

```

Custom bootstrap example for Azure

In the following example, a new bootstrap sequence for ADC is mentioned and default bootstrap is skipped. You provide the interface details along with the IP addresses and subnet masks as follows:

- Management interface (eth2), NSIP (172.27.2.53), and subnet mask (255.255.255.0)
- Client facing interface (eth1), VIP (172.27.1.53), and subnet mask (255.255.255.0)
- Server facing interface (eth0), SNIP (172.27.0.53), and subnet mask (255.255.255.0)

```

<NS-PRE-BOOT-CONFIG>

  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth2 </INTERFACE-NUM>
      <IP> 172.27.2.53 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </MGMT-INTERFACE-CONFIG>

    <CLIENT-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth1 </INTERFACE-NUM>
      <IP> 172.27.1.53 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </CLIENT-INTERFACE-CONFIG>

    <SERVER-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth0 </INTERFACE-NUM>
      <IP> 172.27.0.53 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </SERVER-INTERFACE-CONFIG>

  </NS-BOOTSTRAP>
</NS-PRE-BOOT-CONFIG>
  
```

You can see that the NetScaler VPX instance is created with three network interfaces. Navigate to the **Azure portal > VM instance > Networking**, and verify the networking properties of the three NICs as shown in the following illustrations.

You can run the `show ns ip` command in the ADC CLI, and verify that the new bootstrap sequence specified in the `<NS-BOOTSTRAP>` section is applied. You can run the “show route” command to verify the subnet mask.

```
> sh ns ip
-----
1) 172.27.2.53 0 NetScaler IP Active Enabled Enabled NA Enabled
2) 172.27.0.53 0 SNIP Active Enabled Enabled NA Enabled
3) 172.27.1.53 0 VIP Active Enabled Enabled Enabled Enabled
Done
> sh vlan
1) VLAN ID: 1
Link-local IPv6 addr: fe80::20d:3aff:fec9:c26c/64
Interfaces : 0/1 1/1 LO/1
2) VLAN ID: 10 VLAN Alias Name:
Interfaces : 1/2
IPs :
172.27.2.53 Mask: 255.255.255.0
Done
> sh route
-----
1) 0.0.0.0 0.0.0.0 172.27.2.1 0 UP 0 STATIC
2) 127.0.0.0 255.0.0.0 127.0.0.1 0 UP 0 PERMANENT
3) 172.27.0.0 255.255.255.0 172.27.0.53 0 UP 0 DIRECT
4) 172.27.1.0 255.255.255.0 172.27.1.53 0 UP 0 DIRECT
5) 172.27.2.0 255.255.255.0 172.27.2.53 0 UP 0 DIRECT
6) 169.254.0.0 255.255.0.0 172.27.0.1 0 UP 0 STATIC
7) 168.63.129.16 255.255.255.255 172.27.0.1 0 UP 0 STATIC
8) 169.254.169.254 255.255.255.255 172.27.0.1 0 UP 0 STATIC
Done
```

Custom bootstrap example for GCP

In the following example, a new bootstrap sequence for ADC is mentioned and default bootstrap is skipped. You provide the interface details along with the IP addresses and subnet masks as follows:

- Management interface (eth2), NSIP (10.128.4.31), and subnet mask (255.255.255.0)
- Client facing interface (eth1), VIP (10.128.0.43), and subnet mask (255.255.255.0)
- Server facing interface (eth0), SNIP (10.160.0.75), and subnet mask (255.255.255.0)

```

<NS-PRE-BOOT-CONFIG>
  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth2 </INTERFACE-NUM>
      <IP> 10.128.4.31 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </MGMT-INTERFACE-CONFIG>

    <CLIENT-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth1 </INTERFACE-NUM>
      <IP> 10.128.0.43 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </CLIENT-INTERFACE-CONFIG>

    <SERVER-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth0 </INTERFACE-NUM>
      <IP> 10.160.0.75 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </SERVER-INTERFACE-CONFIG>

  </NS-BOOTSTRAP>
</NS-PRE-BOOT-CONFIG>

```

After the VM instance is created in the GCP portal with the custom bootstrap, you can verify the network interface properties as follows:

1. Select the instance that you have created by providing the custom bootstrap information.
2. Navigate to the Network interface properties and verify the NIC details as follows.

Network interfaces								
Name	Network	Subnetwork	Primary internal IP	Alias IP ranges	External IP	Network Tier	IP forwarding	Network details
nic0	default	default	vsk-defnw-st-ip1 (10.160.0.75)	—	34.93.216.90 (ephemeral)	Premium	Off	View details
nic1	vsk-vpc-network-1	asia-south1-subnet-1	vsk-vpc-nw1-st-ip1 (10.128.0.43)	—	35.244.40.113 (ephemeral)	Premium		View details
nic2	vsk-vpc-network-2	asia-south1-subnet-5	vsk-nw2-st-ip-1 (10.128.4.31)	—	34.93.202.214 (ephemeral)	Premium		View details

You can run the `show nsip` command in the ADC CLI, and verify that the new bootstrap sequence specified in the `<NS-BOOTSTRAP>` section is applied. You can run the “show route” command to verify the subnet mask.

```

> sh ns ip
-----
Ipaddress      Traffic Domain  Type           Mode   Arp   Icmp   Vserver  State
-----
1) 10.128.4.31   0              NetScaler IP   Active Enabled Enabled NA      Enabled
2) 10.160.0.75   0              SNIP          Passive Enabled Enabled NA      Enabled
3) 10.128.0.43   0              VIP           Passive Enabled Enabled Enabled Enabled
Done
> sh vlan
1)  VLAN ID: 1
   Link-local IPv6 addr: fe80::4001:aff:fea0:4b/64
   Interfaces : 0/1 1/1 LO/1
2)  VLAN ID: 10   VLAN Alias Name:
   Interfaces : 1/2
   IPs :
      10.128.4.31      Mask: 255.255.255.0
Done
> sh route
-----
Network      Netmask      Gateway/OwnedIP  VLAN  State  Traffic Domain  Type
-----
1) 0.0.0.0    0.0.0.0     10.128.4.1      0     UP     0               STATIC
2) 127.0.0.0  255.0.0.0   127.0.0.1      0     UP     0               PERMANENT
3) 10.128.0.0  255.255.255.0 10.128.0.43    0     UP     0               DIRECT
4) 10.128.4.0  255.255.255.0 10.128.4.31    0     UP     0               DIRECT

```

Method 3: Custom bootstrap by providing bootstrap related commands in the <NS-CONFIG> section

You can provide the bootstrap related commands in the <NS-CONFIG> section. In the <NS-BOOTSTRAP> section, you must specify the <NEW-BOOTSTRAP-SEQUENCE> as “No” to run the bootstrapping commands in the <NS-CONFIG> section. You must also provide the commands to assign NSIP, default route, and NSVLAN. In addition, provide the commands relevant for the cloud that you use.

Before providing a custom bootstrap, ensure that your cloud infrastructure supports a particular interface configuration.

Custom bootstrap example for AWS

In this example, bootstrap related commands are provided in the <NS-CONFIG> section. The <NS-BOOTSTRAP> section indicates that the default bootstrapping is skipped, and the custom bootstrap information provided in the <NS-CONFIG> section is run. You must also provide the commands to create NSIP, add default route, and add NSVLAN.

```

<NS-PRE-BOOT-CONFIG>
  <NS-CONFIG>
    set ns config -IPAddress 172.31.52.88 -netmask 255.255.240.0
    add route 0.0.0.0 0.0.0.0 172.31.48.1
    set ns config -nsvlan 10 -ifnum 1/2 -tagged NO
    add route 172.31.0.2 255.255.255.255 172.31.48.1

    enable ns feature WL SP LB RESPONDER
    add server 5.0.0.201 5.0.0.201
    add service preboot_s5_201 5.0.0.201 HTTP 80 -gslb NONE -maxClient 0 -maxReq 0 -cip DISABLED -usip NO -
useproxyport YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO -CMP NO
    add lb vserver preboot_v4_101 HTTP 4.0.0.101 80 -persistenceType NONE -cltTimeout 180

  </NS-CONFIG>

  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE> NO </NEW-BOOTSTRAP-SEQUENCE>
  </NS-BOOTSTRAP>

</NS-PRE-BOOT-CONFIG>

```

Bootstrap related commands

route to DNS server is added through default gateway

You can copy the configuration shown in the preceding screenshot from here:

```

1 <NS-PRE-BOOT-CONFIG>
2   <NS-CONFIG>
3
4     set ns config -IPAddress 172.31.52.88 -netmask 255.255.240.0
5     add route 0.0.0.0 0.0.0.0 172.31.48.1
6     set ns config -nsvlan 10 -ifnum 1/2 -tagged NO
7     add route 172.31.0.2 255.255.255.255 172.31.48.1
8
9     enable ns feature WL SP LB RESPONDER
10    add server 5.0.0.201 5.0.0.201
11    add service preboot_s5_201 5.0.0.201 HTTP 80 -gslb NONE -
maxClient 0 -maxReq 0 -cip DISABLED -usip NO - useproxyport
YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO
-CMP NO
12    add lb vserver preboot_v4_101 HTTP 4.0.0.101 80 -
persistenceType NONE -cltTimeout 180
13
14  </NS-CONFIG>
15
16  <NS-BOOTSTRAP>
17    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
18    <NEW-BOOTSTRAP-SEQUENCE> NO </NEW-BOOTSTRAP-SEQUENCE>
19  </NS-BOOTSTRAP>
20
21
22 </NS-PRE-BOOT-CONFIG>

```

23 <!--NeedCopy-->

After the VM instance is created, in the AWS portal, you can verify the network interface properties as follows:

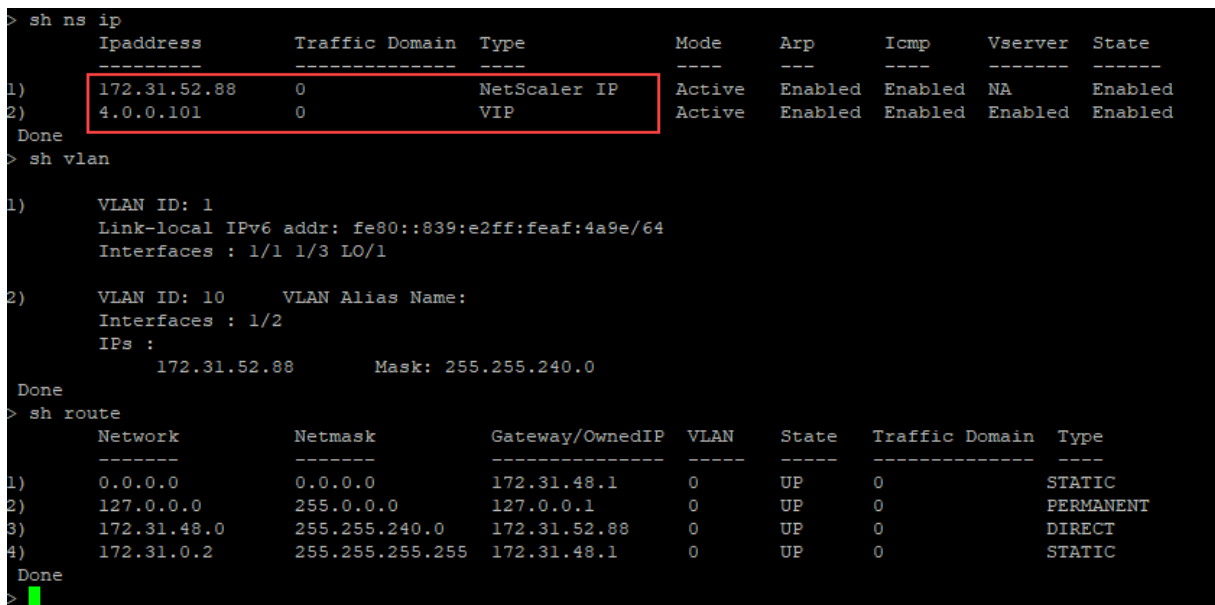

1. Navigate to the **AWS Portal > EC2 instances**, and select the instance that you have created by providing the custom bootstrap information.
2. In the **Description** tab, you can verify the properties of each network interface as shown in the following illustrations.

Network Interface eth1	
Interface ID	eni-021961099be6815eb
VPC ID	vpc-6b258c02
Attachment Owner	566658252593
Attachment Status	attached
Attachment Time	Fri Jan 01 11:11:23 GMT+530 2021
Delete on Terminate	false
Private IP Address	172.31.52.88
Private DNS Name	ip-172-31-52-88.ap-south-1.compute.internal

Network Interface eth0	
Interface ID	eni-039e5f3329cd879e9

Private DNS Name	ip-172-31-5-155.ap-south-1.compute.internal

You can run the `show ns ip` command in **ADC CLI**, and verify the network interfaces applied to the NetScaler VPX instance during the first boot of the ADC appliance.

Custom bootstrap example for Azure

In this example, bootstrap related commands are provided in the `<NS-CONFIG>` section. The `<NS-BOOTSTRAP>` section indicates that the default bootstrapping is skipped, and the custom bootstrap information provided in the `<NS-CONFIG>` section is run.

Note:

For Azure cloud, Instance Metadata Server (IMDS) and DNS servers are accessible only through primary interface (Eth0). Therefore, if Eth0 interface is not used as management interface (NSIP),

Eth0 interface must at least be configured as SNIP for IMDS or DNS access to work. The route to IMDS endpoint (169.254.169.254) and DNS endpoint (168.63.129.16) through Eth0's gateway must also be added.

```

<NS-PRE-BOOT-CONFIG>

  <NS-CONFIG>

    set ns config -IPAddress 172.27.2.61 -netmask 255.255.255.0
    add route 0.0.0.0 0.0.0.0 172.27.2.1
    set ns config -nsvlan 10 -ifnum 1/2 -tagged NO
    add ns ip 172.27.0.61 255.255.255.0 -type SNIP

You can see that the NetScaler VPX instance is created with three network interfaces. Navigate to the **Azure portal > VM instance > Networking**, and verify the networking properties of the three NICs as shown in the following illustrations.

You can run the `show ns ip` command in the ADC CLI, and verify that the new bootstrap sequence specified in the `<NS-BOOTSTRAP>` section is applied. You can run the “show route” command to verify the subnet mask.

```

> sh ns ip
-----
Ipaddress      Traffic Domain  Type           Mode   Arp   Icmp   Vserver  State
-----

```

Custom bootstrap example for GCP

In this example, bootstrap related commands are provided in the <NS-CONFIG> section. The <NS-BOOTSTRAP> section indicates that the default bootstrapping is skipped, and the custom bootstrap information provided in the <NS-CONFIG> section is applied.

```

<NS-PRE-BOOT-CONFIG>

  <NS-CONFIG>
    set ns config -IPAddress 10.128.0.2 -netmask 255.255.255.0
    add route 0.0.0.0 0.0.0.0 10.128.0.1
    set ns config -nsvlan 10 -ifnum 1/1 -tagged NO

    enable ns feature WL SP LB RESPONDER
    add server 5.0.0.201 5.0.0.201
    add service preboot_s5_201 5.0.0.201 HTTP 80 -gslb NONE -maxClient 0 -maxReq 0 -cip
    DISABLED -usip NO -useproxyport YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO -CMP NO
    add lb vserver preboot_v4_101 HTTP 4.0.0.101 80 -persistenceType NONE -cltTimeout 180

  </NS-CONFIG>

  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE> NO </NEW-BOOTSTRAP-SEQUENCE>
  </NS-BOOTSTRAP>

</NS-PRE-BOOT-CONFIG>

```

You can copy the configuration shown in the preceding screenshot from here:

```

1 <NS-PRE-BOOT-CONFIG>
2
3   <NS-CONFIG>
4
5       set ns config -IPAddress 10.128.0.2 -netmask 255.255.255.0
6       add route 0.0.0.0 0.0.0.0 10.128.0.1
7       set ns config -nsvlan 10 -ifnum 1/1 -tagged NO
8
9       enable ns feature WL SP LB RESPONDER
10      add server 5.0.0.201 5.0.0.201
11      add service preboot_s5_201 5.0.0.201 HTTP 80 -gslb NONE -
12          maxClient 0 -maxReq 0 -cip DISABLED -usip NO -useproxyport
13          YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO
14          -CMP NO
15      add lb vserver preboot_v4_101 HTTP 4.0.0.101 80 -
16          persistenceType NONE -cltTimeout 180
17
18   </NS-CONFIG>
19
20   <NS-BOOTSTRAP>
21       <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
22       <NEW-BOOTSTRAP-SEQUENCE> NO </NEW-BOOTSTRAP-SEQUENCE>
23   </NS-BOOTSTRAP>
24
25 </NS-PRE-BOOT-CONFIG>
26 <!--NeedCopy-->

```

After the VM instance is created in the GCP portal with the custom bootstrap, you can verify the network interface properties as follows:

1. Select the instance that you have created by providing the custom bootstrap information.
2. Navigate to the Network interface properties and verify the NIC details as shown in the illustration.

Network interfaces					
Name	Network	Subnetwork	Primary internal IP	Alias IP ranges	External IP
nic0	default	default	10.160.0.74	–	34.93.9.79 (ephemeral)
nic1	vsk-vpc-network-1	asia-south1-subnet-1	asia-south1-subnet1-10-128-0-2 (10.128.0.2)	–	34.93.245.110 (ephemeral)
nic2	vsk-vpc-network-2	asia-south1-subnet-5	10.128.4.30	–	34.93.146.248 (ephemeral)

You can run the `show nsip` command in **ADC CLI**, and verify that the configurations provided in the preceding `<NS-CONFIG>` section are applied at the first boot of the ADC appliance.

```
> sh ns ip
  Ippaddress      Traffic Domain  Type
  -----
1) 10.128.0.2      0               NetScaler IP
2) 4.0.0.101      0               VIP
Done
> sh vlan
1)  VLAN ID: 1
   Link-local IPv6 addr: fe80::4001:aff:fea0:4a/64
   Interfaces : 0/1 1/2 LO/1
2)  VLAN ID: 10   VLAN Alias Name:
   Interfaces : 1/1
   IPs :
      10.128.0.2      Mask: 255.255.255.0
Done
> sh route
  Network      Netmask      Gateway/OwnedIP  VLAN  State  Traffic Domain  Type
  -----
1) 0.0.0.0      0.0.0.0      10.128.0.1       0     UP     0               STATIC
2) 127.0.0.0    255.0.0.0    127.0.0.1        0     UP     0               PERMANENT
3) 10.128.0.0   255.255.255.0 10.128.0.2       0     UP     0               DIRECT
Done
```

Impact of attaching and detaching NICs in AWS and Azure

AWS and Azure provide the option to attach a network interface to an instance, and detach a network interface from an instance. Attaching or detaching interfaces might alter interface positions. Hence, Citrix recommends you to refrain from detaching interfaces from the NetScaler VPX instance. If you detach or attach an interface when custom bootstrapping is configured, NetScaler VPX instance reassigns the primary IP of the newly available interface in the management interface’s position as NSIP. If no further interfaces are available after the one you detached, then the first interface is made the management interface for the NetScaler VPX instance.

For example, a NetScaler VPX instance is brought up with 3 interfaces: Eth0 (SNIP), Eth1 (NSIP), and Eth2 (VIP). If you detach Eth1 interface from the instance, which is a management interface, ADC configures the next available interface (Eth2) as the management interface. Thereby, the NetScaler VPX instance is still accessed through the primary IP of Eth2 interface. If Eth2 is also not available, then the remaining interface (Eth0) is made the management interface. Therefore, the access to NetScaler VPX instance continues to exist.

Let's consider a different assignment of interfaces as follows: Eth0 (SNIP), Eth1 (VIP), and Eth2 (NSIP). If you detach Eth2 (NSIP), because no new interface is available after Eth2, the first interface (Eth0) is made the management interface.

Improve SSL-TPS performance on public cloud platforms

May 2, 2023

You can get better SSL-TPS performance on AWS and GCP clouds by distributing the packet engine (PE) weights equally. Enabling this feature might result in a slight drop in HTTP throughput by around 10–12 %.

On AWS and GCP clouds, the NetScaler VPX instances with 10–16 vCPUs do not show any performance improvement because the PE weights are equally distributed by default.

Note:

In the Azure cloud, the PE weights are equally distributed by default. This feature does not improve any performance for the Azure instances.

Configure PE mode by using the NetScaler CLI

After setting the PE mode, you must reboot the system for the configuration changes to take effect.

At the command prompt, type:

```
1 set cpuparam pemode [CPUBOUND | Default]
2 <!--NeedCopy-->
```

When the PE mode is set to CPUBOUND, the PE weights are equally distributed.

When the PE mode is set to DEFAULT, the PE weights are set to default values.

Note:

This command is node specific. In a high availability or a cluster setup, you must run the command on each node. If you run the command on CLIP, the following error occurs:

Operation not permitted on CLIP

To show the state of the PE mode that is configured, run the following command:

```
1 show cpuparam
2 <!--NeedCopy-->
```

Example:

```
1 > show cpuparam
2     Pemode:  CPUBOUND
3     Done
4 <!--NeedCopy-->
```

Apply PE mode configuration at the first boot of the NetScaler appliance in the cloud

To apply the PE mode configuration at the first boot of the NetScaler appliance in the cloud, you must create a `/nsconfig/.cpubound.conf` file using the custom script. For more information, see [Apply NetScaler VPX configurations at the first boot of the NetScaler appliance in cloud](#).

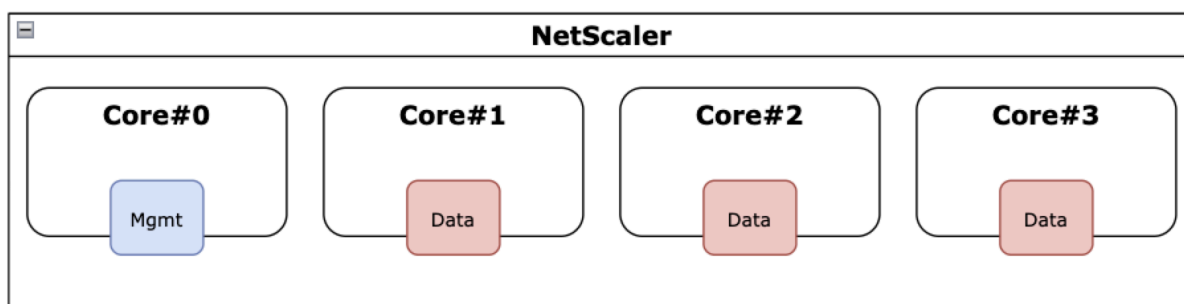

Configure simultaneous multithreading for NetScaler VPX on public clouds

January 25, 2024

NetScaler uses different dedicated cores for its management and its data plane functions. One core is typically assigned to management plane functions. The rest of the available cores are assigned to data plane functions.

The following image shows a simplified illustration of a 4 core NetScaler VPX.

Figure 1. NetScaler management and data plane workload on a 4 core system

While the preceding image shows the distribution of NetScaler functions across available cores, it's not necessarily an accurate depiction of the underlying hardware. Most modern x86 CPUs provide two

logical cores per physical core, through features commercially known as Intel Hyperthreading (HT) or AMD simultaneous multithreading (SMT).

The following image shows NetScaler VPX running on a modern CPU with SMT disabled. Each CPU core is split into two or more logical CPUs, commonly referred to as threads. Each thread has its own set of replicated resources, a portion of partitioned resources, and competes for shared resources with its sibling threads.

Figure 2. NetScaler management and data plane workload on a 4 core/8 thread system with SMT disabled

The following image shows NetScaler VPX running on a modern CPU with SMT enabled.

Figure 3. NetScaler management and data plane workload on a 4 core system with SMT enabled

Enabling SMT improves NetScaler performance by:

- Running data plane functions on all physical cores.
- Moving the management plane functions to the sibling thread.
- Introducing a flexible resource limit mechanism to prevent management plane functions from compromising the performance of data plane functions.

SMT support matrix

The VPX platforms, cloud instance types, and NetScaler versions that support SMT are listed in the following table.

VPX platform	Instance types	NetScaler VPX version
AWS	M5, m5n, c5, c5n	14.1-12.x and later
Azure	Any instance family with hyperthreading, for example, Ds_v4	14.1-12.x and later
GCP	e2-instances	14.1-12.x and later

Note:

By enabling the SMT feature, NetScaler VPX performance is boosted on the supported types.

Limitations

The SMT feature effectively doubles the vCPUs available to a NetScaler appliance. The licensing limits must be considered to allow NetScaler appliance to use them.

For example, consider NetScaler VPX illustrated in Figure 3. If a throughput-based licensing is used, a 10 Gbps or above license is required with the SMT feature to enable 8 vCPUs. Previously, a 1 Gbps license was sufficient for enabling 4 vCPUs. If a vCPU licensing is used, NetScaler VPX must be configured to check out licenses for double the count of vCPUs for proper operation. Contact NetScaler technical support for further guidance on this topic.

Configure SMT

Before enabling the SMT feature, ensure that your platform supports this feature. See the support matrix table in the previous section.

To enable the SMT feature, follow these steps:

1. Create an empty file named `.smt_handling` under the “/nsconfig” directory.
2. Save the current configuration.
3. Reboot NetScaler VPX instance.

```
1 nscli> shell touch /nsconfig/.smt_handling
2 Done
3 nscli> reboot
4 Are you sure you want to restart NetScaler (Y/N)? [N]:Y
5 Done
6 <!--NeedCopy-->
```

4. After rebooting, NetScaler indicates that the feature is both available and enabled.

```
1 smt_handling and smt_handling_active are set to " 1 "  
2  
3 > shell sysctl -a | grep smt_handling  
4 netscaler.smt_handling_platform: 1  
5 netscaler.smt_handling: 1  
6 netscaler.smt_handling_active: 1  
7 <!--NeedCopy-->
```

To disable the SMT feature, follow these steps:

1. Remove the `.smt_handling` file.
2. Reboot NetScaler VPX instance.

```
1 shell rm -f /nsconfig/.smt_handling  
2 Done  
3  
4 reboot  
5  
6 Are you sure you want to restart NetScaler (Y/N)? [N]:Y  
7 Done  
8 <!--NeedCopy-->
```

3. After rebooting, NetScaler indicates that the feature is available but disabled.

```
1 > shell sysctl -a | grep smt_handling  
2 netscaler.smt_handling_platform: 1  
3 netscaler.smt_handling: 0  
4 netscaler.smt_handling_active: 0  
5 <!--NeedCopy-->
```

Troubleshooting

Run the `sysctl` shell command to verify the status of the SMT feature.

```
1 ````  
2 > shell sysctl -a | grep smt_handling  
3 >  
4 <!--NeedCopy--> ````
```

The command can return any of the following outputs.

- The SMT feature is missing.

The `sysctl` command returns no output.

- The SMT feature is not supported.

The SMT feature isn't supported for any of the following reasons:

- Your NetScaler VPX is older than 13.1-48.x or 14.1-12.x.

- Your cloud does not support SMT.
- Your VM instance type doesn't support SMT, for example, the vCPU count is more than 8.

```
1 > shell sysctl -a | grep smt_handling
2 netcaler.smt_handling_platform: 0(indicates not supported)
3 netcaler.smt_handling: 0 (indicates not enabled)
4 netcaler.smt_handling_active: 0 (indicates not active)
5 <!--NeedCopy-->
```

- The SMT feature is supported but not enabled.

```
1 > shell sysctl -a | grep smt_handling
2 netcaler.smt_handling_platform: 1 (available)
3 netcaler.smt_handling: 0 (not enabled)
4 netcaler.smt_handling_active: 0 (not active)
5 <!--NeedCopy-->
```

Install a NetScaler VPX instance on a bare metal server

May 2, 2023

A bare metal is a fully dedicated physical server that delivers physical isolation, fully integrated into the cloud environment. It is also known as a single-tenant server. Single tenancy allows you to avoid the noisy neighbor effect. With bare metal, you do not witness the noisy neighbor effect because you are the sole user.

A bare metal server installed with a hypervisor provides you a management suite to create virtual machines on the server. The hypervisor does not run applications natively. Its purpose is to virtualize your workloads into separate virtual machines to gain the flexibility and reliability of virtualization.

Prerequisites for installing NetScaler VPX instance on bare metal servers

A bare metal server must be obtained from a cloud vendor that meets all the system requirements for the respective hypervisor.

Install the NetScaler VPX instance on bare metal servers

To install NetScaler VPX instances on a bare metal server, you must first obtain a bare metal server with adequate system resources from a cloud vendor. On that bare metal server, any of the supported hypervisors such as Linux KVM, VMware ESX, Citrix Hypervisor, or Microsoft Hyper-V must be installed and configured before deploying the NetScaler VPX instance.

For more information on the list of different hypervisors and features supported on a NetScaler VPX instance, see [Support matrix and usage guidelines](#).

For more information on installing NetScaler VPX instances on different hypervisors, see the respective documentation.

- **Citrix Hypervisor:** See [Install a NetScaler VPX instance on Citrix Hypervisor](#).
- **VMware ESX:** See [Install a NetScaler VPX instance on VMware ESX](#).
- **Microsoft Hyper-V:** See [Install a NetScaler VPX instance on Microsoft Hyper-V server](#).
- **Linux KVM platform:** See [Install a NetScaler VPX instance on Linux-KVM platform](#).

Install a NetScaler VPX instance on Citrix Hypervisor

May 2, 2023

To install VPX instances on the Citrix Hypervisor, you must first install the Hypervisor on a machine with adequate system resources. To perform the NetScaler VPX instance installation, you use Citrix XenCenter, which must be installed on a remote machine that can connect to the Hypervisor host through the network.

For more information about Hypervisor, see [Citrix Hypervisor documentation](#).

The following figure shows the bare-metal solution architecture of NetScaler VPX instance on Hypervisor.

Figure. A NetScaler VPX instance on Citrix Hypervisor

Prerequisites for installing a NetScaler VPX instance on Hypervisor

Before you begin installing a virtual appliance, do the following:

- Install Hypervisor version 6.0 or later on hardware that meets the minimum requirements.
- Install XenCenter on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the [NetScaler Licensing Guide](#).

Hypervisor hardware requirements

The following table describes the minimum hardware requirements for a Hypervisor platform running a NetScaler VPX instance.

Table 1. Minimum system requirements for Hypervisor running a nCore VPX instance

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. To run the NetScaler VPX instance, hardware support for virtualization must be enabled on the Hypervisor host. Make sure that the BIOS option for virtualization support is not disabled. For more details, see BIOS documentation.
RAM	3 GB
Disk space	Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space. Note: Hypervisor installation creates a 4 GB partition for the Hypervisor host control domain. The remaining space is available for NetScaler VPX instance and other virtual machines.
NIC	One 1-Gbps NIC; recommended: two 1-Gbps NICs

For information about installing Hypervisor, see the Hypervisor documentation at <http://support.citrix.com/product/xens/>.

The following table lists the virtual computing resources that Hypervisor must provide for each nCore VPX virtual appliance.

Table 2. Minimum virtual computing resources required for running a nCore VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (vCPU)	2
Virtual network interfaces	2

Note:

For production use of NetScaler VPX instance, Citrix recommends that CPU priority (in virtual machine properties) must be set to the highest level, to improve scheduling behavior and network latency.

XenCenter system requirements

XenCenter is a Windows client application. It cannot run on the same machine as the Hypervisor host. For more information about minimum system requirements and installing XenCenter, see the following Hypervisor documents:

- [System requirements](#)
- [Install](#)

Install NetScaler VPX instances on Hypervisor by using XenCenter

After you have installed and configured Hypervisor and XenCenter, you can use XenCenter to install virtual appliances on Hypervisor. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running Hypervisor.

To install NetScaler VPX instances on Hypervisor by using XenCenter, follow these steps:

1. Start **XenCenter** on your workstation.
2. On the **Server** menu, click **Add**.
3. In the **Add New Server** dialog box, in the host name text box, type the IP address or DNS name of the Hypervisor that you want to connect to.
4. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click **Connect**. The Hypervisor name appears in the navigation pane with a green circle, which indicates that the Hypervisor is connected.
5. In the navigation pane, click the name of the Hypervisor on which you want to install the NetScaler VPX instance.
6. On the **VM** menu, click **Import**.
7. In the **Import** dialog box, in the Import file name, browse to the location at which you saved the NetScaler VPX instance `.xva` image file. Make sure that the Exported VM option is selected, and then click **Next**.
8. Select the Hypervisor on which you want to install the virtual appliance, and then click **Next**.
9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.
10. You can add, modify, or delete the virtual network interfaces as required. When finished, click Next.
11. Click **Finish** to complete the import process.

Note: To view the status of the import process, click the **Log** tab.

12. If you want to install another virtual appliance, repeat steps 5 through 11.

Note:

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see [Upgrading or Downgrading the System Software](#).

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces

May 2, 2023

After you have installed and configured a NetScaler VPX instance on Citrix Hypervisor, you can configure the virtual appliance to use SR-IOV network interfaces.

The following NICs are supported:

- Intel 82599 10G
- Intel X710 10G
- Intel XL710 40G

Limitations

Citrix Hypervisor does not support some features on SR-IOV interfaces. The limitations with Intel 82599, Intel X710, and Intel XL710 NICs are listed in the following sections.

Limitations for Intel 82599 NIC

Intel 82599 NIC does not support the following features:

- L2 mode switching
- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active - Active mode]
- Jumbo frames
- IPv6 protocol in Cluster environment

Limitations for Intel X710 10G and Intel XL710 40G NICs

Intel X710 10G and Intel XL710 40G NICs have the following limitations:

- L2 mode switching is not supported.
- Admin partitioning (shared VLAN mode) is not supported.
- In a cluster, Jumbo frames are not supported when the XL710 NIC is used as a data interface.
- Interface list reorders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- For both Intel X710 10G and Intel XL710 40G NICs, the interface comes up as 40/x interface.
- Up to only 16 Intel X710/XL710 SR-IOV interfaces can be supported on a VPX instance.

Note:

For Intel X710 10G and Intel XL710 40G NICs to support IPv6, enable trust mode on the Virtual Functions (VFs) by typing the following command on the Citrix Hypervisor host:

```
# ip link set <PNIC> <VF> trust on
```

Example:

```
# ip link set ens785f1 vf 0 trust on
```

Prerequisites for Intel 82599 NIC

On the Citrix Hypervisor host, ensure that you:

- Add the Intel 82599 NIC (NIC) to the host.
- Block list the `ixgbevf` driver by adding the following entry to the `/etc/modprobe.d/blacklist.conf` file:

```
blacklist ixgbevf
```

- Enable SR-IOV Virtual Functions (VFs) by adding the following entry to the `/etc/modprobe.d/ixgbe` file:

```
options ixgbe max_vfs=<number_of_VFs>
```

where `<number_VFs>` is the number of SR-IOV VFs that you want to create.

- Verify that SR-IOV is enabled in BIOS.

Note:

IXGBE driver version 3.22.3 is recommended.

Assign Intel 82599 SR-IOV VFs to the NetScaler VPX instance by using the Citrix Hypervisor host

To assign an Intel 82599 SR-IOV VFs to NetScaler VPX instance, follow these steps:

1. On the Citrix Hypervisor host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance:

```
xe host-call-plugin plugin=iovirt host-uuid=<Xen host UUID> fn=assign_free_vf args:uuid=<NetScaler VM UUID> args:ethdev=<interface name> args:mac=<Mac addr>
```

Where:

- <Xen host UUID> is the UUID of the Citrix Hypervisor host.
- <NetScaler VM UUID> is the UUID of the NetScaler VPX instance.
- <interface name> is the interface for the SR-IOV VFs.
- <MAC address > is the MAC address of the SR-IOV VF.

Note

Specify the MAC address that you want use in the args:Mac= parameter, if not specified, the `iovirt` script randomly generates and assigns a MAC address. Also, if you want to use the SR-IOV VFs in Link Aggregation mode, make sure that you specify the MAC address as 00:00:00:00:00:00.

2. Boot the NetScaler VPX instance.

Unassign Intel 82599 SR-IOV VFs to the NetScaler VPX instance by using the Citrix Hypervisor host

If you have assigned an incorrect SR-IOV VFs or if you want to modify an assigned SR-IOV VFs, you need to unassign and reassign the SR-IOV VFs to the NetScaler VPX instance.

To unassign SR-IOV network interface assigned to a NetScaler VPX instance, follow these steps:

1. On the Citrix Hypervisor host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance and reboot the NetScaler VPX instance:

```
xe host-call-plugin plugin=iovirt host-uuid=<Xen_host_UUID> fn=unassign_all args:uuid=<Netscaler_VM_UUID>
```

Where:

- <Xen_host_UUID> - The UUID of the Citrix Hypervisor host.
- <Netscaler_VM_UUID> - The UUID of the NetScaler VPX instance

2. Boot the NetScaler VPX instance.

Assign Intel X710/XL710 SR-IOV VFs to the NetScaler VPX instance by using the Citrix Hypervisor host

To assign an Intel X710/XL710 SR-IOV VF to the NetScaler VPX instance, follow these steps:

1. Run the following command on the Citrix Hypervisor host to create a network.

```
1 xe network-create name=label=<network-name>
2 <!--NeedCopy-->
```

Example:

```
1 xe network-create name=label=SR-IOV-NIC-18 8ee59b73-7319-6998-cd69-
  -b9fa3e8d7503
2 <!--NeedCopy-->
```

2. Determine the PIF Universal Unique Identifier (UUID) of the NIC on which the SR-IOV network is to be configured.

```
1 xe pif-list
2
3         uuid ( R0) : e2874343-f1de-1fa7-8fef-98547c348783
4         device ( R0): eth18
5 currently-attached ( R0): true
6         VLAN ( R0): -1
7         network-uuid ( R0): f865bd85-44dd-b865-ab65-dcd6ae28c16e
8 <!--NeedCopy-->
```

3. Configure the network as an SR-IOV network. The following command also returns the UUID of the newly created SR-IOV network:

```
1 xe network-sriov-create network-uuid=<network-uuid> pif-uuid=<
  physical-pif-uuid>
2 <!--NeedCopy-->
```

Example:

```
1 xe network-sriov-create network-uuid=8ee59b73-7319-6998-cd69-
  b9fa3e8d7503 pif-uuid=e2874343-f1de-1fa7-8fef-98547
  c3487831629b44f-832a-084e-d67d-5d6d314d5e0f
2 <!--NeedCopy-->
```

To get more information on the SR-IOV network parameters, run the following command:

```
1 [root@citrix-XS82-TOP0 ~]# xe network-sriov-param-list uuid=1629
  b44f-832a-084e-d67d-5d6d314d5e0f
2
3         uuid ( R0): 1629b44f-832a-084e-d67d-5d6d314d5e0f
4         physical-PIF ( R0): e2874343-f1de-1fa7-8fef-98547c348783
5         logical-PIF ( R0): 85d52771-5814-c62d-45fa-f37b536144ff
6         requires-reboot ( R0): false
```

```
7 remaining-capacity ( R0): 32
8 <!--NeedCopy-->
```

4. Create a virtual interface (VIF) and attach it to the target VM.

```
1 xe vif-create device=0 mac=b2:61:fc:ae:00:1d network-uuid=8ee59b73
  -7319-6998-cd69-b9fa3e8d7503 vm-uuid=b507e8a6-f5ca-18eb-561d
  -308218a9dd68
2 3e1e2e58-b2ad-6dc0-61d4-1d149c9c6466
3 <!--NeedCopy-->
```

NOTE: The NIC index number of the VM must start with 0.

Use the following command to find the VM UUID:

```
1 [root@citrix-XS82-TOP0 ~]# xe vm-list
2 uuid ( R0): b507e8a6-f5ca-18eb-561d-308218a9dd68
3 name-label ( RW): sai-vpx-1
4 power-state ( R0): halted
5 <!--NeedCopy-->
```

Remove Intel X710/XL710 SR-IOV VFs from the NetScaler instance by using the Citrix Hypervisor host

To remove an Intel X710/XL710 SR-IOV VF from a NetScaler VPX instance, follow these steps:

1. Copy the UUID for the VIF that you want to destroy.
2. Run the following command on the Citrix Hypervisor host to destroy the VIF.

```
1 xe vif-destroy uuid=<vif-uuid>
2 <!--NeedCopy-->
```

Example:

```
1 [root@citrix-XS82-TOP0 ~]# xe vif-destroy uuid=3e1e2e58-b2ad-6dc0
  -61d4-1d149c9c6466
2 <!--NeedCopy-->
```

Configure link aggregation on the SR-IOV interface

To use the SR-IOV virtual functions (VFs) in link aggregation mode, you need to disable spoof checking for virtual functions that you have created.

On the Citrix Hypervisor host, use the following command to disable spoof checking:

ip link set <interface_name> vf <VF_id> spoofchk off

Where:

- <interface_name> is the interface name.
- <VF_id> is the virtual function ID.

After disabling spoof checking for all the virtual function that you have created, restart the NetScaler VPX instance, and configure link aggregation. For instructions, see [Configure link aggregation](#).

Important

While you are assigning the SR-IOV VFs to the NetScaler VPX instance, make sure that you specify MAC address 00:00:00:00:00:00 for the VFs.

Configure VLAN on the SR-IOV interface

You can configure VLAN on the SR-IOV virtual functions. For instructions, see [Configuring a VLAN](#).

Important

Make sure that the Citrix Hypervisor host does not contain VLAN settings for the VF interface.

Install a NetScaler VPX instance on VMware ESX

May 2, 2023

Before installing NetScaler VPX instances on VMware ESX, make sure the VMware ESX Server is installed on a machine with adequate system resources. To install a NetScaler VPX instance on VMware ESXi, you use the VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

This section includes the following topics:

- Prerequisites
- Installing a NetScaler VPX instance on VMware ESX

Important:

You can't install standard VMware Tools or upgrade the VMware Tools version available on a NetScaler VPX instance. VMware Tools for a NetScaler VPX instance are delivered as part of the NetScaler software release.

Prerequisites

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the NetScaler VPX appliance setup files.
- Create a virtual switch and attach the physical NIC to the virtual switch.
- Add port group and attach to the virtual switch.
- Attach the port group to the VM.
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see [Licensing overview](#).

VMware ESX hardware requirements

The following table describes the minimum system requirements for VMware ESX servers running NetScaler VPX nCore virtual appliance.

Table 1. Minimum system requirements for a VMware ESX server running a NetScaler VPX instance

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. To run a NetScaler VPX instance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support isn't disabled. For more information, see your BIOS documentation. From the NetScaler 13.1 release onwards, the NetScaler VPX instance on VMware ESXi hypervisor supports AMD processors.
RAM	2 GB VPX. For critical deployments, we do not recommend 2 GB RAM for VPX because the system operates in a memory-constrained environment. This might lead to scale, performance, or stability related issues. Recommended is 4 GB RAM or 8 GB RAM.
Disk space	20 GB more than the minimum server requirements from VMware for setting up ESXi. See VMware documentation for minimum server requirements.

Component	Requirement
Network	One 1-Gbps NIC (NIC); Two 1-Gbps NICs recommended

For information about installing VMware ESX, see <http://www.vmware.com/>.

For the SR-IOV network interface or PCI passthrough support, ensure that the following processors and settings are enabled:

- Intel processors supporting Intel-VT
- AMD processors supporting AMD-V
- I/O Memory Management Unit (IOMMU) or SR-IOV is enabled in BIOS

The following NICs are supported in SR-IOV mode:

- Mellanox ConnectX-4 NIC, starting from NetScaler release 13.1-42.x onwards
- Intel 82599 NIC

The following table lists the virtual computing resources that the VMware ESX server must provide for each VPX nCore virtual appliance.

Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
Memory	4 GB
Virtual CPU (vCPU)	2
Virtual network interfaces	In ESX, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded to version 7 or higher.
Disk space	20 GB

Note:

This is in addition to any disk requirements for the hypervisor.

For production use of VPX virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX must be reserved.

VMware vSphere client system requirements

VMware vSphere is a client application that can run on Windows and Linux operating systems. It can't run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum system requirements for VMware vSphere client installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “vSphere Compatibility Matrixes” PDF file at http://kb.vmware.com/ .
CPU	750 MHz; 1 gigahertz (GHz) or faster recommended
RAM	1 GB. 2 GB recommended
NIC (NIC)	100 Mbps or faster NIC

OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. It can't run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 4. Minimum system requirements for OVF tool installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “OVF Tool User Guide” PDF file at http://kb.vmware.com/ .
CPU	750 MHz minimum, 1 GHz or faster recommended
RAM	1 GB Minimum, 2 GB recommended
NIC (NIC)	100 Mbps or faster NIC

For information about installing OVF, search for the “OVF Tool User Guide” PDF file at <http://kb.vmware.com/>.

Downloading the NetScaler VPX setup files

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from the Citrix website. You need a Citrix account to log on. If you do not have a Citrix account, access the home page at <http://www.citrix.com>, click the **New Users link**, and follow the instructions to create a Citrix account.

Once logged on, navigate the following path from the Citrix home page:

Citrix.com > **Downloads** > **NetScaler** > **Virtual Appliances**.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-13.0-71.44_nc_64-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-13.0-71.44_nc_64.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-13.0-71.44_nc_64.mf)

Install a NetScaler VPX instance on VMware ESX

After you have installed and configured VMware ESX, you can use the VMware vSphere client to install virtual appliances on the VMware ESX server. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler VPX instances on VMware ESX by using VMware vSphere Client, follow these steps:

1. Start the VMware vSphere client on your workstation.
2. In the **IP address / Name** text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click **Login**.
4. On the **File** menu, click **Deploy OVF Template**.
5. In the **Deploy OVF Template** dialog box, in **Deploy from file**, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click **Next**.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click **Next** to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have installed, and from the right-click menu, select **Power On**.

8. After the VM is booted, from the console, configure the NetScaler IP, Netmask, and Gateway addresses. When you complete the configuration, select the **Save and Quit** option in the console.
9. To install another virtual appliance, repeat from Step 6 through Step 8.

Note:

By default, the NetScaler VPX instance uses E1000 network interfaces.

After the installation, you can use the vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX.

For the VLAN tagging feature to work, on the VMware ESX, set the port group's VLAN ID to All (4095) on the vSwitch of VMware ESX server. For more information about setting a VLAN ID on the vSwitch of VMware ESX server, see http://www.vmware.com/pdf/esx3_vlan_wp.pdf.

Migrate a NetScaler VPX instance by using VMware vMotion

You can migrate a NetScaler VPX instance by using VMware vSphere vMotion.

Follow these usage guidelines:

- VMware does not support the vMotion feature on virtual machines configured with PCI Passthrough and SR-IOV interfaces.
- Supported interfaces are E1000 and VMXNET3. To use vMotion on your VPX instance, ensure that the instance is configured with a supported interface.
- For more information about how to migrate an instance by using VMware vMotion, see the VMware documentation.

Configure a NetScaler VPX instance to use VMXNET3 network interface

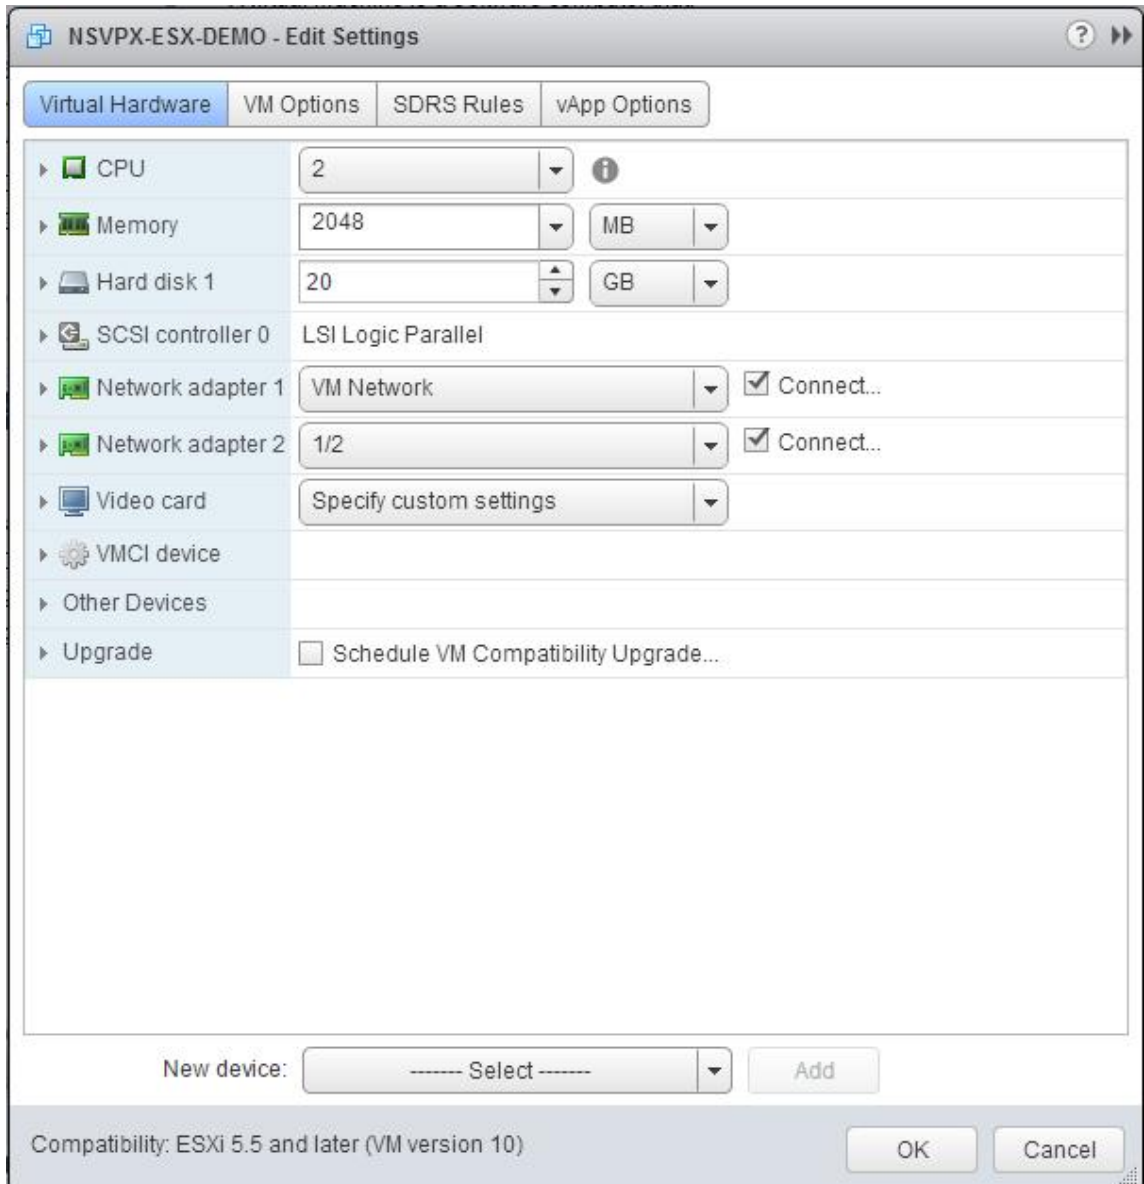

May 2, 2023

After you have installed and configured the NetScaler VPX instance on the VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use VMXNET3 network interfaces.

To configure NetScaler VPX instances to use VMXNET3 network interfaces by using the VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX, as follows:
 - a. Power off the NetScaler VPX instance.

- b. Right-click the NetScaler VPX instance and select Compatibility > Upgrade VM Compatibility.
 - c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.
3. Right-click on the NetScaler VPX instance and click Edit Settings.

4. In the <virtual_appliance> - Edit Settings dialog box, click the CPU section.

5. In the CPU section, update the following:

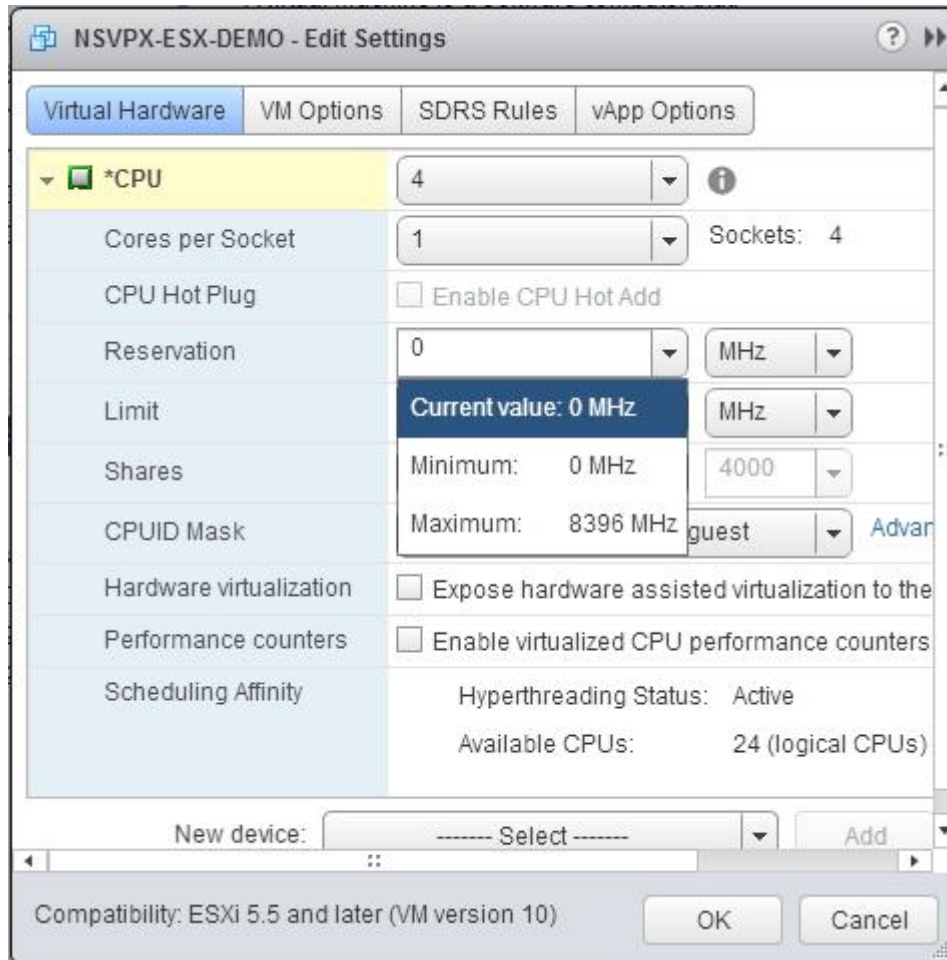

- Number of CPUs
- Number of Sockets
- Reservations
- Limit
- Shares

Set the values as follows:

- In the CPU drop-down list, select the number of CPUs to assign to the virtual appliance.
- In the Cores per Socket drop-down list, select the number of sockets.
- (Optional) In the CPU Hot Plug field, select or unselect the Enable CPU Hot Add check box.

Note: Citrix recommends accepting the default (disabled).

d. In the Reservation drop-down list, select the number that is shown as the maximum value.

e. In the Limit drop-down list, select the number that is shown as the maximum value.

f. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

6. In the Memory section, update the following:

- Size of RAM
- Reservations
- Limit
- Shares

Set the values as follows:

a. In the RAM drop-down list, select the size of the RAM. It must be the number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the RAM must be 4 x 2 GB = 8 GB.

Note: For an Advanced or Premium edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

b. In the Reservation drop-down list, enter the value for the memory reservation, and select the Reserve all guest memory (All locked) check box. The memory reservation must be the number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation must be 4 x 2 GB = 8 GB.

Note: For an Advanced or Premium edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

c. In the Limit drop-down list, select the number that is shown as the maximum value.

d. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

7. Add a VMXNET3 network interface. From the New device drop-down list, select Network and click Add.

8. In the New Network section, from the drop-down list, select the network interface, and do the following:

a. In the Adapter Type drop-down list, select VMXNET3.

Important

The default E1000 network interface and VMXNET3 cannot coexist, make sure that you remove the E1000 network interface and use VMXNET3 (0/1) as the management interface.

9. Click OK.
10. Power on the NetScaler VPX instance.
11. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
show interface summary
```

The output must show all the interfaces that you configured:

```

1 > show interface summary
2 -----
3      Interface  MTU      MAC                               Suffix
4 -----
5 1      0/1        1500     00:0c:29:89:1d:0e               NetScaler Vir...rface,
6      VMXNET3
7 2      1/1        9000     00:0c:29:89:1d:18               NetScaler Vir...rface,
8      VMXNET3

```

7	3	1/2 VMXNET3	9000	00:0c:29:89:1d:22	NetScaler Vir...rface,
8	4	L0/1 interface	9000	00:0c:29:89:1d:0e	Netscaler Loopback

Note

After you add a VMXNET3 interface and restart the NetScaler VPX appliance, the VMware ESX hypervisor might change the order in which the NIC is presented to the VPX appliance. So, network adapter 1 might not always remain 0/1, resulting in loss of management connectivity to the VPX appliance. To avoid this issue, change the virtual network of the network adapter accordingly.

This is a VMware ESX hypervisor limitation.

Configure a NetScaler VPX instance to use SR-IOV network interface

May 2, 2023

After you have installed and configured the NetScaler VPX instance on VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use single root I/O virtualization (SR-IOV) network interfaces.

Limitations

A NetScaler VPX configured with SR-IOV network interface has the following limitations:

- The following features are not supported on SR-IOV interfaces using the Intel 82599 10G NIC on ESX VPX:
 - L2 mode switching
 - Static Link Aggregation and LACP
 - Clustering
 - Admin partitioning [Shared VLAN mode]
 - High Availability [Active - Active mode]
 - Jumbo frames
 - IPv6
- The following features are not supported on the SR-IOV interface with an Intel 82599 10G NIC on KVM VPX:
 - Static Link Aggregation and LACP
 - L2 mode switching

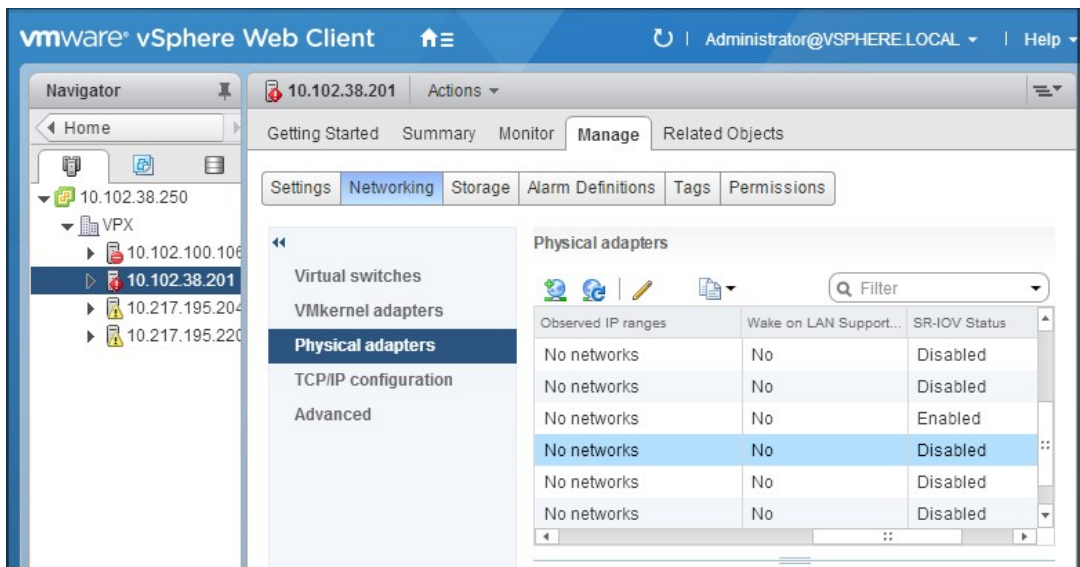

- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active –Active mode]
- Jumbo frames
- IPv6
- VLAN configuration on Hypervisor for SR-IOV VF interface through `ip link` command is not supported

Prerequisite

- Make sure that you add any of the following NICs to the ESX host:
 - Intel 82599 NIC, IXGBE driver version 3.7.13.7.14iov or later is recommended.
 - Mellanox ConnectX-4 NIC
- Enable SR-IOV on the host physical adapter.

Follow this procedure to enable SR-IOV on the host physical adapter:

1. In the vSphere Web Client, navigate to the Host.
2. On the **Manage > Networking** tab, select **Physical adapters**. The SR-IOV Status field shows whether a physical adapter supports SR-IOV.

3. Select the physical adapter, and then click the pencil icon to open the **Edit Settings** dialog box.

- Under SR-IOV, select **Enabled** from the **Status** drop-down list.

- In the **Number of virtual functions** field, enter the number of virtual functions that you want to configure for the adapter.

6. Click **OK**.
 7. Restart the host.
- Create a Distributed Virtual Switch (DVS) and [Portgroups](#). For instructions, see the VMware Documentation.

Note

Citrix has qualified the SR-IOV configuration on DVS and [Portgroups](#) only.

To configure NetScaler VPX instances to use SR-IOV network interface by using VMware vSphere Web Client:

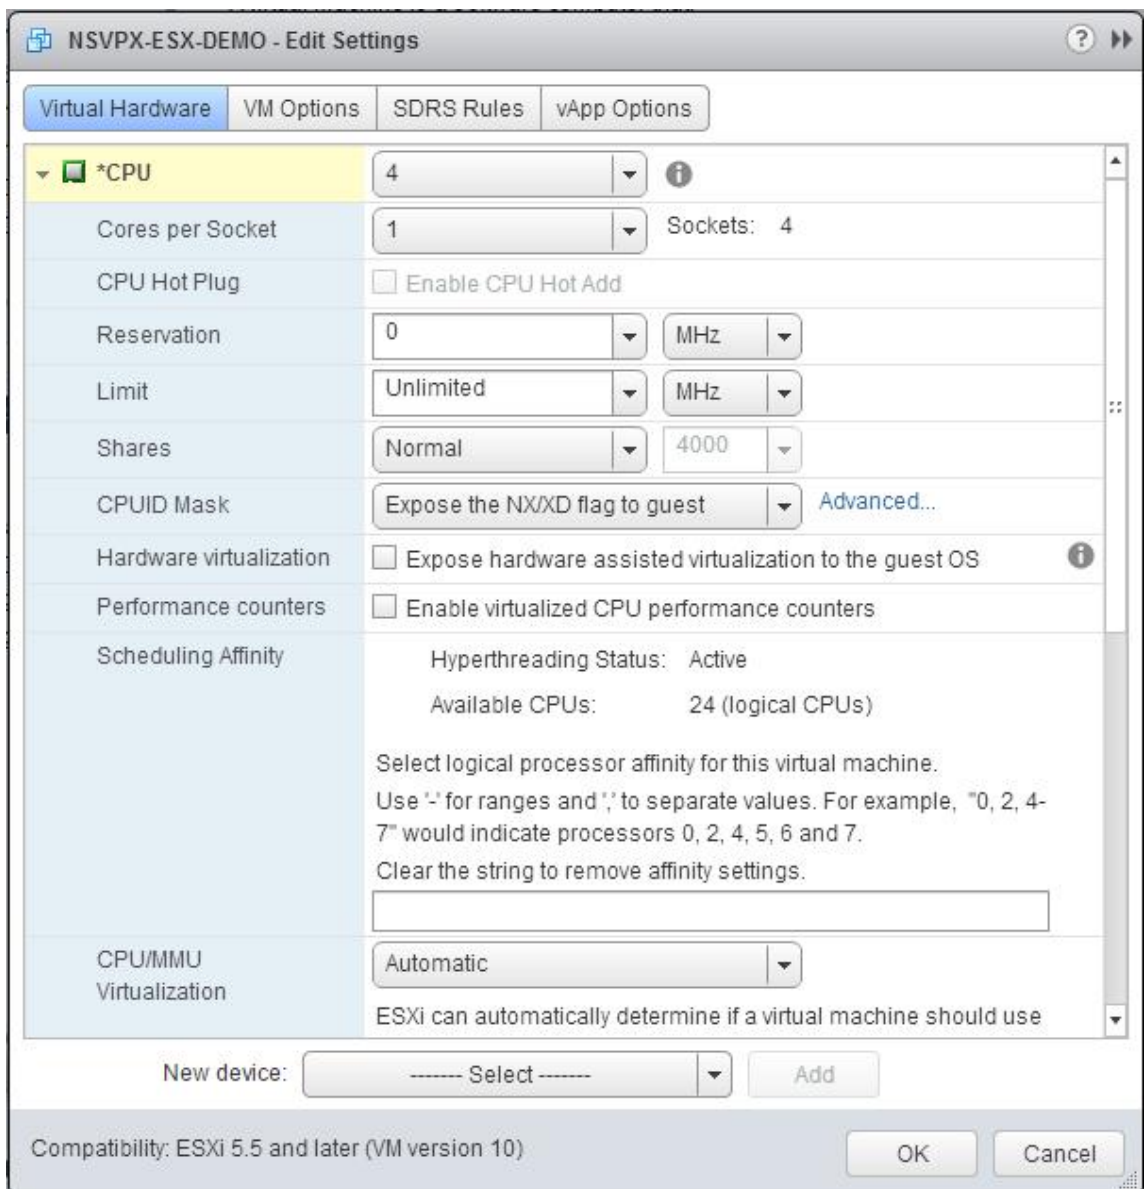

1. In the vSphere Web Client, select **Hosts and Clusters**.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX 5.5 or later, as follows:
 - a. Power off the NetScaler VPX instance.
 - b. Right-click the NetScaler VPX instance and select **Compatibility > Upgrade VM Compatibility**.
 - c. In the **Configure VM Compatibility** dialog box, select **ESXi 5.5 and later** from the **Compatible with** drop-down list and click **OK**.

3. Right-click on the NetScaler VPX instance and click **Edit Settings**.

4. In the **<virtual_appliance> - Edit Settings** dialog box, click the **CPU** section.

5. In the **CPU** section, update the following settings:

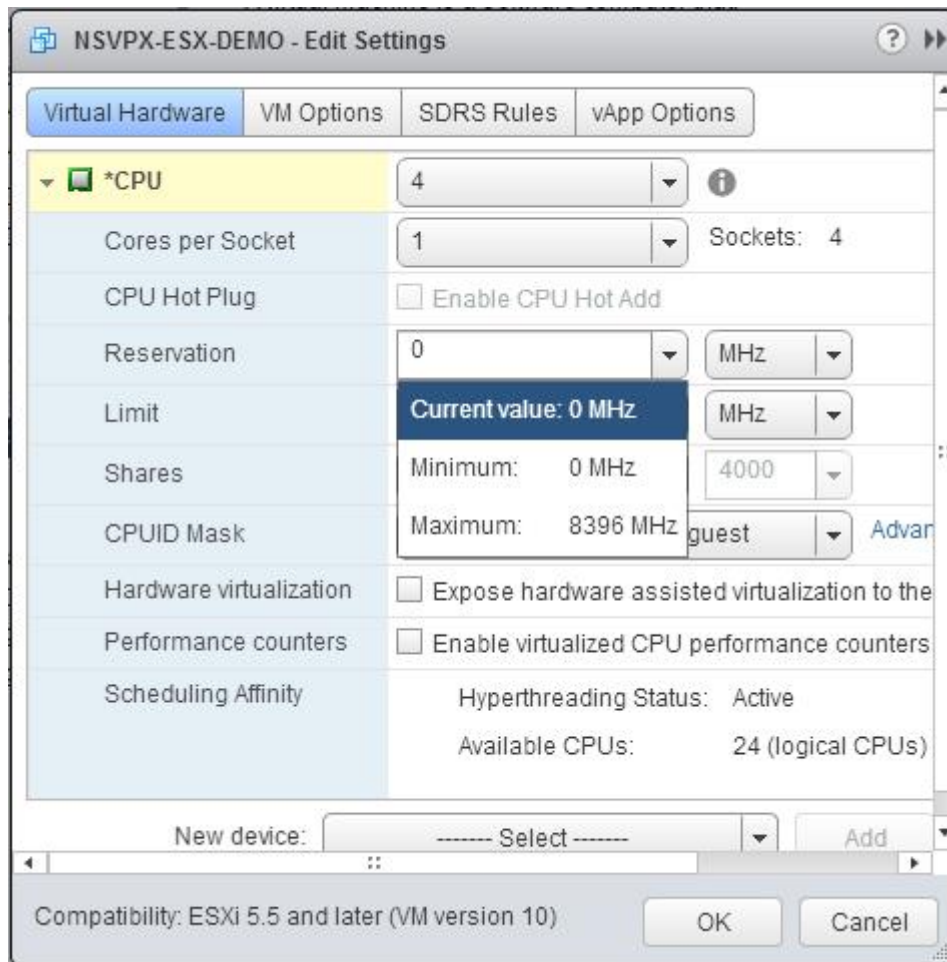

- Number of CPUs
- Number of Sockets
- Reservations
- Limit
- Shares

Set the values as follows:

- a. In the **CPU** drop-down list, select the number of CPUs to assign to the virtual appliance.
- b. In the **Cores per Socket** drop-down list, select the number of sockets.
- c. (Optional) In the **CPU Hot Plug** field, select or clear the **Enable CPU Hot Add** check box.

Note: Citrix recommends accepting the default (disabled).

d. In the **Reservation** drop-down list, select the number that is shown as the maximum value.

e. In the **Limit** drop-down list, select the number that is shown as the maximum value.

f. In the **Shares** drop-down lists, select **Custom** and the number that is shown as the maximum value.

6. In the **Memory** section, update the following settings:

- Size of RAM
- Reservations
- Limit
- Shares

Set the values as follows:

a. In the **RAM** drop-down list, select the size of the RAM. It must be the number of vCPUs x 2 GB. For example, if the number of vCPU is 4 then RAM = 4 x 2 GB = 8 GB.

Note: For Advanced or Premium edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

b. In the **Reservation** drop-down list, enter the value for the memory reservation, and select the **Reserve all guest memory (All locked)** check box. The memory reservation must be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation must be 4 x 2 GB = 8 GB.

Note: For Advanced or Premium edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

c. In the **Limit** drop-down list, select the number that is shown as the maximum value.

d. In the **Shares** drop-down lists, select **Custom**, and select the number that is shown as the maximum value.

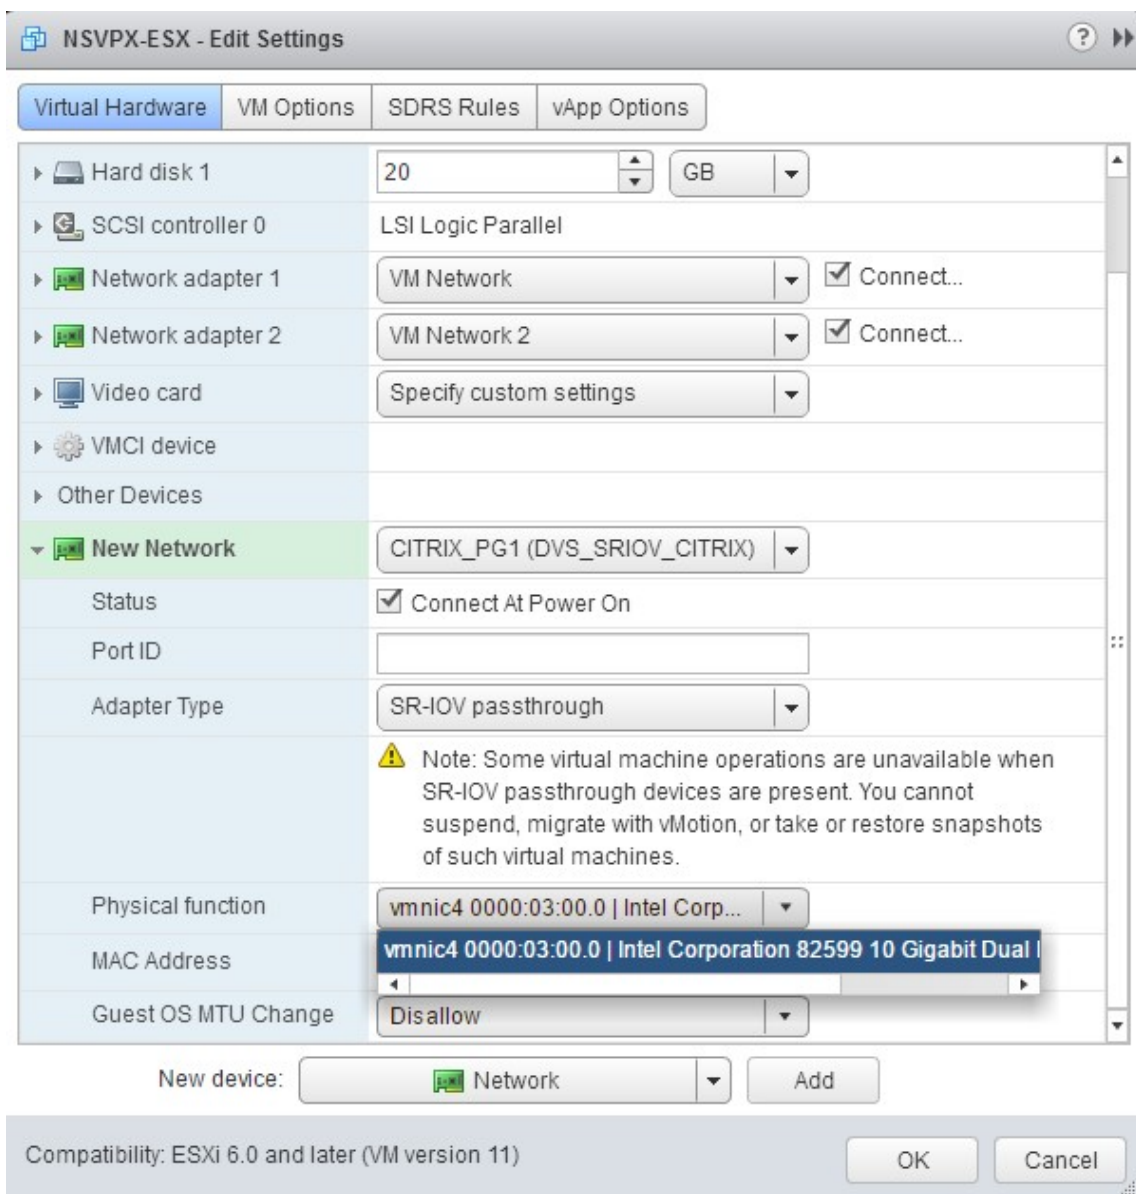

7. Add an SR-IOV network interface. From the **New device** drop-down list, select **Network** and click **Add**.

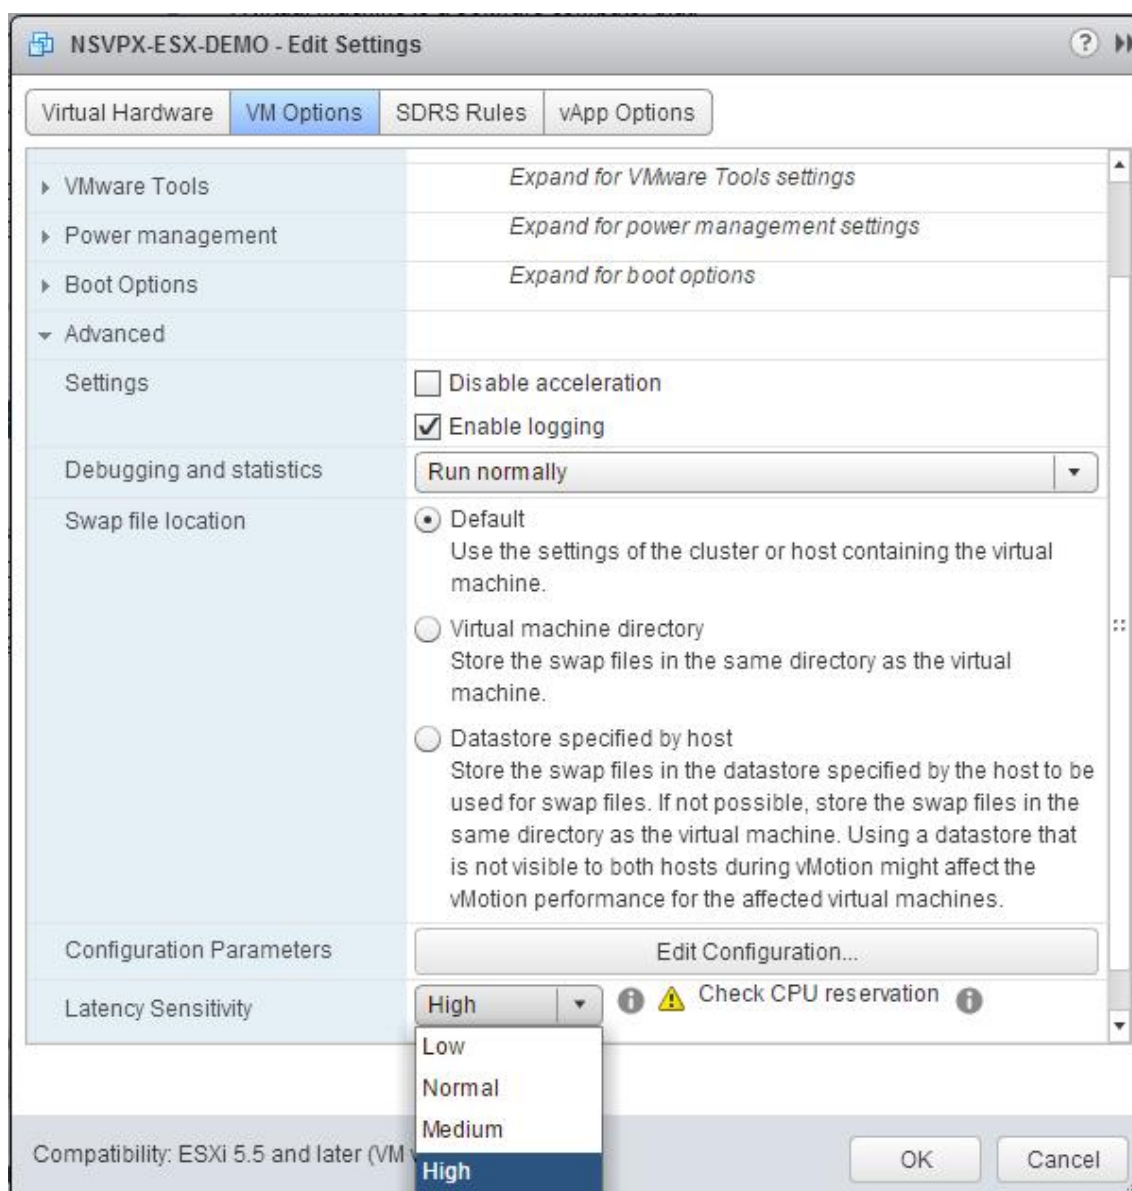

8. In the **New Network** section. From the drop-down list, select the **Portgroup** that you created, and do the following:
 - a. In the **Adapter Type** drop-down list, select **SR-IOV passthrough**.

- b. In the **Physical function** drop-down list, select the physical adapter mapped with the Portgroup.

- c. In the **Guest OS MTU Change** drop-down list, select **Disallow**.
9. In the **<virtual_appliance> - Edit Settings** dialog box, click the **VM Options** tab.
10. On the **VM Options** tab, select the **Advanced** section. From the **Latency Sensitivity** drop-down list, select **High**.

11. Click **OK**.
12. Power on the NetScaler VPX instance.
13. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
show interface summary
```

The output must show all the interfaces that you configured:

```

1 > show interface summary
2 -----
3      Interface  MTU      MAC      Suffix

```

```

4 -----

Configure a NetScaler VPX on ESX hypervisor to use Intel QAT for SSL acceleration in SR-IOV mode

February 14, 2024

The NetScaler VPX instance on the VMware ESX hypervisor can use the Intel QuickAssist Technology (QAT) to accelerate the NetScaler SSL performance. Using Intel QAT, all heavy-latency crypto processing can be offloaded to the chip thus freeing up one or more host CPUs to do other tasks.

Previously, all NetScaler data path crypto processing was done in the software using host vCPUs.

Note:

Currently, NetScaler VPX supports only the C62x chip model under Intel QAT family. This feature is supported starting from NetScaler release 14.1 build 8.50.

Prerequisites

- The ESX host is provisioned with one or more Intel C62x (QAT) chips.
- NetScaler VPX meets the VMware ESX hardware requirements. For more information, see [Install a NetScaler VPX instance on VMware ESX](#).

Limitations

There's no provision to reserve crypto units or bandwidth for individual VMs. All the available crypto units of any Intel QAT hardware are shared across all VMs using the QAT hardware.

Set up the host environment for using Intel QAT

1. Download and install the Intel-provided VMware driver for the C62x series (QAT) chip model in the VMware host. For more information on the Intel package downloads and installation instructions, see [Intel QuickAssist Technology Driver for VMware](#).
2. Enable SR-IOV on the ESX host.
3. Create virtual machines. When creating a VM, assign the appropriate number of PCI devices to meet the performance requirements.

Note:

Each C62x (QAT) chip can have up to three separate PCI endpoints. Each endpoint is a logical collection of VFs, and shares the bandwidth equally with other PCI endpoints of the chip. Each endpoint can have up to 16 VFs that show up as 16 PCI devices. You can add these devices to the VM to do the crypto acceleration using the QAT chip.

Points to note

- If the VM crypto requirement is to use more than one QAT PCI endpoint/chip, it's recommended to pick the corresponding PCI devices/VFs in a round-robin fashion to have a symmetric distribution.
- It's recommended that the number of PCI devices picked is equal to the number of licensed vCPUs (without including the management vCPU count). Adding more PCI devices than the available number of vCPUs does not necessarily improve the performance.

Example:

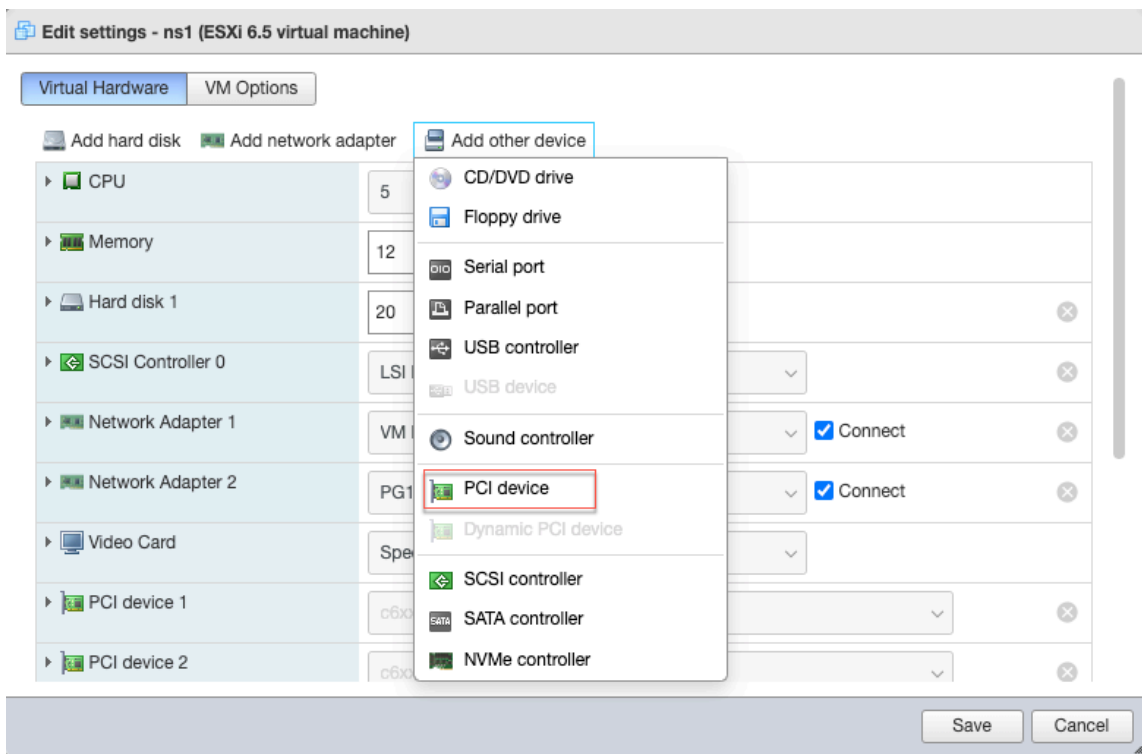

Consider an ESX host with one Intel C62x chip that has 3 endpoints. While provisioning a VM with 6 vCPUs, pick 2 VFs from each endpoint, and assign them to the VM. This kind of assignment ensures an effective and equal distribution of crypto units for the VM. From the total available vCPUs, by default, one vCPU is reserved for the management plane, and the rest of the vCPUs are available for the data plane PEs.

Assign QAT VFs to VPX using the vSphere web client

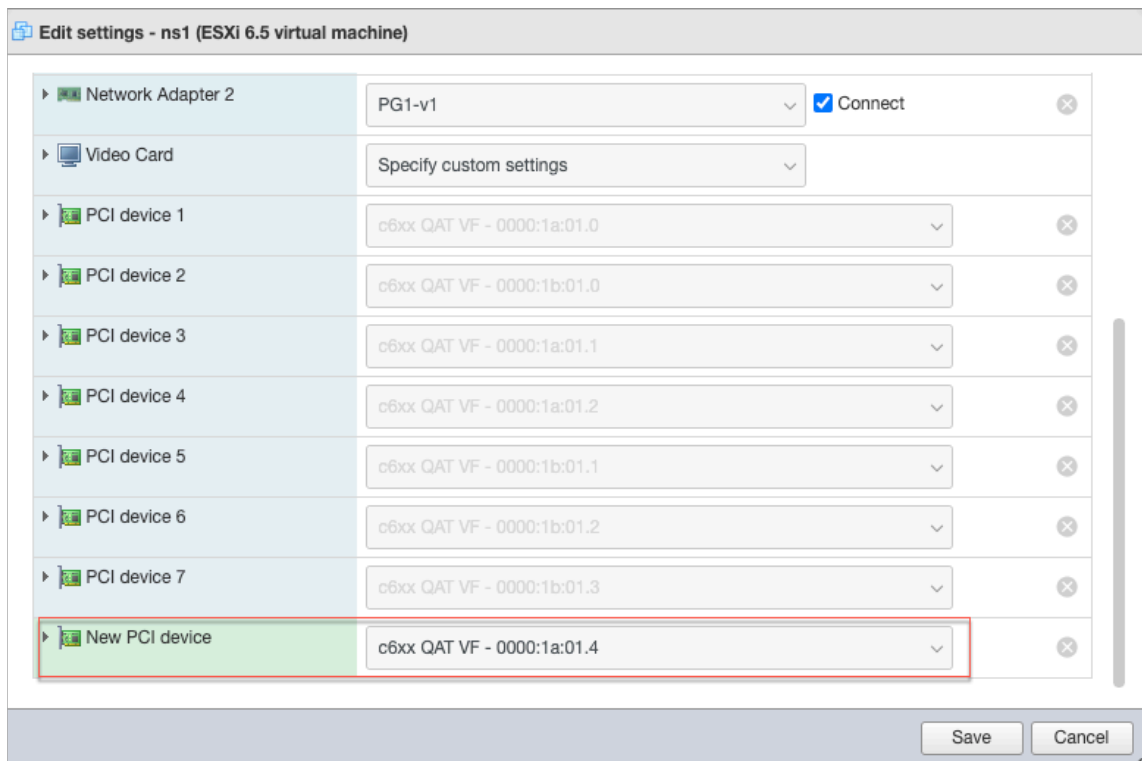

1. In the vSphere web client, navigate to the ESX host where the virtual machine is located and click **Power off**.

2. Navigate to **Actions > Edit settings > Add other device**, and select PCI device.

3. For the newly added PCI device, assign the c6xx QAT VF, and save the configuration.

4. Power on the VM again.

5. Run the `stat ssl` command in the NetScaler CLI to display the SSL summary, and verify the

SSL cards after assigning QAT VFs to VPX.

```
> stat ssl

SSL Summary

# SSL cards present           1
# SSL cards UP                1
SSL engine status            1
```

About the deployment

This deployment was tested with the following component specifications:

- **NetScaler VPX version and build:** 14.1–8.50
- **VMware ESXi version:** 7.0.3 (build 20036589)
- **Intel C62x QAT driver version for VMware:** 1.5.1.54

Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces

May 2, 2023

May 24, 2018

You can configure your existing NetScaler VPX instances that use E1000 network interfaces to use SR-IOV or VMXNET3 network interfaces.

To configure an existing NetScaler VPX instance to use SR-IOV network interfaces, see [Configure a NetScaler VPX instance to use SR-IOV network interface](#).

To configure an existing NetScaler VPX instance to use VMXNET3 network interfaces, see [Configure a NetScaler VPX instance to use VMXNET3 network interface](#).

Configure a NetScaler VPX instance to use PCI passthrough network interface

May 2, 2023

Overview

After you have installed and configured a NetScaler VPX instance on VMware ESX Server, you can use the vSphere Web Client to configure the virtual appliance to use PCI passthrough network interfaces.

The PCI passthrough feature allows a guest virtual machine to directly access physical PCI and PCIe devices connected to a host.

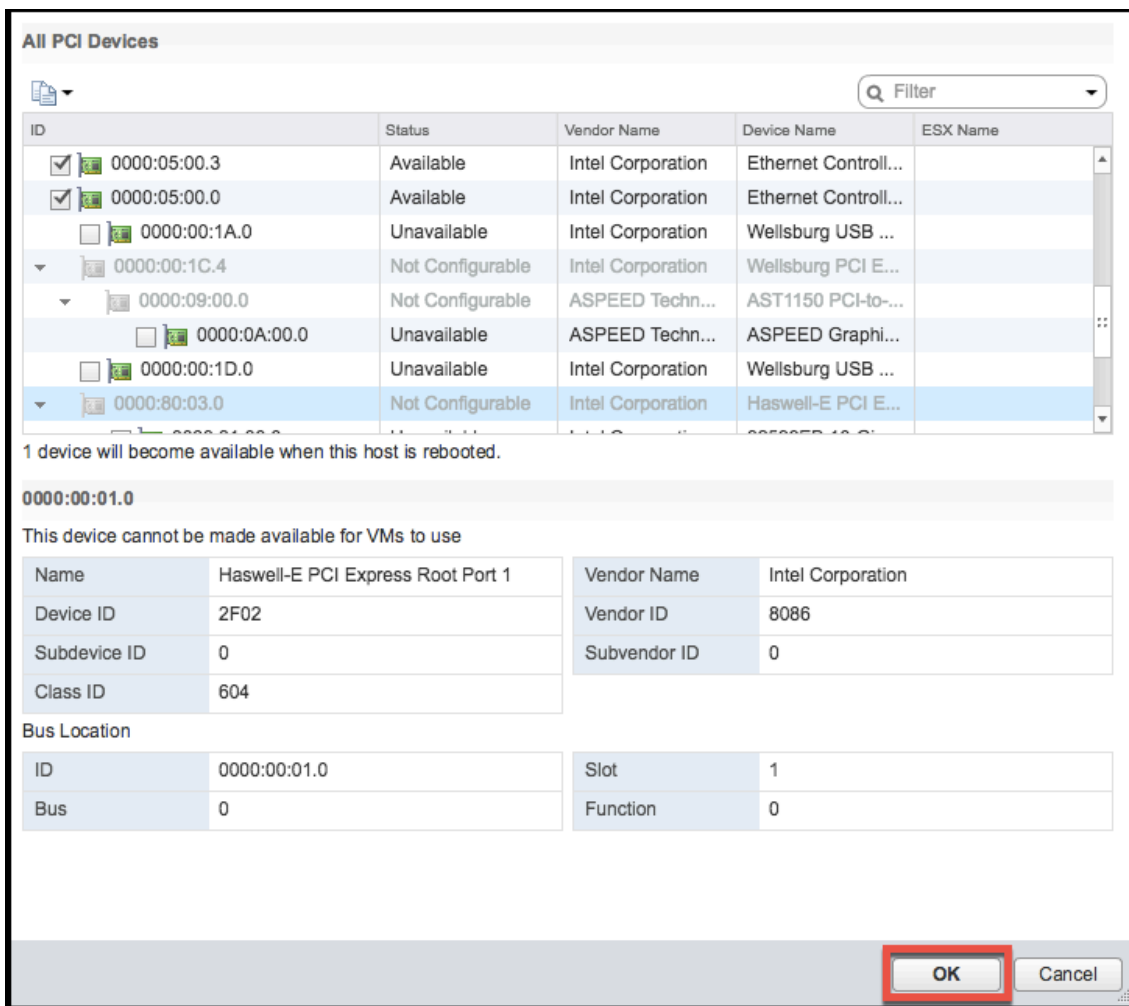

Prerequisites

- The firmware version of the Intel XL710 NIC on the host is 5.04.
- A PCI passthrough device connected to and configured on the host
- Supported NICs:
 - Intel X710 10G NIC
 - Intel XL710 Dual Port 40G NIC
 - Intel XL710 Single Port 40G NIC

Configure passthrough devices on a host

Before configuring a passthrough PCI device on a virtual machine, you must configure it on the host machine. Follow these steps to configure passthrough devices on a host.

1. Select the host from the Navigator panel of the vSphere Web Client.
2. Click **Manage > Settings > PCI Devices**. All available passthrough devices are displayed.
3. Right-click the device that you want to configure and click **Edit**.
4. The **Edit PCI Device Availability** window appears.
5. Select the devices to be used for passthrough and click **OK**.

6. Restart the host machine.

Configure passthrough devices on a NetScaler VPX instance

Follow these steps to configure a passthrough PCI device on a NetScaler VPX instance.

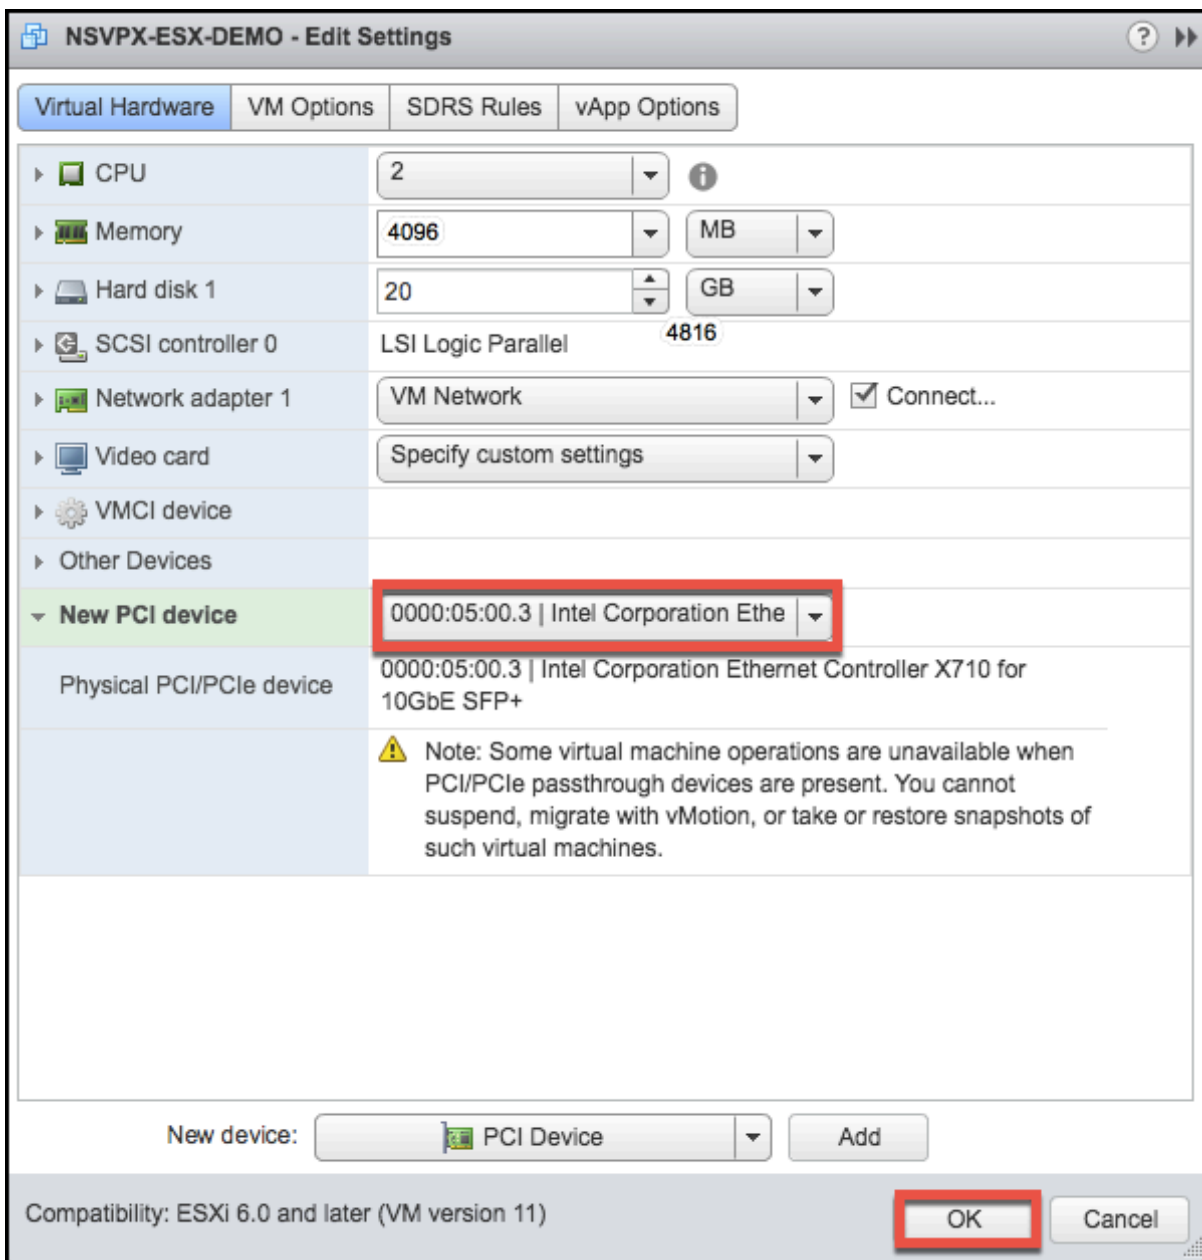

1. Power off the virtual machine.
2. Right-click the virtual machine and select **Edit Settings**.
3. On the **Virtual Hardware** tab, select **PCI Device** from the **New Device** drop-down menu, and click **Add**.

4. Expand **New PCI device** and select the passthrough device to connect to the virtual machine from the drop-down list and click **OK**.

Note

VMXNET3 network interface and PCI Passthrough Network Interface cannot coexist.

1. Power on the guest virtual machine.

You have completed the steps to configuring NetScaler VPX to use PCI passthrough network interfaces.

Apply NetScaler VPX configurations at the first boot of the NetScaler appliance on VMware ESX hypervisor

May 2, 2023

You can apply the NetScaler VPX configurations during the first boot of the NetScaler appliance on the VMware ESX hypervisor. Therefore in certain cases, a specific setup or VPX instance is brought up in much lesser time.

For more information on Preboot user data and its format, see [Apply NetScaler VPX configurations at the first boot of the NetScaler appliance in cloud](#).

Note:

To bootstrap using preboot user data in ESX, default gateway config must be passed in `<NS-CONFIG>` section. For more information on the content of the `<NS-CONFIG>` tag, see [Sample-`<NS-CONFIG>`-section](#).

Sample `<NS-CONFIG>` section:

```
1 <NS-PRE-BOOT-CONFIG>
2
3 <NS-CONFIG>
4   add route 0.0.0.0 0.0.0.0 10.102.38.1
5 </NS-CONFIG>
6
7 <NS-BOOTSTRAP>
8   <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
9   <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>
10
11 <MGMT-INTERFACE-CONFIG>
12   <INTERFACE-NUM> eth0 </INTERFACE-NUM>
13   <IP> 10.102.38.216 </IP>
14   <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
15 </MGMT-INTERFACE-CONFIG>
16 </NS-BOOTSTRAP>
17
18 </NS-PRE-BOOT-CONFIG>
19 <!--NeedCopy-->
```

How to provide preboot user data on ESX hypervisor

You can provide preboot user data on ESX hypervisor from web client or vSphere client in the following two ways:

- Using CD/DVD ISO
- Using OVF Property

Provide user data using CD/DVD ISO

You can use the VMware vSphere client to inject user data into the VM as an ISO image using the CD/DVD drive.

Follow these steps to provide user data using the CD/DVD ISO:

1. Create a file with file name `userdata` that has the preboot user data content. For more information on the content of the `<NS-CONFIG>` tag, see Sample `<NS-CONFIG>` section.

Note: File name must be strictly used as `userdata`.

2. Store the `userdata` file in a folder, and build an ISO image using the folder.

You can build an ISO image with `userdata` file by the following two methods:

- Using any image processing tool such as PowerISO.
- Using `mkisofs` command in Linux.

The following sample configuration shows how to generate an ISO image using the `mkisofs` command in Linux.

```

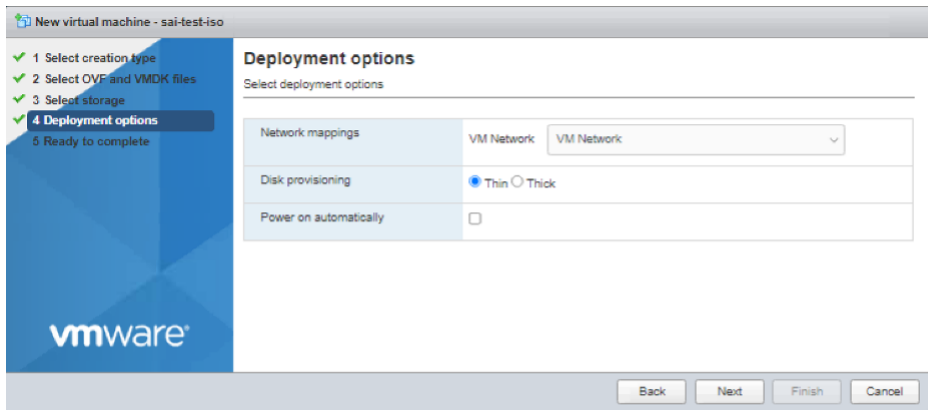

1 root@ubuntu:~/sai/14jul2021# ls -l total 4
2 drwxr-xr-x 2 root root 4096 Jul 14 12:32 esx_preboot_userdata
3 root@ubuntu:~/sai/14jul2021#
4 root@ubuntu:~/sai/14jul2021# ls -l esx_preboot_userdata/total 4
5 -rw-r--r-- 1 root root 3016 Jul 14 12:32 userdata
6 root@ubuntu:~/sai/14jul2021# mkisofs -o esx_preboot_userdata.iso
  ./esx_preboot_userdata
7 I: -input-charset not specified, using utf-8 (detected in locale
  settings)
8 Total translation table size: 0
9 Total rockridge attributes bytes: 0
10 Total directory bytes: 112
11 Path table size(bytes): 10
12 Max brk space used 0
13 176 extents written (0 MB)
14 root@ubuntu:~/sai/14jul2021# ls -lh
15 total 356K
16 drwxr-xr-x 2 root root 4.0K Jul 14 12:32 esx_preboot_userdata
17 -rw-r--r-- 1 root root 352K Jul 14 12:34 esx_preboot_userdata.iso
18
19 root@ubuntu:~/sai# ls preboot_userdata_155_193 userdata
20 root@ubuntu:~/sai# mkisofs -o preboot_userdata_155_193.iso ./
  preboot_userdata_155_193
21 I: -input-charset not specified, using utf-8 (detected in locale
  settings)
22 Total translation table size: 0
23 Total rockridge attributes bytes: 0
24 Total directory bytes: 112
25 Path table size(bytes): 10

```

```
26 Max brk space used 0
27 176 extents written (0 MB)
28
29 <!--NeedCopy-->
```

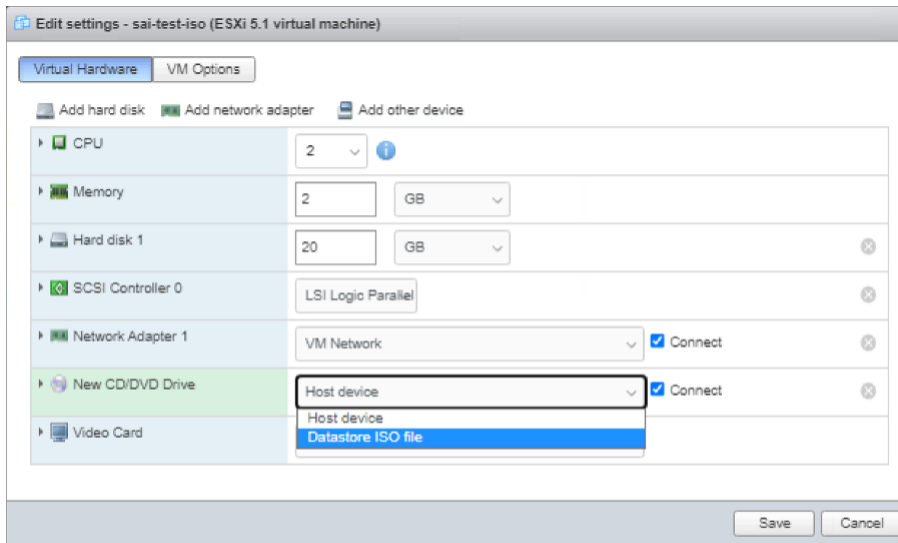

3. Provision the NetScaler VPX instance using standard deployment process to create the VM. But do not power on the VM automatically.

4. After the VM is successfully created, attach the ISO file as CD/DVD drive to the VM.

5. Navigate to **New CD/DVD Drive** and choose **Datastore ISO file** from the drop-down menu.

6. Select a Datastore in the vSphere Client.

7. Power on the VM.

Provide user data using OVF property from ESX web client

Follow these steps to provide user data using OVF property.

1. Create a file with user data content.

```
root@ubuntu:~/sai/14jul2021# cat esx_userdata.xml
<NS-PRE-BOOT-CONFIG>
  <NS-CONFIG>
    add route 0.0.0.0 0.0.0.0 10.102.38.1
  </NS-CONFIG>

  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth0 </INTERFACE-NUM>
      <IP> 10.102.38.219 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </MGMT-INTERFACE-CONFIG>
  </NS-BOOTSTRAP>
</NS-PRE-BOOT-CONFIG>
```

2. Encode the user data content with Base64 encoding. You can perform the Base64 encoding using the following two methods:

- In Linux, use the following command:

```
1  base64 <userdata-filename> > <output-file>
2  <!--NeedCopy-->
```

Example:

```
1  base64 esx_userdata.xml > esx_userdata_b64
2  <!--NeedCopy-->
```

```
root@ubuntu:~/sai/14jul2021# base64 esx_userdata.xml > esx_userdata_b64
root@ubuntu:~/sai/14jul2021#
root@ubuntu:~/sai/14jul2021# cat esx_userdata_b64
PE5TLVBSRS1CT09ULUNPTkZJRz4KICAgIDx0Uy1DT05GSUc+CglhZGQgcm91dGUgMC4wLjAuMCAw

RS1DT05GSUc+CjAgICAgICA8L05TLUNPTkZJRz4KICAgICA8TlMtOk9PFVNUUkFQgogCg==
```

- Use online tools to encode user data content, for example, Base64 Encode and Decode.
3. Include a **Product** section in the OVF template of a NetScaler VPX instance on ESX hypervisor.

Sample Product section:

```
1  <ProductSection>
2
3  <Info>Information about the installed software</Info>
4  <Product>NSVPX-VSK Template</Product>
5  <Vendor>Citrix</Vendor>
6  <VendorUrl>www.citrix.com</VendorUrl>
```

```

 7 <Category> Preboot Userdata </Category>
 8
 9 <Property ovf:key="guestinfo.userdata" ovf:type="string" ovf:
    userConfigurable="true" ovf:value="">
10
11 <Label>Userdata</Label>
12 <Description> Userdata for ESX VPX </Description>
13 </Property>
14
15 </ProductSection>
16 <!--NeedCopy-->

```

4. Provide the base64 encoded user data as the `ovf:value` for `guestinfo.userdata` property in the Product section.

```

 1 <ProductSection>
 2
 3 <Info>Information about the installed software</Info>
 4 <Product>NSVPX-VSK Template</Product>
 5 <Vendor>Citrix</Vendor>
 6 <VendorUrl>www.citrix.com</VendorUrl>

Provide user data using OVF property from ESX vSphere client

Follow these steps to provide user data using OVF property from ESX vSphere client.

1. Create a file with user data content.

```

root@ubuntu:~/sai/14jul2021# cat esx_userdata.xml
<NS-PRE-BOOT-CONFIG>
  <NS-CONFIG>
    add route 0.0.0.0 0.0.0.0 10.102.38.1
  </NS-CONFIG>

  <NS-BOOTSTRAP>
    <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
    <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>

    <MGMT-INTERFACE-CONFIG>
      <INTERFACE-NUM> eth0 </INTERFACE-NUM>
      <IP> 10.102.38.219 </IP>
      <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
    </MGMT-INTERFACE-CONFIG>
  </NS-BOOTSTRAP>
</NS-PRE-BOOT-CONFIG>

```

2. Encode the user data content with Base64 encoding. You can perform the Base64 encoding using the following two methods:

- In Linux, use the following command:

```

1 base64 <userdata-filename> > <output-file>
2 <!--NeedCopy-->

```

Example:

```

1 base64 esx_userdata.xml > esx_userdata_b64
2 <!--NeedCopy-->

```

```

root@ubuntu:~/sai/14jul2021# base64 esx_userdata.xml > esx_userdata_b64
root@ubuntu:~/sai/14jul2021#

```

- Use online tools to encode user data content, for example, Base64 Encode and Decode.
3. Include a **Product** section in the OVF template of a NetScaler VPX instance on ESX hypervisor.

Sample Product section:

```

1 <ProductSection>
2
3 <Info>Information about the installed software</Info>
4 <Product>NSVPX-VSK Template</Product>
5 <Vendor>Citrix</Vendor>
6 <VendorUrl>www.citrix.com</VendorUrl>
7 <Category> Preboot Userdata </Category>
8
9 <Property ovf:key="guestinfo.userdata" ovf:type="string" ovf:
  userConfigurable="true" ovf:value="">
10
11 <Label>Userdata</Label>
12 <Description> Userdata for ESX VPX </Description>
13 </Property>
14
15 </ProductSection>
16 <!--NeedCopy-->

```

4. Provide the base64 encoded user data as the `ovf:value` for `guestinfo.userdata` property in the Product section.

```

1 <ProductSection>
2
3 <Info>Information about the installed software</Info>
4 <Product>NSVPX-VSK Template</Product>
5 <Vendor>Citrix</Vendor>
6 <VendorUrl>www.Citrix.com</VendorUrl>
7 <Category> Preboot Userdata </Category>
8 <Property ovf:key="guestinfo.userdata" ovf:type="string" ovf:
  userConfigurable="true"
9   ovf:value="PE5TLVBSRS1CT09ULUNPTkZJRz4KICAgIDx0Uy1DT05GSUc+

Install a NetScaler VPX instance on VMware cloud on AWS

May 2, 2023

The VMware Cloud (VMC) on AWS enables you to create cloud software-defined data centers (SDDC) on AWS with the desired number of ESX hosts. The VMC on AWS supports NetScaler VPX deployments. VMC provides a user interface same as on-prem vCenter. It functions identical to the ESX-based NetScaler VPX deployments.

Prerequisites

Before you begin installing a virtual appliance, do the following:

- One VMware SDDC must be present with at least one host.
- Download the NetScaler VPX appliance setup files.
- Create appropriate network segments on VMware SDDC to which the virtual machines connect.
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see the *NetScaler VPX Licensing Guide* at <http://support.citrix.com/article/ctx131110>.

VMware cloud hardware requirements

The following table lists the virtual computing resources that the VMware SDDC must provide for each VPX nCore virtual appliance.

Table 1. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (vCPU)	2
Virtual network interfaces	In VMware SDDC, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded to version 7 or higher.
Disk space	20 GB

Note

This is in addition to any disk requirements for the hypervisor.

For production use of the VPX virtual appliance, the full memory allocation must be reserved.

OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. The following table describes the minimum system requirements.

Table 2. Minimum system requirements for OVF tool installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “OVF Tool User Guide” PDF file at http://kb.vmware.com/ .
CPU	750 MHz minimum, 1 GHz or faster recommended
RAM	1 GB Minimum, 2 GB recommended
NIC	100 Mbps or faster NIC

For information about installing OVF, search for the “OVF Tool User Guide” PDF file at <http://kb.vmware.com/>.

Downloading the NetScaler VPX setup files

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from the Citrix website. You need a Citrix account to log on. If you do not have a Citrix account, access the home page at <http://www.citrix.com>. Click the **New Users link**, and follow the instructions to create a new Citrix account.

Once logged on, navigate the following path from the Citrix home page:

Citrix.com > **Downloads > NetScaler > Virtual Appliances.**

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-13.0-79.64-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-13.0-79.64.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-13.0-79.64.mf)

Install a NetScaler VPX instance on VMware cloud

After you have installed and configured VMware SDDC, you can use the SDDC to install virtual appliances on the VMware cloud. The number of virtual appliances that you can install depends on the

amount of memory available on the SDDC.

To install NetScaler VPX instances on VMware cloud, follow these steps:

1. Open VMware SDDC on your workstation.
2. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click **Login**.
3. On the **File** menu, click **Deploy OVF Template**.
4. In the **Deploy OVF Template** dialog box, in **Deploy from file**, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click **Next**.

Note: By default, the NetScaler VPX instance uses E1000 network interfaces. To deploy ADC with the VMXNET3 interface, modify the OVF to use VMXNET3 interface instead of E1000.

5. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the VMware SDDC. Click **Next** to start installing a virtual appliance on VMware SDDC.
6. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have installed and, from the right-click menu, select **Power On**. Click the **Console** tab to emulate a console port.
7. If you want to install another virtual appliance, repeat from Step 6.
8. Specify the management IP address from the same segment that is selected to be the management network. The same subnet is used for the Gateway.
9. The VMware SDDC requires that NAT and firewall rules are created explicitly for all private IP addresses belonging to network segments.

Install a NetScaler VPX instance on Microsoft Hyper-V server

May 2, 2023

To install NetScaler VPX instances on Microsoft Windows Server, you must first install Windows Server with the Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the NICs on the server that Hyper-V uses to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler VPX instance installation.

The NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler VPX instance, you can configure the network adapters on a virtual appliance,

add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see [Upgrade a NetScaler VPX standalone appliance](#)

Note

Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the NetScaler VPX virtual appliance hosted on the HyperV-2012 platform.

Prerequisites for installing NetScaler VPX instance on Microsoft servers

Before you begin installing a virtual appliance, do the following:

- Enable the Hyper-V role on Windows Servers. For more information, see [http://technet.microsoft.com/en-us/library/ee344837\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/ee344837(WS.10).aspx).
- Download the virtual appliance setup files.
- Get NetScaler VPX instance license files. For more information about NetScaler VPX instance licenses, see the *NetScaler VPX Licensing Guide* at <http://support.citrix.com/article/ctx131110>.

Microsoft server hardware requirements

The following table describes the minimum system requirements for Microsoft servers.

Table 1. Minimum system requirements for Microsoft servers

Component	Requirement
CPU	1.4 GHz 64-bit processor
RAM	8 GB
Disk Space	32 GB or greater

The following table lists the virtual computing resources for each NetScaler VPX instance.

Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
RAM	4 GB

Component	Requirement
Virtual CPU	2
Disk Space	20 GB
Virtual Network Interfaces	1

Download the NetScaler VPX setup files

The NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from the Citrix website. You need a Citrix account to log in. If you do not have a Citrix account, access the home page at <http://www.citrix.com>, click **Sign In > My account > Create Citrix Account**, and follow the instructions to create a Citrix account.

To download the NetScaler VPX instance setup files, follow these steps:

1. In a web browser, go to <http://www.citrix.com/>.
2. Sign in with your user name and password.
3. Click **Downloads**.
4. In **Select a Product** drop-down menu, select **NetScaler (NetScaler ADC)**.
5. Under **NetScaler Release X.X > Virtual Appliances**, click **NetScaler VPX Release X.X**
6. Download the compressed file to your server.

Install the NetScaler VPX instance on Microsoft servers

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install NetScaler VPX instance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

Note

You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

To install NetScaler VPX instance on Microsoft Server by using Hyper-V Manager:

1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.
2. In the navigation pane, under **Hyper-V Manager**, select the server on which you want to install NetScaler VPX instance.
3. On the **Action** menu, click **Import Virtual Machine**.
4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the NetScaler VPX instance software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.
5. **Note:** If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
6. Click **Import**.
7. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.
8. To install another virtual appliance, repeat steps **2** through **6**.

Important

Make sure that you extract the files to a different folder in step **4**.

Auto-provision a NetScaler VPX instance on Hyper-V

Auto-provisioning of NetScaler VPX instance is optional. If auto-provisioning is not done, the virtual appliance provides an option to configure the IP address and so on.

To auto-provision NetScaler VPX instance on Hyper-V, follow these steps.

1. Create an ISO9660 compliant ISO image using the xml file as depicted in the example. Make sure that the name of the xml file is **userdata**.

You can create an ISO file from XML file using:

- Any image processing tool such as PowerISO.
- `mkisofs` command in Linux.

```

1 <?xml version="1.0" encoding="UTF-8" standalone="no"?>
2
3 <Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
4
5 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
6
7 oe:id=""
8
9 xmlns="http://schemas.dmtf.org/ovf/environment/1">
10
11 <PlatformSection>
```

```
12
13 <Kind>HYPER-V</Kind>
14
15 <Version>2013.1</Version>
16
17 <Vendor>CITRIX</Vendor>
18
19 <Locale>en</Locale>
20
21 </PlatformSection>
22
23 <PropertySection>
24
25 <Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"
   />
26
27 <Property oe:key="com.citrix.netscaler.platform" oe:value="NS1000V
   "/>
28
29 <Property oe:key="com.citrix.netscaler.orch\_env" oe:value="cisco-
   orch-env"/>
30
31 <Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="
   10.102.100.122"/>
32
33 <Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="
   255.255.255.128"/>
34
35 <Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="
   10.102.100.67"/></PropertySection>
36
37 </Environment>
38 <!--NeedCopy-->
```

2. Copy the ISO image to hyper-v server.
3. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**. You can also select the virtual appliance and then right click and select **Settings**. The **Settings** window for the selected virtual appliance is displayed.
4. In the **Settings** window, under the hardware section, click **IDE Controller**.
5. In the right window pane, select **DVD Drive** and click **Add**. The DVD Drive is added under the **IDE Controller** section in the left window pane.
6. Select the **DVD Drive** added in step 5. In the right window pane, select the **Image file radio** button and click **Browse** and select the ISO image that you copied on Hyper-V server, in step 2.
7. Click **Apply**.

Note

The virtual appliance instance comes up in the default IP address, when:

- The DVD drive is attached and the ISO file is not provided.
- The ISO file does not include the user data file.
- The user data file name or format is not correct.

To configure virtual NICs on the NetScaler VPX instance, follow these steps:

1. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**.
2. In the **Settings for <virtual appliance name>** dialog box, click **Add Hardware** in the left pane.
3. In the right pane, from the list of devices, select **Network Adapter**.
4. Click **Add**.
5. Verify that **Network Adapter (not connected)** appears in the left pane.
6. Select the network adapter in the left pane.
7. In the right pane, from the **Network** menu, select the virtual network to connect the adapter to.
8. To select the virtual network for other network adapters that you want to use, repeat steps **6** and **7**.
9. Click **Apply**, and then click **OK**.

To configure the NetScaler VPX instance:

1. Right-click the virtual appliance that you previously installed, and then select **Start**.
2. Access the console by double-clicking the virtual appliance.
3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

Note

You can also use virtual machine (VM) template to provision NetScaler VPX instance using SCVMM.

If you use Microsoft Hyper-V NIC teaming solution with NetScaler VPX instances, see article [CTX224494](#) for more information.

Install a NetScaler VPX instance on Linux-KVM platform

May 2, 2023

To set up a NetScaler VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virtual Manager) application. If you prefer the Linux-KVM command line, you can use the `virsh` program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a NetScaler VPX instance, you can add more interfaces.

Limitations and usage guidelines

General recommendations

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the VNet interface associated with the VPX VM. Shut down the VPX VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the VPX VM. That is, do not use the **Force off** command.
- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
- The NetScaler package has to be unique for each of the NetScaler VPX instance provisioned.

Limitations

- Live migration of a VPX instance that runs on KVM is not supported.

Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform

May 2, 2023

Check the minimum system requirements for a Linux-KVM server running on a NetScaler VPX instance.

CPU requirement:

- 64-bit x86 processors with the hardware virtualization feature included in Intel VT-X processors.

To test whether your CPU supports the Linux host, enter the following command at the host Linux shell prompt:

```
1 *.egrep '^f\l\ags.*(vmx|svm)' /proc/cpuinfo*
2 <!--NeedCopy-->
```

If the **BIOS** settings for the preceding extension are disabled, you must enable them in the BIOS.

- Provide at least 2 CPU cores to Host Linux.
- There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.

Memory (RAM) requirement:

Minimum 4 GB for the host Linux kernel. Add more memory as required by the VMs.

Hard disk requirement:

Calculate the space for Host Linux kernel and VM requirements. A single NetScaler VPX VM requires 20 GB of disk space.

Software requirements

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, CentOS, and Fedora, have tested kernel versions and associated virtualization tools.

Guest VM hardware requirements

NetScaler VPX supports IDE and virtIO hard disk type. The Hard Disk Type has been configured in the XML file, which is a part of the NetScaler package.

Networking requirements

NetScaler VPX supports virtIO para-virtualized, SR-IOV, and PCI Passthrough network interfaces.

For more information about the supported network interfaces, see:

- [Provision the NetScaler VPX instance by using the Virtual Machine Manager](#)
- [Configure a NetScaler VPX instance to use SR-IOV network interfaces](#)
- [Configure a NetScaler VPX instance to use PCI passthrough network interfaces](#)

Source Interface and Modes

The source device type can be either Bridge or MacVTap. In MacVTap, four modes are possible - VEPA, Bridge, Private, and Pass-through. Check the types of interfaces that you can use and the supported traffic types, as per the following:

Bridge:

- Linux Bridge.
- `Ebtables` and `iptables` settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable `IPtable` services.

MacVTap (VEPA mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible only if the upstream or downstream switch supports VEPA mode.

MacVTap (private mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is not possible.

MacVTap (bridge mode):

- Better as compared to bridge.
- Interfaces out of the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible, if the lower device link is UP.

MacVTap (Pass-through mode):

- Better as compared to bridge.
- Interfaces out of the same lower device cannot be shared across the VMs.
- Only one VM can use the lower device.

Note: For best performance by the VPX instance, ensure that the `gro` and `lro` capabilities are switched off on the source interfaces.

Properties of source interfaces

Make sure that you switch off the generic-receive-offload (`gro`) and large-receive-offload (`lro`) capabilities of the source interfaces. To switch off the `gro` and `lro` capabilities, run the following commands at the host Linux shell prompt.

```
ethtool -K eth6 gro off
ethool -K eth6 lro off
```

Example:

```

1 [root@localhost ~]# ethtool -K eth6
2
3         Offload parameters for eth6:
4
5             rx-checksumming: on
6
7             tx-checksumming: on
8
9         scatter-gather: on
10
11        tcp-segmentation-offload: on
12
13        udp-fragmentation-offload: off
14
15        generic-segmentation-offload: on
16
17        generic-receive-offload: off
18
19        large-receive-offload: off
20
21        rx-vlan-offload: on
22
23        tx-vlan-offload: on
24
25        ntuple-filters: off
26
27        receive-hashing: on
28
29 [root@localhost ~]#
30 <!--NeedCopy-->

```

Example:

If the host Linux bridge is used as a source device, as in the following example, and `lro` capabilities must be switched off on the VNet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```

1 [root@localhost ~]# brctl show eth6_br
2
3 bridge name      bridge id          STP enabled interfaces
4
5 eth6_br          8000.00e0ed1861ae  no                    eth6
6
7
8
9
10
11 [root@localhost ~]#
12 <!--NeedCopy-->

```

In the preceding example, the two virtual interfaces are derived from the `eth6_br` and are represented as `vnet0` and `vnet2`. Run the following commands to switch off `gro` and `lro` capabilities on these

interfaces.

```
1 ethtool -K vnet0 gro off
2 ethtool -K vnet2 gro off
3 ethtool -K vnet0 lro off
4 ethtool -K vnet2 lro off
5 <!--NeedCopy-->
```

Promiscuous mode

The promiscuous mode must be enabled for the following features to work:

- L2 mode
- Multicast traffic processing
- Broadcast
- IPV6 traffic
- virtual MAC
- Dynamic routing

Use the following command to enable the promiscuous mode.

```
1 [root@localhost ~]# ifconfig eth6 promisc
2 [root@localhost ~]# ifconfig eth6
3 eth6      Link encap:Ethernet  HWaddr 78:2b:cb:51:54:a3
4          inet6 addr: fe80::7a2b:cbff:fe51:54a3/64 Scope:Link
5          UP BROADCAST RUNNING PROMISC MULTICAST  MTU:9000  Metric:1
6          RX packets:142961 errors:0 dropped:0 overruns:0 frame:0
7          TX packets:2895843 errors:0 dropped:0 overruns:0 carrier:0
8          collisions:0 txqueuelen:1000
9          RX bytes:14330008 (14.3 MB)  TX bytes:1019416071 (1.0 GB)
10
11 [root@localhost ~]#
12 <!--NeedCopy-->
```

Module required

For better network performance, make sure the `vhost_net` module is present in the Linux host. To check the existence of `vhost_net` module, run the following command on the Linux host:

```
1 lsmod | grep "vhost\_net"
2 <!--NeedCopy-->
```

If `vhost_net` is not yet running, enter the following command to run it:

```
1 modprobe vhost\_net
2 <!--NeedCopy-->
```

Provision the NetScaler VPX instance by using OpenStack

May 2, 2023

You can provision a NetScaler VPX instance in an OpenStack environment either by using the **Nova boot** command (OpenStack CLI) or Horizon (OpenStack dashboard) .

Provisioning a VPX instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance as a CD-ROM device when it boots. This configuration drive can be used to pass networking configuration such as management IP address, network mask, default gateway, and to inject customer scripts.

In a NetScaler appliance, the default authentication mechanism is password based. Now, the SSH key-pair authentication mechanism is supported for NetScaler VPX instances on the OpenStack environment.

The key-pair (public key and private key) is generated before using the Public Key Cryptography mechanism. You can use different mechanisms, such as Horizon, Puttygen.exe for Windows, and [ssh-keygen](#) for the Linux environment, to generate the key pair. Refer to online documentation of respective mechanisms for more information about generating key pair.

Once a key pair is available, copy the private key to a secure location to which authorized persons have access. In OpenStack, public key can be deployed on a VPX instance by using the Horizon or Nova boot command. When a VPX instance is provisioned by using OpenStack, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string. This string is “OpenStack Foundation” and for Red Hat Linux distributions it is stored in `/etc/nova/release`. This is a standard mechanism that is available in all OpenStack implementations based on the KVM hypervisor platform. The drive must have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the network configuration, custom scripts, and SSH key pair if provided.

User data file

The NetScaler VPX instance uses a customized OVF file, also known as the user data file, to inject network configuration, custom scripts. This file is provided as part of config drive. Here is an example of a customized OVF file.

```
1  `` `
2  <?xml version="1.0" encoding="UTF-8" standalone="no"?>
3  <Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
4  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
5  oe:id=""
6  xmlns="http://schemas.dmtf.org/ovf/environment/1"
```

```

 7 xmlns:cs="http://schemas.citrix.com/openstack">
 8 <PlatformSection>

49 my $name = "VPX";
50 print "Hello, World $name !\n" ;
51 </pre>
52 </Script>
53 <Script>
54 <Type>nscli</Type>
55 <BootScript>after</BootScript>

```

```
56         <Text>
57             add vlan 33
58     bind vlan 33 -ifnum 1/2
59         </Text>
60     </Script>
61 </Scripts>
62 </ScriptSettingSection>
63 </cs:ScriptSection>
64 </Environment>
65 <!--NeedCopy--> `` `
```

In the OVF file preceding “PropertySection” is used for NetScaler networking configuration while `<cs:ScriptSection>` is used to enclose all scripts. `<Scripts></Scripts>` tags are used to bundle all scripts together. Each script is defined in between `<Script>` `</Script>` tags. Each script tag has following fields/tags:

- a) `<Type>`: Specifies value for script type. Possible values: Shell/Perl/Python/NSLCI (for NetScaler CLI scripts)
- b) `<Parameter>`: Provides parameters to the script. Each script can have multiple `<Parameter>` tags.
- c) `<BootScript>`: Specifies script execution point. Possible values for this tag: before/after. “before” specifies script is run before PE comes up. “after” specifies that the script will be run after PE comes up.
- d) `<Text>`: Pastes content of a script.

Note

Currently the VPX instance does not take care of sanitization of scripts. As an administrator, you must check the validity of the script.

Not all sections need to be present. Use an empty “PropertySection” to only define scripts to run on first boot or an empty `<cs:ScriptSection>` to only define networking configuration.

After the required sections of the OVF file (user data file) are populated, use that file to provision the VPX instance.

Network configuration

As part of the network configuration, the VPX instance reads:

- Management IP address
- Network mask
- Default gateway

After the parameters are successfully read, they are populated in the NetScaler configuration, to allow managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with the default network configuration (192.168.100.1/16).

Customer script

The VPX instance allows to run a custom script during initial provisioning. The appliance supports script of type Shell, Perl, Python, and NetScaler CLI commands.

SSH key pair authentication

The VPX instance copies public key, available within the configuration drive as part of instance meta data, into its “authorized_keys”file. This allows the user to access the instance with private key.

Note

When an SSH key is provided, the default credentials (nsroot/nsroot) no longer work, if password-based access is needed, log on with the respective SSH private key and manually set a password.

Before you begin

Before you provision a VPX instance on OpenStack environment, extract the `.qcow2` file from the `.tgz` file and build

An OpenStack image from the qcow2 image. Follow these steps:

1. Extract the `.qcow2` file from the `.tgz` file by typing the following command

```
1 tar xvzf <TAR file>
2 tar xvzf <NSVPX-KVM-12.0-26.2_nc.tgz>
3 NSVPX-KVM.xml
4 NSVPX-KVM-12.0-26.2_nc.qcow2
```

2. Build an OpenStack image using the `.qcow2` file extracted in step 1 by typing the following command.

```
1 openstack image create --container-format bare --property
  hw_disk_bus=ide --disk-format qcow2 --file <path to qcow2 file>
  --public <name of the OpenStack image>
2
3 glance image-create --name="NS-VPX-12-0-26-2" --property
  hw_disk_bus=ide --ispublic=
4 true --container-format=bare --disk-format=qcow2< NSVPX-KVM
  -12.0-26.2_nc.qcow2
```

Figure 1: The following illustration provides a sample output for the glance image-create command.

Field	Value
checksum	154ade3fc7dca7d1706b1d03d7d97552

Provisioning the VPX instance

You can provision a VPX instance in two ways by using one of the options:

- Horizon (OpenStack dashboard)
- Nova boot command (OpenStack CLI)

Provision a VPX instance by using the OpenStack dashboard

Follow these steps to provision the VPX instance by using Horizon:

1. Log on to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select **Instances**.
3. In the Instances panel, click **Launch Instance** to open the Instance Launching wizard.

4. In the Launch Instance wizard, fill in the details, like:

- a) Instance Name
- b) Instance Flavor
- c) Instance Count
- d) Instance Boot Source
- e) Image Name

Launch Instance ✕

Details *
Access & Security *
Networking *
Post-Creation
Advanced Options

Availability Zone:
nova ▼

Instance Name: *
NSVPX_10_1

Flavor: *
m1.medium ▼

Instance Count: *
1

Instance Boot Source: *
Boot from image ▼

Image Name:
NS-VPX-10-1-130-11 (20.0 GB) ▼

Specify the details for launching an instance.

The chart below shows the resources used by this project in relation to the project's quotas.

Flavor Details

Name	m1.medium
VCPUs	2
Root Disk	40 GB
Ephemeral Disk	0 GB
Total Disk	40 GB
RAM	4,096 MB

Project Limits

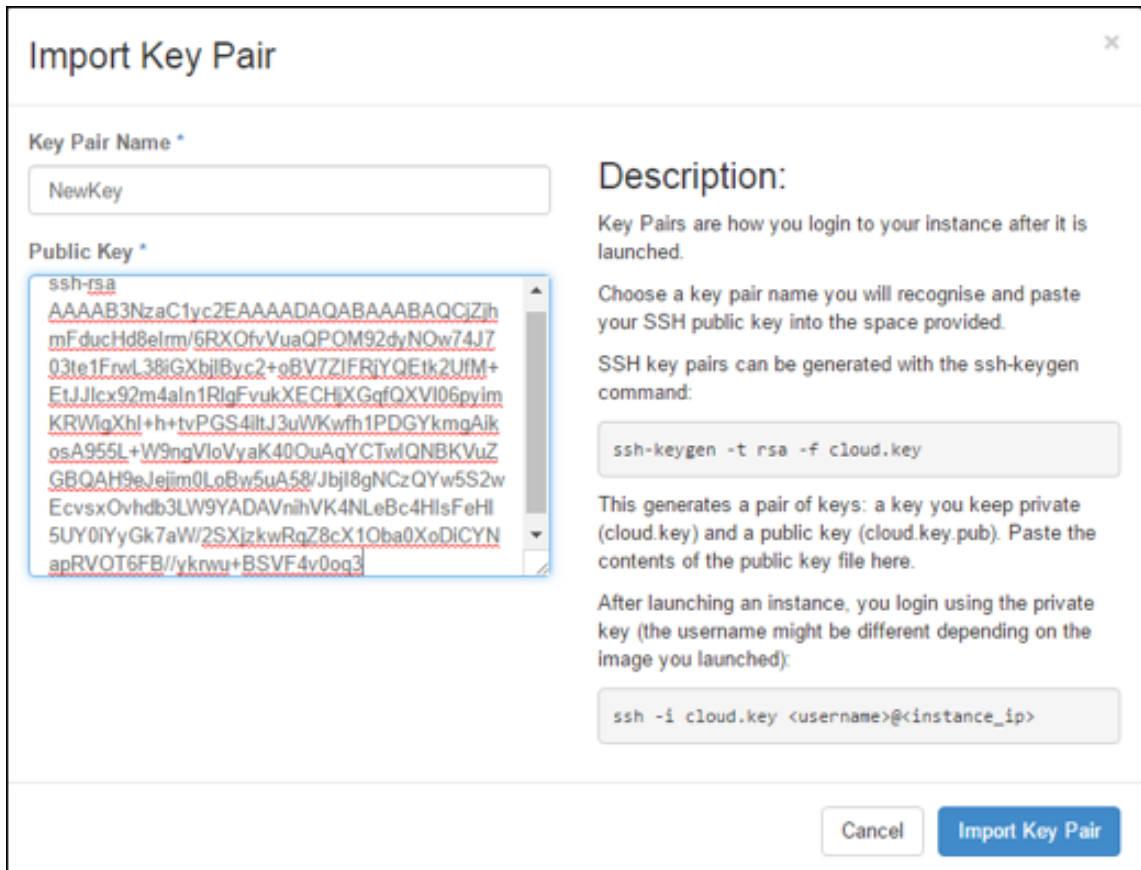

Number of Instances 6 of 10 Used

Number of VCPUs 12 of 20 Used

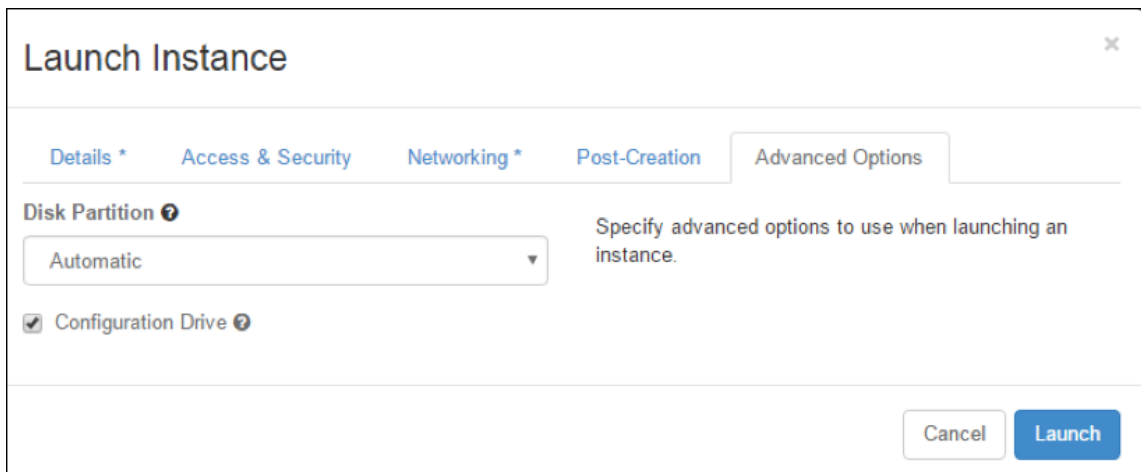

Total RAM 24,576 of 51,200 MB Used

Cancel
Launch

5. Deploy a new key pair or an existing key pair through Horizon by completing the following steps:
 - a) If you don't have an existing key pair, create the key by using any existing mechanisms. If you've an existing key, skip this step.
 - b) Copy the content of public key.
 - c) Go to **Horizon > Instances > Create New Instances**.
 - d) Click **Access & Security**.
 - e) Click the + sign next to the **Key Pair** drop-down menu and provide values for shown parameters.
 - f) Paste public key content in *Public key* box, give a name to the key and click **Import Key Pair**.

6. Click the **Post Creation** tab in the wizard. In Customization Script, add the content of the user data file. The user data file contains the IP address, Netmask and Gateway details, and customer scripts of the VPX instance.
7. After a key pair is selected or imported, check config-drive option and click **Launch**.

Provision the VPX instance by using OpenStack CLI

Follow these steps to provision a VPX instance by using OpenStack CLI.

1. To create an image from qcow2, type the following command:

```
openstack image create --container-format bare --property hw_disk_bus=ide --diskformat qcow2 --file NSVPX-OpenStack.qcow2 --public VPX-ToT-Image
```

2. To select an image for creating an instance, type the following command:

```
openstack image list | more
```

3. To create an instance of a particular flavor, type the following command to choose a flavor ID/Name of from a list:

```
openstack flavor list
```

4. To attach a NIC to a particular network, type the following command to choose a network ID from a network list:

```
openstack network list
```

5. To create an instance, type the following command:

```
1 openstack server create --flavor FLAVOR_ID --image IMAGE_ID --key-name KEY_NAME
2 --user-data USER_DATA_FILE_PATH --config-drive True --nic net-id=net-uuid
3 INSTANCE_NAME
4 openstack server create --image VPX-ToT-Image --flavor m1.medium
  --user-data
5 ovf.xml --config-drive True --nic net-id=2734911b-ee2b-48d0-a1b6-3
  efd44b761b9
6 VPX-ToT

Provision the NetScaler VPX instance by using the Virtual Machine Manager

May 2, 2023

The Virtual Machine Manager is a desktop tool for managing VM guests. It enables you to create new VM guests and various types of storage, and manage virtual networks. You can access the graphical console of VM guests with the built-in VNC viewer and view performance statistics, either locally or remotely.

After installing your preferred Linux distribution, with KVM virtualization enabled, you can proceed with provisioning virtual machines.

While using the Virtual Machine Manager to provision a NetScaler VPX instance, you have two options:

- Enter the IP address, gateway, and netmask manually
- Assign the IP address, gateway, and netmask automatically (auto-provisioning)

You can use two kinds of images to provision a NetScaler VPX instance:

- RAW
- QCOW2

You can convert a NetScaler VPX RAW image to a QCOW2 image and provision the NetScaler VPX instance. To convert the RAW image to a QCOW2 image, type the following command:

```
qemu-img convert -O qcow2 original-image.raw image-converted.qcow
```

For example:

```
qemu-img convert -O qcow2 NSVPX-KVM-11.1-12.5_nc.raw NSVPX-KVM-11.1-12.5_nc.qcow
```

A typical NetScaler VPX deployment on KVM includes the following steps:

- Checking prerequisites for Auto-Provisioning a NetScaler VPX Instance
- Provisioning the NetScaler VPX Instance by Using a RAW Image
- Provisioning the NetScaler VPX Instance by Using a QCOW2 Image
- Adding Additional Interfaces to a VPX Instance by using Virtual Machine Manager

Check prerequisites for auto-provisioning a NetScaler VPX instance

Auto-provisioning is an optional feature, and it involves using data from the CDROM drive. If this feature is enabled, you need not enter the management IP address, network mask, and default gateway of the NetScaler VPX instance during initial setup.

You need to complete the following tasks before you can auto-provision a VPX instance:

1. Create a customized Open Virtualization Format (OVF) XML file or user data file.
2. Convert the OVF file into an ISO image by using an online application (for example PowerISO).
3. Mount the ISO image on the KVM host by using any secure copy (SCP)-based tools.

Sample OVF XML file:

Here's is an example of the contents an OVF XML file, which you can use as a sample to create your file.

```
1 <?xml version="1.0" encoding="UTF-8" standalone="no"?>
2
3 <Environment xmlns:oe="`http://schemas.dmtf.org/ovf/environment/1"`
4
5 xmlns:xsi="`http://www.w3.org/2001/XMLSchema-instance"`
6
7 oe:id=""
8
9 xmlns="`http://schemas.dmtf.org/ovf/environment/1"`
10
11 xmlns:cs="`http://schemas.citrix.com/openstack">`
12
13 <PlatformSection>
14
15 <Kind></Kind>
```

```
16
17 <Version>2016.1</Version>
18
19 <Vendor>VPX</Vendor>
20
21 <Locale>en</Locale>
22
23 </PlatformSection>
24
25 <PropertySection>
26
27 <Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
28
29 <Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
30
31 <Property oe:key="com.citrix.netscaler.orch\_env" oe:value="KVM"/>
32
33 <Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
34
35 <Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="
    255.255.255.0"/>
36
37 <Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1
    "/>
38
39 </PropertySection>
40
41 </Environment>
42 <!--NeedCopy-->
```

In the OVF XML file preceding, “PropertySection” is used for NetScaler networking configuration. When you create the file, specify values for the parameters that are highlighted at the end of the example:

- Management IP address
- Netmask
- Gateway

Important

If the OVF file is not properly XML formatted, the VPX instance is assigned the default network configuration, not the values specified in the file.

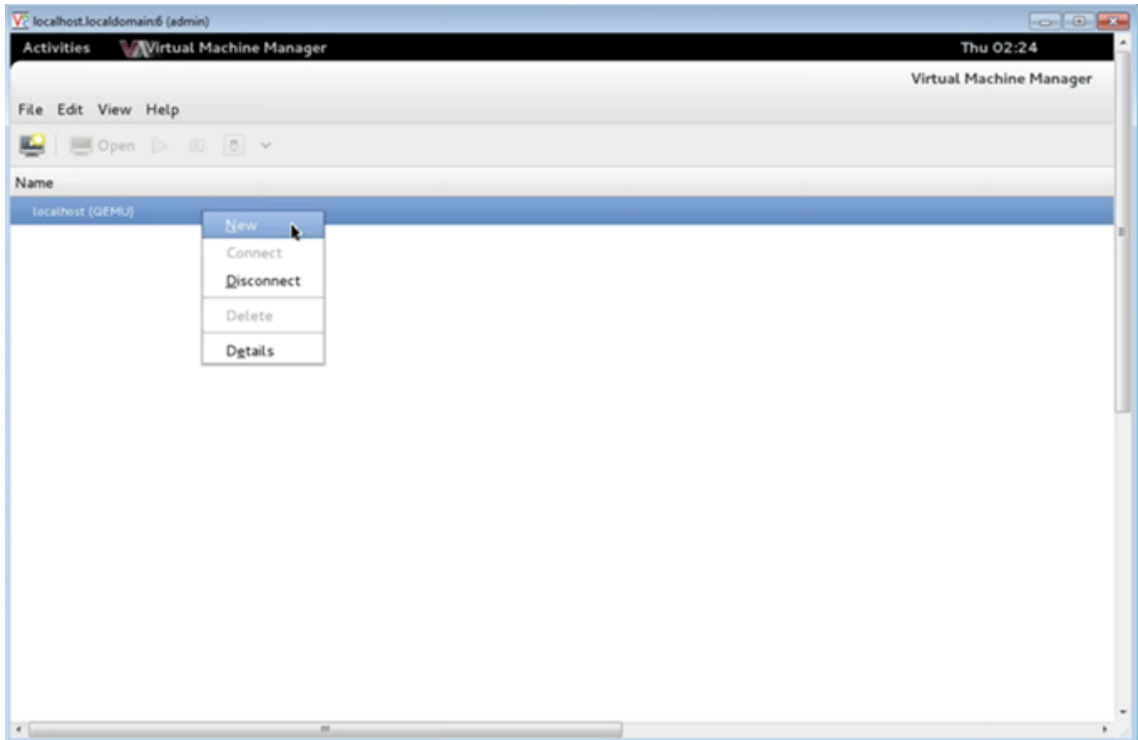

Provision the NetScaler VPX instance by using a RAW image

The Virtual Machine Manager enables you to provision a NetScaler VPX instance by using a RAW image.

To provision a NetScaler VPX instance by using the Virtual Machine Manager, follow these steps:

1. Open the Virtual Machine Manager (**Application > System Tools > Virtual Machine Manager**) and enter the logon credentials in the **Authenticate** window.

2. Click the  icon or right-click **localhost (QEMU)** to create a new NetScaler VPX instance.

3. In the **Name** text box, enter a name for the new VM (for example, NetScaler-VPX).
4. In the **New VM** window, under “Choose how you would like to install the operating system,” select **Import existing disk image**, and then and click **Forward**.

5. In the **Provide the existing storage path** field, navigate the path to the image. Choose the OS type as UNIX and Version as FreeBSD 6.x. Then, click **Forward**.

6. Under **Choose Memory and CPU** settings select the following settings, and then click **Forward**:
- Memory (RAM)—2048 MB
 - CPUs—2

7. Select the **Customize configuration before install** check box. Optionally, under **Advanced options** you can customize the MAC address. Make sure the **Virt Type** selected is KVM and the Architecture selected is x86_64. Click **Finish**.

8. Select a NIC and provide the following configuration:
- Source device—`ethX` `macvtap` or `Bridge`
 - Device model—`virtio`
 - Source mode—`Bridge`

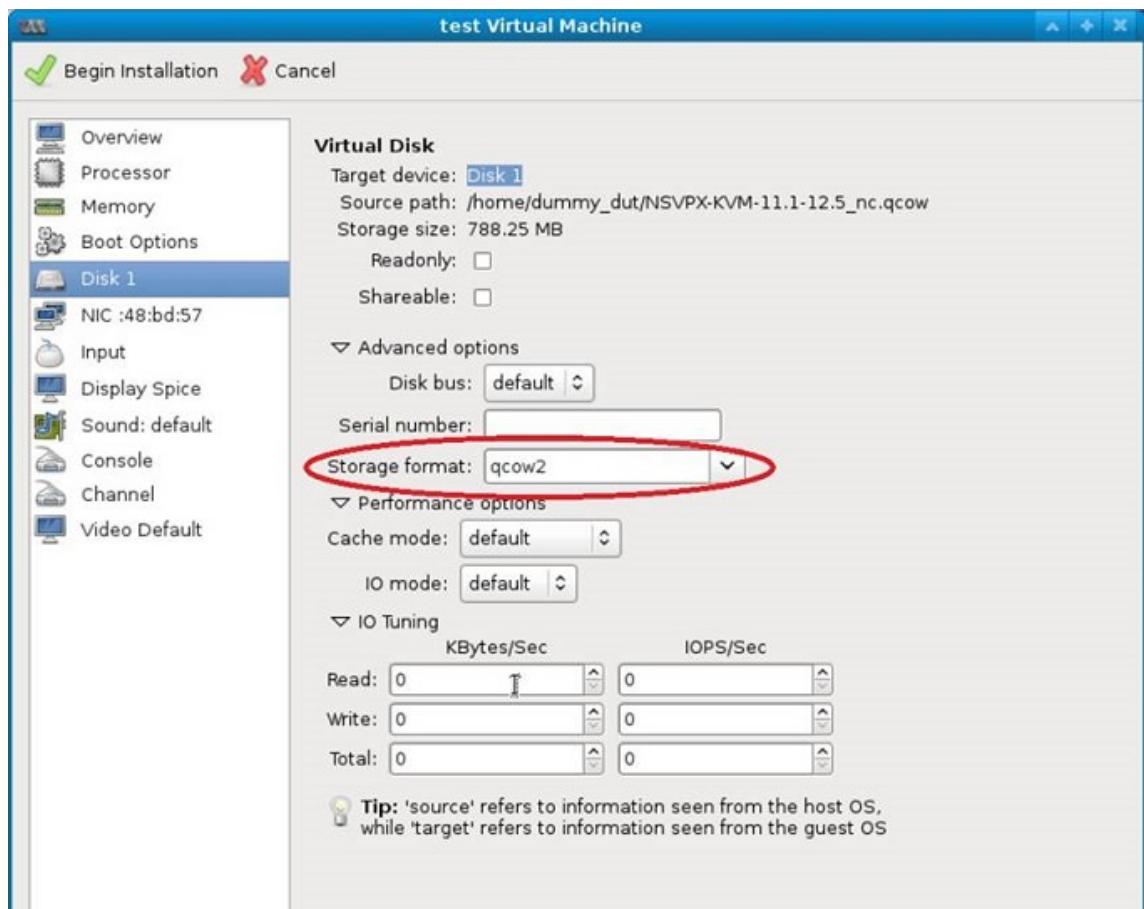

9. Click **Apply**.
10. If you want to auto-provision the VPX instance, see the section **Enabling Auto-Provisioning by Attaching a CDROM Drive** in this document. Otherwise, click **Begin Installation**. After you have provisioned the NetScaler VPX on KVM, you can add more interfaces.

Provision the NetScaler VPX instance by using a QCOW2 image

Using the Virtual Machine Manager, you can provision the NetScaler VPX instance by using a QCOW2 image.

To provision a NetScaler VPX instance by using a QCOW2 image, follow these steps:

1. Follow **step 1 to step 8** in [Provision the NetScaler VPX instance by using a RAW image](#).
Note: Ensure that you select **qcow2** image in **step 5**.
2. Select **Disk 1** and click **Advanced options**.
3. Select **qcow2** from the Storage format drop-down list.

4. Click **Apply**, and then click **Begin Installation**. After you have provisioned the NetScaler VPX on KVM, you can add more interfaces.

Enable auto-provisioning by attaching a CDROM drive

1. Click Add **Hardware** > **Storage** > **Device type** > **CDROM device**.
2. Click **Manage** and select the correct ISO file that you mounted in the “Prerequisites for Auto-Provisioning a NetScaler VPX Instance” section, and click **Finish**. A new CDROM under Resources on your NetScaler VPX instance is created.

3. Power on the VPX instance, and it auto-provisions with the network configuration provided in the OVF file, as shown in the example screen capture.

```

```

4. If auto-provision fails, the instance comes up with the default IP address (192.168.100.1). In that case, you must complete the initial configuration manually. For more information, see [Configure the ADC for the first time](#).

Add more interfaces to the NetScaler VPX instance by using the Virtual Machine Manager

After you have provisioned the NetScaler VPX instance on KVM, you can add additional interfaces.

To add more interfaces, follow these steps.

1. Shut down the NetScaler VPX instance running on the KVM.
2. Right-click the VPX instance and choose **Open** from the pop-up menu.

3. Click the  icon in the header to view the virtual hardware details.
4. Click **Add Hardware**. In the **Add New Virtual Hardware window**, select **Network** from the navigation menu.

5. In **Host Device** field, select the physical interface type. The host device type can be either Bridge or MacVTap. In case of MacVTap, four modes possible are VEPA, Bridge, Private, and Pass-through.

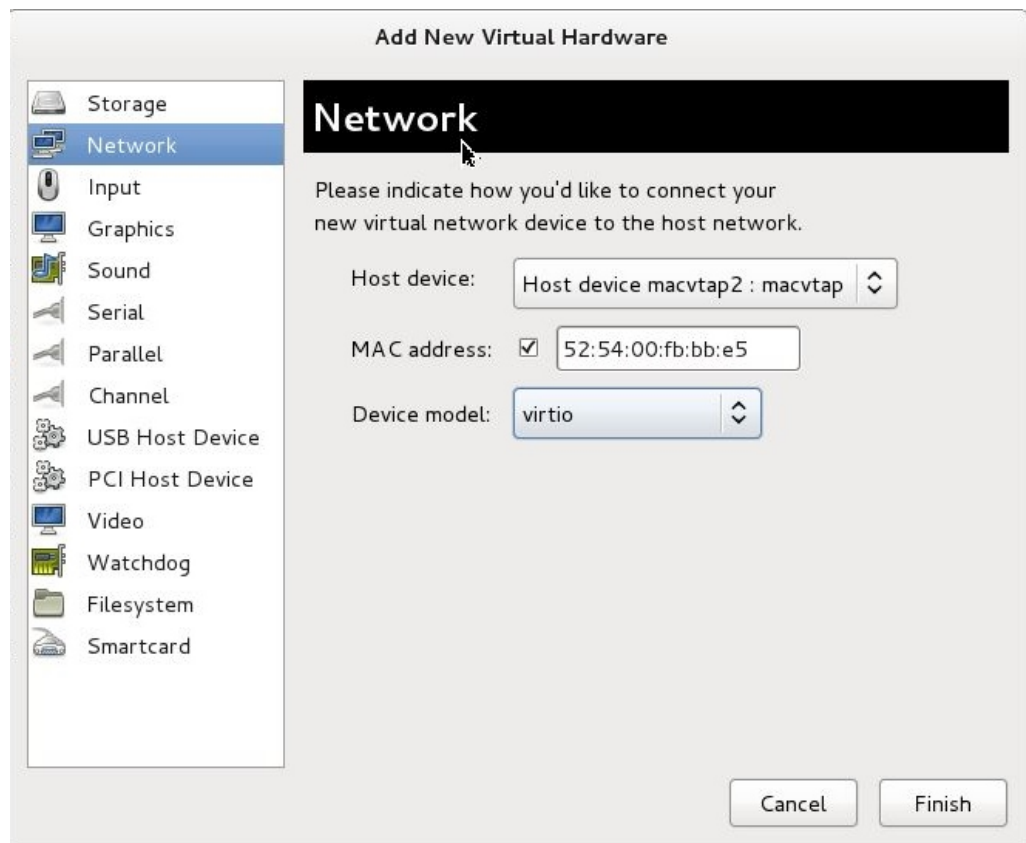

a) For Bridge

- i. Host device—Select the “Specify shared device name” option.
- ii. Provide the Bridge name that is configured in the KVM host.

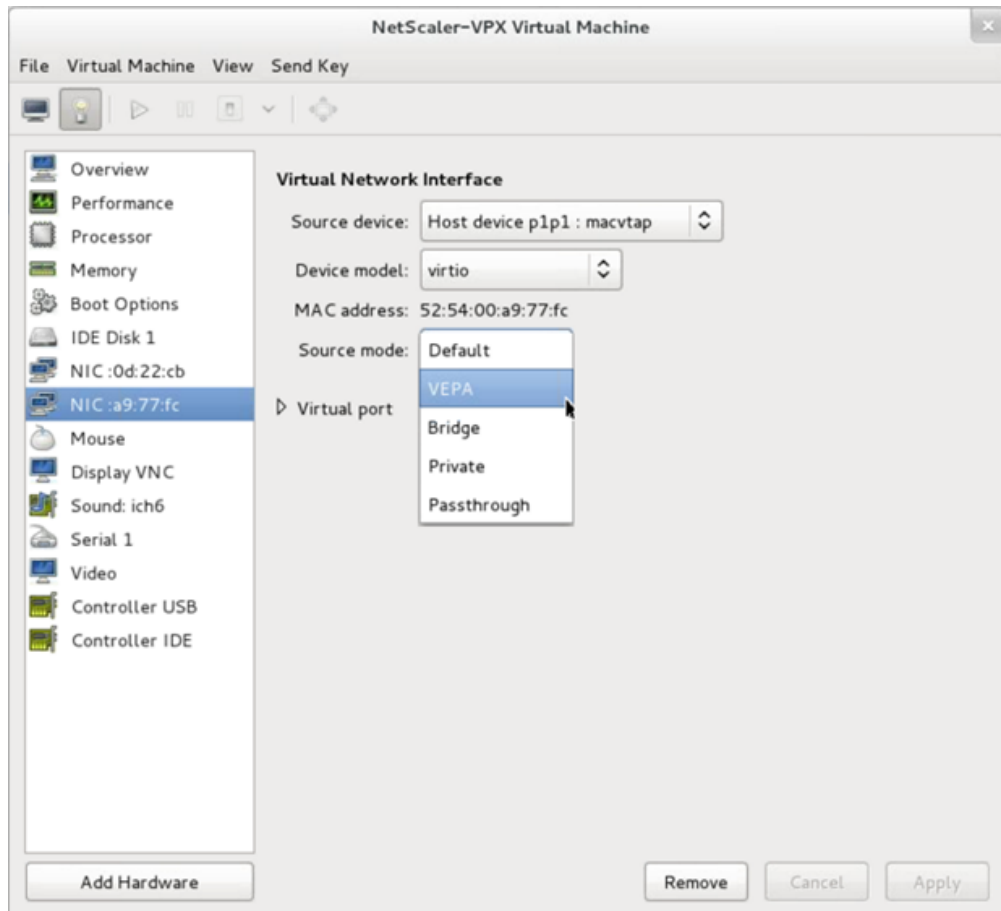

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- iii. Device model—`virtio`.
 - iv. Click Finish.
- b) For MacVTap
- i. Host device—Select the physical interface from the menu.
 - ii. Device model—`virtio`.

iii. Click Finish. You can view the newly added NIC in the navigation pane.

- iv. Select the newly added NIC and select the Source mode for this NIC. The available modes are VEPA, Bridge, Private, and Passthrough. For more details on the interface and modes, see Source Interface and Modes.
- v. Click Apply.

6. If you want to auto-provision the VPX instance, see the section “Adding a Config Drive to Enable Auto-Provisioning” in this document. Otherwise, power on the VPX instance to complete the initial configuration manually.

Important

Interface parameter configurations such as speed, duplex, and autonegotiation are not supported.

Configure a NetScaler VPX instance to use SR-IOV network interfaces

May 2, 2023

You can configure a NetScaler VPX instance running on Linux-KVM platform using single root I/O virtualization (SR-IOV) with the following NICs:

- Intel 82599 10G
- Intel X710 10G
- Intel XL710 40G
- Intel X722 10G

This section describes how to:

- Configure a NetScaler VPX Instance to Use SR-IOV Network Interface
- Configure Static LA/LACP on the SR-IOV Interface
- Configure VLAN on the SR-IOV Interface

Limitations

Keep the limitations in mind while using Intel 82599, X710, XL710, and X722 NICs. The following features not supported.

Limitations for Intel 82599 NIC:

- L2 mode switching.
- Admin partitioning (shared VLAN mode).
- High availability (active-active mode).
- Jumbo frames.
- IPv6: You can configure only up to 30 unique IPv6 addresses in a VPX instance if you've at least one SR-IOV interface.
- VLAN configuration on Hypervisor for SRIOV VF interface through `ip link` command is not supported.
- Interface parameter configurations such as speed, duplex, and autonegotiations are not supported.

Limitations for Intel X710 10G, Intel XL710 40G, and Intel X722 10G NICs:

- L2 mode switching.
- Admin partitioning (shared VLAN mode).
- In a cluster, Jumbo frames are not supported when the XL710 NIC is used as a data interface.
- Interface list reorders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- Interface name is 40/X for Intel X710 10G, Intel XL710 40G, and Intel X722 10G NICs
- Up to 16 Intel XL710/X710/X722 SRIOV or PCI passthrough interfaces can be supported on a VPX instance.

Note: For Intel X710 10G, Intel XL710 40G, and Intel X722 10G NICs to support IPv6, you need to enable trust mode on the Virtual Functions (VFs) by typing the following command on the KVM host:

```
# ip link set <PNIC> <VF> trust on
```

Example:

```
# ip link set ens785f1 vf 0 trust on
```

Prerequisites

Before you configure a NetScaler VPX instance to use SR-IOV network interfaces, complete the following prerequisite tasks. See the NIC column for details about how to complete the corresponding tasks.

Task	Intel 82599 NIC	Intel X710, XL710, and X722 NICs
1. Add the NIC to the KVM host.	-	-
1. Download and install the latest Intel driver.	IXGBE driver	I40E driver
1. Block list the driver on the KVM host.	Add the following entry in the /etc/modprobe.d/blacklist.conf file: <code>blacklist ixgbevf</code> . Use IXGBE driver version 4.3.15 (recommended).	Add the following entry in the /etc/modprobe.d/blacklist.conf file: <code>blacklist i40evf</code> . Use i40e driver version 2.0.26 (recommended).

Task	Intel 82599 NIC	Intel X710, XL710, and X722 NICs
<p>4.Enable SR-IOV Virtual Functions (VFs) on the KVM host. In both the commands in the next two columns: <code>number_of_VFs</code> = the number of Virtual VFs that you want to create. <code>device_name</code> = the interface name.</p> <p>1. Make the VFs persistent by adding the commands that you used to create VFs, to the <code>rc.local</code> file.</p>	<p>If you are using earlier version of kernel 3.8, then add the following entry to the <code>/etc/modprobe.d/ixgbe</code> file and restart the KVM host:</p> <pre>options ixgbe max_vfs =<number_of_VFs>.</pre> <p>If you are using kernel 3.8 version or later, create VFs using the following command:</p> <pre>echo <number_of_VFs> > /sys/class/net/<device_name>/device/sriov_numvfs.</pre> <p>See example in figure 1.</p> <p>See example in figure 3.</p>	<p>If you are using earlier version of kernel 3.8, then add the following entry to the <code>/etc/modprobe.d/i40e.conf</code> file and restart the KVM host:</p> <pre>options i40e max_vfs =<number_of_VFs>.</pre> <p>If you are using kernel 3.8 version or later, create VFs using the following command:</p> <pre>echo<number_of_VFs> > /sys/class/net/<device_name>/device/sriov_numvfs.</pre> <p>See example in figure 2.</p> <p>See example in figure 3.</p>

Important

When you create the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

Figure 1: Enable SR-IOV VFs on the KVM host for Intel 82599 10G NIC.

Figure 2: Enable SR-IOV VFs on the KVM host for Intel X710 10G and XL710 40G NICs.

Configure a NetScaler VPX instance to use SR-IOV network interface

To configure the NetScaler VPX instance to use SR-IOV network interface by using Virtual Machine Manager, complete these steps:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and then select Open.

3. In the <virtual machine on KVM> window, select the **i** icon.

4. Select **Add Hardware**.

5. In the **Add New Virtual Hardware** dialog box, do the following:
 - a) Select PCI Host Device.
 - b) In the Host Device section, select the VF you have created and click Finish.

Figure 4: VF for Intel 82599 10G NIC

Figure 5: VF for Intel XL710 40G NIC

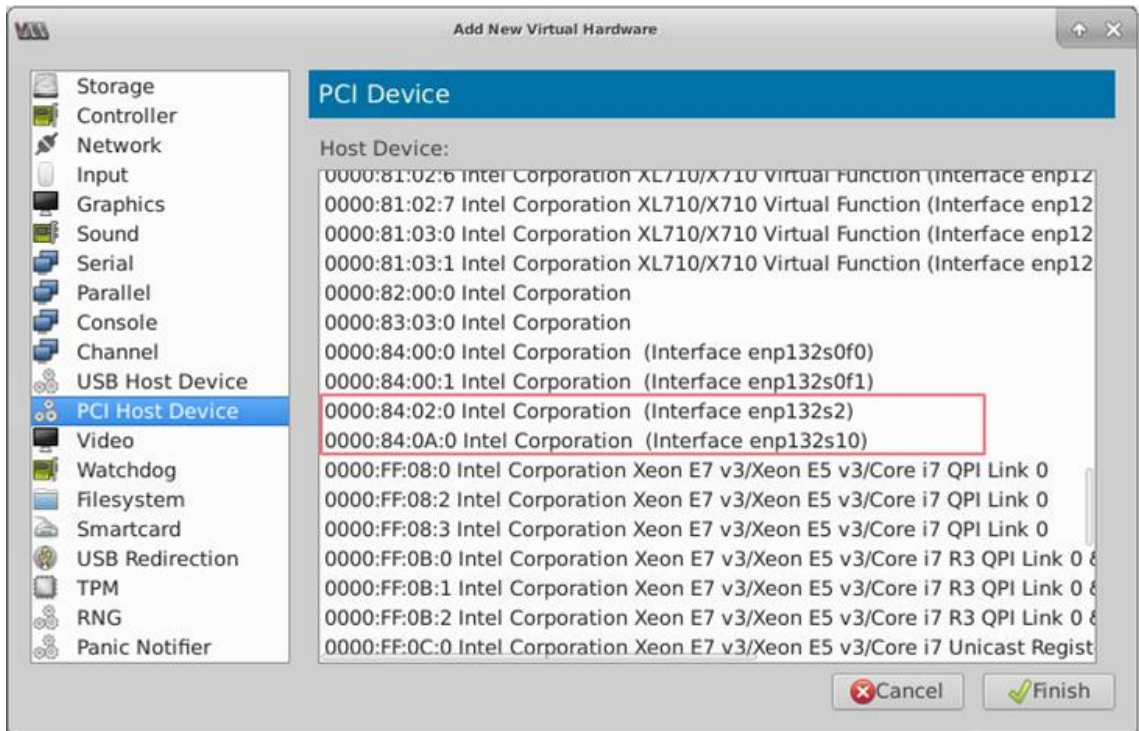

Figure 6: VF for Intel X722 10G NIC

6. Repeat Step 4 and 5 to add the VFs that you have created.
7. Power on the NetScaler VPX instance.
8. After the NetScaler VPX instance powers on, use the following command to verify the configuration:

```

1 show interface summary
2 <!--NeedCopy-->
    
```

The output shows all the interfaces that you configured.

Figure 6: output summary for Intel 82599 NIC.

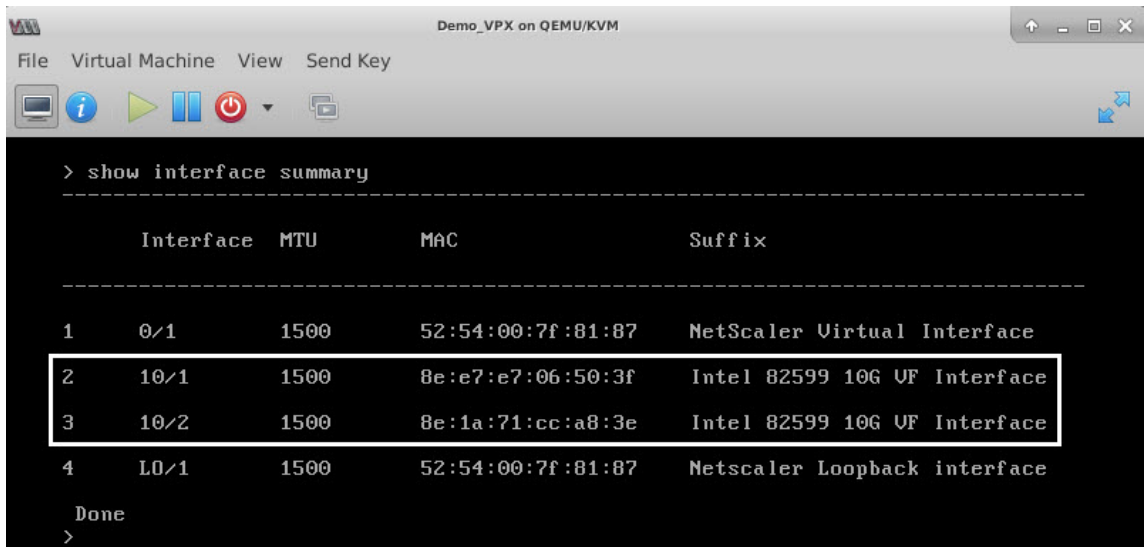

Figure 7. Output summary for Intel X710 and XL710 NICs.

Configure static LA/LACP on the SR-IOV interface

Important

When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

To use the SR-IOV VFs in link aggregation mode, disable spoof checking for VFs that you have created. On the KVM host, use the following command to disable spoof checking:

```
*ip link set \<interface\_name\> vf \<VF\_id\> spoofchk off*
```

Where:

- Interface_name –is the interface name.
- VF_id –is the Virtual Function id.

Example:

```
Terminal - root@ubuntu: /etc
File Edit View Terminal Tabs Help
root@ubuntu:/etc# ip link show ens3f0

    vf 0 MAC 8e:1a:71:cc:a8:3e, spoof checking off, link-state auto
root@ubuntu:/etc#
```

After you disable spoof checking for all the VFs that you have created. Restart the NetScaler VPX instance and configure link aggregation. For detailed instructions, see [Configuring Link Aggregation](#).

Configuring VLAN on the SR-IOV Interface

You can configure VLAN on SR-IOV VFs. For detailed instructions, see [Configuring a VLAN](#).

Important

Ensure that the KVM host does not contain VLAN settings for the VF interface.

Configure a NetScaler VPX on the KVM hypervisor to use Intel QAT for SSL acceleration in SR-IOV mode

February 14, 2024

The NetScaler VPX instance on the Linux KVM hypervisor can use the Intel QuickAssist Technology (QAT) to accelerate the NetScaler SSL performance. Using Intel QAT, all heavy-latency crypto processing can be offloaded to the chip thus freeing up one or more host CPUs to do other tasks.

Previously, all NetScaler data path crypto processing was done in the software using host vCPUs.

Note:

Currently, NetScaler VPX supports only the C62x chip model under Intel QAT family. This feature is supported starting from NetScaler release 14.1 build 8.50.

Prerequisites

- The Linux host is equipped with an Intel QAT C62x chip, either as a SoC or as an external PCI card.
- The NetScaler VPX meets the VMware ESX hardware requirements. For more information, see [Install a NetScaler VPX instance on Linux KVM platform](#).

Limitations

There's no provision to reserve crypto units or bandwidth for individual VMs. All the available crypto units of any Intel QAT hardware are shared across all VMs using the QAT hardware.

Set up the host environment for using Intel QAT

1. Download and install the Intel-provided driver for the C62x series (QAT) chip model in the Linux host. For more information on the Intel package downloads and installation instructions, see [Intel QuickAssist Technology Driver for Linux](#).

A readme file is available as part of the download package. This file provides instructions about compiling and installing the package in the host.

After you download and install the driver, perform the following sanity checks:

- Note the number of C62x chips. Each C62x chip has up to 3 PCIe endpoints.
- Make sure that all the endpoints are UP. Run the `adf_ctl status` command to display the status of all the PF endpoints (up to 3).

```
1 root@Super-Server:~# adf_ctl status
2
3 Checking status of all devices.
4 There is 51 QAT acceleration device(s) in the system
5 qat_dev0 - type: c6xx, inst_id: 0, node_id: 0, bsf: 0000:1
   a:00.0, #accel: 5 #engines: 10 state: up
6 qat_dev1 - type: c6xx, inst_id: 1, node_id: 0, bsf: 0000:1
   b:00.0, #accel: 5 #engines: 10 state: up
7 qat_dev2 - type: c6xx, inst_id: 2, node_id: 0, bsf: 0000:1
   c:00.0, #accel: 5 #engines: 10 state: up
8 <!--NeedCopy-->
```

- Enable SRIOV (VF support) for all QAT endpoints.

```
1 root@Super-Server:~# echo 1 > /sys/bus/pci/devices/0000\:1a
   \:00.0/sriov_numvfs
2 root@Super-Server:~# echo 1 > /sys/bus/pci/devices/0000\:1b
   \:00.0/sriov_numvfs
3 root@Super-Server:~# echo 1 > /sys/bus/pci/devices/0000\:1c
   \:00.0/sriov_numvfs
```

```
4
5 <!--NeedCopy-->
```

- Make sure that all VFs are displayed (16 VFs per endpoint, totaling to 48 VFs).
- Run the `adf_ctl status` command to verify that all the PF endpoints (up to 3) and the VFs of each Intel QAT chip are UP. In this example, the system has only one C62x chip. So, it has 51 endpoints (3 + 48 VFs) in total.

```
root@venkat-Super-Server:~# adf_ctl status
Checking status of all devices.
There is 47 QAT acceleration device(s) in the system:

root@venkat-Super-Server:~#
```

2. Enable SR-IOV on the Linux host.
3. Create virtual machines. When creating a VM, assign the appropriate number of PCI devices to meet the performance requirements.

Note:

Each C62x (QAT) chip can have up to three separate PCI endpoints. Each endpoint is a logical collection of VFs, and shares the bandwidth equally with other PCI endpoints of the chip. Each

endpoint can have up to 16 VFs that show up as 16 PCI devices. Add these devices to the VM to do the crypto acceleration using the QAT chip.

Points to note

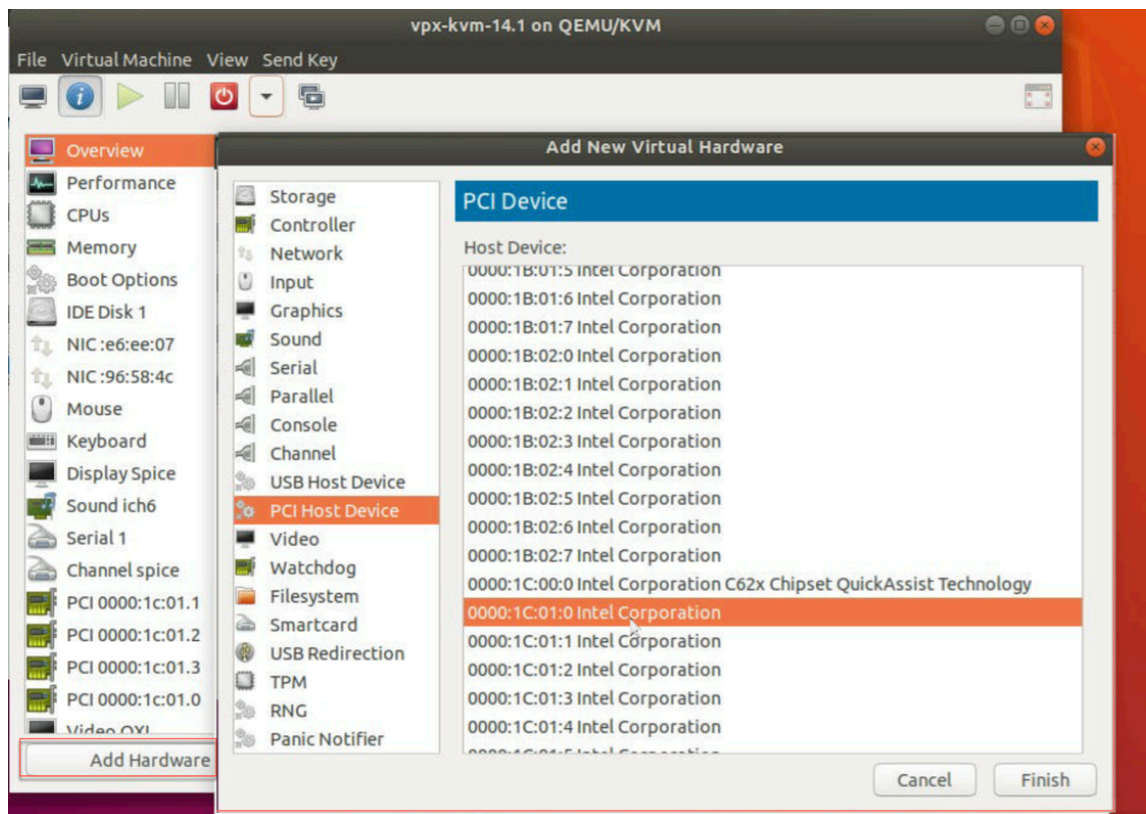

- If the VM crypto requirement is to use more than one QAT PCI endpoint/chip, we recommend that you pick the corresponding PCI devices/VFs in a round-robin fashion to have a symmetric distribution.
- We recommend that the number of PCI devices selected is equal to the number of licensed vCPUs (without including the management vCPU count). Adding more PCI devices than the available number of vCPUs does not necessarily improve the performance.

Example:

Consider a Linux host with one Intel C62x chip that has 3 endpoints. While provisioning a VM with 6 vCPUs, pick 2 VFs from each endpoint, and assign them to the VM. This assignment ensures an effective and equal distribution of crypto units for the VM. From the total available vCPUs, by default, one vCPU is reserved for the management plane, and the rest of the vCPUs are available for the data plane PEs.

Assign QAT VFs to NetScaler VPX deployed on Linux KVM hypervisor

1. In the Linux KVM virtual machine manager, make sure the VM (NetScaler VPX) is powered off.
2. Navigate to **Add hardware > PCI Host Device**.
3. Assign Intel QAT VF to the PCI device.

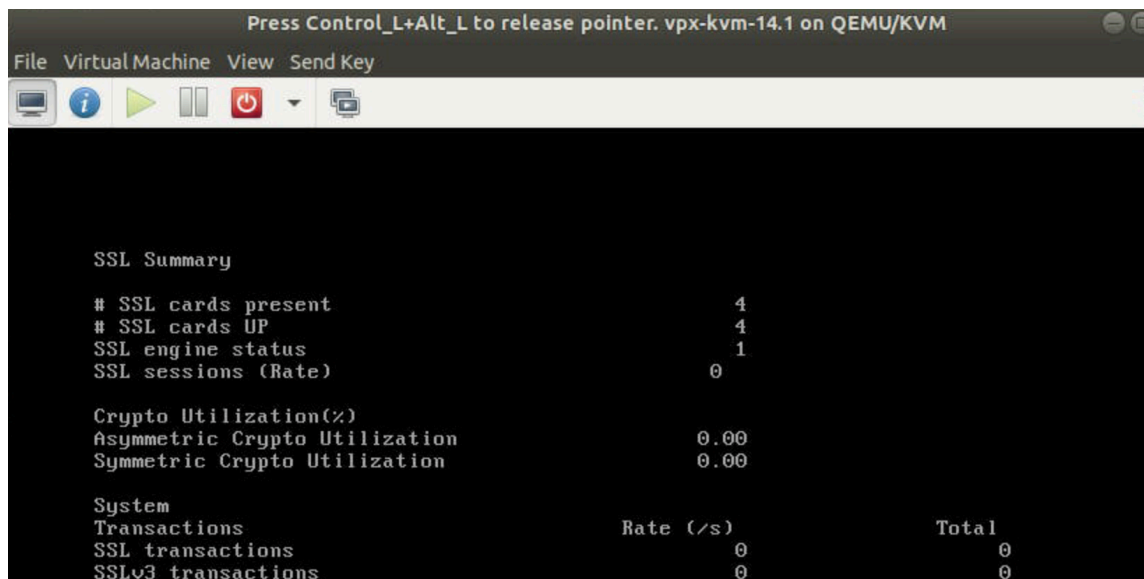

4. Click **Finish**.
5. Repeat the preceding steps to assign one or more Intel QAT VFs to the NetScaler VPX instance up to the limit of one less than the total number of vCPUs. Because One vCPU is reserved for the management process.

$$\text{Number of QAT VFs per VM} = \text{Number of vCPUs} - 1$$

6. Power on the VM.
7. Run the `stat ssl` command in the NetScaler CLI to display the SSL summary, and verify the SSL cards after assigning QAT VFs to NetScaler VPX.

In this example, we have used 5 vCPUs, which implies 4 packet engines (PEs).

```
Press Control_L+Alt_L to release pointer. vpx-kvm-14.1 on QEMU/KVM
File Virtual Machine View Send Key

```

About the deployment

This deployment was tested with the following component specifications:

- **NetScaler VPX Version and Build:** 14.1–8.50
- **Ubuntu Version:** 18.04, Kernel 5.4.0-146
- **Intel C62x QAT driver version for Linux:** L.4.21.0-00001

Configure a NetScaler VPX instance to use PCI passthrough network interfaces

May 2, 2023

After you have installed and configured a NetScaler VPX instance on the Linux-KVM platform, you can use the Virtual Machine Manager to configure the virtual appliance to use PCI passthrough network interfaces.

Prerequisites

- The firmware version of the Intel XL710 NIC (NIC) on the KVM Host is 5.04.
- The KVM Host supports input–output memory management unit (IOMMU) and Intel VT-d, and they are enabled in the BIOS of the KVM Host. On the KVM Host, to enable IOMMU, add the following entry to the `/boot/grub2/grub.cfg` file: **intel_iommu=1**

- Run the following command and reboot the KVM Host: **Grub2-mkconfig -o /boot/grub2/grub.cfg**

To configure NetScaler VPX instances to use PCI passthrough network interfaces by using the Virtual Machine Manager:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and click **Open**.

3. In the **virtual_machine on KVM>** window, click the **i** icon.

4. Click **Add Hardware**.
5. In the **Add New Virtual Hardware** dialog box, do the following:
 - a. Select **PCI Host Device**.
 - b. In the **Host Device** section, select the Intel XL710 physical function.
 - c. Click **Finish**.

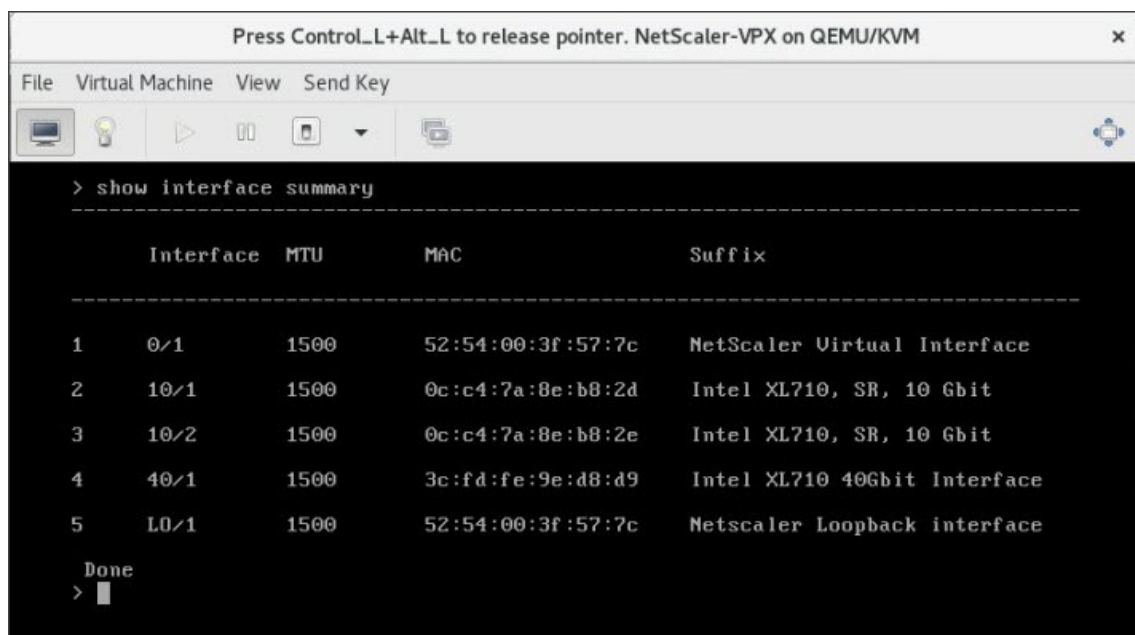

6. Repeat steps 4 and 5 to add any additional Intel XL710 physical functions.
7. Power on the NetScaler VPX instance.
8. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```

COMMAND
> show interface summary
    
```

The output must show all the interfaces that you configured:

```

> show interface summary
-----
      Interface  MTU      MAC                               Suffix
-----
1      0/1         1500    52:54:00:3f:57:7c    NetScaler Virtual Interface
2      10/1         1500    0c:c4:7a:8e:b8:2d    Intel XL710, SR, 10 Gbit
3      10/2         1500    0c:c4:7a:8e:b8:2e    Intel XL710, SR, 10 Gbit
4      40/1         1500    3c:fd:fe:9e:d8:d9    Intel XL710 40Gbit Interface
5      L0/1         1500    52:54:00:3f:57:7c    Netscaler Loopback interface

Done

```

Provision the NetScaler VPX instance by using the virsh program

May 2, 2023

The `virsh` program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest's status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The `virsh` program is also useful for scripting VM Guest management operations.

To provision NetScaler VPX by using the `virsh` program, follow these steps:

1. Use the `tar` command to untar the NetScaler VPX package. The `NSVPX-KVM-*_nc.tgz` package contains the following components:
 - The Domain XML file specifying VPX attributes [`NSVPX-KVM-*_nc.xml`]
 - Check sum of NS-VM Disk Image [`Checksum.txt`]
 - NS-VM Disk Image [`NSVPX-KVM-*_nc.raw`]

Example:

```

1 tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
2 NSVPX-KVM-10.1-117_nc.xml
3 NSVPX-KVM-10.1-117_nc.raw
4 checksum.txt
5 <!--NeedCopy-->

```

- Copy the NSVPX-KVM-*_nc.xml XML file to a file named <DomainName>-NSVPX-KVM-*_nc.xml. The <DomainName> is also the name of the virtual machine. Example:

```
1 cp NSVPX-KVM-10.1-117_nc.xml NetScaler-VPX-NSVPX-KVM-10.1-117_nc.xml
2 <!--NeedCopy-->
```

- Edit the <DomainName>-NSVPX-KVM-*_nc.xml file to specify the following parameters:

- name—Specify the name.
- Mac—Specify the MAC address.
Note: The domain name and the MAC address have to be unique.
- source file—Specify the absolute disk-image source path. The file path has to be absolute. You can specify the path of the RAW image file or a QCOW2 image file.

If you want to specify a RAW image file, specify the disk image source path as shown in the following example:

Example:

```
1 <name>NetScaler-VPX</name>
2 <mac address='52:54:00:29:74:b3' />
3 <source file='/root/NSVPX-KVM-10.1-117_nc.raw' />
4 <!--NeedCopy-->
```

Specify the absolute QCOW2 disk-image source path and define the driver type as **qcow2**, as shown in the following example:

Example:

```
1 <name>NetScaler-VPX</name>
2 <mac address='52:54:00:29:74:b3' />
3 <driver name='qemu' type='qcow2' />
4 <source file='/root/NSVPX-KVM-10.1-117_nc.qcow' />*
5 <!--NeedCopy-->
```

- Edit the <DomainName>-NSVPX-KVM-*_nc.xml file to configure the networking details:

- source dev—specify the interface.
- mode—specify the mode. The default interface is **Macvtap Bridge**.

Example: Mode: MacVTap Bridge Set target interface as **ethx** and mode as bridge Model type as **virtio**

```
1 <interface type='direct'>
2   <mac address='52:54:00:29:74:b3' />
3   <source dev='eth0' mode='bridge' />
4   <target dev='macvtap0' />
5   <model type='virtio' />
```

```

6     <alias name='net0' />
7     <address type='pci' domain='0x0000' bus='0x00' slot='0x03'
      function='0x0' />
8     </interface>
9     <!--NeedCopy-->

```

Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the <DomainName>-NSVPX-KVM-*_nc.xml file by using the following command: `virsh define <DomainName>-NSVPX-KVM-*_nc.xml` Example:

```

1  virsh define NS-VPX-NSVPX-KVM-10.1-117_nc.xml
2  <!--NeedCopy-->

```

Start the VM by entering the following command:

] Example

`virsh start` [

```

1  virsh start NetScaler-VPX
2  <!--NeedCopy-->

```

Connect the Guest VM through

] Example

the console `virsh console` [

```

1  virsh console NetScaler-VPX
2  <!--NeedCopy-->

```

Add more interfaces to NetScaler VPX instance using `virsh` program

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add more interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.

Edit the -NSVPX-KVM-*_nc.xml file using the `virsh edit` command: `virsh edit` [

2.

3. In the <DomainName>-NSVPX-KVM-*_nc.xml file, append the following parameters:

a) **For MacVTap**

- Interface type—Specify the interface type as ‘direct’.
- MAC address—Specify the MAC address and make sure the MAC address is unique across the interfaces.
- source dev—Specify the interface name.
- mode—Specify the mode. The modes supported are - Bridge, VEPA, Private, and Pass-through
- model type—Specify the model type as `virtio`

Example:

Mode: MacVTap Pass-through

Set target interface as

`ethx`, Mode as

bridge, and model type as

`virtio`

```

1 <interface type='direct'>
2     <mac address='52:54:00:29:74:b3' />
3     <source dev='eth1' mode='passthrough' />
4     <model type='virtio' />
5 </interface>
6 <!--NeedCopy-->

```

Here eth1 is the physical interface attached to the VM.

b) For Bridge Mode

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- Interface type—Specify the interface type as ‘bridge’.
- MAC address—Specify the MAC address and make sure the MAC address is unique across the interfaces.
- source bridge—Specify the bridge name.
- model type—Specify the model type as `virtio`

Example: Bridge Mode

```

1 <interface type='bridge'>
2     <mac address='52:54:00:2d:43:a4' />
3     <source bridge='br0' />
4     <model type='virtio' />
5 </interface>
6 <!--NeedCopy-->

```

Manage the NetScaler VPX guest VMs

May 2, 2023

You can use the Virtual Machine Manager and the `virsh` program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).

Manage the VPX guest VMs by using Virtual Machine Manager

- List the VM guests

The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine's name, along with its status (Running, Paused, or Shutoff) displayed as in the icon.

- Open a graphical console

Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

- Start and shut down a guest

You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.

- Reboot a guest

You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then select Shut Down > Reboot from the pop-up menu.

- Delete a guest

Deleting a VM Guest removes its XML configuration by default. You can also delete a guest's storage files. Doing so completely erases the guest.

1. In the Virtual Machine Manager, right-click the VM Guest entry.
2. Select Delete from the pop-up menu. A confirmation window opens.
Note: The Delete option is enabled only when the VM Guest is shut down.
3. Click Delete.
4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

Manage the NetScaler VPX guest VMs using the `virsh` program

- List the VM Guests and their current states.

To use `virsh` to display information about the Guests

```
virsh list --all
```

The command output displays all domains with their states. Example output:

1	Id	Name	State
2	-----		
3	0	Domain-0	running
4	1	Domain-1	paused
5	2	Domain-2	inactive
6	3	Domain-3	crashed
7	<!--NeedCopy-->		

- Open a `virsh` console.

Connect the Guest VM through the console

```
virsh console [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh console NetScaler-VPX
```

- Start and shut down a guest.

Guests can be started using the DomainName or Domain-UUID.

```
virsh start [<DomainName> | <DomainUUID>]
```

Example:

```
virsh start NetScaler-VPX
```

To shut down a guest:

```
virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh shutdown NetScaler-VPX
```

- Reboot a guest

```
virsh reboot [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh reboot NetScaler-VPX
```

Delete a guest

To delete a Guest VM you must shut down the Guest and undefine the <DomainName>-NSVPX-KVM-*_nc.xml before you run the delete command.

```
1 virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
2 virsh undefine [<DomainName> | <DomainUUID>]
3 <!--NeedCopy-->
```

Example:

```
1 virsh shutdown NetScaler-VPX
2 virsh undefine NetScaler-VPX
3 <!--NeedCopy-->
```

Note: The delete command doesn't remove disk image file which must be removed manually.

Provision the NetScaler VPX instance with SR-IOV, on OpenStack

May 2, 2023

You can deploy high-performance NetScaler VPX instances that use single-root I/O virtualization (SR-IOV) technology, on OpenStack.

You can deploy a NetScaler VPX instance that uses SR-IOV technology, on OpenStack, in three steps:

- Enable SR-IOV Virtual Functions (VFs) on the host.
- Configure and make the VFs available to OpenStack.
- Provision the NetScaler VPX on OpenStack.

Prerequisites

Ensure that you:

- Add the Intel 82599 NIC (NIC) to the host.
- Download and Install the latest IXGBE driver from Intel.
- Block list the IXGBEVF driver on the host. Add the following entry in the `/etc/modprobe.d/blacklist.conf` file: Block list `ixgbevf`

Note

The `ixgbe` driver version must be minimum 5.0.4.

Enable SR-IOV VFs on the host

Do one of the following steps to enable SR-IOV VFs:

- If you are using a kernel version earlier than 3.8, add the following entry to the `/etc/modprobe.d/ixgbe` file and restart the host: `options ixgbe max_vfs=<number_of_VFs>`

- If you are using kernel 3.8 version or later, create VFs by using the following command:

```
1     echo <number_of_VFs> > /sys/class/net/<device_name>/device/
      sriov_numvfs
2 <!--NeedCopy-->
```

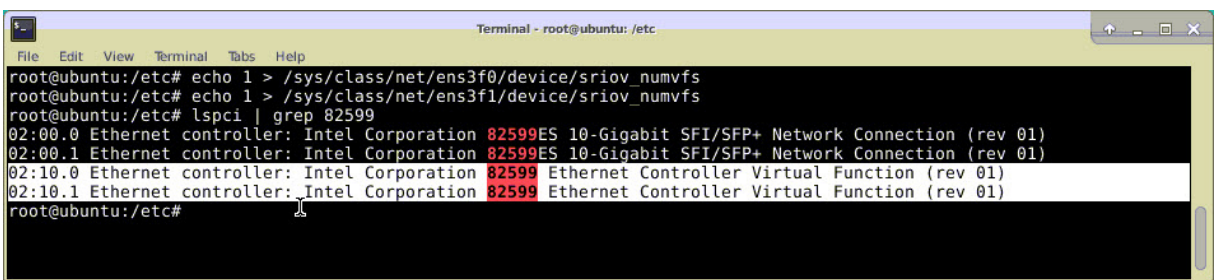

Where:

- number_of_VFs is the number of Virtual Functions that you want to create.
- device_name is the interface name.

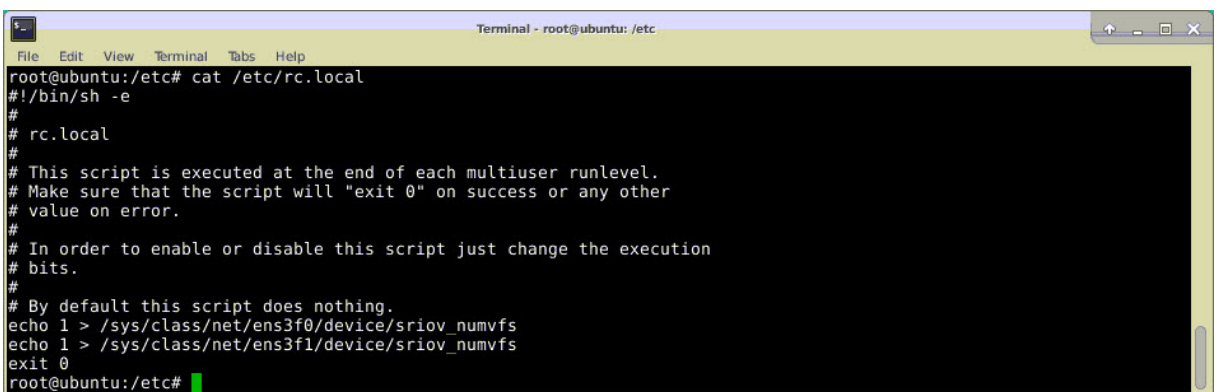

Important

While you are creating the SR-IOV VFs, make sure that you do not assign MAC addresses to the VFs.

Here is an example of four VFs being created.

Make the VFs persistent, add the commands that you used to created VFs to the **rc.local** file. Here is an example showing content of rc.local file.

For more information, see this [Intel SR-IOV Configuration Guide](#).

Configure and make the VFs available to OpenStack

Follow the steps given at the link below to configure SR-IOV on OpenStack: <https://wiki.openstack.org/wiki/SR-IOV-Passthrough-For-Networking>.

Provision the NetScaler VPX instance on OpenStack

You can provision a NetScaler VPX instance in an OpenStack environment by using the OpenStack CLI.

Provisioning a VPX instance, optionally involves using data from the config drive. The config drive is a special configuration drive that attaches to the instance when it boots. This configuration drive can be used to pass networking configuration information such as management IP address, network mask, and default gateway and so on to the instance before you configure the network settings for the instance.

When OpenStack provisions a VPX instance, it first detects that the instance is booting in an OpenStack environment, by reading a specific BIOS string (OpenStack Foundation) that indicates OpenStack. For Red Hat Linux distributions, the string is stored in `/etc/nova/release`. This is a standard mechanism that is available in all OpenStack implementations based on KVM hyper-visor platform. The drive must have a specific OpenStack label. If the config drive is detected, the instance attempts to read the following information from the file name specified in the `nova` boot command. In the procedures below, the file is called “`userdata.txt`.”

- Management IP address
- Network mask
- Default gateway

Once the parameters are successfully read, they are populated in the NetScaler stack. This helps in managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

Provision the NetScaler VPX instance on OpenStack through CLI

You can provision a VPX instance in an OpenStack environment by using the OpenStack CLI. Here’s the summary of the steps to provision a NetScaler VPX instance on OpenStack:

1. Extracting the `.qcow2` file from the `.tgz` file
2. Building an OpenStack image from the `qcow2` image
3. Provisioning a VPX instance

To provision a VPX instance in an OpenStack environment, do the following steps.

1. Extract the `qcow2` file from the `.tgz` file by typing the command:

```

1 tar xvzf <TAR file>
2 tar xvzf NSVPX-KVM-12.0-26.2_nc.tgz
3 NSVPX-KVM.xml
4 NSVPX-KVM-12.0-26.2_nc.qcow2
5 <!--NeedCopy-->

```

2. Build an OpenStack image using the `.qcow2` file extracted in step 1 by typing the following command:

```

1 glance image-create --name="<name of the OpenStack image>" --
  property hw_disk_bus=ide --is-public=true --container-format=
  bare --disk-format=qcow2< <name of the qcow2 file>
2
3 glance image-create --name="NS-VPX-12-0-26-2" --property
  hw_disk_bus=ide --is-public= true --container-format=bare --
  disk-format=qcow2< NSVPX-KVM-12.0-26.2_nc.qcow2
4 <!--NeedCopy-->

```

The following illustration provides a sample output for the `glance image-create` command.

Property	Value
checksum	735dae4ea6e46e39ed3f0acfba02e755
container_format	bare
created_at	2017-02-16T10:03:29Z
disk_format	qcow2
hw_disk_bus	ide
id	aeaa13e9-b49b-411c-ab54-c61820a8e2f3
min_disk	0
min_ram	0
name	NSVPX-KVM-12.0-26.2
owner	06c41a73b32f4b48af55359fd7d3502c

size	717946880
status	active
tags	[]
updated_at	2017-02-16T10:03:38Z
virtual_size	None
visibility	private

3. After an OpenStack image is created, provision the NetScaler VPX instance.

```

1 nova boot --image NSVPX-KVM-12.0-26.2 --config-drive=true --
  userdata
2 ./userdata.txt --flavor m1.medium --nic net-id=3b258725-eaae-

```

```

3 455e-a5de-371d6d1f349f --nic port-id=218ba819-9f55-4991-adb6-
4 02086a6bdee2 NSVPX-10
5 <!--NeedCopy-->

```

In the preceding command, userdata.txt is the file which contains the details like, IP address, netmask, and default gateway for the VPX instance. The user data file is a user customizable file. NSVPX-KVM-12.0-26.2 is the name of the virtual appliance that you want to provision. --NIC port-id=218ba819-9f55-4991-adb6-02086a6bdee2 is the OpenStack VF.

The following illustration gives a sample output of the `nova boot` command.

Property	Value
OS-DCF:diskConfig	MANUAL
OS-EXT-AZ:availability_zone	
OS-EXT-SRV-ATTR:host	-
OS-EXT-SRV-ATTR:hypervisor_hostname	-

```

Additional supported Configurations: Creating and Deleting VLANs on SR-IOV VFs from the Host

Type the following command to create a VLAN on the SR-IOV VF:

```
ip link show enp8s0f0 vf 6 vlan 10
```

In the preceding command “enp8s0f0” is the name of the physical function.

Example: VLAN 10, created on vf 6

```

4: enp8s0f0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT qlen 1000
   link/ether 00:1b:21:7b:d7:88 brd ff:ff:ff:ff:ff:ff
   vf 0 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 1 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 2 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 3 MAC fa:16:3e:1e:0b:ee, spoof checking on, link-state auto, trust off
   vf 4 MAC fa:16:3e:0d:05:62, spoof checking on, link-state auto, trust off
   vf 5 MAC 5e:46:0d:79:de:f8, spoof checking on, link-state auto, trust off
   vf 6 MAC fa:16:3e:db:ea:b3, vlan 10, spoof checking on, link-state auto, trust off
   vf 7 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off

```

Type the following command to delete a VLAN on the SR-IOV VF:

```
ip link show enp8s0f0 vf 6 vlan 0
```

Example: VLAN 10, removed from vf 6

```

[root@localhost ~]# ip link show enp8s0f0
4: enp8s0f0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT qlen 1000
   link/ether 00:1b:21:7b:d7:88 brd ff:ff:ff:ff:ff:ff
   vf 0 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 1 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 2 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 3 MAC fa:16:3e:1e:0b:ee, spoof checking on, link-state auto, trust off
   vf 4 MAC fa:16:3e:0d:05:62, spoof checking on, link-state auto, trust off
   vf 5 MAC 5e:46:0d:79:de:f8, spoof checking on, link-state auto, trust off
   vf 6 MAC fa:16:3e:db:ea:b3, spoof checking on, link-state auto, trust off
   vf 7 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off

```

These steps complete the procedure for deploying a NetScaler VPX instance that uses SRIOV technology, on OpenStack.

Configure a NetScaler VPX instance on KVM to use OVS DPDK-based host interfaces

May 2, 2023

You can configure a NetScaler VPX instance running on KVM (Fedora and RHOS) to use Open vSwitch (OVS) with Data Plane Development Kit (DPDK) for better network performance. This document describes how to configure the NetScaler VPX instance to operate on the `vhost-user` ports exposed by OVS-DPDK on the KVM host.

[OVS](#) is a multilayer virtual switch licensed under the open-source Apache 2.0 license. [DPDK](#) is a set of libraries and drivers for fast packet processing.

The following Fedora, RHOS, OVS, and DPDK versions are qualified for configuring a NetScaler VPX instance:

Fedora	RHOS
Fedora 25	RHOS 7.4
OVS 2.7.0	OVS 2.6.1
DPDK 16.11.12	DPDK 16.11.12

Prerequisites

Before you install DPDK, make sure the host has 1 GB huge pages.

For more information, see this [DPDK system requirements documentation](#). Here is a summary of the steps required to configure a NetScaler VPX instance on KVM to use OVS DPDK-based host interfaces:

- Install DPDK.
- Build and Install OVS.
- Create an OVS bridge.
- Attach a physical interface to the OVS bridge.
- Attach `vhost-user` ports to the OVS data path.
- Provision a KVM-VPX with OVS-DPDK based `vhost-user` ports.

Install DPDK

To install DPDK, follow the instruction given at this [Open vSwitch with DPDK](#) document.

Build and install OVS

Download OVS from the OVS [download page](#). Next, build, and install OVS by using a DPDK datapath. Follow the instructions given in the [Installing Open vSwitch](#) document.

For more detailed information, [DPDK Getting Started Guide for Linux](#).

Create an OVS bridge

Depending on your need, type the Fedora or RHOS command to create an OVS bridge:

Fedora command:

```
1 > $OVS_DIR/utilities/ovs-vsctl add-br ovs-br0 -- set bridge ovs-br0
   datapath_type=netdev
2 <!--NeedCopy-->
```

RHOS command:

```
1 ovs-vsctl add-br ovs-br0 -- set bridge ovs-br0 datapath_type=netdev
2 <!--NeedCopy-->
```

Attach the physical interface to the OVS bridge

Bind the ports to DPDK and then attach them to the OVS bridge by typing the following Fedora or RHOS commands:

Fedora command:

```
1 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 dpdk0 -- set Interface
   dpdk0 type=dppk options:dppk-devargs=0000:03:00.0
2
3 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 dpdk1 -- set Interface
   dpdk1 type=dppk options:dppk-devargs=0000:03:00.1
4 <!--NeedCopy-->
```

RHOS command:

```
1 ovs-vsctl add-port ovs-br0 dpdk0 -- set Interface dpdk0 type=dppk
   options:dppk-devargs=0000:03:00.0
2
3
```

```

4 ovs-vsctl add-port ovs-br0 dpdk1 -- set Interface dpdk1 type=dpdk
  options:dpdk-devargs=0000:03:00.1
5 <!--NeedCopy-->

```

The `dpdk-devargs` shown as part of the options specifies the PCI BDF of the respective physical NIC.

Attach vhost-user ports to the OVS data path

Type the following Fedora or RHOS commands to attach `vhost-user` ports to the OVS data path:

Fedora command:

```

1 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 vhost-user1 -- set
  Interface vhost-user1 type=dpdkvhostuser -- set Interface vhost-
  user1 mtu_request=9000
2
3 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 vhost-user2 -- set
  Interface vhost-user2 type=dpdkvhostuser -- set Interface vhost-
  user2 mtu_request=9000
4
5 chmod g+w /usr/local/var/run/openvswitch/vhost*
6 <!--NeedCopy-->

```

RHOS command:

```

1 ovs-vsctl add-port ovs-br0 vhost-user1 -- set Interface vhost-user1
  type=dpdkvhostuser -- set Interface vhost-user1 mtu_request=9000
2
3 ovs-vsctl add-port ovs-br0 vhost-user2 -- set Interface vhost-user2
  type=dpdkvhostuser -- set Interface vhost-user2 mtu_request=9000
4
5 chmod g+w /var/run/openvswitch/vhost*
6 <!--NeedCopy-->

```

Provision a KVM-VPX with OVS-DPDK-based vhost-user ports

You can provision a VPX instance on Fedora KVM with OVS-DPDK-based `vhost-user` ports only from the CLI by using the following QEMU commands:

Fedora command:

```

1 qemu-system-x86_64 -name KVM-VPX -cpu host -enable-kvm -m 4096M \
2
3 -object memory-backend-file,id=mem,size=4096M,mem-path=/dev/hugepages,
  share=on -numa node,memdev=mem \
4
5 -mem-prealloc -smp sockets=1,cores=2 -drive file=<absolute-path-to-disc
  -image-file>,if=none,id=drive-ide0-0-0,format=<disc-image-format> \

```

```
6
7 -device ide-drive,bus=ide.0,unit=0,drive=drive-ide0-0-0,id=ide0-0-0,
  bootindex=1 \
8
9 -netdev type=tap,id=hostnet0,script=no,downscript=no,vhost=on \
10
11 -device virtio-net-pci,netdev=hostnet0,id=net0,mac=52:54:00:3c:d1:ae,
  bus=pci.0,addr=0x3 \
12
13 -chardev socket,id=char0,path=</usr/local/var/run/openvswitch/vhost-
  user1> \
14
15 -netdev type=vhost-user,id=mynet1,chardev=char0,vhostforce -device
  virtio-net-pci,mac=00:00:00:00:00:01,netdev=mynet1,mrg_rxbuf=on \
16
17 -chardev socket,id=char1,path=</usr/local/var/run/openvswitch/vhost-
  user2> \
18
19 -netdev type=vhost-user,id=mynet2,chardev=char1,vhostforce -device
  virtio-net
20
21 pci,mac=00:00:00:00:00:02,netdev=mynet2,mrg_rxbuf=on \
22
23 --nographic
24 <!--NeedCopy-->
```

For RHOS, use the following sample XML file to provision the NetScaler VPX instance, by using `virsh`

```
1 <domain type='kvm'>

5     <source type='unix' path='/var/run/openvswitch/vhost-user1' mode=
6         'client' />
7
8     <model type='virtio' />
9
10    <address type='pci' domain='0x0000' bus='0x00' slot='0x04'
11        function='0x0' />
12 </interface>
13 <!--NeedCopy-->
```

To bring up the NetScaler VPX instance, start using the `virsh` command.

Apply NetScaler VPX configurations at the first boot of the NetScaler appliance on the KVM hypervisor

May 2, 2023

You can apply the NetScaler VPX configurations on the KVM hypervisor during the first boot of the NetScaler appliance. Therefore, a customer setup on a VPX instance can be configured in much lesser time.

For more information about Preboot user data and its format, see [Apply NetScaler VPX configurations at the first boot of the NetScaler appliance in cloud](#).

Note:

To bootstrap using preboot user data in KVM hypervisor, the default gateway configuration must be passed in `<NS-CONFIG>` section. For more information on the content of the `<NS-CONFIG>` tag, see the following Sample `<NS-CONFIG>` section.

Sample `<NS-CONFIG>` section:

```
1 <NS-PRE-BOOT-CONFIG>
2
3     <NS-CONFIG>
4         add route 0.0.0.0 0.0.0.0 10.102.38.1
```

```

5     </NS-CONFIG>
6
7     <NS-BOOTSTRAP>
8         <SKIP-DEFAULT-BOOTSTRAP>YES</SKIP-DEFAULT-BOOTSTRAP>
9         <NEW-BOOTSTRAP-SEQUENCE>YES</NEW-BOOTSTRAP-SEQUENCE>
10
11        <MGMT-INTERFACE-CONFIG>
12            <INTERFACE-NUM> eth0 </INTERFACE-NUM>
13            <IP> 10.102.38.216 </IP>
14            <SUBNET-MASK> 255.255.255.0 </SUBNET-MASK>
15        </MGMT-INTERFACE-CONFIG>
16    </NS-BOOTSTRAP>
17
18 </NS-PRE-BOOT-CONFIG>
19 <!--NeedCopy-->

```

How to provide preboot user data on KVM hypervisor

You can provide preboot user data on KVM hypervisor through an ISO file, which is attached using a CDROM device.

Provide user data using CDROM ISO file

You can use Virtual Machine Manager (VMM) to inject user data into the Virtual Machine (VM) as an ISO image using the CDROM device. KVM supports CD-ROMs in VM Guest either by directly accessing a physical drive on the VM host server or by accessing ISO images.

The following steps enable you to provide user data using the CDROM ISO file:

1. Create a file with file name `userdata` that contains the preboot user data content.

Note: File name must be strictly used as `userdata`.

2. Store the `userdata` file in a folder, and build an ISO image using the folder.

You can build an ISO image with `userdata` file by the following two methods:

- Using any image processing tool such as PowerISO.
- Using `mkisofs` command in Linux.

The following sample configuration shows how to generate an ISO image using the `mkisofs` command in Linux.

```

1 root@ubuntu:~/sai/19oct# ls -lh
2 total 4.0K
3 -rw-r--r-- 1 root root 1.1K Oct 19 16:25 userdata
4 root@ubuntu:~/sai/19oct#

```

```
5 root@ubuntu:~/sai/19oct# mkisofs -o kvm-userdata.iso userdata
6 I: -input-charset not specified, using utf-8 (detected in locale
  settings)
7 Total translation table size: 0
8 Total rockridge attributes bytes: 0
9 Total directory bytes: 0
10 Path table size(bytes): 10
11 Max brk space used 0
12 175 extents written (0 MB)
13 root@ubuntu:~/sai/19oct#
14 root@ubuntu:~/sai/19oct# ls -lh
15 total 356K
16 -rw-r--r-- 1 root root 350K Oct 19 16:25 kvm-userdata.iso
17 -rw-r--r-- 1 root root 1.1K Oct 19 16:25 userdata
18 <!--NeedCopy-->
```

3. Provision the NetScaler VPX instance using the standard deployment process to create the VM. But do not power on the VM automatically.
4. Add a CD-ROM device with Virtual Machine Manager using the following steps:
 - a) Double-click a VM Guest entry in the Virtual Machine Manager to open its console, and switch to the Details view with **View > Details**.
 - b) Click **Add Hardware > Storage > Device type > CDROM device**.
 - c) Click **Manage** and select the correct ISO file, and click **Finish**. A new CDROM under **Resources** on your NetScaler VPX instance is created.
5. Power on the VM.

NetScaler VPX on AWS

May 2, 2023

You can launch a NetScaler VPX instance on Amazon Web Services (AWS). The NetScaler VPX appliance is available as an Amazon Machine Image (AMI) in AWS marketplace. A NetScaler VPX instance on AWS enables you to use AWS cloud computing capabilities and use NetScaler load balancing and traffic management features for their business needs. The VPX instance supports all the traffic management features of a physical NetScaler appliance, and it can be deployed as standalone instances or in HA pairs. For more information on VPX features, see the [VPX data sheet](#).

Getting started

Before you get started with your VPX deployment, you must be familiar with the following information:

- [AWS terminology](#)
- [AWS-VPX support matrix](#)
- [Limitations and usage guidelines](#)
- [Prerequisites](#)
- [How a NetScaler VPX instance on AWS works](#)

Deploy a NetScaler VPX instance on AWS

In AWS, the following deployment types are supported for VPX instances:

- [Standalone](#)
- [High availability \(Active-Passive\)](#)
 - [High availability within same zone](#)
 - [High availability across different zones using Elastic IP](#)
 - [High availability across different zones using Private IP](#)
- [Active-Active GSLB](#)
- [Autoscaling \(Active-Active\) using ADM](#)

Hybrid Deployments

- [Deploy NetScaler in AWS Outpost](#)
- [Deploy NetScaler in VMC in AWS](#)

Licensing

A NetScaler VPX instance on AWS requires a license. The following licensing options are available for NetScaler VPX instances running on AWS:

- [Free \(unlimited\)](#)
- [Hourly](#)
- [Annual](#)
- [BYOL](#)
- [Free Trial \(all NetScaler VPX-AWS subscription offerings for 21 days free in AWS marketplace.\)](#)

Automation

- [NetScaler Console: Smart Deployment](#)
- [AWS Quick Starts: NetScaler VPX for Web Applications on AWS](#)

- [GitHub CFTs: NetScaler templates and scripts for AWS deployment](#)
- [GitHub Ansible: NetScaler templates and scripts for AWS deployment](#)
- [GitHub Terraform: NetScaler templates and scripts for AWS deployment](#)
- [AWS Pattern Library \(PL\): NetScaler VPX](#)

AWS terminology

February 24, 2021

This section describes the list of commonly used AWS terms and phrases. For more information, see [AWS Glossary](#).

Term	Definition
Amazon Machine Image (AMI)	A machine image, which provides the information required to launch an instance, which is a virtual server in the cloud.
Elastic Block Store	Provides persistent block storage volumes for use with Amazon EC2 instances in the AWS Cloud.
Simple Storage Service (S3)	Storage for the Internet. It is designed to make web-scale computing easier for developers.
Elastic Compute Cloud (EC2)	A web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers.
Elastic Load Balancing (ELB)	Distributes incoming application traffic across multiple EC2 instances, in multiple Availability Zones. This increases the fault tolerance of your applications.
Elastic network interface (ENI)	A virtual network interface that you can attach to an instance in a Virtual Private Cloud (VPC).
Elastic IP (EIP) address	A static, public IPv4 address that you have allocated in Amazon EC2 or Amazon VPC and then attached to an instance. Elastic IP addresses are associated with your account, not a specific instance. They are elastic because you can easily allocate, attach, detach, and free them as your needs change.
Instance type	Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instance types comprise varying combinations of CPU, memory, storage, and networking capacity and give you the flexibility to choose the appropriate mix of resources for your applications.

Term	Definition
Identity and Access Management (IAM)	An AWS identity with permission policies that determine what the identity can and cannot do in AWS. You can use an IAM role to enable applications running on an EC2 instance to securely access your AWS resources. IAM role is required for deploying VPX instances in a high-availability setup.
Internet Gateway	Connects a network to the Internet. You can route traffic for IP addresses outside your VPC to the Internet gateway.
Key pair	A set of security credentials that you use to prove your identity electronically. A key pair consists of a private key and a public key.
Route tables	A set of routing rules that controls the traffic leaving any subnet that is associated with the route table. You can associate multiple subnets with a single route table, but a subnet can be associated with only one route table at a time.
Security groups	A named set of allowed inbound network connections for an instance.
Subnets	A segment of the IP address range of a VPC that EC2 instances can be attached to. You can create subnets to group instances according to security and operational needs.
Virtual Private Cloud (VPC)	A web service for provisioning a logically isolated section of the AWS cloud where you can launch AWS resources in a virtual network that you define.
Auto Scaling	A web service to launch or terminate Amazon EC2 instances automatically based on user-defined policies, schedules, and health checks.
CloudFormation	A service for writing or changing templates that create and delete related AWS resources together as a unit.

AWS-VPX support matrix

April 25, 2024

The following tables list the supported VPX model and AWS regions, instance types, and services.

Table 1: Supported VPX models on AWS

Supported VPX model

NetScaler VPX Advanced - 200 Mbps
NetScaler VPX Premium - 1 Gbps
NetScaler VPX Premium - 5 Gbps
NetScaler VPX Express - 20 Mbps
NetScaler VPX - Customer Licensed
NetScaler VPX FIPS - Customer Licensed
NetScaler VPX FIPS ENA - Customer Licensed

Table 2: Supported AWS regions

Supported AWS regions

US West (Oregon)
US West (N. California)
US East (Ohio)
US East (N. Virginia)
Asia Pacific (Mumbai)
Asia Pacific (Seoul)
Asia Pacific (Singapore)
Asia Pacific (Sydney)
Asia Pacific (Tokyo)
Asia Pacific (Hong Kong)
Asia Pacific (Osaka)
Asia Pacific (Jakarta)

Supported AWS regions

Asia Pacific (Hyderabad)

Canada (Central)

EU (Frankfurt)

EU (Ireland)

EU (London)

EU (Paris)

EU (Milan)

South America (São Paulo)

AWS GovCloud (US-East)

AWS GovCloud (US-West)

AWS Top Secret (C2S)

Middle East (Bahrain)

Africa (Cape Town)

C2S

Note:

For AWS Hong Kong region, NetScaler VPX support is available only with BYOL licenses.

Table 3: Supported AWS instance types

Supported AWS instance types

c4.large, c4.xlarge, c4.2xlarge, c4.4xlarge, c4.8xlarge

c5.large, c5.xlarge, c5.2xlarge, c5.4xlarge, c5.9xlarge, c5.18xlarge, c5.24xlarge

c5n.large, c5n.xlarge, c5n.2xlarge, c5n.4xlarge, c5n.9xlarge, c5n.18xlarge

d2.xlarge, d2.2xlarge, d2.4xlarge, d2.8xlarge

m3.large, m3.xlarge, m3.2xlarge

m4.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m4.10xlarge, m4.16xlarge

m5.large, m5.xlarge, m5.2xlarge, m5.4xlarge, m5.8xlarge, m5.12xlarge, m5.16xlarge, m5.24xlarge

m5a.large, m5a.xlarge, m5a.2xlarge, m5a.8xlarge, m5a.12xlarge, m5a.16xlarge, m5a.24xlarge

Supported AWS instance types

m6i.large, m6i.xlarge, m6i.2xlarge, m6i.4xlarge, m6i.8xlarge, m6i.12xlarge, m6i.16xlarge, m6i.24xlarge, m6i.32xlarge

Note: NetScaler VPX provisioned on AWS M6i instance type does not support the ENA low latency queue (ENQLQ) feature.

r7iz.large, r7iz.xlarge, r7iz.2xlarge, r7iz.4xlarge, r7iz.8xlarge, r7iz.12xlarge, r7iz.16xlarge, r7iz.32xlarge

t2.medium, t2.large, t2.xlarge, t2.2xlarge

t3a.medium, t3a.large, t3a.xlarge, t3a.2xlarge

Table 4: Supported AWS Services

Supported AWS services

EC2: Launches ADC instances.

Lambda: Invokes NetScaler VPX NITRO APIs during provisioning of NetScaler VPX instances from CFT.

VPC and VPC ingress routing: VPC creates isolated networks in which ADC can be launched. VPC ingress routing

Route53: Distributes traffic across all the NetScaler VPX nodes in the NetScaler Autoscale solution.

ELB: Distributes traffic across all the NetScaler VPX nodes in the NetScaler Autoscale solution.

Cloudwatch: Monitors performance and system parameters for NetScaler VPX instance.

AWS Autoscaling: Used for back-end server autoscaling.

Cloud formation: CloudFormation templates are used to deploy NetScaler VPX instances.

Simple Queue Service (SQS): Monitors scale up and scale down events in back-end autoscaling.

Simple Notification Service (SNS): Monitors scale up and scale down events in back-end autoscaling.

Identity and Access Management (IAM): Provides access to AWS services and resources.

AWS Outposts: Provisions NetScaler VPX instances in AWS Outposts.

NetScaler recommends the following AWS instance types:

- M5 and C5n series for marketplace editions or bandwidth-based pool licensing.
- C5n series for vCPU-based pool licensing.

VPX offering in AWS marketplace	AWS instance recommendation
VPX Express 20, VPX 200	M5.xLarge
VPX 1G, VPX 5G	M5.2xLarge

NetScaler recommends the following AWS instance types based on throughput.

VPX with Pooled licensing (Bandwidth licenses)	AWS instance recommendation
VPX 8G	C5n.4xLarge
VPX 10G, VPX 15G, VPX 25G	C5n.9xLarge

Note:

The VPX 25G offering doesn't give the desired 25G throughput in AWS but can give a higher SSL transactions rate.

To achieve throughput more than 5G, do the following:

- Choose **NetScaler VPX - Customer Licensed (BYOL)** offering in the AWS marketplace.
- Select **Pooled Licensing (Bandwidth licenses)** in NetScaler GUI or CLI.

To determine your instance based on different metrics such as packets per second, SSL transactions rate, reach out to your NetScaler contact for guidance. For vCPU based Pool licensing and sizing guidance, reach out to NetScaler support.

Limitations and usage guidelines

March 28, 2024

The following limitations and usage guidelines apply when deploying a NetScaler VPX instance on AWS:

- Before you start, read the AWS terminology section in [Deploy a NetScaler VPX instance on AWS](#).
- The clustering feature is not supported for VPX.
- For the high availability setup to work effectively, associate a dedicated NAT device to management Interface or associate EIP to NSIP. For more information on NAT, in the AWS documentation, see [NAT Instances](#).
- Data traffic and management traffic must be segregated with ENIs belonging to different subnets.
- Only the NSIP address must be present on the management ENI.
- If a NAT instance is used for security instead of assigning an EIP to the NSIP, appropriate VPC level routing changes are required. For instructions on making VPC level routing changes, in the AWS documentation, see [Scenario 2: VPC with Public and Private Subnets](#).

- A VPX instance can be moved from one EC2 instance type to another (for example, from m3.large to an m3.xlarge).
- For storage options for VPX on AWS, Citrix recommends EBS, because it is durable and the data is available even after it is detached from the instance.
- Dynamic addition of ENIs to VPX is not supported. Restart the VPX instance to apply the update. Citrix recommends you to stop the standalone or HA instance, attach the new ENI, and then restart the instance.
- You can assign multiple IP addresses to an ENI. The maximum number of IP addresses per ENI is determined by the EC2 instance type, see the section “IP Addresses Per Network Interface Per Instance Type” in [Elastic Network Interfaces](#). You must allocate the IP addresses in AWS before you assign them to ENIs. For more information, see [Elastic Network Interfaces](#).
- Citrix recommends that you avoid using the enable and disable interface commands on NetScaler VPX interfaces.
- The NetScaler `set ha node \<NODE_ID\> -haStatus STAYPRIMARY` and `set ha node \<NODE_ID\> -haStatus STAYSECONDARY` commands are disabled by default.
- IPv6 is not supported for VPX.
- Due to AWS limitations, these features are not supported:
 - Gratuitous ARP (GARP)
 - L2 mode
 - Tagged VLAN
 - Dynamic Routing
 - virtual MAC
- For RNAT to work, ensure **Source/Destination Check** is disabled. For more information, see “Changing the Source/Destination Checking” in [Elastic Network Interfaces](#).
- In a NetScaler VPX deployment on AWS, in some AWS regions, the AWS infrastructure might not be able to resolve AWS API calls. This happens if the API calls are issued through a nonmanagement interface on the NetScaler VPX instance.

As a workaround, restrict the API calls to the management interface only. To do that, create an NSVLAN on the VPX instance and bind the management interface to the NSVLAN by using the appropriate command.

For example:

```
set ns config -nsvlan <vlan id> -ifnum 1/1 -tagged NO
save config
```

Restart the VPX instance at the prompt. For more information about configuring `nsvlan`, see [Configuring NSVLAN](#).

- In the AWS console, the vCPU usage shown for a VPX instance under the **Monitoring** tab might be high (up to 100 percent), even when the actual usage is much lower. To see the actual vCPU usage, navigate to **View all CloudWatch metrics**. For more information, see [Monitor your instances using Amazon CloudWatch](#).
- Hot adding is supported only for PV and SRIOV interfaces with NetScaler on AWS. VPX instances with ENA interfaces do not support hot-plug, and the behavior of the instances can be unpredictable if hot-plugging is attempted.
- Hot removing either through the AWS Web console or AWS CLI interface is not supported with the PV, SRIOV, and ENA interfaces for NetScaler. The behavior of the instances can be unpredictable if hot-removal is attempted.

Prerequisites

August 11, 2023

Before attempting to create a VPX instance in AWS, ensure you have the following:

- **An AWS account:** to launch a NetScaler VPX AMI in an AWS Virtual Private Cloud (VPC). You can create an AWS account for free at www.aws.amazon.com.
- **An AWS Identity and Access Management (IAM) user account:** to securely control access to AWS services and resources for your users. For more information about how to create an IAM user account, see [Creating IAM Users \(Console\)](#). An IAM role is mandatory for both standalone and high availability deployments.

The IAM role associated with your AWS account must have the following IAM permissions for various scenarios.

HA pair with IPv4 addresses in the same AWS zone:

```
1 "ec2:DescribeInstances",
2 "ec2:AssignPrivateIpAddresses",
3 "iam:SimulatePrincipalPolicy",
4 "iam:GetRole",
5 "ec2:CreateTags"
6 <!--NeedCopy-->
```

HA pair with IPv6 addresses in the same AWS zone:

```
1 "ec2:DescribeInstances",
2 "ec2:AssignIpv6Addresses",
3 "ec2:UnassignIpv6Addresses",
4 "iam:SimulatePrincipalPolicy",
5 "iam:GetRole",
```

```
6 "ec2:CreateTags"
7 <!--NeedCopy-->
```

HA pair with both IPv4 and IPv6 addresses in the same AWS zone:

```
1 "ec2:DescribeInstances",
2 "ec2:AssignPrivateIpAddresses",
3 "ec2:AssignIpv6Addresses",
4 "ec2:UnassignIpv6Addresses",
5 "iam:SimulatePrincipalPolicy",
6 "iam:GetRole",
7 "ec2:CreateTags"
8 <!--NeedCopy-->
```

HA pair with elastic IP addresses across different AWS zones:

```
1 "ec2:DescribeInstances",
2 "ec2:DescribeAddresses",
3 "ec2:AssociateAddress",
4 "ec2:DisassociateAddress",
5 "iam:SimulatePrincipalPolicy",
6 "iam:GetRole",
7 "ec2:CreateTags"
8 <!--NeedCopy-->
```

HA pair with private IP addresses across different AWS zones:

```
1 "ec2:DescribeInstances",
2 "ec2:DescribeRouteTables",
3 "ec2:DeleteRoute",
4 "ec2:CreateRoute",
5 "ec2:ModifyNetworkInterfaceAttribute",
6 "iam:SimulatePrincipalPolicy",
7 "iam:GetRole",
8 "ec2:CreateTags"
9 <!--NeedCopy-->
```

HA pair with both private IP and elastic IP addresses across different AWS zones:

```
1 "ec2:DescribeInstances",
2 "ec2:DescribeAddresses",
3 "ec2:AssociateAddress",
4 "ec2:DisassociateAddress",
5 "ec2:DescribeRouteTables",
6 "ec2:DeleteRoute",
7 "ec2:CreateRoute",
8 "ec2:ModifyNetworkInterfaceAttribute",
9 "iam:SimulatePrincipalPolicy",
10 "iam:GetRole",
11 "ec2:CreateTags"
12 <!--NeedCopy-->
```

AWS backend autoscaling:

```
1  "ec2:DescribeInstances",
2  "autoscaling:*",
3  "sns:CreateTopic",
4  "sns:DeleteTopic",
5  "sns:ListTopics",
6  "sns:Subscribe",
7  "sqs:CreateQueue",
8  "sqs:ListQueues",
9  "sqs:DeleteMessage",
10 "sqs:GetQueueAttributes",
11 "sqs:SetQueueAttributes",
12 "iam:SimulatePrincipalPolicy",
13 "iam:GetRole",
14 "ec2:CreateTags"
15 <!--NeedCopy-->
```

Note:

- If you use any combination of the preceding features, use the combination of IAM permissions for each of the features.
- If you use the Citrix CloudFormation template, the IAM role is automatically created. The template does not allow selecting an already created IAM role.
- When you log on to the VPX instance through the GUI, a prompt to configure the required privileges for the IAM role appears. Ignore the prompt if you've already configured the privileges.

- **AWS CLI:** To use all the functionality provided by the AWS Management Console from your terminal program. For more information, see the [AWS CLI user guide](#). You also need the AWS CLI to change the network interface type to SR-IOV.
- **Elastic Network Adapter (ENA):** For ENA driver-enabled instance type, for example M5, C5 instances, the firmware version must be 13.0 and above.
- You must configure Instance Metadata Service (IMDS) on the EC2 instance for NetScaler VPX. IMDSv1 and IMDSv2 are two modes available for accessing instance metadata from a running AWS EC2 instance. IMDSv2 is more secure than IMDSv1. You can configure the instance either to use both methods (the default option) or only the IMDSv2 mode (by disabling IMDSv1). Citrix ADC VPX supports IMDSv2 only mode from NetScaler VPX release 13.1.48.x onwards.

Configure AWS IAM roles on NetScaler VPX instance

May 2, 2023

Applications that run on an Amazon EC2 instance must include AWS credentials in the AWS API requests. You can store AWS credentials directly within the Amazon EC2 instance and allow applications in that instance to use those credentials. But you then have to manage the credentials and ensure that they securely pass the credentials to each instance and update each Amazon EC2 instance when it's time to rotate the credentials. That's a lot of additional work.

Instead, you can and must use an Identity and Access Management (IAM) role to manage temporary credentials for applications that run on an Amazon EC2 instance. When you use a role, you don't have to distribute long-term credentials (such as a user name and password or access keys) to an Amazon EC2 instance. Instead, the role provides temporary permissions that applications can use when they make calls to other AWS resources. When you launch an Amazon EC2 instance, you specify an IAM role to associate with the instance. Applications that run on the instance can then use the role-supplied temporary credentials to sign API requests.

The IAM role associated with your AWS account must have the following IAM permissions for various scenarios.

HA pair with IPv4 addresses in the same AWS zone:

```
1 "ec2:DescribeInstances",
2 "ec2:AssignPrivateIpAddresses",
3 "iam:SimulatePrincipalPolicy",
4 "iam:GetRole"
5 <!--NeedCopy-->
```

HA pair with IPv6 addresses in the same AWS zone:

```
1 "ec2:DescribeInstances",
2 "ec2:AssignIpv6Addresses",
3 "ec2:UnassignIpv6Addresses",
4 "iam:SimulatePrincipalPolicy",
5 "iam:GetRole"
6 <!--NeedCopy-->
```

HA pair with both IPv4 and IPv6 addresses in the same AWS zone:

```
1 "ec2:DescribeInstances",
2 "ec2:AssignPrivateIpAddresses",
3 "ec2:AssignIpv6Addresses",
4 "ec2:UnassignIpv6Addresses",
5 "iam:SimulatePrincipalPolicy",
6 "iam:GetRole"
7 <!--NeedCopy-->
```

HA pair with elastic IP addresses across different AWS zones:

```
1 "ec2:DescribeInstances",
2 "ec2:DescribeAddresses",
3 "ec2:AssociateAddress",
4 "ec2:DisassociateAddress",
```

```
5 "iam:SimulatePrincipalPolicy",
6 "iam:GetRole"
7 <!--NeedCopy-->
```

HA pair with private IP addresses across different AWS zones:

```
1 "ec2:DescribeInstances",
2 "ec2:DescribeRouteTables",
3 "ec2>DeleteRoute",
4 "ec2:CreateRoute",
5 "ec2:ModifyNetworkInterfaceAttribute",
6 "iam:SimulatePrincipalPolicy",
7 "iam:GetRole"
8 <!--NeedCopy-->
```

HA pair with both private IP and elastic IP addresses across different AWS zones:

```
1 "ec2:DescribeInstances",
2 "ec2:DescribeAddresses",
3 "ec2:AssociateAddress",
4 "ec2:DisassociateAddress",
5 "ec2:DescribeRouteTables",
6 "ec2>DeleteRoute",
7 "ec2:CreateRoute",
8 "ec2:ModifyNetworkInterfaceAttribute",
9 "iam:SimulatePrincipalPolicy",
10 "iam:GetRole"
11 <!--NeedCopy-->
```

AWS backend autoscaling:

```
1 "ec2:DescribeInstances",
2 "autoscaling:*",
3 "sns:CreateTopic",
4 "sns>DeleteTopic",
5 "sns:ListTopics",
6 "sns:Subscribe",
7 "sqs:CreateQueue",
8 "sqs:ListQueues",
9 "sqs>DeleteMessage",
10 "sqs:GetQueueAttributes",
11 "sqs:SetQueueAttributes",
12 "iam:SimulatePrincipalPolicy",
13 "iam:GetRole"
14 <!--NeedCopy-->
```

Points to note:

- If you use any combination of the preceding features, use the combination of IAM permissions for each of the features.
- If you use the Citrix CloudFormation template, the IAM role is automatically created. The template does not allow selecting an already created IAM role.

- When you log on to the VPX instance through the GUI, a prompt to configure the required privileges for the IAM role appears. Ignore the prompt if you've already configured the privileges.
- An IAM role is mandatory for both standalone and high availability deployments.

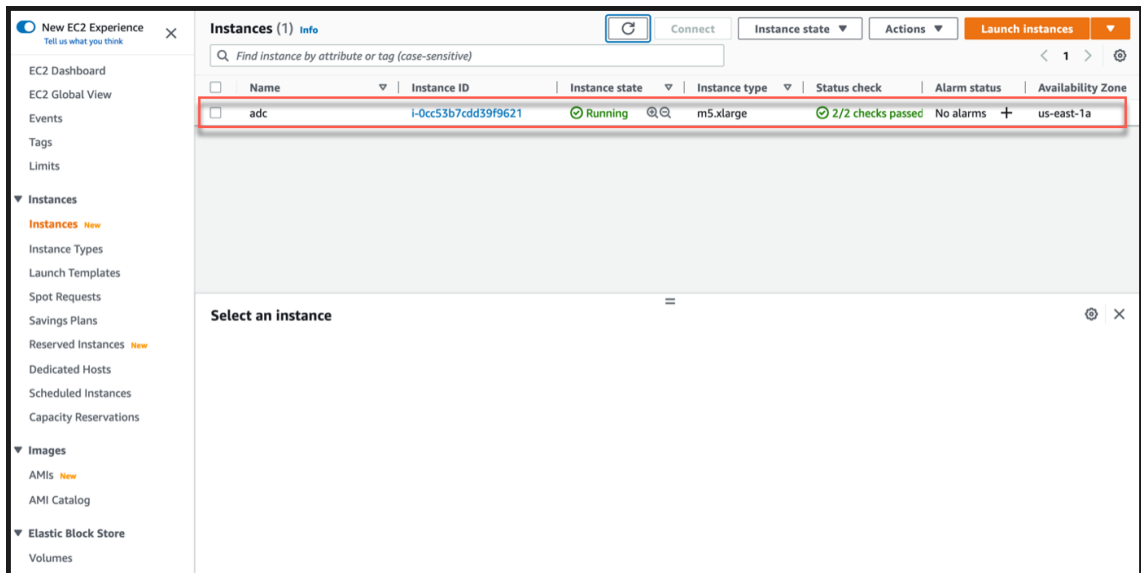

Create an IAM role

This procedure describes how to create an IAM role for the AWS back-end autoscaling feature.

Note:

You can follow the same procedure to create any IAM roles corresponding to other features.

1. Log on to the AWS Management Console for EC2.
2. Go to EC2 instance page, and select your ADC instance.

3. Navigate to **Actions > Security > Modify IAM role**.

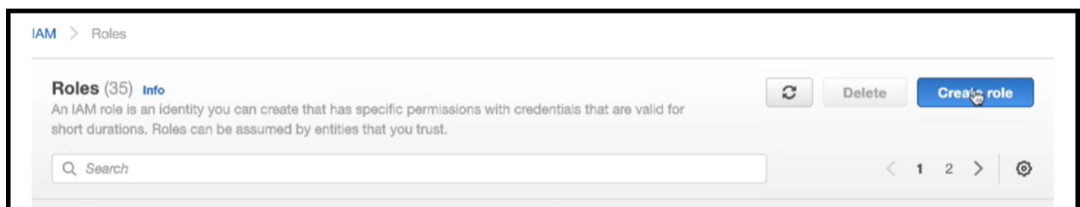

4. In the **Modify IAM role** page, you can either choose an existing IAM role or create a IAM role.
5. To create a IAM role, follow these steps:

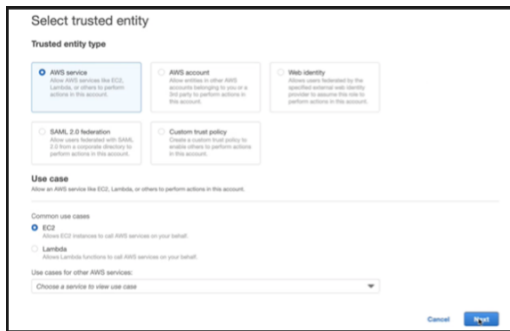

a) In the **Modify IAM role** page, click **Create new IAM role**.

b) In the **Roles** page, click **Create role**.

c) Select **AWS service** under **Trusted entity type** and **EC2** under **Common use cases** and then click **Next**.

d) In the **Add permissions** page, click **Create policy**.

e) Click the **JSON** tab to open the JSON editor.

f) In the JSON editor, delete everything and paste the IAM permissions for the feature that you want to use.

For example, paste the following IAM permissions for the AWS back-end autoscaling feature:

```

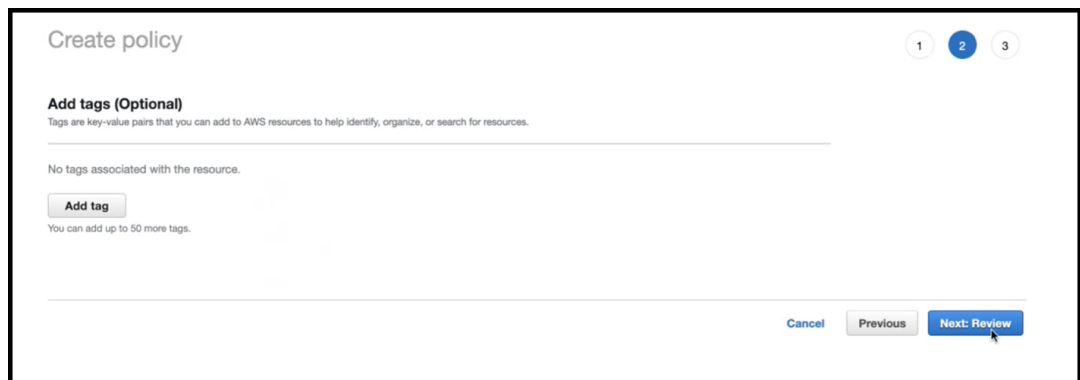

1  {
2
3     "Version": "2012-10-17",
4     "Statement": [
5         {
6
7             "Sid": "VisualEditor0",
8             "Effect": "Allow",

```

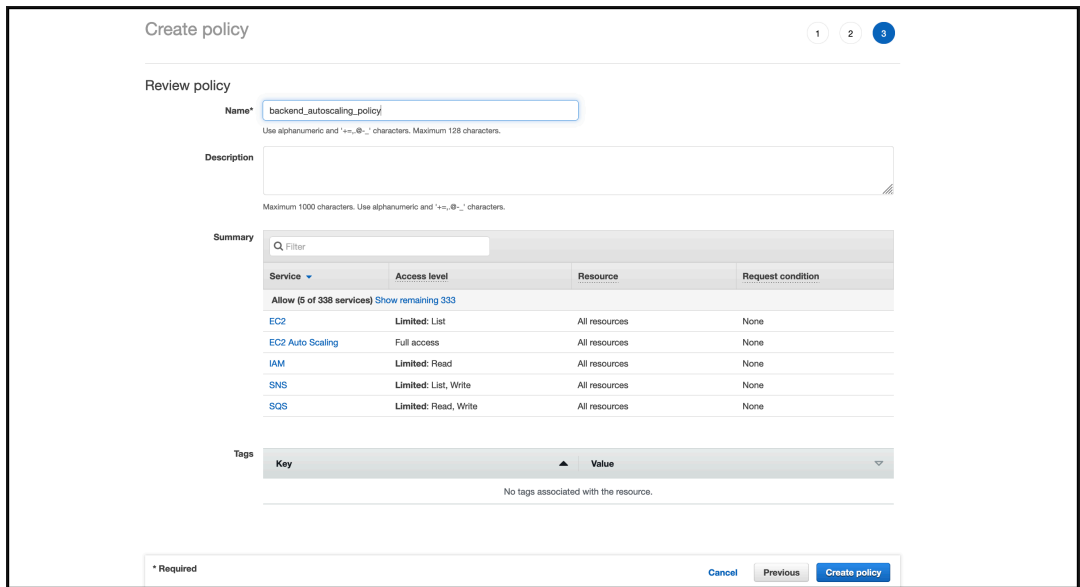

```
9         "Action": [  
10             "ec2:DescribeInstances",  
11             "autoscaling:*",  
12             "sns:CreateTopic",  
13             "sns:DeleteTopic",  
14             "sns:ListTopics",  
15             "sns:Subscribe",  
16             "sqs:CreateQueue",  
17             "sqs:ListQueues",  
18             "sqs:DeleteMessage",  
19             "sqs:GetQueueAttributes",  
20             "sqs:SetQueueAttributes",  
21             "iam:SimulatePrincipalPolicy",  
22             "iam:GetRole"  
23         ],  
24         "Resource": "*"   
25     }  
26 ]  
27 }  
28 }  
29  
30  
31 <!--NeedCopy-->
```

Ensure that the “Version”key-value pair that you provide is the same as the one automatically generated by AWS.

g) Click **Next: Review**.

h) In the **Review policy** tab, give a valid name to the policy, and click **Create Policy**.

i) In the **Identity Access Management** page, click the policy name that you created. Expand the policy to check the entire JSON, and click **Next**.

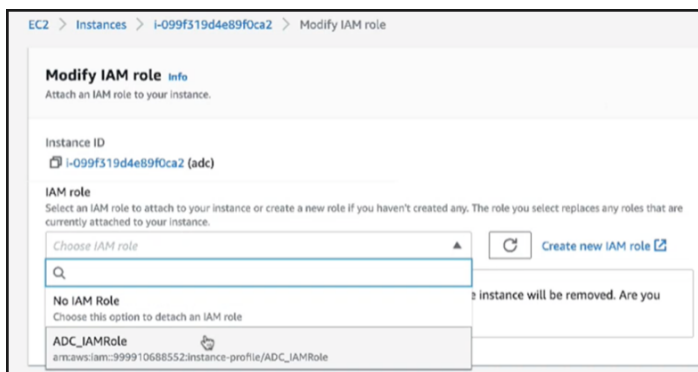

j) In the **Name, review, and create** page, give a valid name to the role.

k) Click **Create role**.

6. Repeat steps: 1, 2 and 3. Select the **Refresh** button and select the drop-down menu to see the role that you created.

7. Click **Update IAM role**.

Test IAM policies with the IAM policy simulator

The IAM policy simulator is a tool that enables you to test the effects of IAM access control policies before committing them into production. It is easier to verify and troubleshoot permissions.

1. In the **IAM** page, select the IAM role that you want to test, and click **Simulate**. In the following example, “ADC_IAMRole” is the IAM role.

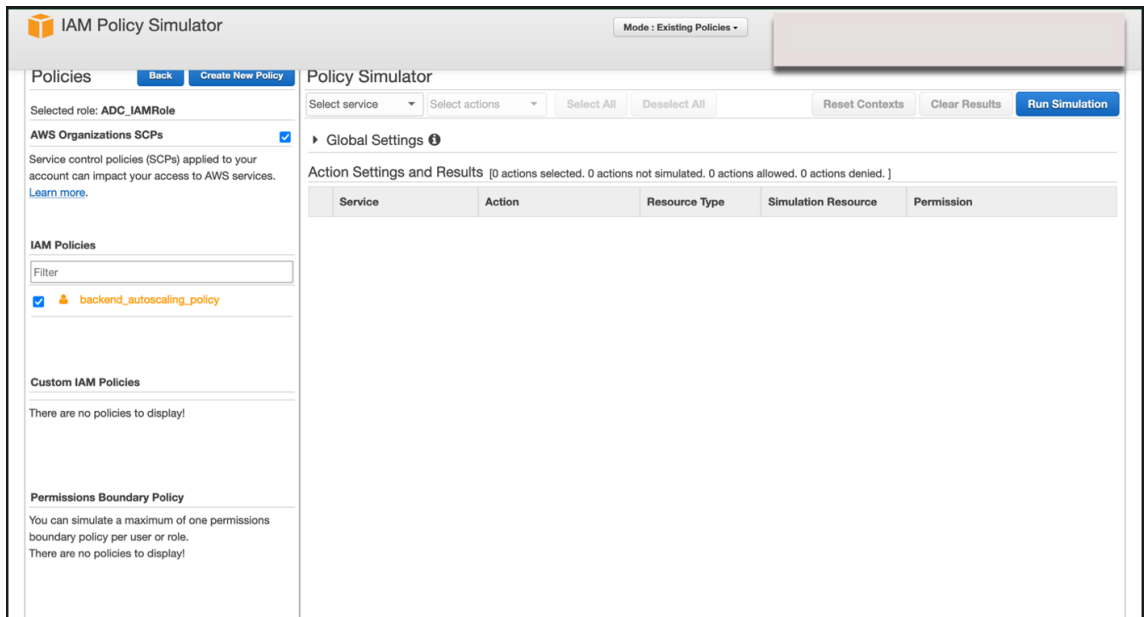

2. In the **IAM policy simulator** console, select **Existing Policies** as the **Mode**.

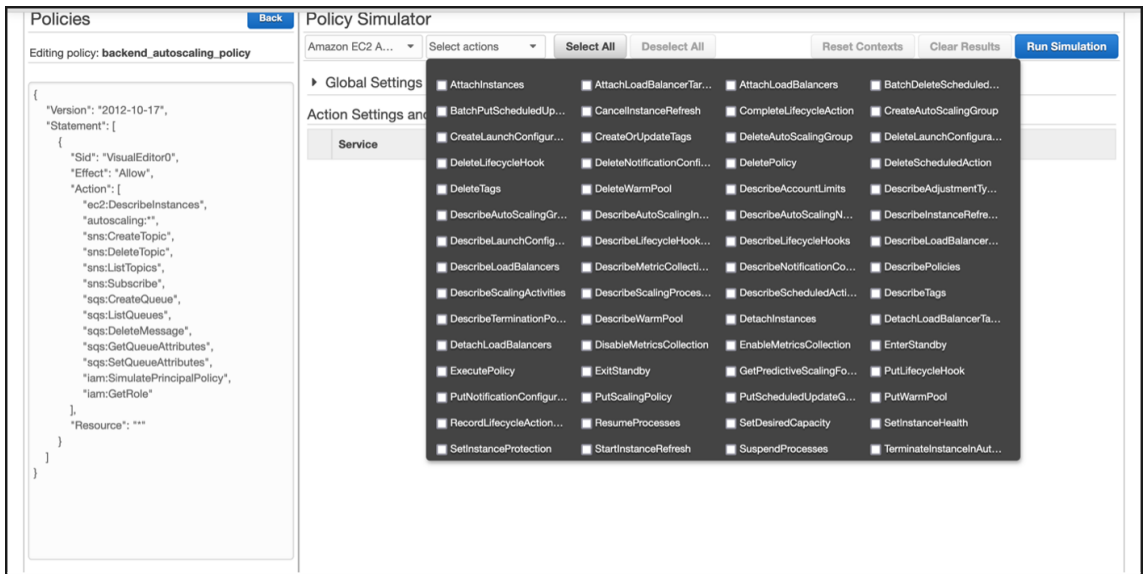

3. In the **Users, Groups and Roles** tab, select **Roles** from the drop-down menu and choose an existing role.

4. After selecting the existing role, select the existing policy under it.

5. After you select the policy, you can see the exact JSON on the left-hand side of the screen. Select the desired actions in the **Select actions** drop-down menu.

6. Click **Run simulation.**

For detailed information, see [AWS IAM documentation](#).

How a NetScaler VPX instance on AWS works

May 2, 2023

The NetScaler VPX instance is available as an AMI in AWS marketplace, and it can be launched as an EC2 instance within an AWS VPC. The NetScaler VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Each VPX instance requires at least three IP subnets:

- A management subnet
- A client-facing subnet (VIP)
- A back-end facing subnet (SNIP, MIP, and so on)

Citrix recommends three network interfaces for a standard VPX instance on AWS installation.

AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances. An Amazon VPC allows you to create and control a virtual networking environment, including your own IP address range, subnets, route tables, and network gateways.

Note: By default, you can create up to 5 VPC instances per AWS region for each AWS account. You can request higher VPC limits by submitting Amazon's request form <http://aws.amazon.com/contact-us/vpc-request>.

Figure 1. A Sample NetScaler VPX Instance Deployment on AWS Architecture

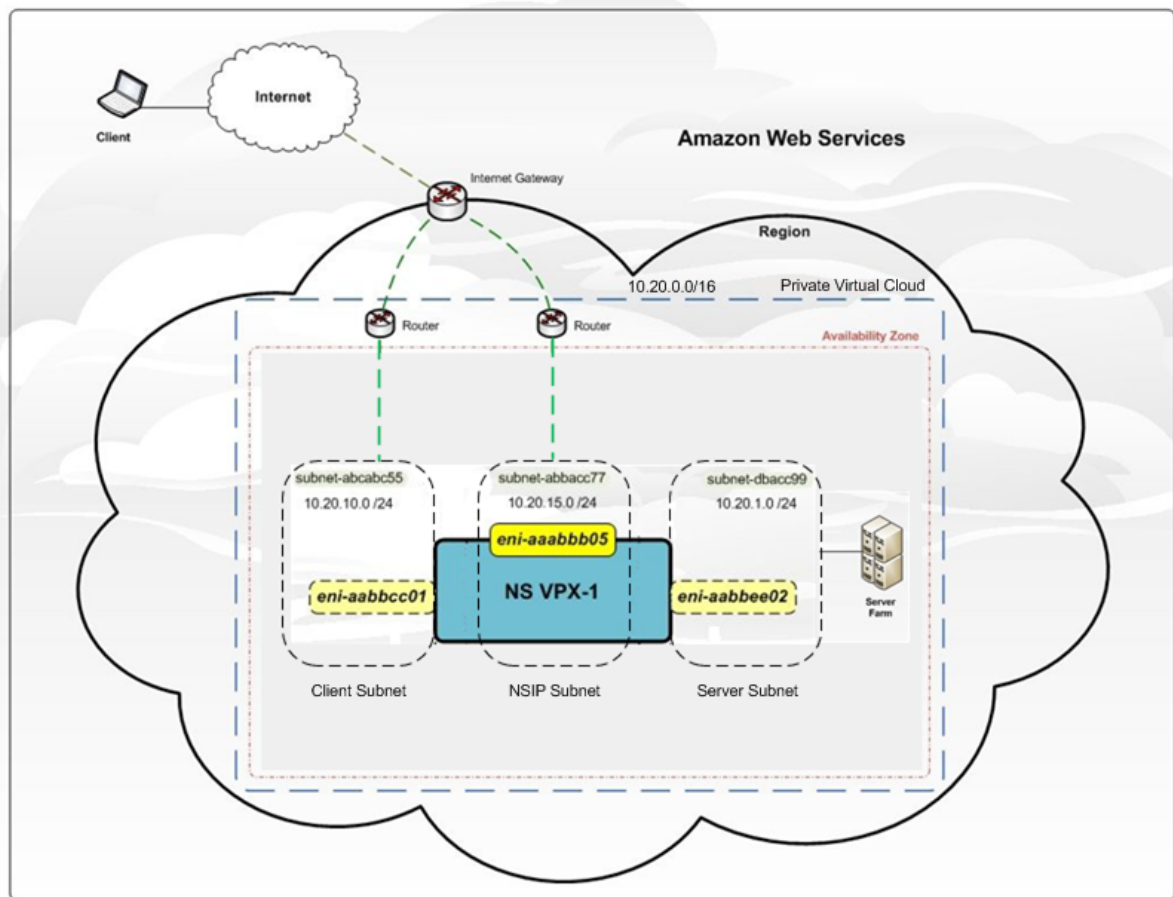

Figure 1 shows a simple topology of an AWS VPC with a NetScaler VPX deployment. The AWS VPC has:

1. A single Internet gateway to route traffic in and out of the VPC.
2. Network connectivity between the Internet gateway and the Internet.
3. Three subnets, one each for management, client, and server.
4. Network connectivity between the Internet gateway and the two subnets (management and client).
5. A standalone NetScaler VPX instance deployed within the VPC. The VPX instance has three ENIs, one attached to each subnet.

Deploy a NetScaler VPX standalone instance on AWS

May 2, 2023

You can deploy a NetScaler VPX standalone instance on AWS by using the following options:

- AWS web console
- Citrix-authored CloudFormation template
- AWS CLI

This topic describes the procedure for deploying a NetScaler VPX instance on AWS.

Before you start your deployment, read the following topics:

- [Prerequisites](#)
- [Limitation and usage guidelines](#)

Deploy a NetScaler VPX instance on AWS by using the AWS web console

You can deploy a NetScaler VPX instance on AWS through the AWS web console. The deployment process includes the following steps:

1. Create a Key Pair
2. Create a Virtual Private Cloud (VPC)
3. Add more subnets
4. Create security groups and security rules
5. Add route tables
6. Create an internet gateway
7. Create a NetScaler VPX instance
8. Create and attach more network interfaces
9. Attach elastic IPs to the management NIC
10. Connect to the VPX instance

Step 1: Create a key pair.

Amazon EC2 uses a key pair to encrypt and decrypt logon information. To log on to your instance, you must create a key pair, specify the name of the key pair when you launch the instance, and provide the private key when you connect to the instance.

When you review and launch an instance by using the AWS Launch Instance wizard, you are prompted to use an existing key pair or create a new key pair. For more information about how to create a key pair, see [Amazon EC2 Key Pairs](#).

Step 2: Create a VPC.

A NetScaler VPC instance is deployed inside an AWS VPC. A VPC allows you to define the virtual network dedicated to your AWS account. For more information about AWS VPC, see [Getting Started With Amazon VPC](#).

While creating a VPC for your NetScaler VPX instance, keep the following points in mind.

- Use the VPC with a Single Public Subnet Only option to create an AWS VPC in an AWS availability zone.
- Citrix recommends that you create at least **three subnets**, of the following types:
 - One subnet for management traffic. You place the management IP(NSIP) on this subnet. By default elastic network interface (ENI) eth0 is used for management IP.
 - One or more subnets for client-access (user-to-NetScaler VPX) traffic, through which clients connect to one or more virtual IP (VIP) addresses assigned to NetScaler load balancing virtual servers.
 - One or more subnets for the server-access (VPX-to-server) traffic, through which your servers connect to VPX-owned subnet IP (SNIP) addresses. For more information about NetScaler load balancing and virtual servers, virtual IP addresses (VIPs), and subnet IP addresses (SNIPs), see:
 - All subnets must be in the same availability zone.

Step 3: Add subnets.

When you used the VPC wizard, only one subnet was created. Depending on your requirement, you might want to create more subnets. For more information about how to create more subnets, see [Adding a Subnet to Your VPC](#).

Step 4: Create security groups and security rules.

To control inbound and outbound traffic, create security groups and add rules to the groups. For more information how to create groups and add rules, see [Security Groups for Your VPC](#).

For NetScaler VPX instances, the EC2 wizard gives default security groups, which are generated by AWS Marketplace and is based on recommended settings by Citrix. However, you can create more security groups based on your requirements.

Note

Port 22, 80, 443 to be opened on the Security group for SSH, HTTP, and HTTPS access respectively.

Step 5: Add route tables.

Route table contains a set of rules, called routes, that are used to determine where network traffic is directed. Each subnet in your VPC must be associated with a route table. For more information about how to create a route table, see [Route Tables](#).

Step 6: Create an internet gateway.

An internet gateway serves two purposes: to provide a target in your VPC route tables for internet-routable traffic, and to perform network address translation (NAT) for instances that have been assigned public IPv4 addresses.

Create an internet gateway for internet traffic. For more information about how to create an Internet Gateway, see the section [Attaching an Internet Gateway](#).

Step 7: Create a NetScaler VPX instance by using the AWS EC2 service.

To create a NetScaler VPX instance by using the AWS EC2 service, complete the following steps.

1. From the AWS dashboard, go to **Compute > EC2 > Launch Instance > AWS Marketplace**.

Before you click **Launch Instance**, ensure your region is correct by checking the note that appears under **Launch Instance**.

2. In the Search AWS Marketplace bar, search with the keyword NetScaler VPX.
3. Select the version you want to deploy and then click **Select**. For the NetScaler VPX version, you have the following options:
 - A licensed version
 - NetScaler VPX Express appliance (This is a free virtual appliance, which is available from NetScaler 12.0 56.20.)
 - Bring your own device

The Launch Instance wizard starts. Follow the wizard to create an instance. The wizard prompts you to:

- Choose Instance Type
- Configure Instance
- Add Storage
- Add Tags
- Configure Security Group
- Review

**Step 8: Create and attach more network interfaces.**

Create two more network interfaces for VIP and SNIP. For more information about how to create more network interfaces, see the [Creating a Network Interface](#) section.

After you've created the network interfaces, you must attach them to the VPX instance. Before attaching the interface, shut down the VPX instance, attach the interface, and power on the instance.

For more information about how to attach network interfaces, see the [Attaching a Network Interface When Launching an Instance](#) section.

Step 9: Allocate and associate elastic IPs.

If you assign a public IP address to an EC2 instance, it remains assigned only until the instance is stopped. After that, the address is released back to the pool. When you restart the instance, a new public IP address is assigned.

In contrast, an elastic IP (EIP) address remains assigned until the address is disassociated from an instance.

Allocate and associate an elastic IP for the management NIC. For more information about how to allocate and associate elastic IP addresses, see these topics:

- [Allocating an Elastic IP Address](#)
- [Associating an Elastic IP Address with a Running Instance](#)

These steps complete the procedure to create a NetScaler VPX instance on AWS. It can take a few minutes for the instance to be ready. Check that your instance has passed its status checks. You can view this information in the **Status Checks** column on the Instances page.

Step 10: Connect to the VPX instance.

After you've created the VPX instance, you connect the instance by using the GUI and an SSH client.

- GUI

The following are the default administrator credentials to access a NetScaler VPX instance

User name: `nsroot`

Password: The default password for the ns root account is set to the AWS instance-ID of the NetScaler VPX instance. On your first logon, you are prompted to change the password for security reasons. After changing the password, you must save the configuration. If the configuration is not saved and the instance restarts, you must log on with the default password. Change the password again at the prompt.

- SSH client

From the AWS management console, select the NetScaler VPX instance and click **Connect**. Follow the instructions given on the **Connect to Your Instance** page.

For more information about how to deploy a NetScaler VPX standalone instance on AWS by using the AWS web console, see:

- [Scenario: standalone instance](#)
- [How to configure a NetScaler VPX instance on AWS by using Citrix CloudFormation template](#)

Configure a NetScaler VPX instance by using the Citrix CloudFormation template

You can use the Citrix-provided CloudFormation template to automate VPX instance launch. The template provides functionality to launch a single NetScaler VPX instance, or to create a high availability environment with a pair of NetScaler VPX instances.

You can launch the template from AWS Marketplace or GitHub.

The CloudFormation template requires an existing VPC environment, and it launches a VPX instance with three elastic network interfaces (ENIs). Before you start the CloudFormation template, ensure that you complete the following requirements:

- An AWS virtual private cloud (VPC)
- Three subnets within the VPC: one for management, one for client traffic, and one for back-end servers
- An EC2 key pair to enable SSH access to the instance
- A security group with UDP 3003, TCP 3009–3010, HTTP, SSH ports open

See the “Deploy a NetScaler VPX Instance on AWS by Using the AWS Web Console” section or AWS documentation for more information about how to complete the prerequisites.

Watch this [video](#) to learn about how to configure and launch a NetScaler VPX standalone instance by using the Citrix CloudFormation template available in the AWS Marketplace.

Further, you configure and launch a NetScaler VPX Express standalone instance by using the Citrix CloudFormation template available in GitHub:

<https://github.com/citrix/citrix-adc-aws-cloudformation/tree/master/templates/standalone/>

An IAM role is not mandatory for a standalone deployment. However, Citrix recommends that you create and attach an IAM role with the required privileges to the instance, for future need. The IAM role ensures that the standalone instance is easily converted to a high availability node with SR-IOV, when required.

For more information about the required privileges, see [Configuring NetScaler VPX instances to Use SR-IOV Network Interface](#).

Note

If you deploy a NetScaler VPX instance on AWS by using the AWS web console, the CloudWatch service is enabled by default. If you deploy a NetScaler VPX instance by using the Citrix CloudFormation template, the default option is “Yes.” If you want to disable the CloudWatch service, select “No.” For more information, see [Monitor your instances using Amazon CloudWatch](#)

Configure a NetScaler VPX instance by using the AWS CLI

You can use the AWS CLI to launch instances. For more information, see the [AWS Command Line Interface Documentation](#).

Scenario: standalone instance

May 2, 2023

This scenario illustrates how to deploy a NetScaler VPX standalone EC2 instance in AWS by using the AWS GUI. Create a standalone VPX instance with three NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, set up the required communication routes between the instance and the back-end servers, and between the instance and the external hosts on the public internet.

For more details about the procedure for deploying a VPX instance, see [Deploy a NetScaler VPX standalone instance on AWS](#).

Create three NICs. Each NIC can be configured with a pair of IP addresses (public and private). The NICs serve the following purposes.

NIC	Purpose	Associated with
eth0	Serves management traffic (NSIP)	A public IP address and a private IP address
eth1	Serves client-side traffic (VIP)	A public IP address and a private IP address

NIC	Purpose	Associated with
eth2	Communicates with back-end servers (SNIP)	A public IP address (Private IP address not mandatory)

Step 1: Create a VPC.

1. Log on to the AWS web console and navigate to **Networking & Content Delivery > VPC**. Click **Start VPC Wizard**.
2. Select **VPC with a Single Public Subnet** and click **Select**.
3. Set the IP CIDR Block to 10.0.0.0/16, for this scenario.
4. Give a name for the VPC.
5. Set the public subnet to 10.0.0.0/24. (This is the management network).
6. Select an availability zone.
7. Give a name for the subnet.
8. Click Create **VPC**.

Step 2: Create extra subnets.

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose Subnets, Create Subnet after you enter the following details.
 - Name tag: Provide a name for your subnet.
 - VPC: Choose the VPC for which you’re creating the subnet.
 - Availability Zone: Choose the availability zone in which you created the VPC in step 1.
 - IPv4 CIDR block: Specify an IPv4 CIDR block for your subnet. For this scenario, choose 10.0.1.0/24.

Create Subnet ✕

Use the CIDR format to specify your subnet's IP address block (e.g., 10.0.0.0/24). Note that block sizes must be between a /16 netmask and /28 netmask. Also, note that a subnet can be the same size as your VPC. An IPv6 CIDR block must be a /64 CIDR block.

Name tag ⓘ

VPC ⓘ

VPC CIDRs

CIDR	Status	Status Reason
10.0.0.0/16	associated	

Availability Zone ⓘ

IPv4 CIDR block ⓘ

Cancel
Yes, Create

3. Repeat the steps to create one more subnet for back-end servers.

Create Subnet ✕

Use the CIDR format to specify your subnet's IP address block (e.g., 10.0.0.0/24). Note that block sizes must be between a /16 netmask and /28 netmask. Also, note that a subnet can be the same size as your VPC. An IPv6 CIDR block must be a /64 CIDR block.

Name tag ⓘ

VPC ⓘ

VPC CIDRs

CIDR	Status	Status Reason
10.0.0.0/16	associated	

Availability Zone ⓘ

IPv4 CIDR block ⓘ

Cancel
Yes, Create

Step 3: Create a route table.

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Route Tables > Create Route Table**.
3. In the Create Route Table window, add a name and select the VPC that you created in step 1.
4. Click **Yes, Create**.

Create Route Table ✕

A route table specifies how packets are forwarded between the subnets within your VPC, the Internet, and your VPN connection.

Name tag ⓘ

VPC ⓘ

Cancel
Yes, Create

The route table is assigned to all the subnets that you created for this VPC, so that routing of traffic from an instance in one subnet can reach an instance in another subnet.

5. Click Subnet Associations, and then click Edit.
6. Click the management and client subnet and click Save. This creates a route table for internet traffic only.

<input type="checkbox"/>	subnet-d0cd99b9 NSDoc-server	10.0.2.0/24	-	Main

7. Click **Routes > Edit > Add another route**.
8. In the Destination field add 0.0.0.0/0, and click the Target field to select igw-<xxxx> the Internet Gateway that the VPC Wizard created automatically.
9. Click Save.

rtb-4329082a | NSDoc-internet-traffic

Summary Routes Subnet Associations Route Propagation Tags

Cancel Save

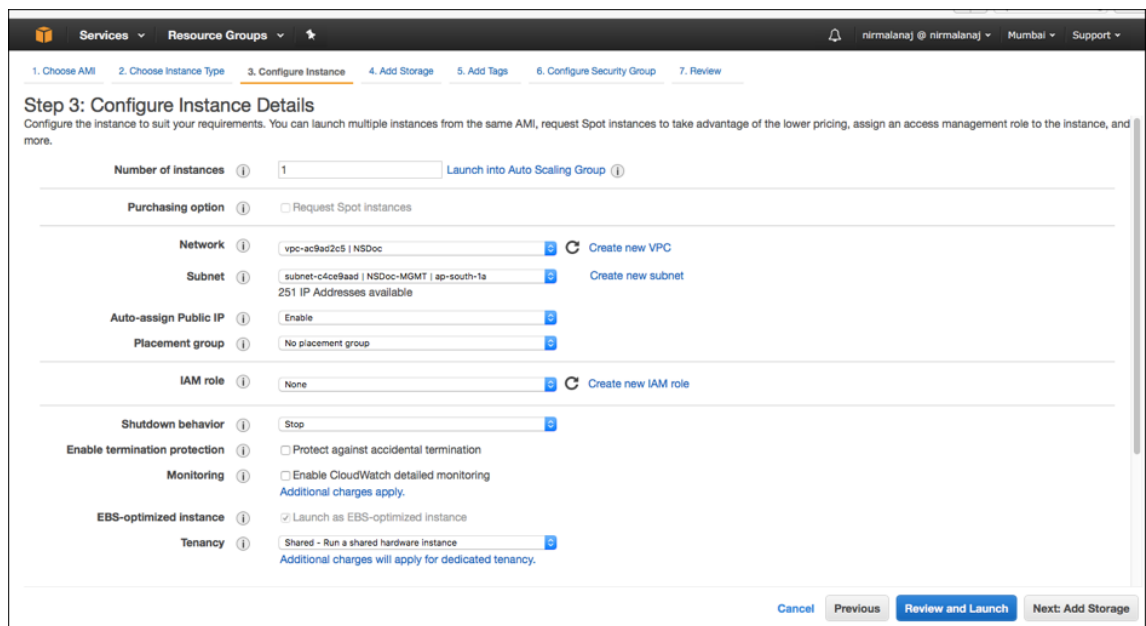

View: All rules

Destination	Target	Status	Propagated	Remove
10.0.0.0/16	local	Active	No	
<input type="text" value="0.0.0.0/0"/>	<input type="text" value="igw-9fbc2df6"/>		No	<input type="button" value="x"/>

10. Follow the steps to create a route table for server-side traffic.

Step 4: Create a NetScaler VPX instance.

1. Log on the AWS management console and click **EC2** under **Compute**.
2. Click AWS Marketplace. In the Search AWS Marketplace bar, type NetScaler VPX and press Enter. The available NetScaler VPX editions are displayed.
3. Click **Select** to choose the desired NetScaler VPX edition. The EC2 instance wizard starts.
4. In the **Choose Instance Type** page, select **m4. Xlarge** (recommended) and click **Next: Configure Instance Details**.
5. In the Configure Instance Details page, select the following, and then click Next: Add Storage.
 - Number of instances: 1
 - Network: the VPC that created in Step 1
 - Subnet: the management subnet
 - Auto-assign Public IP: Enable

6. In the Add Storage page, select the default option, and click Next: Add Tags.
7. In the Add Tags page, add a name for the instance, and click Next: Configure Security Group.
8. In the Configure Security Group page, select the default option (which is generated by AWS Marketplace and is based on recommended settings by Citrix Systems) and then click **Review and Launch > Launch**.
9. You are prompted to select an existing key pair or create a new key pair. From the Select a key pair drop-down list, select the key pair that you created as a prerequisite (See the Prerequisite section.)
10. Check the box to acknowledge the key pair and click Launch Instances.

Select an existing key pair or create a new key pair ✕

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Note: The selected key pair will be added to the set of keys authorized for this instance. Learn more about [removing existing key pairs from a public AMI](#).

Choose an existing key pair ⌵

Select a key pair

NSDOCKeypair ⌵

I acknowledge that I have access to the selected private key file (NSDOCKeypair.pem), and that without this file, I won't be able to log into my instance.

Cancel Launch Instances

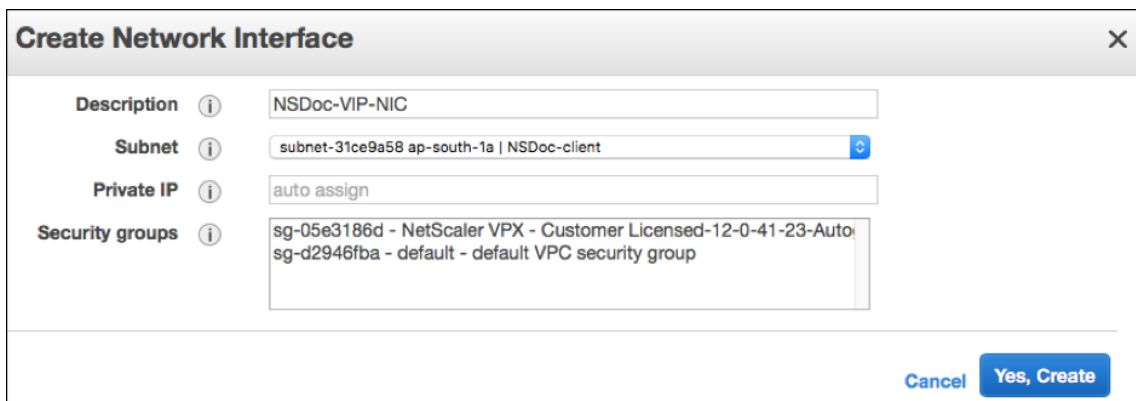

Launch Instance Wizard displays the Launch Status, and the instance appears in the list of instances when it is fully launched.

The check instance, go the AWS console click EC2 > Running Instances. Select the instance and add a name. Make sure the Instance State is running and Status Checks is complete.

Step 5: Create and attach more network interfaces.

When you created the VPC, only one network interface associated with it. Now add two more network interfaces to the VPC, for the VIP and SNIP.

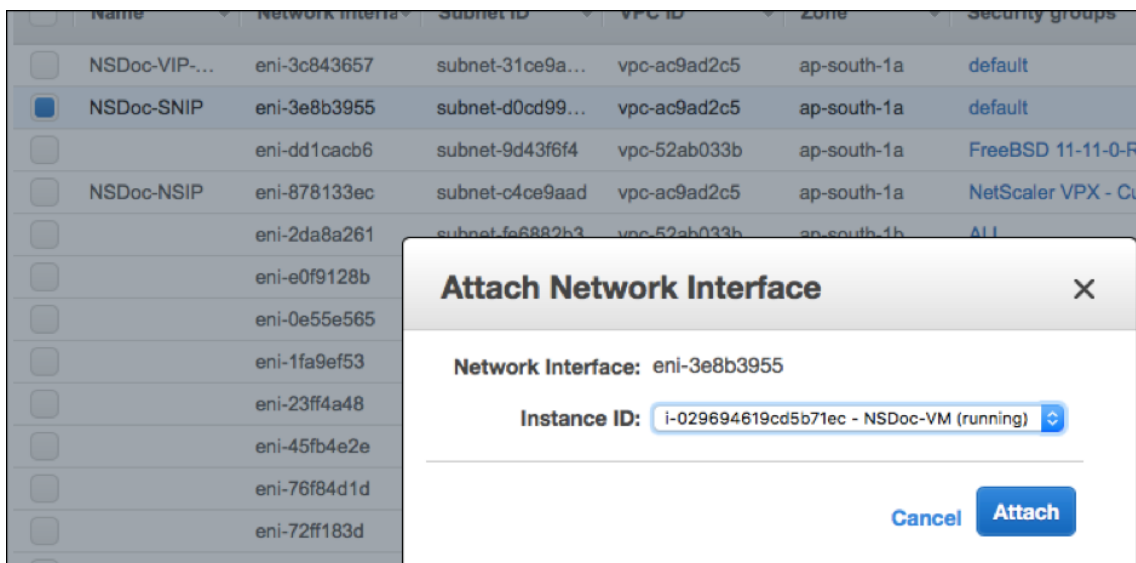

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose Network Interfaces.
3. Choose Create Network Interface.
4. For Description, enter a descriptive name.
5. For Subnet, select the subnet that you created previously for the VIP.
6. For Private IP, leave the default option.
7. For Security groups, select the group.
8. Click **Yes, Create**.

9. After the network interface is created, add a name to the interface.
10. Repeat the steps to create a network interface for server-side traffic.

Attach the network interfaces:

1. In the navigation pane, choose Network Interfaces.
2. Select the network interface and choose Attach.
3. In the Attach Network Interface dialog box, select the instance and choose Attach.

Step 6: Attach an elastic IP to the NSIP.

1. From the AWS management console, go to **NETWORK & SECURITY > Elastic IPs**.
2. Check for available free EIP to attach. If none, click **Allocate new address**.
3. Select the newly allocated IP address and choose **Actions > Associate address**.
4. Click the **Network interface** radio button.
5. From the Network interface drop-down list, select the management NIC.

6. From the **Private IP** drop-down menu, select the AWS-generated IP address.
7. Select the **Reassociation** check box.
8. Click **Associate**.

Access the VPX instance:

After you’ve configured a standalone NetScaler VPX instance with three NICs, log on to the VPX instance to complete the NetScaler-side configuration. Use of the following options:

- GUI: Type the public IP of the management NIC in the browser. Log on by using `ns root` as the user name and the instance ID (`i-0c1ffe1d987817522`) as the password.

Note

On your first logon, you are prompted to change the password for security reasons. After changing the password, you must save the configuration. If the configuration is not saved and the instance restarts, you must log on with the default password. Change the password again at the prompt and save the configuration.

- SSH: Open an SSH client and type:

```
ssh -i \<location of your private key\> ns root@\<public DNS of the instance\>
```

To find the public DNS, click the instance, and click **Connect**.

Related information:

- To configure the NetScaler-owned IP addresses (NSIP, VIP, and SNIP), see [Configuring NetScaler-Owned IP Addresses](#).
- You’ve configured a BYOL version of the NetScaler VPX appliance, for more information see the VPX Licensing Guide at <http://support.citrix.com/article/CTX122426>

Download a NetScaler VPX license

May 2, 2023

After the launch of NetScaler VPX-customer licensed instance from the AWS marketplace, a license is required. For more information on VPX licensing, see [Licensing overview](#).

You have to:

1. Use the licensing portal within the Citrix website to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance activate automatically.

If you use a NetScaler VPX instance with a model number higher than VPX 5000, the network throughput might not be the same as specified by the instance's license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

5 Gbps network bandwidth is observed in the `c4.8xlarge` instance type.

How to migrate the AWS subscription to BYOL

This section describes the procedure to migrate from AWS subscription to Bring your own license (BYOL), and conversely.

Do the following steps to migrate an AWS subscription to BYOL:

Note

The **Step 2** and **Step 3** are done on the NetScaler VPX instance, and all other steps are done on the AWS portal.

1. Create a BYOL EC2 instance using [NetScaler VPX - Customer Licensed](#) in the same availability zone as the old EC2 instance that has the same security group, IAM role, and subnet. The new EC2 instance must have only one ENI interface.
2. To back up the data on the old EC2 instance using the NetScaler GUI, follow these steps.
 - a) Navigate to **System > Backup and Restore**.
 - b) In the **Welcome** page, click **Backup/Import** to start the process.

Welcome to
Backup and Restore

The backup and restore functionality of the Citrix ADC appliance allows you to create a backup file of the Citrix ADC configurations. This file can later be used to restore the Citrix ADC configurations to the previous state.
To create a backup, click the "Backup..." link shown below. When required, select one of the backups and restore the appliance.

[Backup/Import](#)

c) In the **Backup/Import** page, fill in the following details:

- **Name** –Name of the backup file.
- **Level** –Select the backup level as **Full**.
- **Comment** –Provide a brief description of the backup.

Backup/Import

Create Import

Citrix ADC Version
NS13.1: Build 50.19.nc, Date: Sep 25 2023, 21:28:29 (64-bit)

 ⓘ

Comment

[Backup](#) [Cancel](#)

- d) Click **Backup**. Once the backup is complete, you can select the file and download it to your local machine.

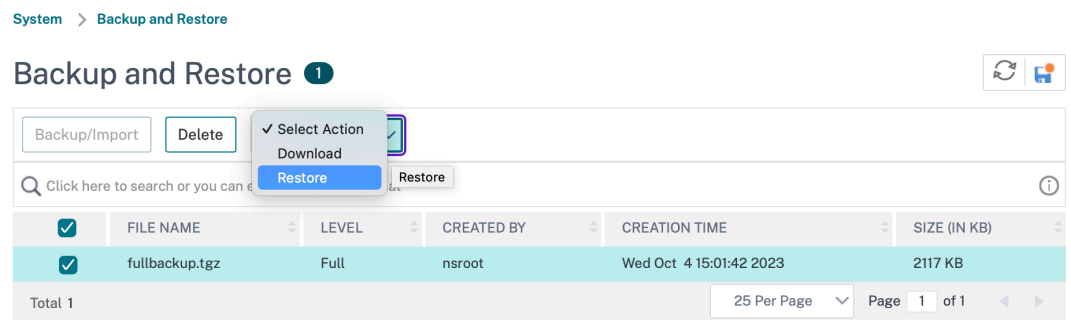

3. To restore the data on the new EC2 instance using the NetScaler GUI, follow these steps:

- a) Navigate to **System > Backup and Restore**.
- b) Click **Backup/Import** to start the process.
- c) Select the **Import** option and upload the backup file.

[System](#) > [Backup and Restore](#) > [Backup/Import](#)

- d) Select the file.
- e) From the **Select Action** drop-down menu, select **Restore**.

- f) On the **Restore** page, verify the file details, and click **Restore**.

← Restore

File Name	fullbackup.tgz
Level	Full

	<input type="checkbox"/> Skip Backup ⓘ

Restore **Close**

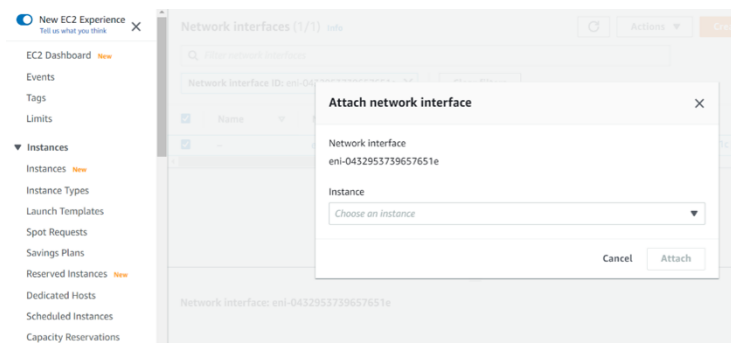

- g) After the restore, reboot the EC2 instance.

4. Move all interfaces (except the management interface to which the NSIP address is bound) from the old EC2 instance to the new EC2 instance. To move a network interface from one EC2 instance to another, follow these steps:

- a) In the **AWS Portal**, stop both the old and new EC2 instances.
- b) Navigate to **Network Interfaces**, and select the network interface attached to the old EC2 instance.
- c) Detach the EC2 instance by clicking **Actions > Detach**.

d) Attach the network interface to the new EC2 instance by clicking **Actions > Attach**. Enter the EC2 instance name to which the network interface must be attached.

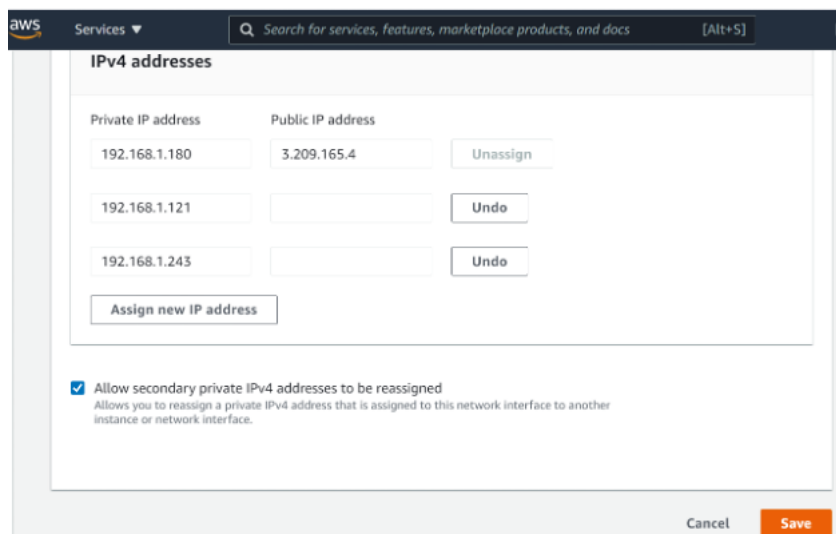

e) Do the **Step 1 to Step 4** for all other interfaces that are attached. Make sure to follow the sequence and maintain the interface order. That is, first detach interface 2 and attach it, and then detach interface 3 and attach it, and so on.

5. You can't detach the management interface from an old EC2 instance. So, move all the secondary IP addresses (if any) on the management interface (primary network interface) of the old EC2 instance to the new EC2 instance. To move an IP address from one interface to another, follow these steps:

- a) In the **AWS Portal**, make sure that both the old and new EC2 instances are in **Stop** state.
- b) Navigate to **Network Interfaces**, and select the management network interface attached to the old EC2 instance.

- c) Click **Actions > Manage IP Address**, and make note of all the secondary IP addresses assigned (if any).
- d) Navigate to the management network interface or primary interface of the new EC2 instance.
- e) Click **Actions > Manage IP Addresses**.
- f) Under **IPv4 Addresses**, click **Assign new IP address**.
- g) Enter the IP addresses, which are noted in the **Step 3**.
- h) Select **Allow secondary private IP addresses to be reassigned** check box.
- i) Click **Save**.

6. Start the new EC2 instance and verify the configuration. After all the configuration is moved, you can delete or keep the old EC2 instance as per your requirement.
7. If any EIP address is attached to the NSIP address of the old EC2 instance, move the old instance NSIP address to the new instance NSIP address.
8. If you want to revert to the old instance, then follow the same steps in the opposite way between the old and new instance.
9. After you move from subscription instance to BYOL instance, a license is required. To install a license follow these steps:
 - Use the licensing portal in the Citrix website to generate a valid license.
 - Upload the license to the instance. For more information, see [VPX ADC - Install a new license](#).

Note

When you move BYOL instance to subscription instance (paid marketplace instance), you need not install the license. The correct feature set and performance is automatically activated.

Limitations

The management interface can't be moved to the new EC2 instance. So Citrix recommends you manually configure the management interface. For more information, see **Step 5** in the preceding procedure. A new EC2 instance is created with the exact replica of the old EC2 instance but only the NSIP address has a new IP address.

Load balancing servers in different availability zones

May 2, 2023

A VPX instance can be used to load balance servers running in the same availability zone, or in:

- A different availability zone (AZ) in the same AWS VPC
- A different AWS region
- AWS EC2 in a VPC

To enable a VPX instance to load balance servers running outside the AWS VPC that the VPX instance is in, configure the instance to use EIPs to route traffic through the Internet gateway, as follows:

1. Configure a SNIP on the NetScaler VPX instance by using the NetScaler CLI or the GUI.
2. Enable traffic to be routed out of the AZ, by creating a public facing subnet for the server-side traffic.
3. Add an Internet gateway route to the routing table, using the AWS GUI console.
4. Associate the routing table you updated with the server-side subnet.
5. Associate an EIP with the server-side private IP address that is mapped to a NetScaler SNIP address.

How high availability on AWS works

May 2, 2023

You can configure two NetScaler VPX instances on AWS as a high availability (HA) active-passive pair. When you configure one instance as the primary node and the other as the secondary node, the primary node accepts connections and manages servers. The secondary node monitors the primary. If for any reason, the primary node is unable to accept connections, the secondary node takes over.

In AWS, the following deployment types are supported for VPX instances:

- High availability within same zone
- High availability across different zones

Note

For high availability to work, ensure that both the NetScaler VPX instances are attached with IAM roles and assigned with the Elastic IP (EIP) address to the NSIP. You need not assign an EIP on NSIP if the NSIP can reach internet through the NAT instance.

High availability within the same zones

In a high-availability deployment within the same zones, both VPX instances must have similar networking configurations.

Follow these two rules:

Rule 1. Any NIC on one VPX instance must be in the same subnet as the corresponding NIC in the other VPX. Both instances must have:

- Management interface on the same subnet (referred as management subnet)
- Client interface on the same subnet (referred as client subnet)
- Server interface on the same subnet (referred as server subnet)

Rule 2. Sequence of mgmt NIC, client NIC, and server NIC on both instances must be the same. For example, the following scenario is not supported.

VPX instance 1

NIC 0: management

NIC 1: client

NIC 2: Server

VPX instance 2

NIC 0: management

NIC 1: server

NIC 2: client

In this scenario, NIC 1 of instance 1 is in client subnet while NIC 1 of instance 2 is in server subnet. For HA to work, NIC 1 of both the instances must be either in the client subnet or in the server subnet.

From 13.0 41.xx, high availability can be achieved by migrating secondary private IP addresses attached to the NICs (client and server-side NICs) of the primary HA node to the secondary HA node after failover. In this deployment:

- Both the VPX instances have the same number of NICs and subnet mapping according to NIC enumeration.
- Each VPX NIC has one extra private IP address, except the first NIC - which corresponds to the management IP address. The extra private IP address appears as the primary private IP address in the AWS web console. In our document, we refer to this extra IP address as the dummy IP address).
- The dummy IP addresses must be not configured on the NetScaler instance as VIP and SNIP.
- Other secondary private IP addresses must be created, as required, and configured as VIP and SNIP.
- On failover, the new primary node looks for configured SNIPs and VIPs and moves them from NICs attached to the previous primary to corresponding NICs on the new primary.
- NetScaler instances require IAM permissions for HA to work. Add the following IAM privileges to the IAM policy added to each instance.

```
"iam:GetRole"  
"ec2:DescribeInstances"  
"ec2:DescribeNetworkInterfaces"  
"ec2:AssignPrivateIpAddresses"
```

Note: `unassignPrivateIpAddress` is not required.

This method is faster than the legacy method. In the older method, HA depends on the migration of AWS elastic network interfaces of the primary node to the secondary node.

For a legacy method, the following policies are required:

```
"iam:GetRole"  
"ec2:DescribeInstances"  
"ec2:DescribeAddresses"  
"ec2:AssociateAddress"  
"ec2:DisassociateAddress"
```

For more information, see [Deploy a high availability pair on AWS](#).

High availability across different zones

You can configure two NetScaler VPX instances on two different subnets or two different AWS availability zones, as a high availability active-passive pair in Independent Network Configuration (INC) mode.

Upon failover, the EIP (Elastic IP) of the VIP of the primary instance migrates to the secondary, which takes over as the new primary. In the failover process, the AWS API:

- Checks the virtual servers that have [IPSets](#) attached to them.
- Finds the IP address that has an associated public IP, from the two IP addresses the virtual server is listening on. One that is directly attached to the virtual server, and one that is attached through the IP set.
- Reassociates the public IP (EIP) to the private IP belonging to the new primary VIP.

For HA across different zones, the following policies are required:

```
"iam:GetRole"  
"ec2:DescribeInstances"  
"ec2:DescribeAddresses"  
"ec2:AssociateAddress"  
"ec2:DisassociateAddress"
```

For more information, see [High availability across AWS availability zones](#).

Before you start your deployment

Before you start any HA deployment on AWS, read the following document:

- [Prerequisites](#)
- [Limitations and usage guidelines](#)
- [Deploy a NetScaler VPX instance on AWS](#)
- [High Availability](#)

Troubleshooting

To troubleshoot any failure during a HA failover of NetScaler VPX instance on AWS cloud, check the `cloud-ha-daemon.log` file stored in the `/var/log/` location.

Deploy a VPX HA pair in the same AWS availability zone

March 8, 2024

Note:

From NetScaler release 13.1 build 27.x onwards, the VPX HA pair in the same AWS availability zone supports IPv6 addresses.

You can configure two NetScaler VPX instances on AWS as a HA pair, in the same AWS zone where both VPX instances are on the same subnet. HA is achieved by migrating secondary private IP addresses attached to the NICs (client and server-side NICs) of the primary HA node to the secondary HA node after failover. All the Elastic IP addresses associated with the secondary private IP addresses are also migrated.

The NetScaler VPX HA pair supports both IPv4 and IPv6 addresses in the same AWS availability zone.

The following illustration depicts an HA failover scenario by migrating secondary private IP addresses.

Figure 1. A NetScaler VPX HA Pair on AWS, using private IP migration

Before you start your document, read the following docs:

- [Prerequisites](#)
- [Limitations and usage guidelines](#)
- [Deploy a NetScaler VPX instance on AWS](#)
- [High Availability](#)

How to deploy a VPX HA pair in the same zone

Here is the summary of the steps to deploy a VPX HA pair in the same zone:

1. Create two VPX instances on AWS, each with three NICs.
2. Assign AWS secondary private IP address to VIP and SNIP of primary node.
3. Configure VIP and SNIP on primary node using AWS secondary private IP addresses.

4. Configure HA on both nodes.

Step 1. Create two VPX instances (primary and secondary nodes) by using the same VPC, each with three NICs (Ethernet 0, Ethernet 1, Ethernet 2)

Follow the steps given in [Deploy a NetScaler VPX instance on AWS by using the AWS web console](#).

Step 2. On the primary node, assign private IP addresses for Ethernet 1 (client IP or VIP) and Ethernet 2 (back-end server IP or SNIP)

The AWS console automatically assigns primary private IP addresses to the configured NICs. Assign more private IP addresses to VIP and SNIP, known as secondary private IP addresses.

To assign a private IP address to a network interface, follow these steps:

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces** and then select the network interface attached to the instance.
3. Choose **Actions > Manage IP Addresses**.
4. Select **IPv4 Addresses** or **IPv6 Addresses** based on your requirement.
5. For IPv4 Addresses:
 - a) Choose **Assign new IP**.
 - b) Enter a specific IPv4 address that's within the subnet range for the instance, or leave the field blank to let Amazon select an IP address for you.
 - c) (Optional) Choose **Allow reassignment** to allow the secondary private IP address to be reassigned if it is already assigned to another network interface.
6. For IPv6 Addresses:
 - a) Choose **Assign new IP**.
 - b) Enter a specific IPv6 address that's within the subnet range for the instance, or leave the field blank to let Amazon select an IP address for you.
 - c) (Optional) Choose **Allow reassignment** to allow the primary or secondary private IP address to be reassigned if it is already assigned to another network interface.
7. Choose **Yes > Update**.

Under the **Instance description**, the assigned private IP addresses appear.

Note:

In an IPv4 HA pair deployment, you can assign only the secondary IPv4 addresses on the interface and use them as VIP and SNIP addresses. But in an IPv6 HA pair deployment, you can assign

either the primary IPv6 or secondary IPv6 addresses on the interface and use them as VIP and SNIP addresses.

Step 3. Configure VIP and SNIP on the primary node, using secondary private IP addresses

Access the primary node using SSH. Open an ssh client and type:

```
1 ssh -i <location of your private key> nsroot@<public DNS of the  
instance>  
2 <!--NeedCopy-->
```

Next, configure VIP and SNIP.

For VIP, type:

```
1 add ns ip <IPAddress> <netmask> -type <type>  
2 <!--NeedCopy-->
```

For SNIP, type:

```
1 add ns ip <IPAddress> <netmask> -type SNIP  
2 <!--NeedCopy-->
```

Type `save config` to save.

To see the configured IP addresses, type the following command:

```
1 show ns ip  
2 <!--NeedCopy-->
```

For more information, see the following topics:

- [Configuring and Managing Virtual IP \(VIP\) Addresses](#)
- [Configuring the NSIP address](#)

Step 4: Configure HA on both instances

On the primary node, open a Shell client and type the following command:

```
1 add ha node <id> <private IP address of the management NIC of the  
secondary node>  
2 <!--NeedCopy-->
```

On the secondary node, type the following command:

```
1 add ha node <id> <private IP address of the management NIC of the  
primary node>  
2 <!--NeedCopy-->
```

Type `save config` to save the configuration.

To see the configured HA nodes, type `show ha node`.

Upon failover, the secondary private IP addresses configured as VIP and SNIP on the previous primary node are migrated to the new primary node.

To force a failover on a node, type `force HAfailover`.

Migrate a legacy HA pair to a new HA pair based on secondary private IP migration

Note:

The legacy method for deploying VPX HA pair that works based on ENI migration is deprecated. Therefore, we recommend you to use the HA pair deployment based on the secondary private IP migration.

To enable seamless migration from legacy HA pair to a new HA pair based on secondary private IP migration, ensure the following:

1. Both the primary and secondary nodes must have the same number of interfaces, and these interfaces must be in the same subnets.
2. The VIP and SNIP configured as primary private IP address in the legacy method, must be migrated to a secondary private IP address in the new method.
3. IAM permissions required for the new HA deployment must be added to the primary and secondary NetScaler instances.
4. Reboot both the primary and secondary NetScaler instances.

For more information, see [High availability within the same zones](#).

Deploy a high availability pair by using the Citrix CloudFormation template

Before starting the CloudFormation template, ensure that you complete the following requirements:

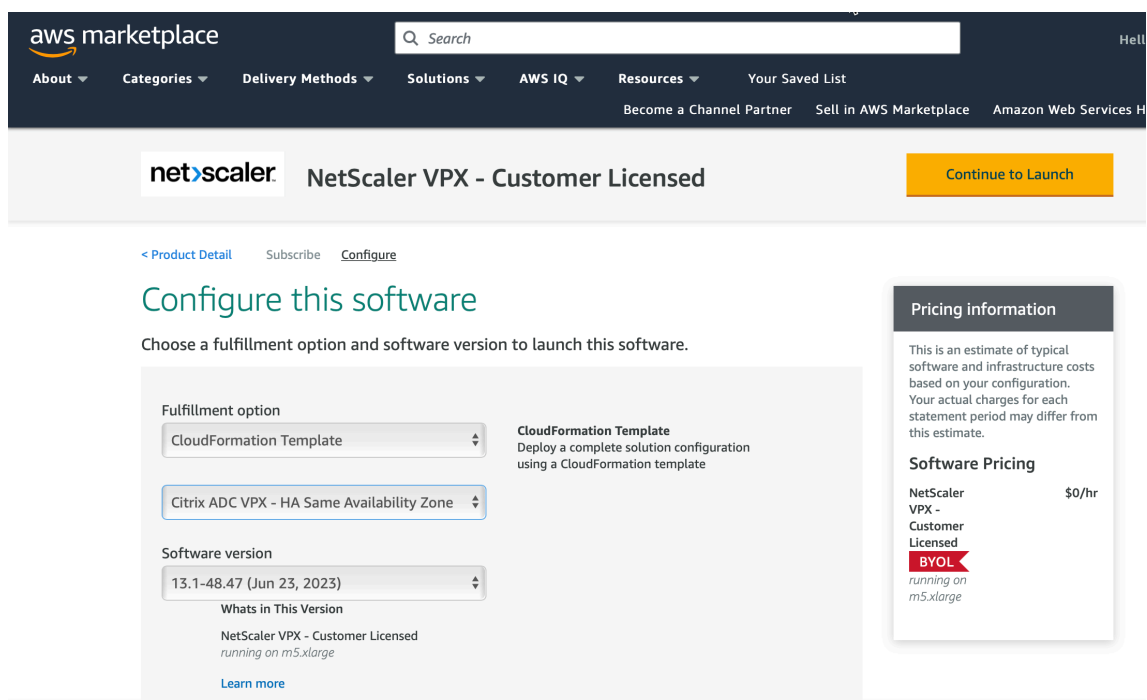

- A VPC
- Three subnets within the VPC
- A security group with UDP 3003, TCP 3009–3010, HTTP, SSH ports open
- A key pair
- Create an internet gateway
- Edit route tables for client and management networks to point to the internet gateway

Note:

The Citrix CloudFormation template automatically creates an IAM Role. Existing IAM Roles do not appear in the template.

To launch the Citrix CloudFormation template:

1. Log on to the [AWS marketplace](#) by using your AWS credentials.
2. In the search field, type **NetScaler VPX** to search for the NetScaler AMI, and click **Go**.
3. On the search result page, click the desired NetScaler VPX offering.
4. Click the **Pricing** tab, to go to **Pricing Information**.
5. Select the region and **Fulfillment Option** as **NetScaler VPX –Customer Licensed**.
6. Click **Continue to Subscribe**.
7. Check the details in the **Subscribe** page and click **Continue to Configuration**.
8. Select **Delivery Method** as **CloudFormation Template**.
9. Select the required CloudFormation template.
10. Select **Software Version** and **Region**, and click **Continue to Launch**.

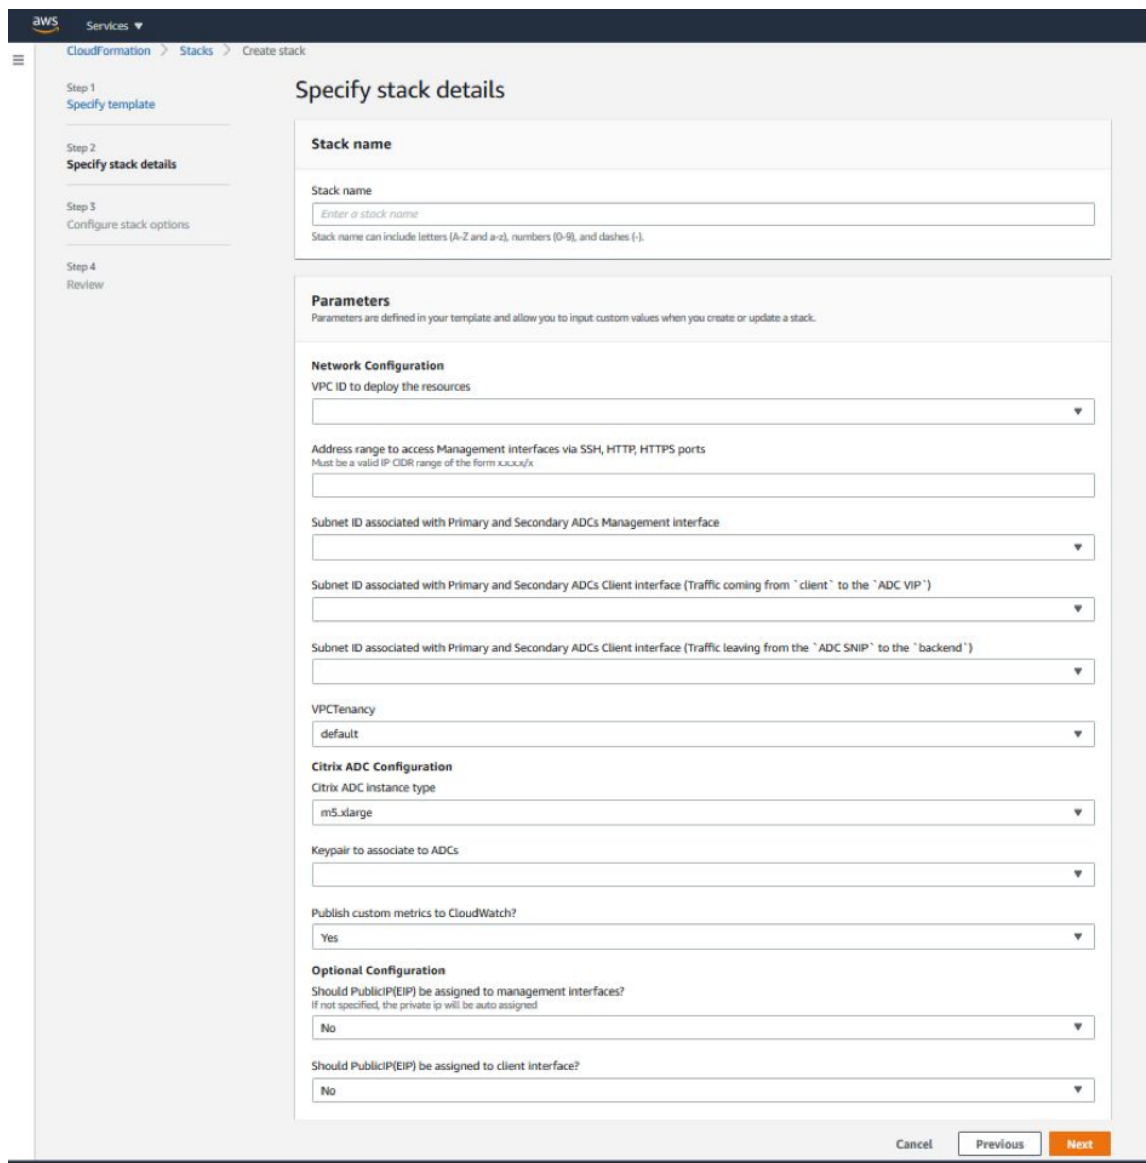

11. Under **Choose Action**, select **Launch CloudFormation**, and click **Launch**.
The **Create stack** page appears.
12. Click **Next**.

13. The **Specify stack details** page appears. Enter the following details.

- Type a **Stack name**. The name must be within 25 characters.
- Under **Network Configuration**, perform the following:
 - Select **Management Subnetwork**, **Client Subnetwork**, and **Server Subnetwork**. Ensure that you select the correct subnetworks you created within the VPC that you selected under VPC ID.
 - Add **Primary Management IP**, **Secondary Management IP**, **Client IP**, and **Server IP**. The IP addresses must belong to the same subnets of the respective subnetworks. Alternatively, you can let the template assign the IP addresses automatically.
 - Select **default** for **VPCTenancy**.
- Under **NetScaler Configuration**, perform the following:
 - Select **m5.xlarge** for **Instance type**.
 - Select the key pair that you've already created from the menu for **Key Pair**.
 - By default, the **Publish custom metrics to CloudWatch?** option is set to **Yes**. If you want to disable this option, select **No**.
For more information about CloudWatch metrics, see Monitor your instances using Amazon CloudWatch.
- Under **Optional Configuration**, do the following:
 - By default, the **Should publicIP(EIP) be assigned to management interfaces?** option is set to **No**.
 - By default, the **Should publicIP(EIP) be assigned to client interface?** option is set to **No**.

14. Click **Next**.

15. The **Configure stack options** page appears. This is an optional page.

16. Click **Next**.
17. The **Options** page appears. (This is an optional page.). Click **Next**.
18. The **Review** page appears. Take a moment to review the settings and make any changes, if necessary.
19. Select the **I acknowledge that AWS CloudFormation might create IAM resources.** check box, and then click **Create stack**.
20. The **CREATE-IN-PROGRESS** status appears. Wait until the status is **CREATE-COMplete**. If the status does not change to **COMPLETE**, check the **Events** tab for the reason of failure, and recreate the instance with proper configurations.

21. After an IAM resource is created, navigate to **EC2 Management Console > Instances**. You find two VPX instances created with IAM role. The primary and secondary nodes are created each with three private IP addresses and three network interfaces.
22. Log on to the primary node with user name `nsroot` and the instance ID as the password. From the GUI, navigate to **System > High Availability > Nodes**. The NetScaler VPX is already configured in HA pair by the CloudFormation template.
23. The NetScaler VPX HA pair appears.

Monitor your instances using Amazon CloudWatch

You can use the Amazon CloudWatch service to monitor a set of NetScaler VPX metrics such as CPU and memory utilization, and throughput. CloudWatch monitors resources and applications that run on AWS, in real time. You can access the Amazon CloudWatch dashboard by using the AWS Management console. For more information, see [Amazon CloudWatch](#).

Points to note

- If you deploy a NetScaler VPX instance on AWS by using the AWS web console, the CloudWatch service is enabled by default.

- If you deploy a NetScaler VPX instance by using the Citrix CloudFormation template, the default option is “Yes.” If you want to disable the CloudWatch service, select “No.”
- Metrics are available for CPU (management and packet CPU usage), memory, and throughput (inbound and outbound).

How to view CloudWatch metrics

To view CloudWatch metrics for your instance, follow these steps:

1. Log on to **AWS Management console > EC2 > Instances**.
2. Select the instance.
3. Click **Monitoring**.
4. Click **View all CloudWatch metrics**.

5. Under All metrics, click your instance ID.

6. Click the metrics that you want to view, set the duration (by minutes, hours, days, weeks, months).
7. Click **Graphed metrics** to view the statistics of usage. Use the **Graph options** to customize your graph.

Figure. Graphed metrics for CPU usage

Configuring SR-IOV on a high availability setup

Support for SR-IOV interfaces in a high availability setup is available from NetScaler release 12.0 57.19 onwards. For more information about how to configure SR-IOV, see [Configuring NetScaler VPX instances to Use SR-IOV Network Interface](#).

Related resources

[How high availability on AWS works](#)

High availability across different AWS availability zones

May 2, 2023

You can configure two NetScaler VPX instances on two different subnets or two different AWS availability zones, as a high availability active-passive pair in Independent Network Configuration (INC) mode. If for any reason, the primary node is unable to accept connections, the secondary node takes over.

For more information about high availability, see [High availability](#). For more information about INC, see [Configuring high availability nodes in different subnets](#).

Points to note

- Read the following documents before you start your deployment:
 - [AWS terminology](#)
 - [Prerequisites](#)
 - [Limitations and usage guidelines](#)

- The VPX high availability pair can either reside in the same availability zone in a different subnet or in two different AWS availability zones.
- Citrix recommends that you use different subnets for management (NSIP), client traffic (VIP), and back-end server (SNIP).
- High availability must be set in Independent Network Configuration (INC) mode for a failover to work.
- The two instances must have port 3003 open for UDP traffic as that is used for heartbeats.
- The management subnets of both the nodes must have access to internet or to AWS API server through internal NAT so that the rest APIs are functional.
- IAM role must have E2 permission for the public IP or elastic IP (EIP) migration and EC2 Route Table permissions for the private IP migration.

You can deploy high availability across AWS availability zones in the following ways:

- [Using elastic IP addresses](#)
- [Using private IP addresses](#)

Additional References

For more information on NetScaler Application Delivery Management (ADM) for AWS, see [Install the NetScaler Console agent on AWS](#).

Deploy a VPX high-availability pair with elastic IP addresses across different AWS zones

May 2, 2023

You can configure two NetScaler VPX instances on two different subnets or two different AWS availability zones using elastic IP (EIP) addresses in the INC mode.

For more information about high availability, see [High availability](#). For more information about INC, see [Configuring high availability nodes in different subnets](#).

How HA with EIP addresses across different AWS zones works

Upon failover, the EIP of the VIP of the primary instance migrates to the secondary, which takes over as the new primary. In the failover process, AWS API:

1. Checks the virtual servers that have [IPSets](#) attached to them.

2. Finds the IP address that has an associated public IP, from the two IP addresses the virtual server is listening on. One that is directly attached to the virtual server, and the one that is attached through the IP set.
3. Reassociates the public IP (EIP) to the private IP belonging to the new primary VIP.

Note

To protect your network from attacks such as denial-of-service (DoS), when using an EIP, you can create security groups in AWS to restrict the IP access. For high availability, you can switch from EIP to a private IP movement solution as per your deployments.

How to deploy a VPX high-availability pair with elastic IP addresses across different AWS zones

The following is the summary of steps for deploying a VPX pair on two different subnets or two different AWS availability zones.

1. Create an Amazon virtual private cloud.
2. Deploy two VPX instances in two different availability zones or in the same zone but in different subnets.
3. Configure high availability
 - a) Set up high availability in INC mode in both the instances.
 - b) Add an [IP set](#) in both the instances.
 - c) Bind the IP set in both the instances to the VIP.
 - d) Add a virtual server in the primary instance.

For steps 1 and 2, use the AWS console. For steps 3, use the NetScaler VPX GUI or the CLI.

Step 1. Create an Amazon virtual private cloud (VPC).

Step 2. Deploy two VPX instance in two different availability zones or in the same zone but in different subnets. Attach an EIP to the VIP of the primary VPX.

For more information about how to create a VPC and deploy a VPX instance on AWS, see [Deploy a NetScaler VPX standalone instance on AWS](#) and [Scenario: standalone instance](#)

Step 3. Configure high availability. You can use the NetScaler VPX CLI or the GUI to set up high availability.

Configure high availability by using the CLI

1. Set up high availability in INC mode in both the instances.

On the primary node:

```
add ha node 1 <sec_ip> -inc ENABLED
```

On the secondary node:

```
add ha node 1 <prim_ip> -inc ENABLED
```

<sec_ip> refers to the private IP address of the management NIC of the secondary node

<prim_ip> refers to the private IP address of the management NIC of the primary node

2. Add the IP set in both the instances.

Type the following command on both the instances.

```
add ipset <ipsetname>
```

3. Bind the IP set to the VIP set on both the instances.

Type the following command on both the instances:

```
add ns ip <secondary vip> <subnet> -type VIP
```

```
bind ipset <ipsetname> <secondary VIP>
```

Note

You can bind the IP set to the primary VIP or to the secondary VIP. However, if you bind the IP set to the primary VIP, use the secondary VIP to add to the virtual server, and conversely.

4. Add a virtual server on the primary instance.

Type the following command:

```
add <server_type> vserver <vserver_name> <protocol> <primary_vip>  
<port> -ipset \<ipset_name>
```

Configure high availability by using the GUI

1. Set up high availability in INC mode on both the instances
2. Log on to the primary node with user name `nsroot` and instance ID as password.
3. From the GUI, go to **Configuration > System > High Availability**. Click **Add**.
4. At the **Remote Node IP address** field, add the private IP address of the management NIC of the secondary node.
5. Select **Turn on NIC (Independent Network Configuration)** mode on self-node.
6. Under **Remote System Login Credential**, add the user name and password for the secondary node and click **Create**.
7. Repeat the steps in the secondary node.

8. Add IP set and bind IP set to the VIP set on both the instances.
9. From the GUI, navigate to **System > Network > IPs > Add**.
10. Add the required values for IP Address, Netmask, IP Type (virtual IP) and click **Create**.
11. Navigate to **System > Network > IP Sets > Add**. Add an IP set name and click **Insert**.
12. From the IPv4s page, select the virtual IP and click **Insert**. Click **Create** to create the IP set.
13. Add a virtual server in the primary instance

From the GUI, go to **Configuration > Traffic Management > Virtual Servers > Add**.

Load Balancing Virtual Server | [Export as a Template](#)

Basic Settings	
Name	vserver1
Protocol	HTTP
State	DOWN
IP Address	192.168.2.129
Port	80

Listen Policy Expression	NONE
Redirection Mode	IP
Range	1
IPset	ipset123
RHI State	PASSIVE
AppFlow Logging	ENABLED
Retain Connections on Cluster	NO

Scenario

In this scenario, a single VPC is created. In that VPC, two VPX instances are created in two availability zones. Each instance has three subnets - one for management, one for client, and one for back-end server. An EIP is attached to the VIP of the primary node.

Diagram: This diagram illustrates the NetScaler VPX high availability setup in INC mode, on AWS

For this scenario, use CLI to configure high availability.

1. Set up high availability in INC mode on both the instances.

Type the following commands on the primary and the secondary nodes.

On primary:

```
add ha node 1 192.168.6.82 -inc enabled
```

Here, 192.168.6.82 refers to the private IP address of the management NIC of the secondary node.

On secondary:

```
add ha node 1 192.168.1.108 -inc enabled
```

Here, 192.168.1.108 refers to the private IP address of the management NIC of the primary node.

2. Add an IP set and bind the IP set to the VIP on both the instances

On primary:

```
add ipset ipset123
add ns ip 192.168.7.68 255.255.255.0 -type VIP
bindipset ipset123 192.168.7.68
```

On secondary:

```
add ipset ipset123
add ns ip 192.168.7.68 255.255.255.0 -type VIP
```

```
bind ipset ipset123 192.168.7.68
```

3. Add a virtual server on the primary instance.

The following command:

```
add lbvserver vserver1 http 192.168.2.129 80 -ipset ipset123
```

4. Save the configuration.

	ID	IP Address	Host Name	Master State	Node State	INC	Synchronization State
<input type="checkbox"/>	0	192.168.1.108		Primary	● UP	ENABLED	ENABLED
<input type="checkbox"/>	1	192.168.6.82		Secondary	● UP	ENABLED	SUCCESS

5. After a forced failover, the secondary becomes the new primary.

	ID	IP Address	Host Name	Master State	Node State	INC	Synchronization State
<input type="checkbox"/>	0	192.168.1.108		Secondary	● UP	ENABLED	SUCCESS
<input type="checkbox"/>	1	192.168.6.82		Primary	● UP	ENABLED	ENABLED

Deploy a VPX high-availability pair with private IP addresses across different AWS zones

September 21, 2023

You can configure two NetScaler VPX instances on two different subnets or two different AWS availability zones using private IP addresses in the INC mode. This solution can be easily integrated with the existing multizone [VPX high-availability pair with elastic IP addresses](#). Therefore, you can use both the solutions together.

For more information about high availability, see [High availability](#). For more information about INC, see [Configuring high availability nodes in different subnets](#).

Note:

This deployment is supported from NetScaler release 13.0 build 67.39 onwards. This deployment is compatible with AWS Transit Gateway.

High availability pair with private IP addresses using AWS non-shared VPC

Prerequisites

Ensure that the IAM role associated with your AWS account has the following IAM permissions:

```
1 {
2
3     "Version": "2012-10-17",
4     "Statement": [
5         {
6
7             "Action": [
8                 "ec2:DescribeInstances",
9                 "ec2:DescribeAddresses",
10                "ec2:AssociateAddress",
11                "ec2:DisassociateAddress",
12                "ec2:DescribeRouteTables",
13                "ec2>DeleteRoute",
14                "ec2:CreateRoute",
15                "ec2:ModifyNetworkInterfaceAttribute",
16                "iam:SimulatePrincipalPolicy",
17                "iam:GetRole"
18            ],
19            "Resource": "*",
20            "Effect": "Allow"
21        }
22    ]
23 }
24
25
26
27 <!--NeedCopy-->
```

Deploy a VPX HA pair with private IP addresses using AWS non-shared VPC

The following is the summary of steps for deploying a VPX pair on two different subnets or two different AWS availability zones using private IP addresses.

1. Create an Amazon virtual private cloud.
2. Deploy two VPX instances in two different availability zones.
3. Configure high availability
 - a) Set up high availability in INC mode in both the instances.
 - b) Add the respective route tables in the VPC that points to the client interface.
 - c) Add a virtual server in the primary instance.

For steps 1, 2, and 3b, use the AWS console. For steps 3a and 3c, use the NetScaler VPX GUI or the CLI.

Step 1. Create an Amazon virtual private cloud (VPC).

Step 2. Deploy two VPX instance in two different availability zones with the same number of ENI (Network Interface).

For more information about how to create a VPC and deploy a VPX instance on AWS, see [Deploy a NetScaler VPX standalone instance on AWS](#) and [Scenario: standalone instance](#)

Step 3. Configure the ADC VIP addresses by choosing a subnet that does not overlap with the Amazon VPC subnets. If your VPC is 192.168.0.0/16, then to configure ADC VIP addresses, you can choose any subnet from these IP address ranges:

- 0.0.0.0 - 192.167.0.0
- 192.169.0.0 - 254.255.255.0

In this example, the chosen 10.10.10.0/24 subnet and created VIPs in this subnet. You can choose any subnet other than the VPC subnet (192.168.0.0/16).

Step 4. Add a route that points to the client interface (VIP) of the primary node from the VPC route table.

From the AWS CLI, type the following command:

```
1 aws ec2 create-route --route-table-id rtb-2272532 --destination-cidr-  
  block 10.10.10.0/24 --gateway-id <eni-client-primary>  
2 <!--NeedCopy-->
```

From the AWS GUI, perform the following steps to add a route:

1. Open the [Amazon EC2 console](#).
2. In the navigation pane, choose **Route Tables**, and select the route table.
3. Choose **Actions**, and click **Edit routes**.
4. To add a route, choose **Add route**. For **Destination**, enter the destination CIDR block, a single IP address, or the ID of a prefix list. For gateway ID, select the ENI of a client interface of the primary node.

[Route Tables](#) > Edit routes

Edit routes

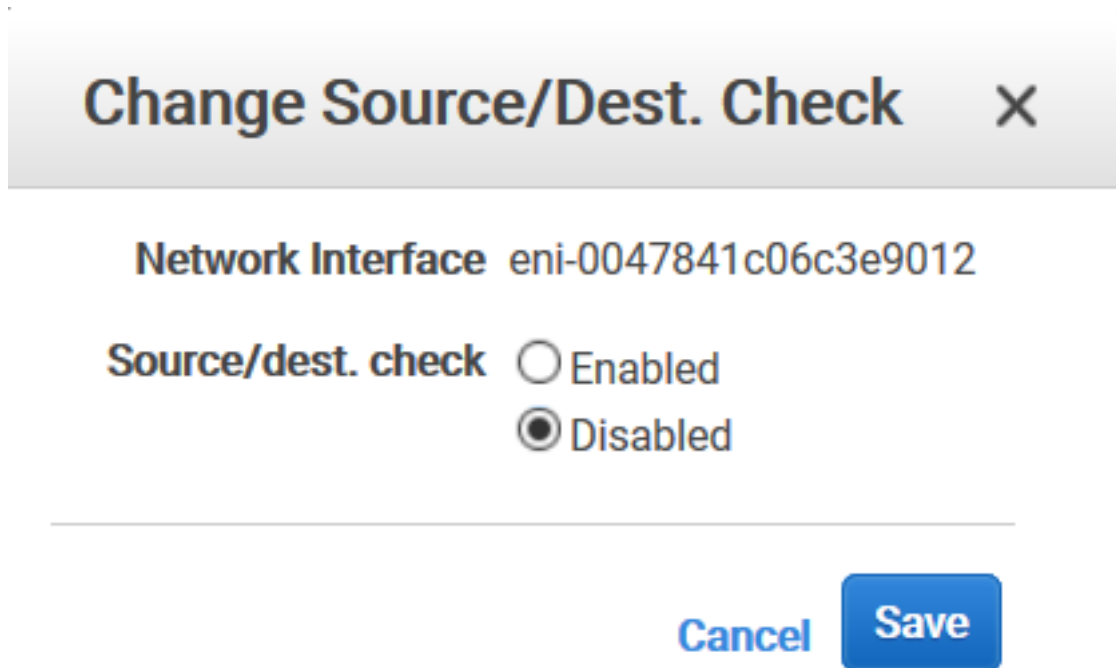

Destination	Target
192.168.0.0/16	local
0.0.0.0/0	igw-0b6da15e72de5729e
10.10.10.0/24	eni-09ad18f01f854b8ab
5.5.0.0/16	eni-09ad18f01f854b8ab

Note:

You must disable **Source/Dest Check** on the client ENI of the primary instance.

To disable the source/destination checking for a network interface using the console, perform the following steps:

1. Open the [Amazon EC2 console](#).
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface of a primary client interface, and choose **Actions**, and click **Change Source/Dest. Check**.
4. In the dialog box, choose **Disabled**, click **Save**.

Step 5. Configure high availability. You can use the NetScaler VPX CLI or the GUI to set up high availability.

Configure high availability by using the CLI

1. Set up high availability in INC mode in both the instances.

On the primary node:

```
1 add ha node 1 \<sec\_ip\> -inc ENABLED
2 <!--NeedCopy-->
```

On the secondary node:

```
1 add ha node 1 \<prim\_ip\> -inc ENABLED
2 <!--NeedCopy-->
```

<sec_ip> refers to the private IP address of the management NIC of the secondary node.

<prim_ip> refers to the private IP address of the management NIC of the primary node.

2. Add a virtual server on the primary instance. You must add it from the chosen subnet, for example, 10.10.10.0/24.

Type the following command:

```
1 add \<server\_type\> vserver \<vserver\_name\> \<protocol\> \<
  primary\_vip\> \<port\>
2 <!--NeedCopy-->
```

Configure high availability by using the GUI

1. Set up high availability in INC mode on both the instances
2. Log on to the primary node with user name `nsroot` and instance ID as password.
3. Navigate to **Configuration > System > High Availability**, and click **Add**.
4. At the **Remote Node IP address** field, add the private IP address of the management NIC of the secondary node.
5. Select **Turn on NIC (Independent Network Configuration)** mode on self-node.
6. Under **Remote System Login Credential**, add the user name and password for the secondary node and click **Create**.
7. Repeat the steps in the secondary node.

8. Add a virtual server in the primary instance

Navigate to **Configuration > Traffic Management > Virtual Servers > Add.**

Deploy a VPX HA pair with private IP addresses using AWS shared VPC

In an AWS shared VPC model, the account that owns the VPC (owner) shares one or more subnets with other accounts (participants). Therefore, you have a VPC owner account and a participant account. After a subnet is shared, the participants can view, create, modify, and delete their application resources in the subnets shared with them. Participants cannot view, modify, or delete resources that belong to other participants or the VPC owner.

For information on AWS shared VPC, see the [AWS documentation](#).

Note:

The configuration steps for deploying a VPX HA pair with private IP addresses using AWS shared VPC is the same as the Deploy a VPX HA pair with private IP addresses using AWS non-shared VPC with the following exception:

- The route tables in the VPC that points to the client interface must be added from the *VPC owner account*.

Prerequisites

- Ensure that the IAM role associated with NetScaler VPX instance in the AWS participant account has the following IAM permissions:

```

1  "Version": "2012-10-17",
2  "Statement": [
3      {
4
5          "Sid": "VisualEditor0",

```

```

6         "Effect": "Allow",
7         "Action": [
8             "ec2:DisassociateAddress",
9             "iam:GetRole",
10            "iam:SimulatePrincipalPolicy",
11            "ec2:DescribeInstances",
12            "ec2:DescribeAddresses",
13            "ec2:ModifyNetworkInterfaceAttribute",
14            "ec2:AssociateAddress",
15            "sts:AssumeRole"
16        ],
17        "Resource": "*"
18    }
19
20 ]
21 }
22
23 <!--NeedCopy-->

```

Note:

The **AssumeRole** allows NetScaler VPX instance to assume the cross-account IAM role, which is created by the VPC owner account.

- Ensure that the VPC owner account provides the following IAM permissions to the participant account using cross-account IAM role:

```

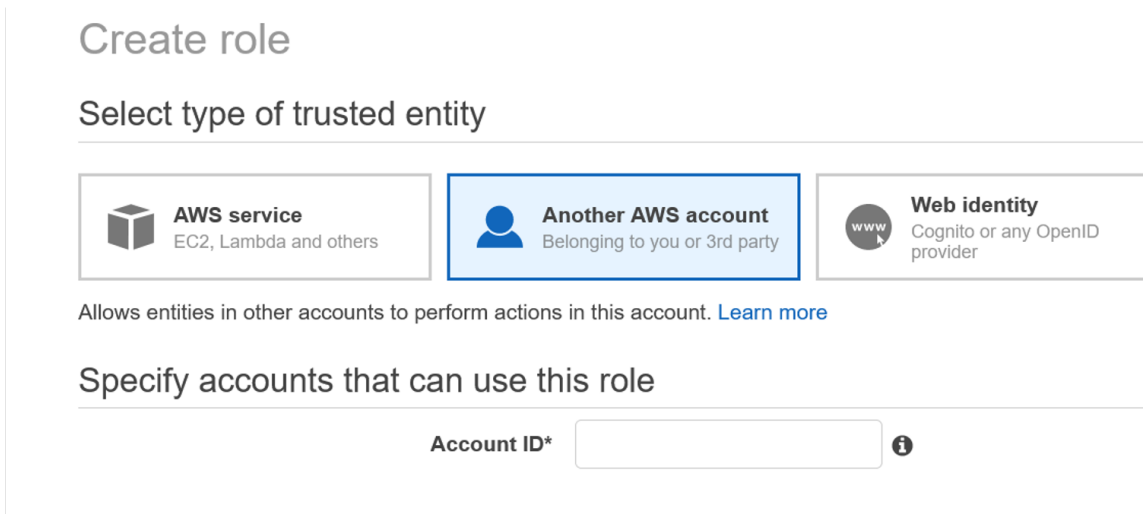

1  {
2
3      "Version": "2012-10-17",
4      "Statement": [
5          {
6
7              "Sid": "VisualEditor0",
8              "Effect": "Allow",
9              "Action": [
10                 "ec2:CreateRoute",
11                 "ec2:DeleteRoute",
12                 "ec2:DescribeRouteTables"
13             ],
14             "Resource": "*"
15         }
16     ]
17 }
18
19
20 <!--NeedCopy-->

```

Create cross-account IAM role

1. Log in to the AWS web console.

- In the **IAM** tab, navigate to **Roles** and then choose **Create Role**.
- Choose **Another AWS account**.

- Enter the 12-digit account ID number of the participant account that you want to grant administrator access to.

Set cross-account IAM role by using the NetScaler CLI

The following command enables NetScaler VPX instance to assume the cross-account IAM role that exists in the VPC owner account.

```
1 set cloud awsParam -roleARN <string>
2 <!--NeedCopy-->
```

Set cross-account IAM role by using the NetScaler GUI

- Sign into NetScaler appliance and navigate to **Configuration > AWS > Change cloud parameters**.

- In the **Configure AWS Cloud Parameters** page, enter the value for the **RoleARN** field.

← Configure AWS Cloud Parameters

neo.rolearn

errtfvf

Scenario

In this scenario, a single VPC is created. In that VPC, two VPX instances are created in two availability zones. Each instance has three subnets - one for management, one for client, and one for back-end server.

The following diagrams illustrate the NetScaler VPX high availability setup in INC mode, on AWS. The custom subnet 10.10.10.10, which is not part of the VPC is used as VIP. Therefore, the 10.10.10.10 subnet can be used across availability zones.

For this scenario, use CLI to configure high availability.

1. Set up high availability in INC mode on both the instances.

Type the following commands on the primary and the secondary nodes.

On the primary node:

```
1 add ha node 1 192.168.4.10 -inc enabled
2 <!--NeedCopy-->
```

Here, 192.168.4.10 refers to the private IP address of the management NIC of the secondary node.

On the secondary node:

```
1 add ha node 1 192.168.1.10 -inc enabled
2 <!--NeedCopy-->
```

Here, 192.168.1.10 refers to the private IP address of the management NIC of the primary node.

2. Add a virtual server on the primary instance.

Type the following command:

```
1 add lbvserver vserver1 http 10.10.10.10 80
2 <!--NeedCopy-->
```

3. Save the configuration.
4. After a forced failover:

- The secondary instance becomes the new primary instance.
- The VPC route pointing to the primary ENI migrates to the secondary client ENI.
- Client traffic resumes to the new primary instance.

AWS Transit Gateway configuration for HA private IP solution

You need AWS Transit Gateway to make the private VIP subnet routable within the internal network, across AWS VPCs, regions, and On-premises networks. The VPC must connect to AWS Transit Gateway. A static route for the VIP subnet or IP pool inside the AWS Transit Gateway route table is created and pointed towards the VPC.

To configure AWS Transit Gateway, follow these steps:

1. Open the [Amazon VPC console](#).
2. On the navigation pane, choose **Transit Gateway Route Tables**.
3. Choose the **Routes** tab, and click **Create static route**.

4. Create a static route where CIDR points to your private VIPS subnet and attachment points to the VPC having NetScaler VPX.

The screenshot shows the 'Create static route' page in the AWS console. It includes the following elements:

- Breadcrumbs: [Transit Gateway Route Tables](#) > Create static route
- Section title: **Create static route**
- Instruction: Add a static route to your Transit Gateway route table.
- Transit Gateway ID: lgw-0b3e99191e03c16ed
- Transit Gateway route table ID: lgw-rtb-09f12ca61473654a7
- CIDR: (Required field)
- Blackhole: (Optional)
- Choose attachment: (Dropdown menu)
- Footer: * Required, Cancel, Create static route

5. Click **Create static route**, then choose **Close**.

Troubleshooting

If you face any issues while configuring HA private IP solution across multizone HA, check the following key points for troubleshooting:

- Both primary and secondary nodes have the same set of IAM permissions.
- INC mode is enabled on both the primary and secondary nodes.
- Both primary and secondary nodes have the same number of interfaces.
- While creating an instance, follow the same sequence of attaching interfaces on both primary and secondary nodes based on the device index number. Let's say on a primary node, the client interface is attached first and the server interface is attached second. Follow the same sequence on the secondary node as well. If there is any mismatch, detach and reattach the interfaces in the correct order.
- You can verify the sequence of interfaces by following this navigation path: **AWS console > Network & Security > ENI > Device Index number**.
By default, the following device index numbers are assigned to these interfaces:
 - Management interface -0
 - Client interface -1
 - Server interface -2
- If the sequence of device index numbers on primary ENI is: 0, 1, 2. The secondary ENI must also follow the same sequence of device index numbers: 0, 1, 2.

If there is a mismatch in the device index number sequence, all the mismatched routes are transferred to index 0, the management interface, to avoid any loss of routes. But you must still detach the interfaces and attach them again in the correct sequence to avoid the movement of routes to the Management interface because it can cause traffic congestion.

- If traffic does not flow, make sure the “Source/dest. Check” is disabled on the client interface of the primary node for the first time.
- Make sure the `cloudhadaemon` command (`ps -aux | grep cloudha`) is running in Shell.
- Make sure that the NetScaler firmware version is 13.0 build 70.x or later.
- For issues with the failover process, check the log file available at: `/var/log/cloud-ha-daemon.log`

Deploy a NetScaler VPX instance on AWS Outposts

May 2, 2023

AWS Outposts is a pool of AWS compute and storage capacity deployed at your site. Outposts provides AWS infrastructure and services in your on-premises location. AWS operates, monitors, and manages this capacity as part of an AWS Region. You can use the same NetScaler VPX instances, AWS APIs, tools, and infrastructure across on-premises and the AWS cloud for a consistent hybrid experience.

You can create subnets on your Outposts and specify them when you create AWS resources such as EC2 instances, EBS volumes, ECS clusters, and RDS instances. Instances in the Outposts subnets communicate with other instances in the AWS Region using private IP addresses, all within the same Amazon Virtual Private Cloud (VPC).

For more information, see the [AWS Outposts user guide](#).

How AWS Outposts works

AWS Outposts is designed to operate with a constant and consistent connection between your Outposts and an AWS Region. To achieve this connection to the Region, and to the local workloads in your on-premises environment, you must connect your Outpost to your on-premises network. Your on-premises network must provide WAN access back to the Region and to the internet. The internet must also provide LAN or WAN access to the local network where your on-premises workloads or applications reside.

Prerequisite

- You must install an AWS Outposts at your site.
- The AWS Outposts' compute and storage capacity must be available for use.

For more information on how to place an order for AWS Outposts, see the following AWS documentation:

<https://aws.amazon.com/blogs/aws/aws-outposts-now-available-order-your-racks-today/>

Deploy a NetScaler VPX instance on AWS Outposts by using the AWS web console

The following figure depicts a simple deployment of NetScaler VPX instances on the Outposts. The NetScaler AMI present in the AWS Marketplace is also deployed in the Outposts.

Log in to the AWS web console and complete the following steps to deploy NetScaler VPX EC2 instances on your AWS Outposts.

1. Create a key pair.
2. Create a Virtual Private Cloud (VPC).
3. Add more subnets.
4. Create security groups and security rules.
5. Add route tables.
6. Create an internet gateway.
7. Create a NetScaler VPX instance by using the AWS EC2 service.
 - From the AWS dashboard, navigate to **Compute > EC2 > Launch Instance > AWS Marketplace**.
8. Create and attach more network interfaces.
9. Attach elastic IPs to the management NIC.
10. Connect to the VPX instance.

For detailed instructions on each of the steps, see [Deploy a NetScaler VPX instance on AWS by using the AWS web console](#).

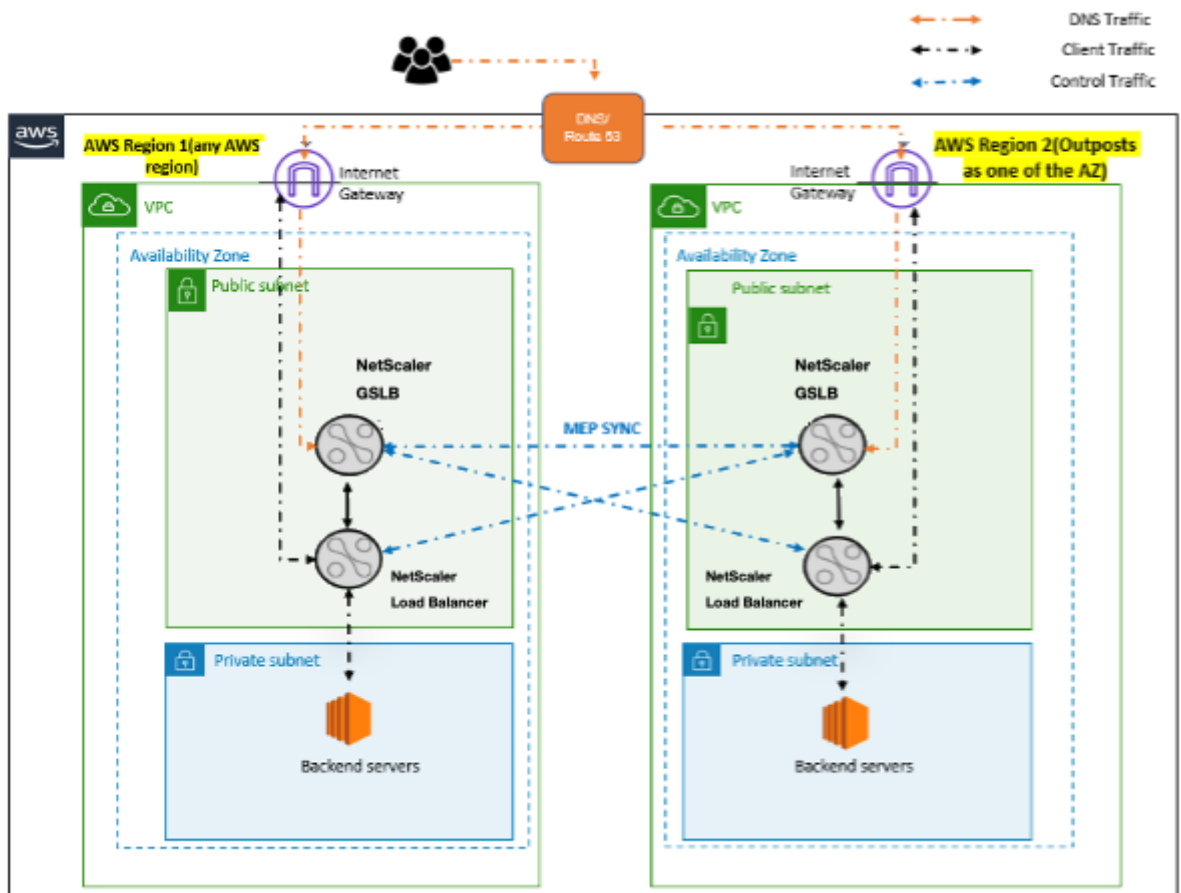

For high availability within same availability zone deployment, see [Deploy a high availability pair on AWS](#).

Deploy a NetScaler VPX instance on hybrid cloud with AWS Outposts

You can deploy a NetScaler VPX instance on hybrid cloud in an AWS environment that contains AWS outposts. You can simplify the app delivery mechanism using the NetScaler global server load balancing (GSLB) solution. The GSLB solution distributes application traffic across multiple data centers in hybrid clouds that are built using AWS regions and AWS Outposts infrastructure.

NetScaler GSLB supports both the active-active and active-passive deployment types to address different use cases. Along with these flexible deployment options and application delivery mechanisms, NetScaler secures the entire network and application portfolio, irrespective of whether applications are deployed natively on AWS Cloud or AWS Outposts.

The following diagram illustrates an application delivery with NetScaler appliance in hybrid cloud with AWS.

In an active-active deployment, the NetScaler steers the traffic globally across a distributed environment. All the sites in the environment exchange metrics about their availability and health of resources through the Metrics Exchange Protocol (MEP). The NetScaler appliance uses this information to load balance traffic across sites, and sends client requests to the most appropriate GSLB site as determined by the defined method (round robin, least connection, and static proximity) specified in the GSLB configuration.

You can use the active-active GSLB deployment to:

- Optimize the resource utilization with all nodes being active.
- Enhance the user experience by steering requests to the site closest to each individual user.
- Migrate applications to the cloud at a user-defined pace.

You can use the active-passive GSLB deployment for:

- Disaster recovery
- Cloud burst

Protect AWS API Gateway using the NetScaler Web App Firewall

May 2, 2023

You can deploy a NetScaler appliance in front of your AWS API Gateway and secure the API gateway from external threats. NetScaler Web App Firewall (WAF) can defend your API against OWASP top 10 threats and zero-day attacks. NetScaler Web App Firewall uses a single code base across all ADC form factors. Hence, you can consistently apply and enforce security policies across any environment. NetScaler Web App Firewall is easy to deploy and is available as a single license. The NetScaler Web App Firewall provides you the following features:

- Simplified configuration
- Bot management
- Holistic visibility
- Collate data from multiple sources and display the data in a unified screen

In addition to API gateway protection, you can also use the other NetScaler features. For more information, see [NetScaler documentation](#). Besides to avoid data center failovers and minimizing shutdown time, you can place ADC in high availability within or across availability zones. You can also use or configure clustering with Autoscale feature.

Earlier, AWS API Gateway did not support the protections needed to secure the applications behind it. Without the Web Application Firewall (WAF) protections, APIs were prone to security threats.

Deploy NetScaler appliance in front of AWS API gateway

In the following example, a NetScaler appliance is deployed in front of the AWS API gateway.

Let's assume there's a genuine API request for AWS Lambda service. This request can be for any of the API services as mentioned in [Amazon API Gateway documentation](#). As shown in the preceding diagram, the traffic flow is as follows:

1. Client sends a request to the AWS Lambda Function (XYZ). This client request is sent to the NetScaler virtual server (192.168.1.1).
2. The virtual server inspects the packet and checks for any malicious content.
3. The NetScaler appliance triggers a Rewrite policy to change the host name and URL in a client request. For example, you want to change `https://restapi.citrix.com/default/LambdaFunctionXYZ` to `https://citrix.execute-api.<region>.amazonaws.com/default/LambdaFunctionXYZ`.
4. The NetScaler appliance forwards this request to the AWS API gateway.
5. The AWS API Gateway further sends the request to the Lambda service and calls the Lambda function "XYZ".
6. At the same time, if an attacker sends an API request with malicious content, the malicious request lands on the NetScaler appliance.

7. The NetScaler appliance inspects the packets and drops the packets based on the configured action.

Configure NetScaler appliance with WAF enabled

To enable WAF on a NetScaler appliance, do the following steps:

1. Add a content switching or a load balancing virtual server. Let's say the IP address of the virtual server is 192.168.1.1, which resolves to a domain name (restapi.citrix.com).
2. Enable WAF policy on NetScaler virtual server. For more information, see [Configuring the Web App Firewall](#).
3. Enable Rewrite policy to change the domain name. Let's say, you want to change the incoming request to load balancer at "restapi.citrix.com" domain name to be rewritten to the back-end AWS API Gateway at "citrix.execute-api.<region>.amazonaws" domain name.
4. Enable L3 mode on the NetScaler appliance to make it act as a proxy. Use the following command:

```
1 enable ns mode L3
2 <!--NeedCopy-->
```

In Step 3 of the preceding example, let's say the website administrator wants the NetScaler appliance to replace the "restapi.citrix.com" domain name with "citrix.execute-api.<region>.amazonaws.com" and the URL with "default/lambda/XYZ".

The following procedure describes how to change the host name and URL in a client request using rewrite feature:

1. Log on to the NetScaler appliance using SSH.
2. Add rewrite actions.

```
1 add rewrite action rewrite_host_hdr_act replace "HTTP.REQ.HEADER
  ("Host\)" "\"citrix.execute-api.<region>.amazonaws.com\""
```

```
2
3 add rewrite action rewrite_url_act replace HTTP.REQ.URL.
  PATH_AND_QUERY "\"/default/lambda/XYZ\""
```

```
4 <!--NeedCopy-->
```

3. Add rewrite policies for the rewrite actions.

```
1 add rewrite policy rewrite_host_hdr_pol "HTTP.REQ.HEADER(\"Host\")
  .CONTAINS(\"restapi.citrix.com\") "rewrite_host_hdr_act
```

```
2
3 add rewrite policy rewrite_url_pol "HTTP.REQ.HEADER(\"Host\").
  CONTAINS(\"restapi.citrix.com\") "rewrite_url_act
```

```
4 <!--NeedCopy-->
```

4. Bind the rewrite policies to a virtual server.

```
1 bind lb vserver LB_API_Gateway -policyName rewrite_host_hdr_pol -  
   priority 10 -gotoPriorityExpression 20 -type REQUEST  
2  
3 bind lb vserver LB_API_Gateway -policyName rewrite_url_pol -  
   priority 20 -gotoPriorityExpression END -type REQUEST  
4 <!--NeedCopy-->
```

For more information, see [Configure rewrite to change the host name and URL in client request on NetScaler appliance](#).

NetScaler features and capabilities

The NetScaler appliance besides securing the deployment can also enhance the request based on the user requirement. The NetScaler appliance provides the following key features.

- **Load balance the API gateway:** If you have more than one API gateway, you can load balance multiple API gateways using the NetScaler appliance and define the behavior of the API request.
 - Different load balancing methods are available. For example, the Least connection method avoids overloading of API Gateway limit, the Custom load method maintains a specific load on a particular API gateway, and so on. For more information, see [Load balancing algorithms](#).
 - SSL offloading is configured without interrupting the traffic.
 - Use Source IP (USIP) mode is enabled to preserve the client IP address.
 - User-defined SSL settings: You can have your own SSL virtual server with your own-signed certificates and algorithms.
 - Backup virtual server: If the API gateway is not reachable, you can send the request to a backup virtual server for further actions.
 - Many other load balancing features are available. For more information, see [Load balance traffic on a NetScaler appliance](#).
- **Authentication, Authorization and Auditing:** You can define your own authentication methods like LDAP, SAML, RADIUS, and authorize and audit the API requests.
- **Responder:** You can redirect API requests to some other API Gateway during the shutdown time.
- **Rate limiting:** You can configure the rate limiting feature to avoid overloading of an API gateway.

- **Better Availability:** You can configure a NetScaler appliance in a high availability setup or a cluster setup to give better availability to your AWS API traffics.
- **REST API:** Supports the REST API, which can be used for automating the work in cloud production environments.
- **Monitor data:** Monitors and logs the data for reference.

The NetScaler appliance provides a lot more features, which can be integrated with the AWS API gateway. For more information, see [NetScaler documentation](#).

Add back-end AWS Autoscaling service

December 4, 2023

Efficient hosting of applications in a cloud involves easy and cost-effective management of resources depending on the application demand. To meet increasing demand, you have to scale network resources upward. When the demand subsides, you need to scale down to avoid the unnecessary cost of idle resources. You can minimize the cost of running the applications by deploying only as many instances as are necessary during any given time. To achieve this, you constantly have to monitor traffic, memory and CPU use, and so on. However, monitoring traffic manually is cumbersome. For the application environment to scale up or down dynamically, you must automate the processes of monitoring traffic and scaling resources up and down whenever necessary.

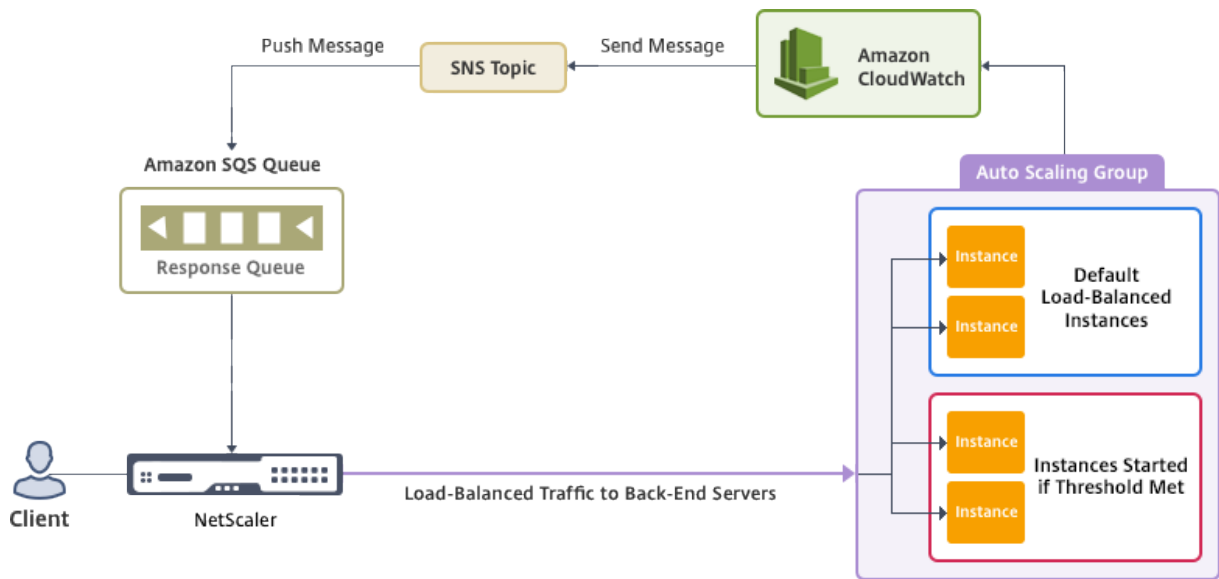

Integrated with the AWS Auto Scaling service, the NetScaler VPX instance provides the following advantages:

- **Load balance and management:** Auto configures servers to scale up and scale down, depending on demand. The VPX instance auto-detects Autoscale groups in the back-end subnet and allows a user to select the Autoscale groups to balance the load. All of this is done by auto configuring the virtual and subnet IP addresses on the VPX instance.
- **High availability:** Detects Autoscale groups that span multiple availability zones and load-balance servers.
- **Better network availability:** The VPX instance supports:
 - Back-end servers on different VPCs, by using VPC peering
 - Back-end servers on the same placement groups
 - Back-end servers on different availability zones
- **Graceful connection termination:** Removes Autoscale servers gracefully, avoiding loss of client connections when scale-down activity occurs, by using the Graceful Timeout feature.

- **Connection draining for standby servers:** Prevents sending any new client connections to the server in the Standby state. However, the Standby servers are still part of the Autoscaling group and they continue to handle the existing client connections until they are closed. When the server changes back to the InService state, the server resumes handling new connections. You can use the Standby state to update, modify, or troubleshoot servers, or to scale down based on the requirement.

For more information, see the [AWS documentation](#).

Diagram: AWS Autoscaling service with a NetScaler VPX Instance

This diagram illustrates how the AWS Autoscaling service is compatible with a NetScaler VPX instance (load balancing virtual server). For more information, see the following AWS topics.

- [Autoscaling groups](#)
- [CloudWatch](#)
- [Simple Notification Service \(SNS\)](#)
- [Simple Queue Service \(Amazon SQS\)](#)

Before you begin

Before you start using Autoscaling with your NetScaler VPX instance, you must complete the following tasks.

- Read the following topics:
 - [Prerequisites](#)
 - [Limitation and usage guidelines](#)
- Create a NetScaler VPX instance on AWS according to your requirement.

- For more information about how to create a NetScaler VPX standalone instance, see [Deploy a NetScaler VPX standalone instance on AWS](#) and [Scenario: standalone instance](#)
- For more information about how to deploy VPX instances in HA mode, see [Deploy a high availability pair on AWS](#).

Note:

We recommend the following:

- Use the CloudFormation template for creating NetScaler VPX instances on AWS.
- Create three separate interfaces: one for management (NSIP), one for client-facing LB virtual server (VIP), and one for subnet IP (NSIP).

- Create an AWS Autoscale group. If you don't have an existing Autoscaling configuration, you must:
 1. Create a Launch Configuration
 2. Create an Autoscaling Group
 3. Verify the Autoscaling Group

For more information, see <http://docs.aws.amazon.com/autoscaling/latest/userguide/GettingStartedTutorial.html>.

- Starting from NetScaler release 14.1-12.x, in an AWS Autoscale group, you must specify a scale-down policy only if you have enabled the Graceful option. In NetScaler releases prior to 14.1-12.x, you had to specify at least one scale-down policy irrespective of whether the Graceful option is enabled or not.

The NetScaler VPX instance supports only the step scaling policy. The simple scaling policy and target tracking scaling policy are not supported for the Autoscale group.

- Make sure that your AWS account has the following IAM permissions:

```

1  {
2
3      "Version": "2012-10-17",
4      "Statement": \[
5          {
6
7              "Action": \[
8                  "ec2:DescribeInstances",
9                  "ec2:DescribeNetworkInterfaces",
10                 "ec2:DetachNetworkInterface",
11                 "ec2:AttachNetworkInterface",
12                 "ec2:StartInstances",
13                 "ec2:StopInstances",
14                 "ec2:RebootInstances",
15                 "autoscaling:*",
16                 "sns:*",

```

```

17         "sqs:*"
18
19         " iam: SimulatePrincipalPolicy "
20         " iam: GetRole "
21     \],
22     "Resource": "\*",
23     "Effect": "Allow"
24 }
25
26 \]
27 }
28
29 <!--NeedCopy-->

```

Add the AWS Autoscaling service to a NetScaler VPX instance

Complete the following steps to add the Autoscaling service to a VPX instance:

1. Log on to the VPX instance by using your credentials for `nsroot`.
2. Navigate to **System > AWS > Cloud Profile** and click **Add**.

The **Create Cloud Profile** configuration page appears.

← Create Cloud Profile

The screenshot shows the 'Create Cloud Profile' configuration page. The form contains the following fields and values:

- Name: test-cloudprofile
- Virtual Server IP Address*: [Redacted]
- Load Balancing Server Protocol: HTTP
- Load Balancing Server Port: 80
- Auto Scale Group: test-script
- Auto Scale Group Protocol: HTTP
- Auto Scale Group Port: 80
- Select this option to drain the connections gracefully. Else the connections will be dropped in the event of scale down.
 - Graceful
- Delay (Seconds): 60

At the bottom of the form, there are two buttons: 'Create' and 'Close'.

Points to note while creating a cloud profile:

- The virtual server IP address is auto populated from the free IP address available to the VPX instance. For more information, see [Manage Multiple IP address](#).

- Type the exact name of the Autoscale group that you configured on your AWS account. For more information, see [AWS Auto Scaling groups](#).
- While selecting the Autoscaling group protocol and port, ensure that your servers listen on those protocols and ports, and you bind the correct monitor in the service group. By default, the TCP monitor is used.
- For SSL Protocol type Autoscaling, after you create the cloud profile, the load balancing virtual server or service group appears to be down because of a missing certificate. You can bind the certificate to the virtual server or service group manually.
- Select **Graceful** and specify a timeout value in the **Delay** field to remove the Autoscale servers gracefully. This option initiates a scale-down event. The VPX instance does not remove the server immediately but marks one of the servers for graceful deletion. During this period, the VPX instance does not allow new connections to this server. Existing connections are served until the timeout occurs. After the timeout, the VPX instance removes the server.

If you do not select the **Graceful** option, the server in the Autoscale group is removed immediately after the load goes down. This might cause service interruption for the existing connected clients.

After you create the cloud profile, a NetScaler load balancing virtual server and a service group with members as the servers of the Autoscaling group is created. Your back-end servers must be reachable through the SNIP configured on the VPX instance.

NAME	AUTO SCALE GROUP	LOAD BALANCING VIRTUAL SERVER	AUTO SCALE GROUP PROTOCOL	GRACEFUL
test-cloudprofile	_test-script_B0	_CP_test-cloudprofile_192.168.2.53_LB_	HTTP	NO

Notes:

- To view Autoscale-related information in the AWS console, go to **EC2 > Dashboard > Auto Scaling > Auto Scaling Group**.
- You can create different cloud profiles for different services (using different ports) with the same Autoscaling Group (ASG) in AWS. Thus, the NetScaler VPX instance supports multiple services with the same Autoscaling group in the public cloud.

Deploy NetScaler GSLB on AWS

February 22, 2024

Setting up GSLB for NetScaler on AWS basically consists of configuring NetScaler to load balance traffic to servers located outside the VPC that NetScaler belongs to, such as within another VPC in a different Availability Region or an on-premises data center.

DBS overview

NetScaler GSLB support using DBS (Domain Based Services) for Cloud load balancers allows for the automatic discovery of dynamic cloud services using a cloud load balancer solution. This configuration allows NetScaler to implement Global Server Load Balancing Domain-Name Based Services (GSLB DBS) in an Active-Active environment. DBS allows the scaling of back-end resources in AWS environments from DNS discovery.

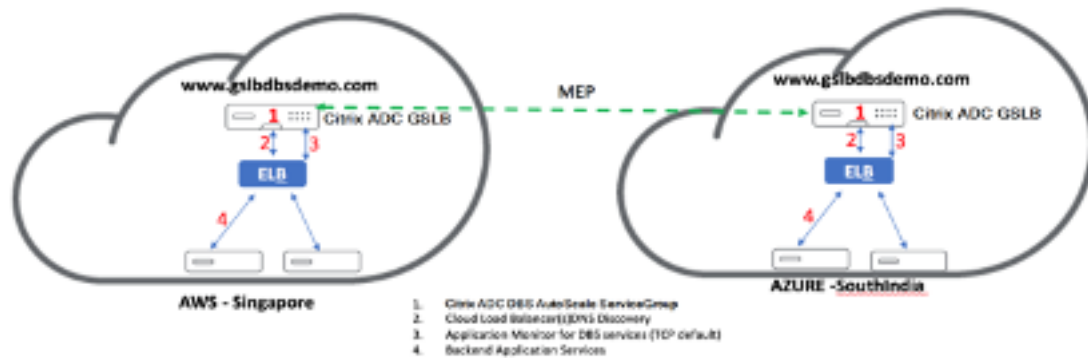

This section covers integrations between NetScaler in AWS AutoScaling environments. The final section of the document details the ability to set up a HA pair of NetScaler ADCs that span two different Availability Zones (AZs) specific to an AWS region.

Domain-name based services (DBS) with ELB

GSLB DBS utilizes the FQDN of the user Elastic Load Balancer (ELB) to dynamically update the GSLB Service Groups to include the back-end servers that are being created and deleted within AWS. The

back-end servers or instances in AWS can be configured to scale based on network demand or CPU utilization. To configure this feature, point NetScaler to the ELB to dynamically route to different servers in AWS without having to manually update NetScaler every time an instance is created and deleted within AWS. NetScaler DBS feature for GSLB Service Groups uses DNS aware service discovery to determine the member service resources of the DBS namespace identified in the AutoScale group.

NetScaler GSLB DBS autoScale components with Cloud Load Balancers:

Configure AWS components

Security groups

Note:

We recommend you to create different security groups for ELB, NetScaler GSLB Instance, and Linux instance, as the set of rules required for each of these entities is different. This example has a consolidated Security Group configuration for brevity.

To ensure the proper configuration of the virtual firewall, see: [Security Groups for Your VPC](#).

1. Log in to the user **AWS resource group** and navigate to **EC2 > NETWORK & SECURITY > Security Groups**.

1. Click **Create Security Group** and provide a name and description. This security group encompasses NetScaler and Linux back-end web servers.

1. Add the inbound port rules from the following screenshot.

Note:

Limiting Source IP access is recommended for granular hardening. For more information, see: [Web Server Rules](#).

Type	Protocol	Port Range	Source	Description
HTTP	TCP	80	0.0.0.0/0	
HTTP	TCP	80	:::0	
SSH	TCP	22	0.0.0.0/0	
DNS (UDP)	UDP	53	0.0.0.0/0	
DNS (UDP)	UDP	53	:::0	
Custom TCP Rule	TCP	3389	0.0.0.0/0	
Custom TCP Rule	TCP	3389	:::0	
All ICMP - IPv4	All	N/A	0.0.0.0/0	
All ICMP - IPv4	All	N/A	:::0	
Custom TCP Rule	TCP	5985	0.0.0.0/0	
Custom TCP Rule	TCP	5985	:::0	
Custom TCP Rule	TCP	3008 - 3011	0.0.0.0/0	
Custom TCP Rule	TCP	3008 - 3011	:::0	

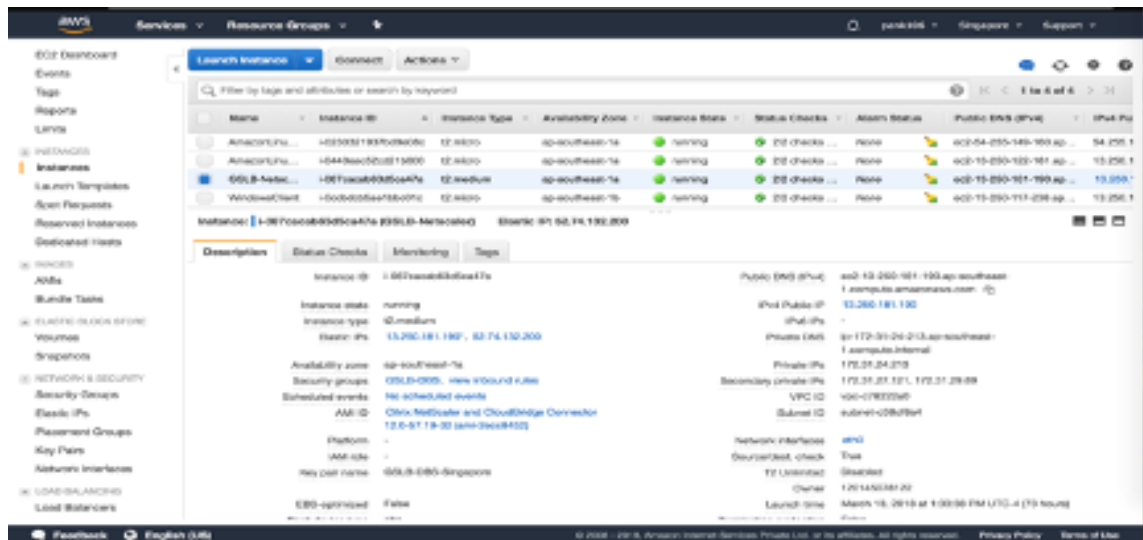

2. Amazon Linux Back-end Web Services

- a) Log in to the user **AWS resource group** and navigate to **EC2 > Instances**.
- a) Click **Launch Instance** using the details that follow to configure the **Amazon Linux** instance.

Enter the details about setting up a Web Server or back-end service on this instance.

3. NetScaler Configuration

- a) Log in to the user **AWS resource group** and navigate to **EC2 > Instances**.

- a) Click **Launch Instance** and use the following details to configure the **Amazon AMI** instance.

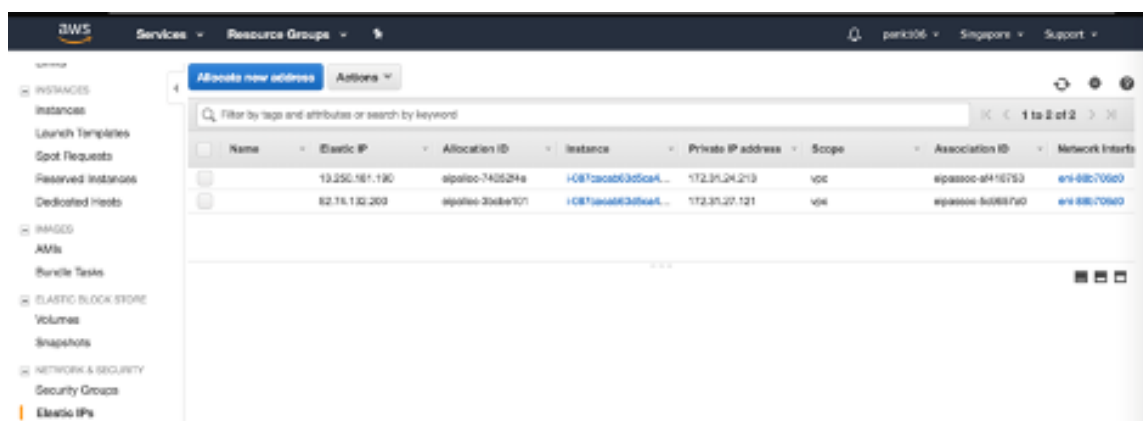

4. Elastic IP Configuration

Note:

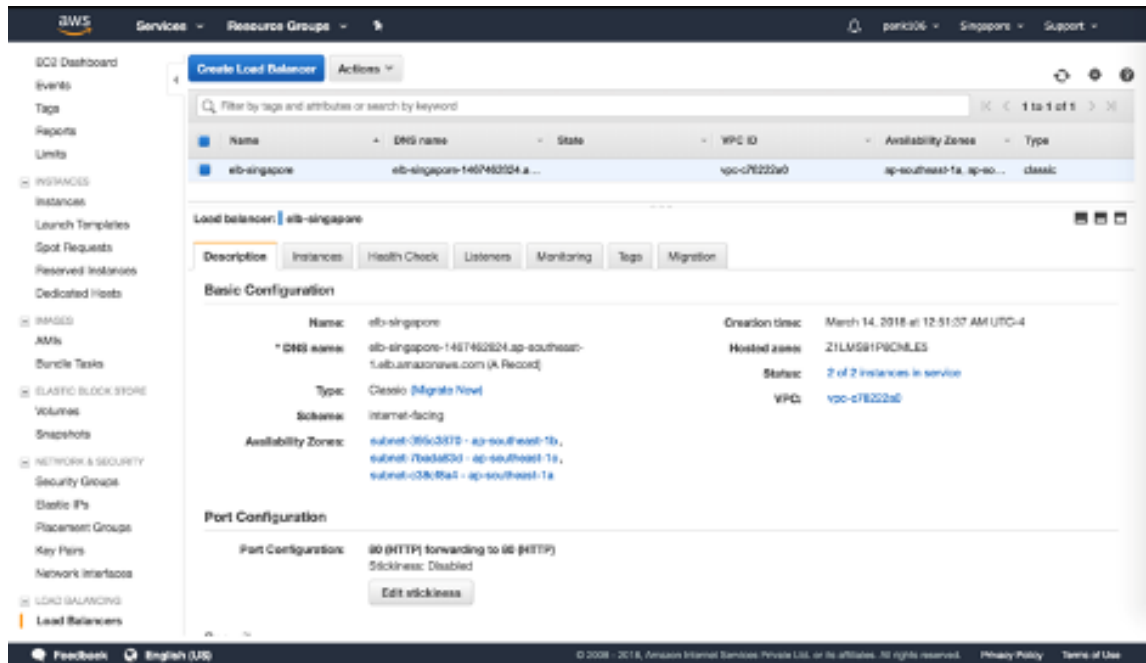

NetScaler can also be made to run with a single elastic IP if necessary to reduce cost, by not having a public IP for the NSIP. Instead, attach an elastic IP to the SNIP which can cover for management access to the box, in addition to the GSLB site IP and ADNS IP.

- a) Log in to the user **AWS resource group** and navigate to **EC2 > NETWORK & SECURITY > Elastic IPs**.
- b) Click **Allocate new address** to create a Elastic IP address.
- c) Configure the Elastic IP to point to the user running NetScaler instance within AWS.
- d) Configure a second Elastic IP and again point it to the user running NetScaler instance.

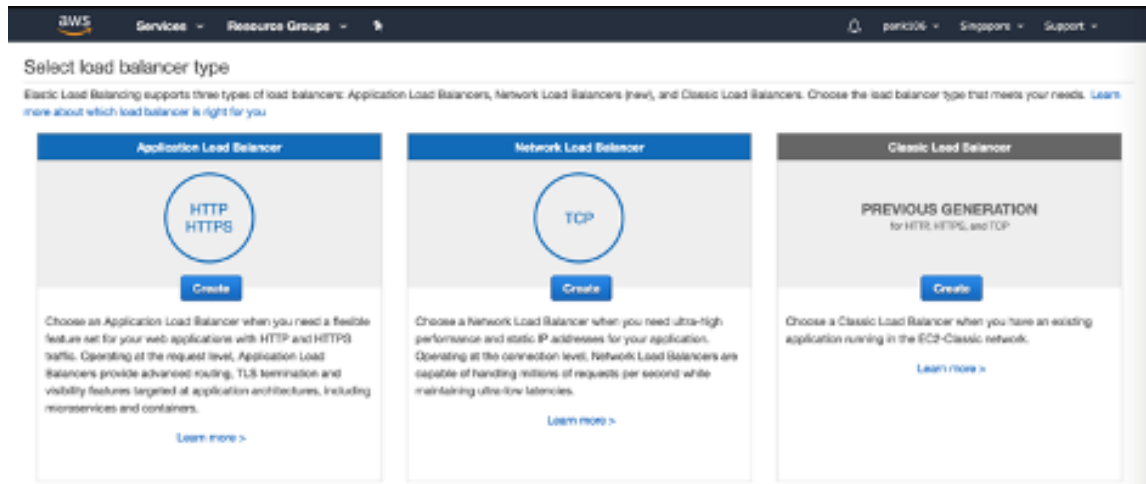

5. Elastic Load Balancer

- a) Log in to the user **AWS resource group** and navigate to **EC2 > LOAD BALANCING > Load Balancers**.

a) Click **Create Load Balancer** to configure a classic load balancer.

The user Elastic Load Balancers allow users to load balance their back-end Amazon Linux instances while also being able to Load Balance other instances that are spun up based on demand.

Configuring global server load balancing domain-name based services

For Traffic Management Configurations, see [Configure NetScaler GSLB domain-based service](#).

Deployment types

Three-NIC Deployment

- Typical Deployments
 - GSLB StyleBook
 - With ADM
 - With GSLB (Route53 w/domain registration)
 - Licensing - Pooled/Marketplace
- Use Cases
 - Three-NIC Deployments are used to achieve real isolation of data and management traffic.
 - Three-NIC Deployments also improve the scale and performance of the ADC.
 - Three-NIC Deployments are used in network applications where throughput is typically 1 Gbps or higher and a Three-NIC Deployment is recommended.

CFT deployment

Customers would deploy using CloudFormation Templates if they are customizing their deployments or they are automating their deployments.

Deployment steps

The following are the deployment steps:

1. Three-NIC deployment for GSLB
2. Licensing
3. Deployment options

Three-NIC deployment for GSLB NetScaler VPX instance is available as an Amazon Machine Image (AMI) in the AWS marketplace, and it can be launched as an Elastic Compute Cloud (EC2) instance within an AWS VPC. The minimum EC2 instance type allowed as a supported AMI on NetScaler VPX is m4.large. NetScaler VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Each VPX instance requires at least three IP subnets:

- A management subnet

- A client-facing subnet (VIP)
- A back-end facing subnet (SNIP)

NetScaler recommends three network interfaces for a standard VPX instance on AWS installation.

AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances. An Amazon VPC allows users to create and control a virtual networking environment, including their own IP address range, subnets, route tables, and network gateways.

Note:

By default, users can create up to 5 VPC instances per AWS region for each AWS account. Users can request higher VPC limits by submitting Amazon's request form here: [Amazon VPC Request](#).

Licensing A NetScaler VPX instance on AWS requires a license. The following licensing options are available for NetScaler VPX instances running on AWS:

- Free (unlimited)
- Hourly
- Annual

Bring your own license

Free Trial (all NetScaler VPX-AWS subscription offerings for 21 days free in AWS marketplace).

Deployment options Users can deploy a NetScaler VPX standalone instance on AWS. For more information, see [Deploy a NetScaler VPX standalone instance on AWS](#)

NetScaler global load balancing for hybrid and multi-cloud deployments

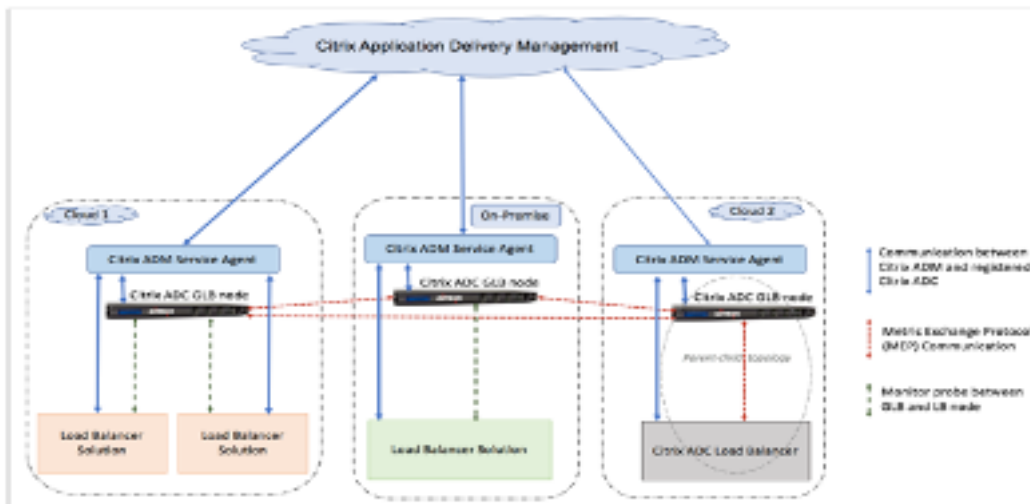

NetScaler hybrid and multi-cloud global server load balancing (GSLB) solution enables users to distribute application traffic across multiple data centers in hybrid clouds, multiple clouds, and on-premises deployments. NetScaler hybrid and multi-cloud GSLB solution helps users to manage their load balancing setup in hybrid or multi-cloud environments without altering the existing setup. Also, if users have an on-premises setup, they can test some of their services in the cloud by using NetScaler hybrid and multi-cloud GSLB solution before completely migrating to the cloud. For example, users can route only a small percentage of their traffic to the cloud, and handle most of the traffic on-premises. NetScaler hybrid and multi-cloud GSLB solution also enables users to manage and monitor NetScaler instances across geographic locations from a single, unified console.

A hybrid and multi-cloud architecture can also improve overall enterprise performance by avoiding “vendor lock-in” and using different infrastructure to meet the needs of user partners and customers.

With multiple cloud architecture, users can manage their infrastructure costs better as they now have to pay only for what they use. Users can also scale their applications better as they now use the infrastructure on demand. It also provides the ability to quickly switch from one cloud to another to take advantage of the best offerings of each provider.

Architecture of NetScaler hybrid and multi-cloud GSLB Solution

The following diagram illustrates the architecture of NetScaler hybrid and multi-cloud GSLB feature.

NetScaler GSLB nodes handle the DNS name resolution. Any of these GSLB nodes can receive DNS requests from any client location. The GSLB node that receives the DNS request returns the load balancer virtual server IP address as selected by the configured load balancing method. Metrics (site, network, and persistence metrics) are exchanged between the GSLB nodes using the metrics exchange protocol (MEP), which is a proprietary NetScaler protocol. For more information on the MEP protocol, see: [Configure Metrics Exchange Protocol](#).

The monitor configured in the GSLB node monitors the health status of the load balancing virtual server in the same data center. In a parent-child topology, metrics between the GSLB and NetScaler nodes are exchanged by using MEP. However, configuring monitor probes between a GSLB and NetScaler LB node is optional in a parent-child topology.

The NetScaler agent enables communication between the NetScaler Console and the managed instances in the user data center. For more information on NetScaler agents and how to install them, see: [Getting Started](#).

Note:

This document makes the following assumptions:

- If users have an existing load balancing setup, it is up and running.
- A SNIP address or a GSLB site IP address is configured on each of NetScaler GSLB nodes. This IP address is used as the data center source IP address when exchanging metrics with other data centers.
- An ADNS or ADNS-TCP service is configured on each of NetScaler GSLB instances to receive the DNS traffic.
- The required firewall and security groups are configured in the cloud service providers.

Security groups configuration

Users must set up the required firewall/security groups configuration in the cloud service providers. For more information about AWS security features, see: [AWS/Documentation/Amazon VPC/User Guide/Security](#).

Also, on the GSLB node, users must open port 53 for ADNS service/DNS server IP address and port 3009 for GSLB site IP address for MEP traffic exchange. On the load balancing node, users must open the appropriate ports to receive the application traffic. For example, users must open port 80 for receiving HTTP traffic and open port 443 for receiving HTTPS traffic. Open port 443 for NITRO communication between the NetScaler agent and NetScaler Console.

For the dynamic round trip time GSLB method, users must open port 53 to allow UDP and TCP probes depending on the configured LDNS probe type. The UDP or the TCP probes are initiated using one of the SNIPs and therefore this setting must be done for security groups bound to the server-side subnet.

Capabilities of NetScaler hybrid and multi-cloud GSLB solution

Some of the capabilities of NetScaler hybrid and multi-cloud GSLB solution are described in this section.

Compatibility with other load balancing solutions

NetScaler hybrid and multi-cloud GSLB solution supports various load balancing solutions such as NetScaler load balancer, NGINX, HAProxy, and other third-party load balancers.

Note:

Load balancing solutions other than NetScaler are supported only if proximity-based and non-metric based GSLB methods are used and if parent-child topology is not configured.

GSLB methods

NetScaler hybrid and multi-cloud GSLB solution supports the following GSLB methods.

- Metric-based GSLB methods. Metric-based GSLB methods collect metrics from the other NetScaler nodes through the metrics exchange protocol.
 - Least Connection: The client request is routed to the load balancer that has the fewest active connections.
 - Least Bandwidth: The client request is routed to the load balancer that is currently serving the least amount of traffic.
 - Least Packets: The client request is routed to the load balancer that has received the fewest packets in the last 14 seconds.
- Non-metric based GSLB methods
 - Round Robin: The client request is routed to the IP address of the load balancer that is at the top of the list of load balancers. That load balancer then moves to the bottom of the list.
 - Source IP Hash: This method uses the hashed value of the client IP address to select a load balancer.
- Proximity-based GSLB methods
 - Static Proximity: The client request is routed to the load balancer that is closest to the client IP address.
 - Round-Trip Time (RTT): This method uses the RTT value (the time delay in the connection between the client's local DNS server and the data center) to select the IP address of the best performing load balancer.

For more information on the load balancing methods, see: [Load Balancing Algorithms](#).

GSLB topologies

NetScaler hybrid and multi-cloud GSLB solution supports the active-passive topology and parent-child topology.

- Active-passive topology - Provides disaster recovery and ensures continuous availability of applications by protecting against points of failure. If the primary data center goes down, the passive data center becomes operational. For more information about GSLB active-passive topology, see: [Configure GSLB for Disaster Recovery](#).

- Parent-child topology –Can be used if customers are using the metric-based GSLB methods to configure GSLB and LB nodes and if the LB nodes are deployed on a different NetScaler instance. In a parent-child topology, the LB node (child site) must be a NetScaler appliance because the exchange of metrics between the parent and child site is through the metrics exchange protocol (MEP).

For more information about parent-child topology, see: [Parent-Child Topology Deployment using the MEP Protocol](#).

IPv6 support

NetScaler hybrid and multi-cloud GSLB solution also supports IPv6.

Monitoring

NetScaler hybrid and multi-cloud GSLB solution supports built-in monitors with an option to enable the secure connection. However, if LB and GSLB configurations are on the same NetScaler instance or if parent-child topology is used, configuring monitors is optional.

Persistence

NetScaler hybrid and multi-cloud GSLB solution supports the following:

- Source IP based persistence sessions, so that multiple requests from the same client are directed to the same service if they arrive within the configured time-out window. If the time-out value expires before the client sends another request, the session is discarded, and the configured load balancing algorithm is used to select a new server for the client's next request.
- Spillover persistence so that the backup virtual server continues to process the requests it receives, even after the load on the primary falls below the threshold. For more information, see: [Configure Spillover](#).
- Site persistence so that the GSLB node selects a data center to process a client request and forwards the IP address of the selected data center for all subsequent DNS requests. If the configured persistence applies to a site that is DOWN, the GSLB node uses a GSLB method to select a new site, and the new site becomes persistent for subsequent requests from the client.

Configuration by using NetScaler Console styleBooks

Customers can use the default Multi-cloud GSLB StyleBook on NetScaler Console to configure NetScaler instances with hybrid and multi-cloud GSLB configurations.

Customers can use the default Multi-cloud GSLB StyleBook for the LB Node StyleBook to configure NetScaler load balancing nodes which are the child sites in a parent-child topology that handle the application traffic. Use this StyleBook only if users want to configure LB nodes in a parent-child topology. However, each LB node must be configured separately using this StyleBook.

Workflow of NetScaler hybrid and multi-cloud GSLB solution configuration

Customers can use the shipped Multi-cloud GSLB StyleBook on NetScaler Console to configure NetScaler instances with hybrid and multi-cloud GSLB configurations.

The following diagram shows the workflow for configuring a NetScaler hybrid and multi-cloud GSLB solution. The steps in the workflow diagram are explained in more detail after the diagram.

Perform the following tasks as a cloud administrator:

1. Sign up for a NetScaler Cloud account.
To start using NetScaler Console, create a NetScaler Cloud company account or join an existing one that has been created by someone in your company.
2. After users log on to NetScaler Cloud, click **Manage** on the **NetScaler Application Delivery Management** tile to set up the ADM service for the first time.
3. Download and install multiple NetScaler Console service agents.

Users must install and configure the NetScaler Console service agent in their network environment to enable communication between the NetScaler Console and the managed instances in

their data center or cloud. Install an agent in each region, so that they can configure LB and GSLB configurations on the managed instances. The LB and GSLB configurations can share a single agent. For more information on the above three tasks, see: [Getting Started](#).

4. Deploy load balancers on Microsoft AWS cloud/on-premises data centers.

Depending on the type of load balancers that users are deploying on cloud and on-premises, provision them accordingly. For example, users can provision NetScaler VPX instances in an Amazon Web Services (AWS) virtual private cloud and in on-premises data centers. Configure NetScaler instances to function as LB or GSLB nodes in standalone mode, by creating the virtual machines and configuring other resources. For more information on how to deploy NetScaler VPX instances, see the following documents:

- [NetScaler VPX on AWS](#).
- [Configure a NetScaler VPX Standalone Instance](#).

5. Perform security configurations.

Configure network security groups and network ACLs in ARM and in AWS to control inbound and outbound traffic for user instances and subnets.

6. Add NetScaler instances in NetScaler Console.

NetScaler instances are network appliances or virtual appliances that users want to discover, manage, and monitor from NetScaler Console. To manage and monitor these instances, users must add the instances to the service and register both LB (if users are using NetScaler for LB) and GSLB instances. For more information on how to add NetScaler instances in the NetScaler Console, see: [Getting Started](#)

7. Implement the GSLB and LB configurations using default NetScaler Console StyleBooks.

- Use Multi-cloud GSLB StyleBook to execute the GSLB configuration on the selected GSLB NetScaler instances.
- Implement the load balancing configuration. (Users can skip this step if they already have LB configurations on the managed instances.) Users can configure load balancers on NetScaler instances in one of two ways:
- Manually configure the instances for load balancing the applications. For more information on how to manually configure the instances, see: [Set up Basic Load Balancing](#).
- Use StyleBooks. Users can use one of the NetScaler Console StyleBooks (HTTP/SSL Load Balancing StyleBook or HTTP/SSL Load Balancing (with Monitors) StyleBook) to create the load balancer configuration on the selected NetScaler instance. Users can also create their own StyleBooks. For more information on StyleBooks, see: [StyleBooks](#).

8. Use Multi-cloud GSLB StyleBook for LB Node to configure GSLB parent-child topology in any of the following cases:

- If users are using the metric-based GSLB algorithms (Least Packets, Least Connections, Least Bandwidth) to configure GSLB and LB nodes and if the LB nodes are deployed on a different NetScaler instance.
- If site persistence is required.

Using styleBooks to configure GSLB on NetScaler LB nodes

Customers can use the **Multi-cloud GSLB StyleBook for LB Node** if they are using the metric-based GSLB algorithms (Least Packets, Least Connections, Least Bandwidth) to configure GSLB and LB nodes and if the LB nodes are deployed on a different NetScaler instance.

Users can also use this StyleBook to configure more child sites for an existing parent site. This StyleBook configures one child site at a time. So, create as many configurations (config packs) from this StyleBook as there are child sites. The StyleBook applies the GSLB configuration on the child sites. Users can configure a maximum of 1024 child sites.

Note:

Use Multi-cloud GSLB StyleBook to configure the parent sites.

This StyleBook makes the following assumptions:

- A SNIP address or a GSLB site IP address is configured.
- The required firewall and security groups are configured in the cloud service providers.

Configuring a child site in a parent-child topology by using multi-cloud GSLB styleBook for LB node

1. Navigate to **Applications > Configuration > Create New**.
2. Navigate to **Applications > Configuration**, and click **Create New**.

The StyleBook appears as a user interface page on which users can enter the values for all the parameters defined in this StyleBook.

Note:

The terms data center and sites are used interchangeably in this document.

3. Set the following parameters:
 - **Application Name.** Enter the name of the GSLB application deployed on the GSLB sites for which you want to create child sites.

- **Protocol.** Select the application protocol of the deployed application from the drop-down list box.
- **LB Health Check** (Optional)
- **Health Check Type.** From the drop-down list box, select the type of probe used for checking the health of the load balancer VIP address that represents the application on a site.
- **Secure Mode.** (Optional) Select **Yes** to enable this parameter if SSL based health checks are required.
- **HTTP Request.** (Optional) If users selected HTTP as the health-check type, enter the full HTTP request used to probe the VIP address.
- **List of HTTP Status Response Codes.** (Optional) If users selected HTTP as the health check type, enter the list of HTTP status codes expected in responses to HTTP requests when the VIP is healthy.

4. Configuring parent site.

- Provide the details of the parent site (GSLB node) under which you want to create the child site (LB node).
 - **Site Name.** Enter the name of the parent site.
 - **Site IP Address.** Enter the IP address that the parent site uses as its source IP address when exchanging metrics with other sites. This IP address is assumed to be already configured on the GSLB node in each site.
 - **Site Public IP Address.** (Optional) Enter the Public IP address of the parent site that is used to exchange metrics, if that site's IP address is NAT'ed.

5. Configuring child site.

- Provide the details of the child site.
 - **Site name.** Enter the name of the site.
 - **Site IP Address.** Enter the IP address of the child site. Here, use the private IP address or SNIP of NetScaler node that is being configured as a child site.
 - **Site Public IP Address.** (Optional) Enter the Public IP address of the child site that is used to exchange metrics, if that site's IP address is NAT'ed.

6. Configuring active GSLB services (optional)

- Configure active GSLB services only if the LB virtual server IP address is not a public IP address. This section allows users to configure the list of local GSLB services on the sites where the application is deployed.

- **Service IP.** Enter the IP address of the load balancing virtual server on this site.
 - **Service Public IP Address.** If the virtual IP address is private and has a public IP address NAT'ed to it, specify the public IP address.
 - **Service Port.** Enter the port of the GSLB service on this site.
 - **Site Name.** Enter the name of the site on which the GSLB service is located.
7. Click **Target Instances** and select NetScaler instances configured as GSLB instances on each site on which to deploy the GSLB configuration.
 8. Click **Create** to create the LB configuration on the selected NetScaler instance (LB node). Users can also click **Dry Run** to check the objects that would be created in the target instances. The StyleBook configuration that users have created appears in the list of configurations on the Configurations page. Users can examine, update, or remove this configuration by using the NetScaler Console GUI.

CloudFormation template deployment

NetScaler VPX is available as Amazon Machine Images (AMI) in the AWS Marketplace. Before using a CloudFormation template to provision a NetScaler VPX in AWS, the AWS user has to accept the terms and subscribe to the AWS Marketplace product. Each edition of NetScaler VPX in the Marketplace requires this step.

Each template in the CloudFormation repository has collocated documentation describing the usage and architecture of the template. The templates attempt to codify recommended deployment architecture of NetScaler VPX, or to introduce the user to NetScaler or to demonstrate a particular feature, edition, or option. Users can reuse, modify, or enhance the templates to suit their particular production and testing needs. Most templates require full EC2 permissions in addition to permissions to create IAM roles.

The CloudFormation templates contain AMI IDs that are specific to a particular release of NetScaler VPX (for example, release 12.0-56.20) and edition (for example, NetScaler VPX Platinum Edition - 10 Mbps) OR NetScaler BYOL. To use a different version / edition of NetScaler VPX with a CloudFormation template requires the user to edit the template and replace the AMI IDs.

The latest NetScaler AWS-AMI-IDs are located here: [NetScaler AWS CloudFormation Master](#).

CFT three-NIC deployment

This template deploys a VPC, with 3 subnets (Management, client, server) for 2 Availability Zones. It deploys an Internet Gateway, with a default route on the public subnets. This template also creates a HA pair across Availability Zones with two instances of NetScaler: 3 ENIs associated to 3 VPC subnets

(Management, Client, Server) on primary and 3 ENIs associated to 3 VPC subnets (Management, Client, Server) on secondary. All the resource names created by this CFT are prefixed with a tagName of the stack name.

The output of the CloudFormation template includes:

- PrimaryCitrixADCManagementURL - HTTPS URL to the Management GUI of the Primary VPX (uses self-signed cert)
- PrimaryCitrixADCManagementURL2 - HTTP URL to the Management GUI of the Primary VPX
- PrimaryCitrixADCInstanceID - Instance Id of the newly created Primary VPX instance
- PrimaryCitrixADCPublicVIP - Elastic IP address of the Primary VPX instance associated with the VIP
- PrimaryCitrixADCPrivateNSIP - Private IP (NS IP) used for management of the Primary VPX
- PrimaryCitrixADCPublicNSIP - Public IP (NS IP) used for management of the Primary VPX
- PrimaryCitrixADCPrivateVIP - Private IP address of the Primary VPX instance associated with the VIP
- PrimaryCitrixADCSNIP - Private IP address of the Primary VPX instance associated with the SNIP
- SecondaryCitrixADCManagementURL - HTTPS URL to the Management GUI of the Secondary VPX (uses self-signed cert)
- SecondaryCitrixADCManagementURL2 - HTTP URL to the Management GUI of the Secondary VPX
- SecondaryCitrixADCInstanceID - Instance Id of the newly created Secondary VPX instance
- SecondaryCitrixADCPrivateNSIP - Private IP (NS IP) used for management of the Secondary VPX
- SecondaryCitrixADCPublicNSIP - Public IP (NS IP) used for management of the Secondary VPX
- SecondaryCitrixADCPrivateVIP - Private IP address of the Secondary VPX instance associated with the VIP
- SecondaryCitrixADCSNIP - Private IP address of the Secondary VPX instance associated with the SNIP
- SecurityGroup - Security group id that the VPX belongs to

When providing input to the CFT, the * against any parameter in the CFT implies that it is a mandatory field. For example, `VPC ID*` is a mandatory field.

The following prerequisites must be met. The CloudFormation template requires sufficient permissions to create IAM roles, beyond normal EC2 full privileges. The user of this template also needs to accept the terms and subscribe to the AWS Marketplace product before using this CloudFormation template.

The following should also be present:

- Key Pair
- 3 unallocated EIPs
- Primary Management
- Client VIP
- Secondary Management

For more information on provisioning NetScaler VPX instances on AWS, users can visit: [Provisioning NetScaler VPX Instances on AWS](#).

For information on how to configure GSLB using stylebooks visit [Using StyleBooks to Configure GSLB](#)

Prerequisites

Before attempting to create a VPX instance in AWS, users should ensure they have the following:

- An AWS account to launch a NetScaler VPX AMI in an Amazon Web Services (AWS) Virtual Private Cloud (VPC). Users can create an AWS account for free at [Amazon](#).
- An AWS Identity and Access Management (IAM) user account to securely control access to AWS services and resources for users. For more information about how to create an IAM user account, see the topic: [Creating IAM Users \(Console\)](#).

An IAM role is mandatory for both standalone and high availability deployments. The IAM role must have the following privileges:

- ec2:DescribeInstances
- ec2:DescribeNetworkInterfaces
- ec2:DetachNetworkInterface
- ec2:AttachNetworkInterface
- ec2:StartInstances
- ec2:StopInstances
- ec2:RebootInstances
- ec2:DescribeAddresses
- ec2:AssociateAddress
- ec2:DisassociateAddress
- autoscaling:*
- sns:*
- sqs:*

- iam:SimulatePrincipalPolicy
- iam:GetRole

If the NetScaler CloudFormation template is used, the IAM role is automatically created. The template does not allow selecting an already created IAM role.

Note:

When users log on the VPX instance through the GUI, a prompt to configure the required privileges for IAM role appears. Ignore the prompt if the privileges have already been configured.

- AWS CLI is required to use all the functionality provided by the AWS Management Console from the terminal program. For more information, see: [What Is the AWS Command Line Interface?](#). Users also need the AWS CLI to change the network interface type to SR-IOV.

GSLB prerequisites

The prerequisites for NetScaler GSLB Service Groups include a functioning AWS environment with the knowledge and ability to configure Security Groups, Linux Web Servers, NetScaler ADCs within AWS, Elastic IPs, and Elastic Load Balancers.

GSLB DBS Service integration requires NetScaler version 12.0.57 for AWS ELB load balancer instances.

For latest update about the current supported VPX models and AWS regions, instance types, and services see [VPX-AWS support matrix](#).

Other resources

[NetScaler Console GSLB for Hybrid and Multi-Cloud Deployments](#).

Deploy NetScaler Web App Firewall on AWS

April 23, 2024

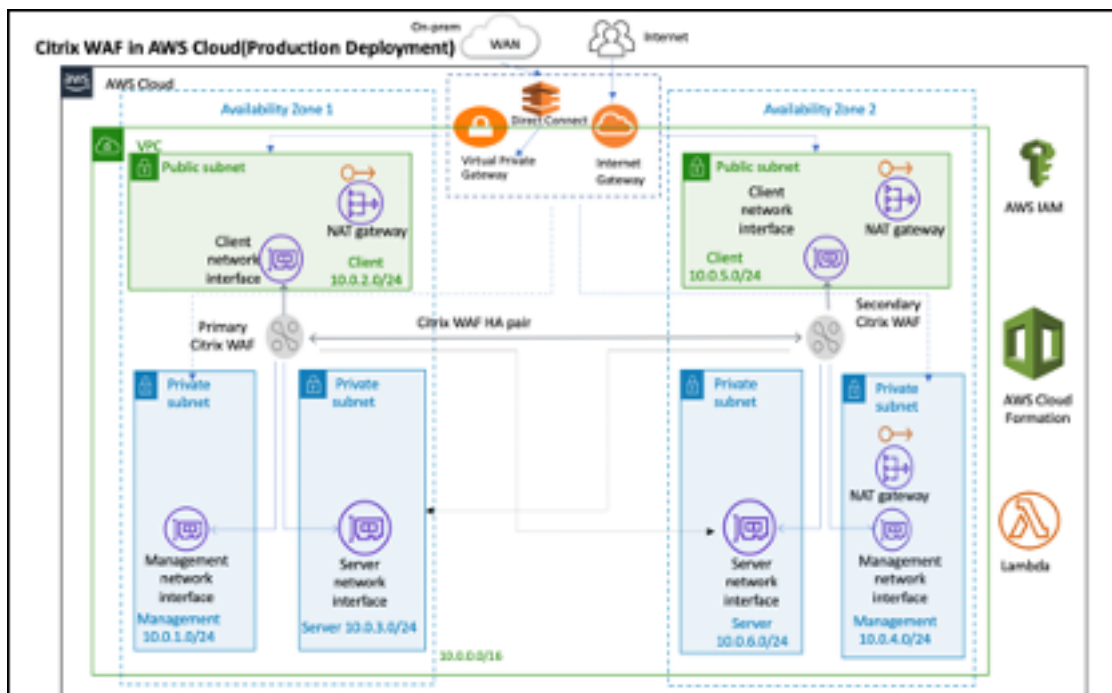

The NetScaler Web App Firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between customer servers and customer users, usually behind the customer company's router or firewall. NetScaler Web App Firewall must be installed in a location where it can intercept traffic between the web servers and the hub or switch through which users access those web servers. Users then configure the network to send requests to the Web Application Firewall instead of directly to their web servers, and responses to the Web Application Firewall instead of directly to their users. The

Web Application Firewall filters that traffic before forwarding it to its final destination, using both its internal rule set and the user additions and modifications. It blocks or renders harmless any activity that it detects as harmful, and then forwards the remaining traffic to the web server. The preceding image provides an overview of the filtering process.

For more information, see [How NetScaler Web App Firewall works](#).

Architecture for NetScaler Web App Firewall on AWS for production deployment

The image shows a virtual private cloud (VPC) with **default parameters** that builds a NetScaler Web App Firewall environment in the AWS Cloud.

In a production deployment, the following parameters are set up for the NetScaler Web App Firewall environment:

- This architecture assumes the use of an AWS CloudFormation Template and an AWS Quick Start Guide, which can be found here: [GitHub/AWS-Quickstart/Quickstart-Citrix-ADC-VPX](#).
- A VPC that spans two Availability Zones, configured with two public and four private subnets, according to AWS best practices, to provide you with your own virtual network on AWS with a /16 Classless Inter-Domain Routing (CIDR) block (a network with 65,536 private IP addresses).
- Two instances of NetScaler Web App Firewall (Primary and Secondary), one in each Availability Zone.
- **Three security groups**, one for each network interface (Management, Client, Server), that acts as virtual firewalls to control the traffic for their associated instances.

- **Three subnets**, for each instance- one for management, one for client, and one for back-end server.
- An **internet gateway** attached to the VPC, and a Public Subnets route table which is associated with public subnets so as to allow access to the internet. This gateway is used by the Web App Firewall host to send and receive traffic. For more information on Internet Gateways, see: [Internet Gateways](#).
- **5 Route tables**-one public route table associated with client subnets of both primary and secondary Web App Firewall. The remaining 4 route tables link to each of the 4 private subnets (management and server-side subnets of primary and secondary Web App Firewall).
- AWS Lambda in Web App Firewall takes care of the following:
 - Configuring two Web App Firewall in each availability zone of HA mode
 - Creating a sample Web App Firewall Profile and thus pushing this configuration with respect to Web App Firewall
- AWS Identity and Access Management (IAM) to securely control access to AWS services and resources for your users. By default, the CloudFormation Template (CFT) creates the required IAM role. However, users can provide their own IAM role for NetScaler ADC instances.
- In the public subnets, two managed Network Address Translation (NAT) gateways to allow outbound internet access for resources in public subnets.

Note:

The CFT Web App Firewall template that deploys the NetScaler Web App Firewall into an existing VPC skips the components marked by asterisks and prompts users for their existing VPC configuration.

Backend servers are not deployed by the CFT.

Cost and licensing

Users are responsible for the cost of the AWS services used while running AWS deployments. The AWS CloudFormation templates that can be used for this deployment include configuration parameters that users can customize as necessary. Some of those settings, such as instance type, affect the cost of deployment. For cost estimates, users should refer to the pricing pages for each AWS service they are using. Prices are subject to change.

A NetScaler Web App Firewall on AWS requires a license. To license NetScaler Web App Firewall, users must place the license key in an S3 bucket and specify its location when they launch the deployment.

Note:

When users elect the Bring your own license (BYOL) licensing model, they should ensure that they have an AppFlow feature enabled. For more information on BYOL licensing, see: [AWS Marketplace/Citrix VPX - Customer Licensed](#).

The following licensing options are available for Citrix ADC Web App Firewall running on AWS. Users can choose an AMI (Amazon Machine Image) based on a single factor such as throughput.

- **License model:** Pay as You Go (PAYG, for the production licenses) or Bring Your Own License (BYOL, for the Customer Licensed AMI - Citrix ADC Pooled Capacity). For more information on Citrix ADC Pooled Capacity, see: [Citrix ADC Pooled Capacity](#).
 - For BYOL, there are 3 licensing modes:
 - * Configure NetScaler Pooled Capacity: [Configure Citrix ADC Pooled Capacity](#)
 - * NetScaler VPX Check-in and Check-out Licensing (CICO): [Citrix ADC VPX Check-in and Check-out Licensing](#)

Tip:

If users elect CICO Licensing with VPX-200, VPX-1000, VPX-3000, VPX-5000, or VPX-8000 application platform type, they should ensure that they have the same throughput license present in their NetScaler Console licensing server.

- * NetScaler virtual CPU Licensing: [NetScaler virtual CPU Licensing](#)

Note:

If users want to dynamically modify the bandwidth of a VPX instance, they should elect a BYOL option, for example **NetScaler pooled capacity** where they can allocate the licenses from NetScaler Console, or they can check out the licenses from NetScaler according to the minimum and maximum capacity of the instance on demand and without a restart. A restart is required only if users want to change the license edition.

- **Throughput:** 200 Mbps or 1 Gbps
- **Bundle:** Premium

Deployment options

This deployment guide provides two deployment options:

- The first option is to deploy using a Quick Start Guide format and the following options:

- **Deploy NetScaler Web App Firewall into a new VPC (end-to-end deployment).** This option builds a new AWS environment consisting of the VPC, subnets, security groups, and other infrastructure components, and then deploys NetScaler Web App Firewall into this new VPC.
 - **Deploy NetScaler Web App Firewall into an existing VPC.** This option provisions NetScaler Web App Firewall in the user existing AWS infrastructure.
- The second option is to deploy using Web App Firewall StyleBooks using NetScaler Console

AWS Quick Start

Step 1: Sign in to the user AWS account

- Sign in to the user account at AWS: [AWS](#) with an IAM (Identity and Access Management) user role that has the necessary permissions to create an Amazon Account (if necessary) or sign in to an Amazon Account.
- Use the region selector in the navigation bar to choose the AWS Region where users want to deploy High Availability across AWS Availability Zones.
- Ensure that the user AWS account is configured correctly, refer to the Technical Requirements section of this document for more information.

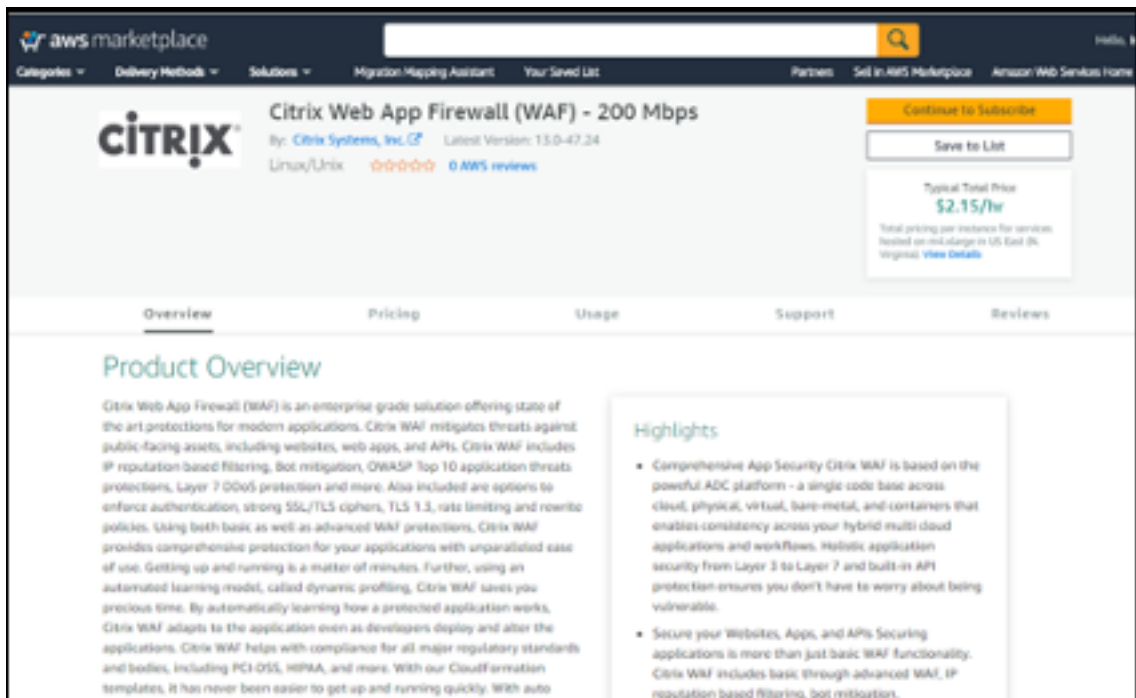

Step 2: Subscribe to the NetScaler Web App Firewall AMI

- This deployment requires a subscription to the AMI for NetScaler Web App Firewall in the AWS Marketplace.
- Sign in to the user AWS account.
- Open the page for the NetScaler Web App Firewall offering by choosing one of the links in the following table.
 - When users launch the Quick Start Guide in to deploy NetScaler Web App Firewall in Step 3 below, they use the **NetScaler Web App Firewall Image** parameter to select the bundle and throughput option that matches their AMI subscription. The following list shows the AMI options and corresponding parameter settings. The VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory.

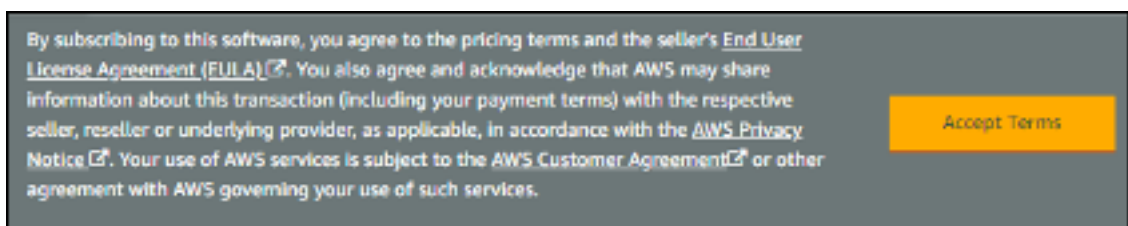

Note:

To retrieve the AMI ID, refer to the NetScaler Products on AWS Marketplace page on GitHub: [Citrix Products on AWS Marketplace](#).

- AWS Marketplace AMI
 - NetScaler Web Application Firewall (Web App Firewall) - 200 Mbps: [Citrix Web App Firewall \(Web App Firewall\) - 200 Mbps](#)
 - NetScaler Web Application Firewall (Web App Firewall) - 1000 Mbps: [Citrix Web App Firewall \(Web App Firewall\) - 1000 Mbps](#)
- On the AMI page, choose **Continue to Subscribe**.

- Review the terms and conditions for software usage, and then choose **Accept Terms**.

Note:

Users receive a confirmation page, and an email confirmation is sent to the account owner. For detailed subscription instructions, see Getting Started in the AWS Marketplace Documentation: [Getting Started](#).

- When the subscription process is complete, exit out of AWS Marketplace without further action. Do not provision the software from AWS Marketplace—users will deploy the AMI with the Quick Start Guide.

Step 3: Launch the AWS Quick Start

- Sign in to the user AWS account, and choose one of the following options to launch the AWS CloudFormation template. For help with choosing an option, see deployment options earlier in this guide.
 - Deploy NetScaler VPX into a new VPC on AWS using one of the AWS CloudFormation Templates located here:
 - ★ [Citrix/Citrix-ADC-AWS-CloudFormation/Templates/High-Availability/Across-Availability-Zone](#)
 - ★ [Citrix/Citrix-ADC-AWS-CloudFormation/Templates/High-Availability/Same-Availability-Zone](#)
 - Deploy NetScaler Web App Firewall into a new or existing VPC on AWS using the AWS Quickstart template located here: [AWS-Quickstart/Quickstart-Citrix-ADC- Web App Firewall](#)

Important:

If users are deploying NetScaler Web App Firewall into an existing VPC, they must ensure that their VPC spans across two Availability Zones, with one public and two private subnets in each Availability Zone for the workload instances, and that the subnets are not shared. This deployment guide does not support shared subnets, see Working with Shared VPCs: [Working with Shared VPCs](#). These subnets require NAT Gateways in their route tables to allow the instances to download packages and software without exposing them to the internet. For more information about NAT Gateways, see: [NAT Gateways](#). Configure the subnets so there is no overlapping of subnets.

Also, users should ensure that the domain name option in the DHCP options is configured as explained in the Amazon VPC documentation found here: DHCP Options Sets: [DHCP Options Sets](#). Users are prompted for their VPC settings when they launch the Quick Start Guide.

- Each deployment takes about 15 minutes to complete.
- Check the AWS Region that is displayed in the upper-right corner of the navigation bar, and change it if necessary. This is where the network infrastructure for Citrix Web App Firewall will be built. The template is launched in the US East (Ohio) Region by default.

Note:

This deployment includes NetScaler Web App Firewall, which isn't currently supported in all AWS Regions. For a current list of supported Regions, see the AWS Service Endpoints: [AWS Service Endpoints](#).

- On the **Select Template** page, keep the default setting for the template URL, and then choose Next.

- On the **Specify Details** page, specify the stack name as per user convenience. Review the parameters for the template. Provide values for the parameters that require input. For all other parameters, review the default settings and customize them as necessary.
- In the following table, parameters are listed by category and described separately for the deployment option:
- Parameters to deploy NetScaler Web App Firewall into a new or existing VPC (Deployment Option 1)
- When users finish reviewing and customizing the parameters, they should choose Next.

Parameters to deploy NetScaler Web App Firewall into a new VPC

VPC network configuration For reference information on this deployment refer to the CFT template here: [AWS-Quickstart/Quickstart-Citrix-ADC-Web App Firewall/Templates](#).

Parameter label (name)	Default	Description
Primary Availability Zone (PrimaryAvailabilityZone)	Requires input	The Availability Zone for Primary NetScaler Web App Firewall deployment
Secondary Availability Zone (SecondaryAvailabilityZone)	Requires input	The Availability Zone for Secondary NetScaler Web App Firewall deployment
VPC CIDR (VPCCIDR)	10.0.0.0/16	The CIDR block for the VPC. Must be a valid IP CIDR range of the form x.x.x.x/x.
Remote SSH CIDR IP(Management) (RestrictedSSHCIDR)	Requires input	The IP address range that can SSH to the EC2 instance (port: 22).
Remote HTTP CIDR IP(Client) (RestrictedWebAppCIDR)	0.0.0.0/0	The IP address range that can HTTP to the EC2 instance (port: 80)
Remote HTTP CIDR IP(Client) (RestrictedWebAppCIDR)	0.0.0.0/0	The IP address range that can HTTP to the EC2 instance (port: 80)
Primary Management Private Subnet CIDR (PrimaryManagementPrivateSubnetCIDR)	10.0.1.0/24	The CIDR block for Primary Management Subnet located in Availability Zone 1.

Parameter label (name)	Default	Description
Primary Management Private IP (PrimaryManagementPrivateIP)	—	Private IP assigned to the Primary Management ENI (last octet has to be between 5 and 254) from the Primary Management Subnet CIDR.
Primary Client Public Subnet CIDR (PrimaryClientPublicSubnetCIDR)	10.0.2.0/24	The CIDR block for Primary Client Subnet located in Availability Zone 1.
Primary Client Private IP (PrimaryClientPrivateIP)	—	Private IP assigned to the Primary Client ENI (last octet has to be between 5 and 254) from Primary Client IP from the Primary Client Subnet CIDR.
Primary Server Private Subnet CIDR (PrimaryServerPrivateSubnetCIDR)	10.0.3.0/24	The CIDR block for Primary Server located in Availability Zone 1.
Primary Server Private IP (PrimaryServerPrivateIP)	—	Private IP assigned to the Primary Server ENI (last octet has to be between 5 and 254) from the Primary Server Subnet CIDR.
Secondary Management Private Subnet CIDR (SecondaryManagementPrivateSubnetCIDR)	10.0.4.0/24	The CIDR block for Secondary Management Subnet located in Availability Zone 2.
Secondary Management Private IP (SecondaryManagementPrivateIP)	—	Private IP assigned to the Secondary Management ENI (last octet has to be between 5 and 254). It would allocate Secondary Management IP from the Secondary Management Subnet CIDR.
Secondary Client Public Subnet CIDR (SecondaryClientPublicSubnetCIDR)	10.0.5.0/24	The CIDR block for Secondary Client Subnet located in Availability Zone 2.

Parameter label (name)	Default	Description
Secondary Client Private IP (SecondaryClientPrivateIP)	—	Private IP assigned to the Secondary Client ENI (last octet has to be between 5 and 254). It would allocate Secondary Client IP from the Secondary Client Subnet CIDR.
Secondary Server Private Subnet CIDR (Secondary-ServerPrivateSubnetCIDR)	10.0.6.0/24	The CIDR block for Secondary Server Subnet located in Availability Zone 2.
Secondary Server Private IP (SecondaryServerPrivateIP)	—	Private IP assigned to the Secondary Server ENI (last octet has to be between 5 and 254). It would allocate Secondary Server IP from the Secondary Server Subnet CIDR.
VPC Tenancy attribute (VPCTenancy)	default	The allowed tenancy of instances launched into the VPC. Choose Dedicated tenancy to launch EC2 instances dedicated to a single customer.

Bastion host configuration

Parameter label (name)	Default	Description
Bastion Host required (LinuxBastionHostEIP)	No	By default, no bastion host will be configured. But if users want to opt for sandbox deployment select yes from the menu which would deploy a Linux Bastion Host in the public subnet with an EIP that would give users access to the components in the private and public subnet.

NetScaler Web App Firewall Configuration

Parameter label (name)	Default	Description
Key pair name (KeyPairName)	Requires input	A public/private key pair, which allows users to connect securely to the user instance after it launches. This is the key pair users created in their preferred AWS Region; see the Technical Requirements section.
NetScaler Instance Type (CitrixADCInstanceType)	m4.xlarge	The EC2 instance type to use for the ADC instances. Ensure that the instance type opted for aligns with the instance types available in the AWS marketplace or else the CFT might fail.
NetScaler ADC AMI ID (CitrixADCImageID)	—	The AWS Marketplace AMI to be used for NetScaler Web App Firewall deployment. This must match the AMI users subscribed to in step 2.
NetScaler ADC VPX IAM role (iam:GetRole)	—	This Template: AWS-Quickstart/Quickstart-Citrix-ADC-VPX/Templates creates the IAM role and the Instance Profile required for NetScaler VPX. If left empty, CFT creates the required IAM role.
Client PublicIP(EIP) (ClientPublicEIP)	No	Select “Yes” if users want to assign a public EIP to the user Client Network interface. Otherwise, even after the deployment, users still have the option of assigning it later if necessary.

Pooled Licensing configuration

Parameter label (name)	Default	Description
NetScaler Console Pooled Licensing	No	If choosing the BYOL option for licensing, select yes from the list. This allows users to upload their already purchased licenses. Before users begin, they should Configure NetScaler ADC Pooled Capacity to ensure NetScaler Console pooled licensing is available, see Configure NetScalerPooled Capacity
Reachable NetScaler Console / NetScaler Console Agent IP	Requires input	For the Customer Licensed option, whether users deploy NetScaler Console on-prem or an agent in the cloud, make sure to have a reachable NetScaler Console IP which would then be used as an input parameter.
Licensing Mode	Optional	Users can choose from the 3 licensing modes: Configure NetScaler Pooled Capacity. For more information, see Configure Citrix ADC Pooled Capacity
License Bandwidth in Mbps	0 Mbps	Only if the licensing mode is NetScaler VPX Check-in and Pooled-Licensing, then this Check-out Licensing (CICO) field comes into the picture. It allocates an initial bandwidth of the license in Mbps to be allocated after BYOL ADCs are NetScaler virtual CPU Licensing created. It should be a multiple of 10 Mbps. For more information, see Citrix ADC VPX Check-in and Check-out Licensing
License Edition	Premium	Citrix ADC virtual CPU Licensing License Edition for Pooled Capacity Licensing Mode is Premium .

Parameter label (name)	Default	Description
Appliance Platform Type	Optional	Choose the required Appliance Platform Type, only if users opt for CICO licensing mode. Users get the options listed: VPX-200, VPX-1000, VPX-3000, VPX-5000, VPX-8000.
License Edition	Premium	License Edition for vCPU based Licensing is Premium .

AWS Quick Start configuration

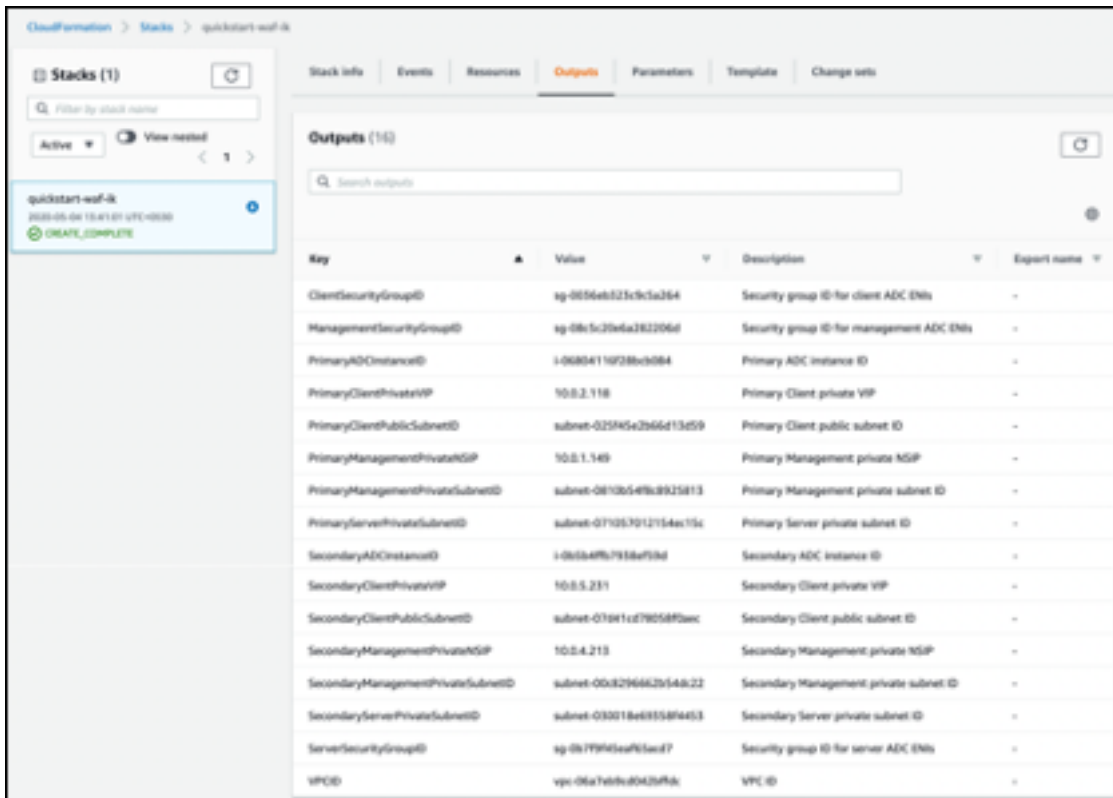

Note:

We recommend that users keep the default settings for the following two parameters, unless they are customizing the Quick Start Guide templates for their own deployment projects. Changing the settings of these parameters will automatically update code references to point to a new Quick Start Guide location. For more details, see the AWS Quick Start Guide Contributor's Guide located here: [AWS Quick Starts/Option 1 - Adopt a Quick Start](#).

Parameter label (name)	Default	Description
Quick Start Guide S3 bucket name (QSS3BucketName)	<code>aws-quickstart</code>	The S3 bucket users created for their copy of Quick Start Guide assets, if users decide to customize or extend the Quick Start Guide for their own use. The bucket name can include numbers, lowercase letters, uppercase letters, and hyphens, but should not start or end with a hyphen.

Parameter label (name)	Default	Description
Quick Start Guide S3 key prefix (QSS3KeyPrefix)	quickstart-citrix-adc-vpx/	The S3 key name prefix, from the Object Key and Metadata: Object Key and Metadata , is used to simulate a folder for the user copy of Quick Start Guide assets, if users decide to customize or extend the Quick Start Guide for their own use. This prefix can include numbers, lowercase letters, uppercase letters, hyphens, and forward slashes.

- On the **Options** page, users can specify a Resource Tag or key-value pair for resources in your stack and set advanced options. For more information on Resource Tags, see: [Resource Tag](#). For more information on setting AWS CloudFormation Stack Options, see: [Setting AWS CloudFormation Stack Options](#). When users are done, they should choose **Next**.
- On the **Review** page, review and confirm the template settings. Under **Capabilities**, select the two check boxes to acknowledge that the template creates IAM resources and that it might require the capability to auto-expand macros.
- Choose **Create** to deploy the stack.
- Monitor the status of the stack. When the status is **CREATE_COMPLETE**, the NetScaler Web App Firewall instance is ready.
- Use the URLs displayed in the **Outputs** tab for the stack to view the resources that were created.

Step 4: Test the deployment

We refer to the instances in this deployment as **primary** and **secondary**. Each instance has different IP addresses associated with it. When the Quick Start has been deployed successfully, traffic goes through the primary NetScaler Web App Firewall instance configured in Availability Zone 1. During failover conditions, when the primary instance does not respond to client requests, the secondary Web App Firewall instance takes over.

The Elastic IP address of the virtual IP address of the primary instance migrates to the secondary instance, which takes over as the new primary instance.

In the failover process, NetScaler Web App Firewall does the following:

- NetScaler Web App Firewall checks the virtual servers that have IP sets attached to them.
- NetScaler Web App Firewall finds the IP address that has an associated public IP address from the two IP addresses that the virtual server is listening on. One that is directly attached to the virtual server, and one that is attached through the IP set.
- NetScaler Web App Firewall reassociates the public Elastic IP address to the private IP address that belongs to the new primary virtual IP address.

To validate the deployment, perform the following:

- Connect to the primary instance

For example, with a proxy server, jump host (a Linux/Windows/FW instance running in AWS, or the bastion host), or another device reachable to that VPC or a Direct Connect if dealing with on-prem connectivity.

- Perform a trigger action to force failover and check whether the secondary instance takes over.

Tip:

To further validate the configuration with respect to NetScaler Web App Firewall, run the following command after connecting to the **Primary NetScaler Web App Firewall instance**:

```
Sh appfw profile QS-Profile
```

Connect to NetScaler Web App Firewall HA pair using bastion host

If users are opting for Sandbox deployment (for example, as part of CFT, users opt for configuring a Bastion Host), a Linux bastion host deployed in a public subnet will be configured to access the Web App Firewall interfaces.

In the AWS CloudFormation console, which is accessed by signing in here: [Sign in](#), choose the master stack, and on the **Outputs** tab, find the value of **LinuxBastionHostEIP1**.

Key	Value	Description
InstanceProfileName	tCaT-tag-citrix-adc-master-10599539-WorkLoadStack-GZX61DAOP4J-IAMRoleStack-36J5FNFG022N-CitrixNodesProfile-7R84KI62FPA3	Instance Profile for ADCs
LinuxBastionHostEIP1	3.124.177.42	Elastic IP 1 for Bastion
PrimaryADCInstanceID	i-09956d309fe8f4752	Primary ADC Instance ID
PrimaryClientPrivateVIP	10.0.2.203	Primary Client Private VIP
PrimaryClientPublicEIP	18.195.151.157	Primary Client Public EIP
PrimaryClientPublicSubnetID	subnet-04c7c93c8f0e12d5e	Primary Client Public Subnet ID
PrimaryManagementPrivateNSIP	10.0.1.91	Primary Management Private NSIP

- **PrivateManagementPrivateNSIP** and **PrimaryADCInstanceID** key’s value to be used in the later steps to SSH into the ADC.
- Choose **Services**.

- On the **Compute** tab, select **EC2**.
 - Under **Resources**, choose **Running Instances**.
 - On the **Description** tab of the primary Web App Firewall instance, note the **IPv4 public IP** address. Users need that IP address to construct the SSH command.

- To store the key in the user keychain, run the command `ssh-add -K [your-key-pair].pem`

On Linux, users might need to omit the -K flag.

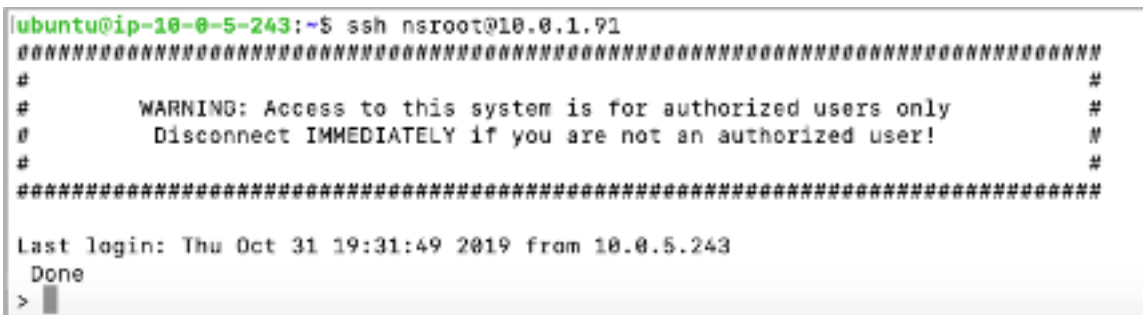

- Log in to the bastion host using the following command, using the value for **LinuxBastionHostEIP1** that users noted in step 1.

```
ssh -A ubuntu@[LinuxBastionHostEIP1]
```

- From the bastion host, users can connect to the primary Web App Firewall instance by using SSH.

```
ssh nsroot@[Primary Management Private NSIP]
```

Password: [Primary ADC Instance ID]

Now users are connected to the primary NetScaler Web App Firewall instance. To see the available commands, users can run the help command. To view the current HA configuration, users can run the show HA node command.

NetScaler Console

NetScaler Application Delivery Management Service provides an easy and scalable solution to manage NetScaler deployments that include NetScaler MPX, NetScaler VPX, NetScaler Gateway, NetScaler Secure Web Gateway, NetScaler SDX, NetScaler ADC CPX, and NetScaler SD-WAN appliances that are deployed on-premises or on the cloud.

The NetScaler Console Service documentation includes information about how to get started with the service, a list of features supported on the service, and configuration specific to this service solution.

For more information, see [NetScaler Console Overview](#).

Deploying NetScaler VPX instances on AWS using NetScaler Console

When customers move their applications to the cloud, the components that are part of their application increase, become more distributed, and need to be dynamically managed.

For more information, see [Provisioning NetScaler VPX Instances on AWS](#).

NetScaler Web App Firewall and OWASP Top 10 –2017

The Open Web Application Security Project: [OWASP](#) released the OWASP Top 10 for 2017 for web application security. This list documents the most common web application vulnerabilities and is a great starting point to evaluate web security. Here we detail how to configure the NetScaler Web App Firewall (Web App Firewall) to mitigate these flaws. Web App Firewall is available as an integrated module in the NetScaler (Premium Edition) as well as a complete range of appliances.

For more information, see [NetScaler Web App Firewall and OWASP top ten–2021](#).

The full OWASP Top 10 document is available at [OWASP Top Ten](#).

Signatures provide the following deployment options to help users to optimize the protection of user applications:

- **Negative Security Model:** With the negative security model, users employ a rich set of pre-configured signature rules to apply the power of pattern matching to detect attacks and protect against application vulnerabilities. Users block only what they don't want and allow the rest. Users can add their own signature rules, based on the specific security needs of user applications, to design their own customized security solutions.
- **Hybrid security Model:** In addition to using signatures, users can use positive security checks to create a configuration ideally suited for user applications. Use signatures to block what users don't want, and use positive security checks to enforce what is allowed.

To protect user applications by using signatures, users must configure one or more profiles to use their signatures object. In a hybrid security configuration, the SQL injection and cross-site scripting patterns, and the SQL transformation rules, in the user signatures object are used not only by the signature rules, but also by the positive security checks configured in the Web Application Firewall profile that is using the signatures object.

The Web Application Firewall examines the traffic to user protected websites and web services to detect traffic that matches a signature. A match is triggered only when every pattern in the rule matches the traffic. When a match occurs, the specified actions for the rule are invoked. Users can display an error page or error object when a request is blocked. Log messages can help users to identify attacks being launched against user applications. If users enable statistics, the Web Application Firewall maintains data about requests that match a Web Application Firewall signature or security check.

If the traffic matches both a signature and a positive security check, the more restrictive of the two actions are enforced. For example, if a request matches a signature rule for which the block action is disabled, but the request also matches an SQL Injection positive security check for which the action is block, the request is blocked. In this case, the signature violation might be logged as [not blocked], although the request is blocked by the SQL injection check.

Customization: If necessary, users can add their own rules to a signatures object. Users can also customize the SQL/XSS patterns. The option to add their own signature rules, based on the specific security needs of user applications, gives users the flexibility to design their own customized security solutions. Users block only what they don't want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. Users can add, modify, or remove SQL injection and cross-site scripting patterns. Built-in RegEx and expression editors help users configure user patterns and verify their accuracy.

NetScaler Web App Firewall

Web App Firewall is an enterprise grade solution offering state of the art protections for modern applications. NetScaler Web App Firewall mitigates threats against public-facing assets, including websites, web applications, and APIs. NetScaler Web App Firewall includes IP reputation-based filtering, Bot mitigation, OWASP Top 10 application threats protections, Layer 7 DDoS protection and more. Also included are options to enforce authentication, strong SSL/TLS ciphers, TLS 1.3, rate limiting and rewrite policies. Using both basic and advanced Web App Firewall protections, NetScaler Web App Firewall provides comprehensive protection for your applications with unparalleled ease of use. Getting up and running is a matter of minutes. Further, using an automated learning model, called dynamic profiling, NetScaler Web App Firewall saves users precious time. By automatically learning how a protected application works, Web App Firewall adapts to the application even as developers deploy and alter the applications. NetScaler Web App Firewall helps with compliance for all major regulatory standards and bodies, including PCI-DSS, HIPAA, and more. With our CloudFormation templates, it

has never been easier to get up and running quickly. With auto scaling, users can rest assured that their applications remain protected even as their traffic scales up.

Web App Firewall deployment strategy

The first step to deploying the web application firewall is to evaluate which applications or specific data need maximum security protection, which ones are less vulnerable, and the ones for which security inspection can safely be bypassed. This helps users in coming up with an optimal configuration, and in designing appropriate policies and bind points to segregate the traffic. For example, users might want to configure a policy to bypass security inspection of requests for static web content, such as images, MP3 files, and movies, and configure another policy to apply advanced security checks to requests for dynamic content. Users can use multiple policies and profiles to protect different contents of the same application.

The next step is to baseline the deployment. Start by creating a virtual server and run test traffic through it to get an idea of the rate and amount of traffic flowing through the user system.

Then, deploy the Web App Firewall. Use NetScaler console and the Web App Firewall StyleBook to configure the Web App Firewall. See the StyleBook section below in this guide for details.

After the Web App Firewall is deployed and configured with the Web App Firewall StyleBook, a useful next step would be to implement the NetScaler ADC Web App Firewall and OWASP Top 10.

Finally, three of the Web App Firewall protections are especially effective against common types of Web attacks, and are therefore more commonly used than any of the others. Thus, they should be implemented in the initial deployment.

For more information, see [Deploy NetScaler Web App Firewall on Azure](#).

NetScaler Console

NetScaler console provides a scalable solution to manage NetScaler ADC deployments that include NetScaler ADC MPX, NetScaler ADC VPX, NetScaler Gateway, NetScaler Secure Web Gateway, NetScaler ADC SDX, NetScaler ADC CPX, and NetScaler SD-WAN appliances that are deployed on-premises or on the cloud.

NetScaler console application analytics and management features

The features that are supported on the NetScaler console are key to the NetScaler Console role in App Security.

For more information on features, see [Features and solutions](#).

Prerequisites

Before attempting to create a VPX instance in AWS, users should ensure that prerequisites are met. For more information, see [Prerequisites](#):

Limitations and usage guidelines

The limitations and usage guidelines that are available at [Limitations and usage guidelines](#) apply when deploying a Citrix ADC VPX instance on AWS.

Technical requirements

Before users launch the Quick Start Guide to begin a deployment, the user account must be configured as specified in the following resource table. Otherwise, the deployment might fail.

Resources

If necessary, sign in to the user amazon account and request service limit increases for the following resources here: [AWS/Sign in](#). You might need to do this if you already have an existing deployment that uses these resources, and you think you might exceed the default limits with this deployment. For default limits, see the AWS Service Quotas in the AWS documentation: [AWS Service Quotas](#).

The AWS Trusted Advisor, found here: [AWS/Sign in](#), offers a service limits check that displays usage and limits for some aspects of some services.

Resource	This deployment uses
VPCs	1
Elastic IP addresses	0/1(for Bastion host)
IAM security groups	3
IAM roles	1
Subnets	6(3/Availability zone)
Internet Gateway	1
Route Tables	5
Web App Firewall VPX instances	2
Bastion host	0/1
NAT gateway	2

Regions

NetScaler Web App Firewall on AWS isn't currently supported in all AWS Regions. For a current list of supported Regions, see AWS Service Endpoints in the AWS documentation: [AWS Service Endpoints](#).

For more information on AWS regions and why cloud infrastructure matters, see: [Global Infrastructure](#).

Key Pair

Make sure that at least one Amazon EC2 key pair exists in the user AWS account in the Region where users are planning to deploy using the Quick Start Guide. Make note of the key pair name. Users are prompted for this information during deployment. To create a key pair, follow the instructions for Amazon EC2 Key Pairs and Linux Instances in the AWS documentation: [Amazon EC2 Key Pairs and Linux Instances](#).

If users are deploying the Quick Start Guide for testing or proof-of-concept purposes, we recommend that they create a new key pair instead of specifying a key pair that's already being used by a production instance.

Configure a NetScaler VPX instance to use SR-IOV network interface

May 2, 2023

Note

Support for SR-IOV interfaces in a high availability setup is available from NetScaler release 12.0 57.19 onwards.

After you have created a NetScaler VPX instance on AWS, you can configure the virtual appliance to use SR-IOV network interfaces, by using the AWS CLI.

In all NetScaler VPX models, except NetScaler VPX AWS Marketplace Editions of 3G and 5G, SR-IOV is not enabled in the default configuration of a network interface.

Before you start the configuration, read the following topics:

- [Prerequisites](#)
- [Limitations and Usage Guidelines](#)

This section includes the following topics:

- [Change the Interface Type to SR-IOV](#)
- [Configure SR-IOV on a High Availability Setup](#)

Change the interface type to SR-IOV

You can run the show interface summary command to check the default configuration of a network interface.

Example 1: The following CLI screen capture shows the configuration of a network interface where SR-IOV is enabled by default on NetScaler VPX AWS Marketplace Editions of 3G and 5G.

```
> show interface summary
-----
Interface  MTU      MAC          Suffix
-----
1  1/1      1500        0a:1e:2e:17:a2:37  Intel 82599 10G VF Interface
2  L0/1     1500        0a:1e:2e:17:a2:37  Netscaler Loopback interface
Done
```

Example 2: The following CLI screen capture shows the default configuration of a network interface where SR-IOV is not enabled.

```

Done
[> sh int s
-----
      Interface  MTU      MAC      Suffix
-----
1      1/1        1500     12:fc:04:c5:d0:12  NetScaler Virtual Interface
2      L0/1        1500     12:fc:04:c5:d0:12  Netscaler Loopback interface
Done
>

```

For more information about changing the interface type to SR-IOV, see <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/sriov-networking.html>

To change the interface type to SR-IOV

1. Shut down the NetScaler VPX instance running on AWS.
2. To enable SR-IOV on the network interface, type the following command in the AWS CLI.

```
$ aws ec2 modify-instance-attribute --instance-id <instance\_id> --sriov-net-support simple
```
3. To check if SR-IOV has been enabled, type the following command in the AWS CLI.

```
$ aws ec2 describe-instance-attribute --instance-id <instance\_id> --attribute sriovNetSupport
```

Example 3: Network interface type changed to SR-IOV, by using the AWS CLI.

```

aws ec2 modify-instance-attribute --instance-id i-008c1230aaf303bee --sriov-net-support simple
aws ec2 describe-instance-attribute --instance-id i-008c1230aaf303bee --attribute sriovNetSupport
{
  "InstanceId": "i-008c1230aaf303bee",
  "SriovNetSupport": {
    "Value": "simple"
  }
}

```

If SR-IOV is not enabled, value for SriovNetSupport is absent.

Example 4: In the following example, SR-IOV support is not enabled.

```

{
  "InstanceId": "i-0c3e84cfa65b04cc8",
  "SriovNetSupport": {}
}

```

4. Power on the VPX instance. To see the changed status of the network interface, type “show interface summary” in the CLI.

Example 5: The following screen capture shows the network interfaces with SR-IOV enabled. The interfaces 10/1, 10/2, 10/3 are SR-IOV enabled.

```
> show interface summary
-----
Interface  MTU      MAC              Suffix
-----
1   10/1      1500            0a:1e:2e:17:a2:37  Intel 82599 10G VF Interface
2   10/2      1500            0a:df:17:0a:fe:83  Intel 82599 10G VF Interface
3   10/3      1500            0a:de:5d:31:bf:c3  Intel 82599 10G VF Interface
4   L0/1      1500            0a:1e:2e:17:a2:37  Netscaler Loopback interface
Done
```

These steps complete the procedure to configure VPX instances to use SR-IOV network interfaces.

Configure SR-IOV on a high availability setup

High availability is supported with SR-IOV interfaces from NetScaler release 12.0 build 57.19 onwards.

If the high availability setup was deployed manually or by using the Citrix CloudFormation template for NetScaler version 12.0 56.20 and lower, the IAM role attached to the high availability setup must have the following privileges:

- ec2:DescribeInstances
- ec2:DescribeNetworkInterfaces
- ec2:DetachNetworkInterface
- ec2:AttachNetworkInterface
- ec2:StartInstances
- ec2:StopInstances
- ec2:RebootInstances
- autoscaling:*
- sns:*
- sqs:*
- IAM:SimulatePrincipalPolicy
- IAM:GetRole

By default, the Citrix CloudFormation template for NetScaler version 12.0 57.19 automatically adds the required privileges to the IAM role.

Note

A high availability setup with SR-IOV Interfaces takes around 100 seconds of downtime.

Related resources:

For more information about IAM roles, see [AWS documentation](#).

Configure a NetScaler VPX instance to use Enhanced Networking with AWS ENA

May 2, 2023

After you have created a NetScaler VPX instance on AWS, you can configure the virtual appliance to use [Enhanced Networking](#) with [AWS Elastic Network Adapter \(ENA\)](#), by using AWS CLI.

Coupled with AWS ENA, enhanced networking provides higher bandwidth, higher packet-per-second (PPS) performance, and consistently lower inter-instance latencies.

Before you start the configuration, read the following topics:

- [Prerequisites](#)
- [Limitations and Usage Guidelines](#)

The following HA configurations are supported for ENA-enabled instances:

- Private IP addresses can be moved within the same availability zone.
- Elastic IP addresses can be moved across availability zones.

Upgrade a NetScaler VPX instance on AWS

May 2, 2023

You can upgrade the EC2 instance type, throughput, software edition, and the system software of a NetScaler VPX running on AWS. For certain types of upgrades, Citrix recommends using the High Availability Configuration method to minimize downtime.

Note:

- NetScaler software release 10.1.e-124.1308.e or later for a NetScaler VPX AMI (including both utility license and customer license) does not support the M1 and M2 instance families.
- Because of changes in VPX instance support, downgrading from 10.1.e-124 or a later release to 10.1.123.x or an earlier release is not supported.
- Most of the upgrades do not require the launch of a new AMI, and the upgrade can be done on the current NetScaler AMI instance. If you do want to upgrade to a new NetScaler AMI instance, use the high availability configuration method.

Change the EC2 instance type of a NetScaler VPX instance on AWS

If your NetScaler VPX instances are running release 10.1.e-124.1308.e or later, you can change the EC2 instance type from the AWS console as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

You can also use the above procedure to change the EC2 instance type for a release, earlier than 10.1.e-124.1308.e, unless you want to change the instance type to M3. In that case, you must first follow the standard NetScaler upgrade procedure, at, to upgrade the NetScaler software to 10.1.e-124 or a later release, and then follow the above steps.

Upgrade the throughput or software edition of a NetScaler VPX instance on AWS

To upgrade the software edition (for example, to upgrade from Standard to Premium edition) or throughput (for example, to upgrade from 200 Mbps to 1000mbps), the method depends on the instance's license.

Using a customer license (Bring-Your-Own-License)

If you are using a customer license, you can purchase and download the new license from the Citrix website, and then install the license on the VPX instance. For more information about downloading and installing a license from the Citrix website, see the VPX Licensing Guide.

Using a utility license (Utility license with hourly fee)

AWS does not support direct upgrades for fee-based instances. To upgrade the software edition or throughput of a fee based NetScaler VPX instance, launch a new AMI with the desired license and capacity and migrate the older instance configuration to the new instance. This can be achieved by using a NetScaler high availability configuration as described in Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration subsection in this page.

Upgrade the system software of a NetScaler VPX instance on AWS

If you need to upgrade a VPX instance running 10.1.e-124.1308.e or a later release, follow the standard NetScaler upgrade procedure at [Upgrade and downgrade a NetScaler appliance](#).

If you need to upgrade a VPX instance running a release older than 10.1.e-124.1308.e to 10.1.e-124.1308.e or a later release, first upgrade the system software, and then change the instance type to M3 as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration

To use the high availability method of upgrading to a new NetScaler AMI instance, perform the following tasks:

- Create a new instance with the desired EC2 instance type, software edition, throughput, or software release from the AWS marketplace.
- Configure high availability between the old instance (to be upgraded) and the new instance. After high availability is configured between the old and the new instance, configuration from the old instance is synchronized to the new instance.
- Force an HA failover from the old instance to the new instance. As a result, the new instance becomes primary and starts receiving traffic.
- Stop, and reconfigure or remove the old instance from AWS.

Prerequisites and points to consider

- Ensure you understand how high availability works between two NetScaler VPX instances on AWS. For more information about high availability configuration between two NetScaler VPX instances on AWS, see [Deploy a high availability pair on AWS](#).
- You must create the new instance in the same availability zone as the old instance, having the exact same security group and subnet.
- High availability setup requires access and secret keys associated with the user's AWS Identity and Access Management (IAM) account for both instances. If the correct key information is not used when creating VPX instances, the HA setup fails. For more information about creating an IAM account for a VPX instance, see [Prerequisites](#).
 - You must use the EC2 console to create the new instance. You cannot use the AWS 1-click launch, because it does not accept the access and secret keys as the input.
 - The new instance must have only one ENI interface.

To upgrade a NetScaler VPX Instance by using a high availability configuration, follow these steps:

1. Configure high availability between the old and the new instance. To configure high availability between two NetScaler VPX instances, at the command prompt of each instance, type:

- `add ha node <nodeID> <IPaddress of the node to be added>`
- `save config`

Example:

At the command prompt of the old instance, type:

```
1 add ha node 30 192.0.2.30
2 Done
3 <!--NeedCopy-->
```

At the command prompt of the new instance, type:

```
1 add ha node 10 192.0.2.10
2 Done
3 <!--NeedCopy-->
```

Note the following:

- In the HA setup, the old instance is the primary node and the new instance is the secondary node.
- The NSIP IP address is not copied from the old instance to the new instance. Therefore, after the upgrade, your new instance has a different management IP address from the previous one.
- The `nsroot` account password of the new instance is set to that of the old instance after HA synchronization.

For more information about high availability configuration between two NetScaler VPX instances on AWS, see [Deploy a high availability pair on AWS](#).

2. Force an HA failover. To force a failover in a high availability configuration, at the command prompt of either of the instances, type:

```
1 force HA failover
2 <!--NeedCopy-->
```

As the result of forcing a failover, the ENIs of the old instance are migrated to the new instance and traffic flows through the new instance (the new primary node). The old instance (the new secondary node) restarts.

If the following warning message appears, type N to abort the operation:

```
1 [WARNING]:Force Failover may cause configuration loss, peer health
   not optimum. Reason(s):
2 HA version mismatch
3 HA heartbeats not seen on some interfaces
```

```

4 Please confirm whether you want force-failover (Y/N)?
5 <!--NeedCopy-->

```

The warning message appears because the system software of the two VPX instances is not HA compatible. As a result, the configuration of the old instance cannot be automatically synced to the new instance during a forced failover.

Following is the workaround for this issue:

- a) At the NetScaler shell prompt of the old instance, type the following command to create a backup of the configuration file (ns.conf):

```
copy /nsconfig/ns.conf to /nsconfig/ns.conf.bkp
```

- b) Remove the following line from the backup configuration file (ns.conf.bkp):

- `set ns config -IPAddress <IP> -netmask <MASK>`

Forexample, `set ns config -IPAddress 192.0.2.10 -netmask 255.255.255.0`

- c) Copy the old instance's backup configuration file (ns.conf.bkp) to the /nsconfig directory of the new instance.
- d) At the NetScaler shell prompt of the new instance, type the following command to load the old instance's configuration file (ns.conf.bkp) on the new instance:

- `batch -f /nsconfig/ns.conf.bkp`

- e) Save the configuration on the new instance.

- `save conifg`

- f) At the command prompt of either of the nodes, type the following command to force a failover, and then type Y for the warning message to confirm the force failover operation:

- `force ha failover`

Example:

```

1         > force ha failover
2
3 WARNING]:Force Failover may cause configuration loss, peer health
   not optimum.
4         Reason(s):
5         HA version mismatch
6         HA heartbeats not seen on some interfaces
7         Please confirm whether you want force-failover (Y/N)? Y
8 <!--NeedCopy-->

```

3. Remove the HA configuration, so that the two instances are no longer in an HA configuration. First remove the HA configuration from the secondary node and then remove the HA configuration from the primary node.

To remove an HA configuration between two NetScaler VPX instances, at the command prompt of each instance, type:

```
1 > remove ha node \<nodeID\>
2 > save config
3 <!--NeedCopy-->
```

For more information about high availability configuration between two VPX instances on AWS, see [Deploy a high availability pair on AWS](#).

Example:

At the command prompt of the old instance (new secondary node), type:

```
1 > remove ha node 30
2 Done
3 > save config
4 Done
5 <!--NeedCopy-->
```

At the command prompt of the new instance (new primary node), type:

```
1 > remove ha node 10
2 Done
3 > save config
4 Done
5 <!--NeedCopy-->
```

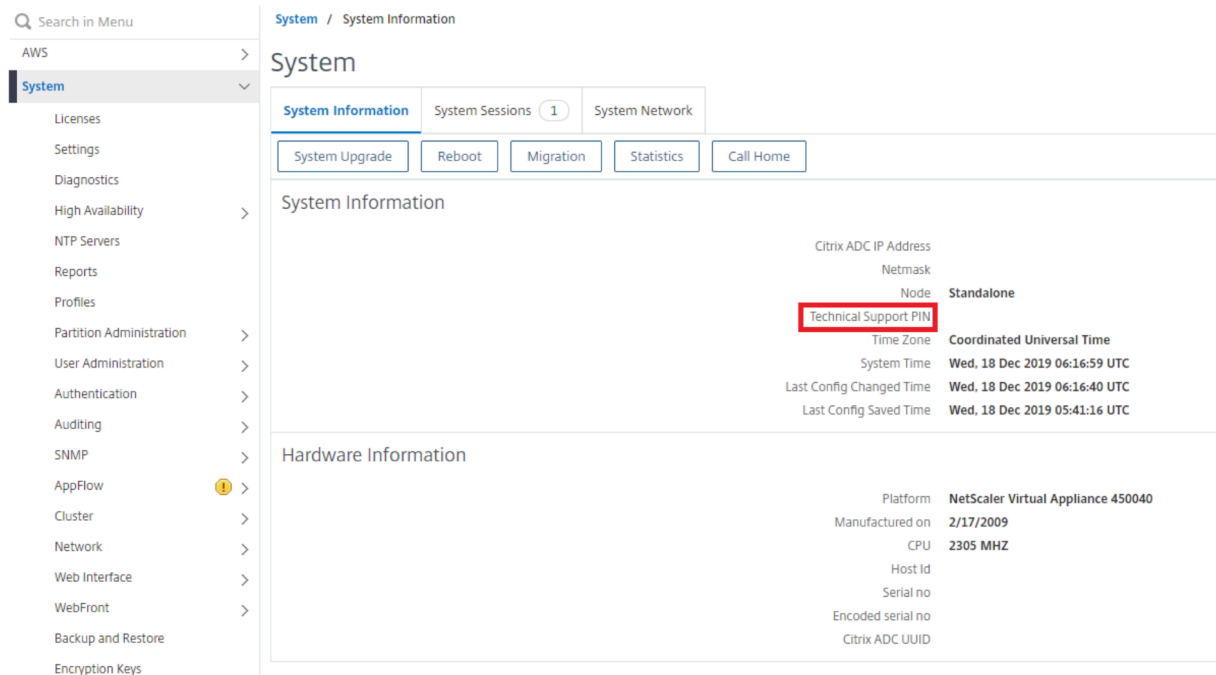

Troubleshoot a VPX instance on AWS

May 2, 2023

Amazon does not provide console access to a NetScaler VPX instance. To troubleshoot, you have to use the AWS GUI to view the activity log. You can debug only if the network is connected. To view an instance's System Log, right-click the instance and select System Log.

NetScaler provides support for AWS Marketplace-licensed NetScaler VPX instances (utility license with hourly fee) on AWS. To file a support case, find your AWS account number and support PIN code, and call NetScaler support. You will also be asked for your name and email address. To find the support PIN, log on to the VPX GUI and navigate to the System page.

Here is an example of a system page showing the support PIN.

AWS FAQs

May 2, 2023

- **Does a NetScaler VPX instance support the encrypted volumes in AWS?**

Encryption and decryption happen at the hypervisor level, and hence it works seamlessly with any instance. For more information about the encrypted volumes see the following AWS document:

<https://docs.aws.amazon.com/kms/latest/developerguide/services-efs.html>

- **What is the best way to provision NetScaler VPX instance on AWS?**

You can provision a NetScaler VPX instance on AWS by any of the following ways:

- AWS CloudFormation Template (CFT) in AWS marketplace
- NetScaler Console
- AWS Quick Starts
- Citrix AWS CFTs in GitHub
- Citrix Terraform Scripts in GitHub
- Citrix Ansible Playbooks in GitHub
- AWS EC2 launch workflow

You can choose any of the listed options based on the automation tool that you use.

For more details about the options, see [NetScaler VPX on AWS](#).

- **How to upgrade NetScaler VPX instance in AWS?**

To upgrade the NetScaler VPX instance in AWS, you can upgrade the system software or upgrade to a new NetScaler VPX Amazon Machine Image (AMI) by following the procedure at [Upgrade a NetScaler VPX instance on AWS](#).

The recommended way to upgrade a NetScaler VPX instance is using the ADM service by following the procedure at [Use jobs to upgrade NetScaler instances](#).

- **What is the HA failover time for NetScaler VPX in AWS?**

- HA failover of NetScaler VPX within the AWS availability zone takes around 3 seconds.
- HA failover of NetScaler VPX across AWS availability zones takes around 5 seconds.

- **What level of support is provided for NetScaler VPX marketplace subscription customers who provide the technical support PIN?**

By default, the “Select for Software” service is provided to customers who provide the technical support PIN.

- **In High availability across different zones using Elastic IP deployment, do we need to create Multiple IP Sets for each application?**

Yes. If there are multiple applications with multiple VIPs mapped to multiple EIPs then multiple IP Sets are required. Therefore during HA failover, all the primary VIP mappings of EIPs are changed to secondary (new primary) VIPs.

- **Why is INC mode enabled in high availability across different zone deployments?**

HA pairs across availability zones are in different networks. For HA synchronization, network configuration must not be synchronized. This is achieved by enabling INC mode on HA pair.

- **Can HA node in one availability zone communicate with back-end servers in another availability zone, provided those availability zones are in same VPC?**

Yes, subnets in different availability zones of the same VPC are reachable by adding an extra route pointing to the backend-server subnet via SNIP. For example, if the SNIP subnet of ADC in AZ1 is 192.168.3.0/24 and the backend-server subnet in AZ2 is 192.168.6.0/24, then a route must be added in the NetScaler appliance present in AZ1 as 192.168.6.0 255.255.255.0 192.168.3.1.

- **Can High availability across different zones using Elastic IP and High availability across different zones using Private IP deployments work together?**

Yes, both the configurations can be applied on the same HA Pair.

- **In High availability across different zones using Private IP deployment, if there are multiple subnets with multiple route tables in a VPC, how does a secondary node in HA pair know about the route table to be checked during HA failover?**

Secondary node is aware of the primary NICs and searches across all the route tables in a VPC.

- **What is the size of the `/var` partition when using the default image for VPX on AWS? How to increase the disk space?**

The size of the root disk is limited to 20 GB to keep the disk image small.

If you want to increase the `/var/core/` or the `/var/crash/` directory space, attach an extra disk. To increase the `/var` size, currently, you must attach an extra disk and create a symbolic link to `/var`, after copying the critical contents to the new disk.

- **How many packet engines are activated and allocated to vCPUs?**

The packet engines (PEs) are limited by the number of licensed vCPUs. The NetScaler daemons are not pinned to any particular vCPU and might run on any of the non-PE vCPUs. According to AWS, the C5.9xlarge is a 36vCPU instance with 72 GB memory. With pooled licensing, the NetScaler VPX instance deploys with the maximum number of PEs. In this case, 19 PEs run on cores 1–19. However, ADC management processes run from CPUs 20–31.

- **How to decide the right AWS instance for ADC?**

1. Understand your use case and requirements like throughput, PPS, SSL requirement, and average packet size.
2. Choose the right ADC offering and licensing that meets your requirements, such as VPX bandwidth offerings or vCPU based licensing.
3. Based on the chosen offering, decide on the AWS instance.

Example:

A 5 Gbps license enables 5 data packet engines. Hence, the vCPU requirement is 6 (5+1 for management). But 6 vCPU instance is not available. So an 8 vCPU is good enough to reach that throughput provided you choose a network that supports 5 Gbps bandwidth. For example, you must choose m5.2xlarge for a 5 Gbps bandwidth license to enable max PE allocation for 5 Gbps license. But if you use vCPU license that is not limited by throughput, you might get 5 Gbps throughput using the m5.xlarge instance itself.

Instance Size	vCPU	Memory (GiB)	Instance Storage (GiB)	Network Bandwidth (Gbps)	EBS Bandwidth (Mbps)
m5.large	2	8	EBS-Only	Up to 10	Up to 4,750
m5.xlarge	4	16	EBS-Only	Up to 10	Up to 4,750
m5.2xlarge	8	32	EBS-Only	Up to 10	Up to 4,750
m5.4xlarge	16	64	EBS-Only	Up to 10	4,750

- **Is three NICs-three subnets deployment mandatory for ADC in AWS?**

Three NICs–three subnets is the recommended deployment, where each one for management, client and server network. This deployment gives better traffic isolation and VPX performance. Two NICs–two subnets, and one NIC–one subnet are the other available options. Citrix don't recommend multiple NICs sharing a subnet in AWS, such as two NICs–one subnet deployment. Because it might lead to networking issues such as asymmetric routing. For more information, see [Best practices for configuring network interfaces in AWS](#).

Deploy a NetScaler VPX instance on Microsoft Azure

November 3, 2023

When you deploy a NetScaler VPX instance on Microsoft Azure Resource Manager (ARM), you can use both of the following feature sets to achieve your business needs:

- Azure cloud computing capabilities
- NetScaler load balancing and traffic management features

You can deploy NetScaler VPX instances on ARM either as standalone instances or as high availability pairs in active-standby modes.

You can deploy a NetScaler VPX instance on the Microsoft Azure in two ways:

- Through Azure Marketplace. The NetScaler VPX virtual appliance is available as an image in the Microsoft Azure Marketplace.
- Using the NetScaler Azure Resource Manager (ARM) json template available on GitHub. For more information, see the [GitHub repository for NetScaler solution templates](#).

The Microsoft Azure stack is an integrated platform of hardware and software that delivers the Microsoft Azure public cloud services in a local data center to let organizations construct hybrid clouds. You can now deploy the NetScaler VPX instances on the Microsoft Azure stack.

Prerequisite

You need some prerequisite knowledge before deploying a NetScaler VPX instance on Azure.

- Familiarity with Azure terminology and network details. For information, see [Azure terminology](#).
- Knowledge of a NetScaler appliance. For detailed information the NetScaler appliance, see [NetScaler](#)
- Knowledge of NetScaler networking. See the [Networking](#) topic.

How a NetScaler VPX instance works on Azure

In an on-premises deployment, a NetScaler VPX instance requires at least three IP addresses:

- Management IP address, called NSIP address
- Subnet IP (SNIP) address for communicating with the server farm
- Virtual server IP (VIP) address for accepting client requests

For more information, see [Network architecture for NetScaler VPX instances on Microsoft Azure](#).

Note

NetScaler VPX instance supports both the Intel and AMD processors. VPX virtual appliances can be deployed on any instance type that has two or more virtualized cores and more than 2 GB memory. For more information on system requirements, see [NetScaler VPX data sheet](#).

In an Azure deployment, you can provision a NetScaler VPX instance on Azure in three ways:

- Multi-NIC multi-IP architecture
- Single NIC multi-IP architecture
- Single NIC single IP

Depending on your needs, you can use any of these supported architecture types.

Multi-NIC multi-IP architecture

In this deployment type, you can have more than one network interfaces (NICs) attached to a VPX instance. Any NIC can have one or more IP configurations - static or dynamic public and private IP addresses assigned to it.

For more information, see the following use cases:

- [Configure a high-availability setup with multiple IP addresses and NICs](#)
- [Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands](#)

Note

To avoid MAC moves and interface mutes on Azure environments, Citrix recommends you to create a VLAN per data interface (without tag) of NetScaler VPX instance and bind the primary IP of NIC in Azure. For more information, see [CTX224626](#) article.

Single NIC multi-IP architecture

In this deployment type, one network interfaces (NIC) associated with multiple IP configurations - static or dynamic public and private IP addresses assigned to it.

For more information, see the following use cases:

- [Configure multiple IP addresses for a NetScaler VPX standalone instance](#)
- [Configure multiple IP addresses for a NetScaler VPX standalone instance by using PowerShell commands](#)

Single NIC single IP

In this deployment type, one network interfaces (NIC) associated with a single IP address, which is used to perform the functions of NSIP, SNIP, and VIP.

For more information, see [Configure a NetScaler VPX standalone instance](#).

Note

The single IP mode is available only in Azure deployments. This mode isn't available for a NetScaler VPX instance on your premises, on AWS, or in other types of deployment.

NetScaler VPX licensing

A NetScaler VPX instance on Azure requires a license. The following licensing options are available for NetScaler VPX instances running on Azure.

- **Subscription-based licensing:** NetScaler VPX appliances are available as paid instances on Azure Marketplace. Subscription-based licensing is a pay-as-you-go option. Users are charged hourly.

Note

For subscription-based license instances, your subscription billing applies throughout the license period for a particular license model. Due to cloud restrictions, Azure does not support changing or removing the license model applicable for your subscription. To change or remove a subscription license, delete the existing ADC VM, and recreate a new ADC VM with the required license.

NetScaler provides technical support for subscription-based license instances. To file a support case, see [Support for NetScaler on Azure –Subscription license with hourly price](#).

- **Bring your own license (BYOL):** If you bring your own license (BYOL), see the VPX Licensing Guide at <http://support.citrix.com/article/CTX122426>. You have to:

- Use the licensing portal within the NetScaler website to generate a valid license.
- Upload the license to the instance.

Note

In an Azure stack environment, **BYOL** is the only available licensing option.

- **NetScaler VPX Check-In/Check-Out licensing:** For more information, see [NetScaler VPX Check-In/Check-Out Licensing](#).

Starting with NetScaler release 12.0 56.20, NetScaler VPX Express for on-premises and cloud deployments does not require a license file. For more information on NetScaler VPX Express, see the “NetScaler VPX Express license” section in [NetScaler licensing overview](#).

The following VPX models and license types are available on Azure Marketplace.

VPX model	License type	Recommended instance		
		VPX 1 NIC/2 NIC	VPX 3 NIC	VPX upto 8 NIC
VPX10	Standard, Advanced, Premium	Standard_D2s_v4	Standard_DS3_v2	Standard_DS4_v2
VPX200	Standard, Advanced, Premium	Standard_D2s_v4	Standard_DS3_v2	Standard_DS4_v2
VPX1000	Standard, Advanced, Premium	Standard_D4s_v4	Standard_DS3_v2	Standard_DS4_v2
VPX3000	Standard, Advanced, Premium	Standard_D4s_v4	Standard_D8ds_v5	Standard_DS4_v2
VPX5000	Standard, Advanced, Premium	Standard_D8ds_v5	Standard_D8ds_v5	Standard_DS4_v2
VPX8000	Standard, Advanced, Premium	Standard_D8ds_v5	Standard_D8ds_v5	Standard_DS4_v2
VPX10000	Standard, Advanced, Premium	Standard_D16s_v4	Standard_D16s_v4	Standard_D16s_v4

Points to note:

- You must enable Azure accelerated networking on NetScaler VPX instances to get the optimal performance on the following VPX models:
 - VPX1000
 - VPX3000
 - VPX5000
 - VPX8000
 - VPX10000

For more information on configuring Accelerated networking, see [Configure a NetScaler VPX instance to use Azure accelerated networking](#).

- The VPX8000 and VPX10000 licenses are available only as BYOL.
- Regardless of the subscription-based hourly license bought from Azure Marketplace, in rare cases, the NetScaler VPX instance deployed on Azure might come up with a default NetScaler license. This happens due to issues with the Azure Instance Metadata Service (IMDS).
- Do a warm restart, before making any configuration change on the NetScaler VPX instance, to enable the correct NetScaler VPX license.

IPv6 support for NetScaler VPX instance in Azure

From release 13.1-21.x onwards, NetScaler VPX standalone instance supports IPv6 addresses in Azure. You can configure the IPv6 addresses as VIP and SNIP addresses on NetScaler VPX standalone instance in Azure cloud.

For information on how to enable IPv6 on Azure, see the following Azure documentation:

- [What is IPv6 for Azure Virtual Network?](#)
- [Add IPv6 to an IPv4 application in Azure virtual network - Azure CLI](#)
- [Address types](#)

For information on how the NetScaler appliance supports IPv6, see [Internet Protocol version 6](#).

IPv6 Limitations:

- IPv6 deployments in NetScaler currently do not support Azure backend autoscaling.
- IPv6 is not supported for NetScaler VPX HA deployment.

Limitations

Running the NetScaler VPX load-balancing solution on ARM imposes the following limitations:

- The Azure architecture does not accommodate support for the following NetScaler features:
 - Gratuitous ARP (GARP)
 - L2 Mode
 - Tagged VLAN
 - Dynamic Routing
 - virtual MAC
 - USIP
 - Clustering

Note:

With the NetScaler Application Delivery Management (ADM) Autoscale feature (cloud deployment), the ADC instances support clustering on all licenses. For information, see [Autoscaling of NetScaler VPX in Microsoft Azure using NetScaler Console](#).

- If you expect that you might have to shut down and temporarily deallocate the NetScaler VPX virtual machine at any time, assign a static Internal IP address while creating the virtual machine. If you do not assign a static internal IP address, Azure might assign the virtual machine a different IP address each time it restarts, and the virtual machine might become inaccessible.
- In an Azure deployment, only the following NetScaler VPX models are supported: VPX 10, VPX 200, VPX 1000, VPX 3000, and VPX 5000. For more information, see the [NetScaler VPX Data Sheet](#).
If you use a NetScaler VPX instance with a model number higher than VPX 3000, the network throughput might not be the same as specified by the instance's license. However, other features such as SSL throughput and SSL transactions per second might improve.
- The deployment ID that is generated by Azure during virtual machine provisioning isn't visible to the user in ARM. You can't use the deployment ID to deploy NetScaler VPX appliance on ARM.
- The NetScaler VPX instance supports 20 Mbps throughput and standard edition features when it's initialized.
- The NetScaler VPX instances on Azure with accelerated networking enabled, provides better performance. Azure accelerated networking is supported on NetScaler VPX instances from release 13.0 build 76.x onwards. To enable accelerated networking on NetScaler VPX, Citrix recommends you to use an Azure instance type which supports accelerated networking.
- For Citrix Virtual Apps and Desktops deployment, a VPN virtual server on a VPX instance can be configured in the following modes:
 - Basic mode, where the [ICAOnly](#) VPN virtual server parameter is set to ON. The Basic mode works fully on an unlicensed NetScaler VPX instance.

- SmartAccess mode, where the `ICAOnly` VPN virtual server parameter is set to OFF. The SmartAccess mode works for only five NetScaler AAA session users on an unlicensed NetScaler VPX instance.

Note:

To configure the SmartControl feature, you must apply a Premium license to the NetScaler VPX instance.

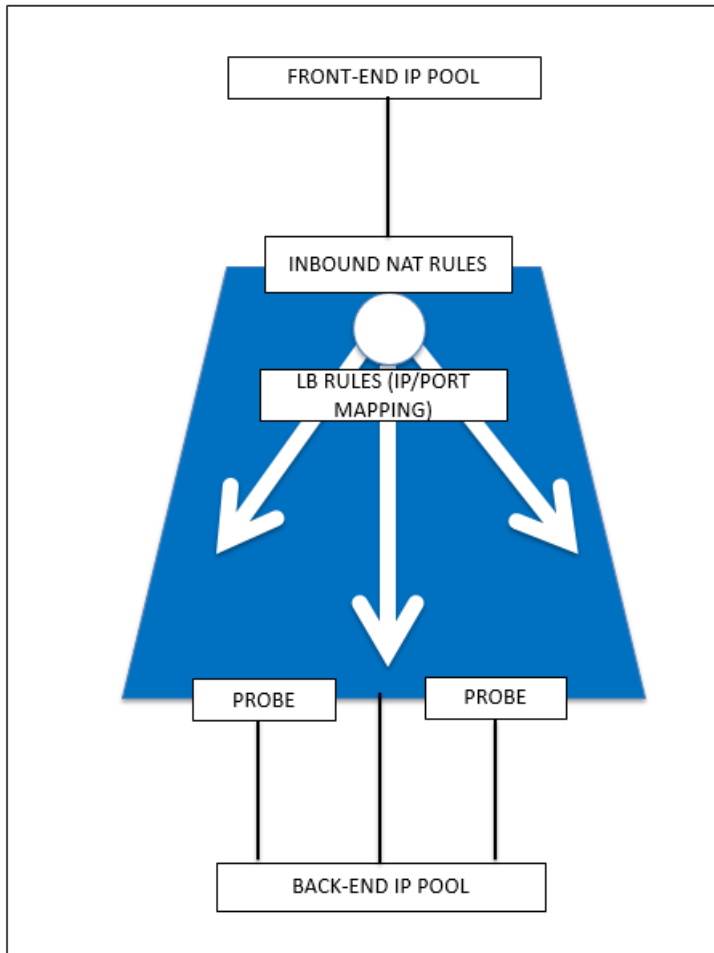

Azure terminology

May 2, 2023

Some of the Azure terms that are used in the NetScaler VPX Azure documentation are listed below.

1. Azure Load Balancer –Azure load balancer is a resource that distributes incoming traffic among computers in a network. Traffic is distributed among virtual machines defined in a load-balancer set. A load balancer can be external or internet-facing, or it can be internal.
2. Azure Resource Manager (ARM) –ARM is the new management framework for services in Azure. Azure Load Balancer is managed using ARM-based APIs and tools.
3. Back-End Address Pool –These are IP addresses associated with the virtual machine NIC (NIC) to which load will be distributed.
4. BLOB - Binary Large Object –Any binary object like a file or an image that can be stored in Azure storage.
5. Front-End IP Configuration –An Azure Load balancer can include one or more front-end IP addresses, also known as a virtual IPs (VIPs). These IP addresses serve as ingress for the traffic.
6. Instance Level Public IP (ILPIP) –An ILPIP is a public IP address that you can assign directly to your virtual machine or role instance, rather than to the cloud service that your virtual machine or role instance resides in. This does not take the place of the VIP (virtual IP) that is assigned to your cloud service. Rather, it's an extra IP address that you can use to connect directly to your virtual machine or role instance.
Note: In the past, an ILPIP was referred to as a PIP, which stands for public IP.
7. Inbound NAT Rules –This contains rules mapping a public port on the load balancer to a port for a specific virtual machine in the back end address pool.
8. IP-Config - It can be defined as an IP address pair (public IP and private IP) associated with an individual NIC. In an IP-Config, the public IP address can be NULL. Each NIC can have multiple IP-Config associated with it, which can be up to 255.

9. Load Balancing Rules –A rule property that maps a given front-end IP and port combination to a set of back-end IP addresses and port combination. With a single definition of a load balancer resource, you can define multiple load balancing rules, each rule reflecting a combination of a front end IP and port and back end IP and port associated with virtual machines.

10. Network security group –Contains a list of Access Control List (ACL) rules that allow or deny network traffic to your virtual machine instances in a virtual network. NSGs can be associated with either subnets or individual virtual machine instances within that subnet. When a network security group is associated with a subnet, the ACL rules apply to all the virtual machine instances in that subnet. In addition, traffic to an individual virtual machine can be restricted further by associating a network security group directly to that virtual machine.
11. Private IP addresses –Used for communication within an Azure virtual network, and your on-premises network when you use a VPN gateway to extend your network to Azure. Private IP addresses allow Azure resources to communicate with other resources in a virtual network or an on-premises network through a VPN gateway or ExpressRoute circuit, without using an Internet-reachable IP address. In the Azure Resource Manager deployment model, a private IP address is associated with the following types of Azure resources –virtual machines, internal load bal-

ancers (ILBs), and application gateways.

12. Probes –This contains health probes used to check availability of virtual machines instances in the back end address pool. If a particular virtual machine does not respond to health probes for some time, then it is taken out of traffic serving. Probes enable you to keep track of the health of virtual instances. If a health probe fails, the virtual instance will be taken out of rotation automatically.
13. Public IP Addresses (PIP) –PIP is used for communication with the Internet, including Azure public-facing services and is associated with virtual machines, Internet-facing load balancers, VPN gateways, and application gateways.
14. Region - An area within a geography that does not cross national borders and that contains one or more data centers. Pricing, regional services, and offer types are exposed at the region level. A region is typically paired with another region, which can be up to several hundred miles away, to form a regional pair. Regional pairs can be used as a mechanism for disaster recovery and high availability scenarios. Also referred to generally as location.
15. Resource Group - A container in Resource Manager holds related resources for an application. The resource group can include all of the resources for an application, or only those resources that are logically grouped together
16. Storage Account –An Azure storage account gives you access to the Azure blob, queue, table, and file services in Azure Storage. Your storage account provides the unique namespace for your Azure storage data objects.
17. Virtual Machine –The software implementation of a physical computer that runs an operating system. Multiple virtual machines can run simultaneously on the same hardware. In Azure, virtual machines are available in a variety of sizes.
18. Virtual Network - An Azure virtual network is a representation of your own network in the cloud. It is a logical isolation of the Azure cloud dedicated to your subscription. You can fully control the IP address blocks, DNS settings, security policies, and route tables within this network. You can also further segment your VNet into subnets and launch Azure IaaS virtual machines and cloud services (PaaS role instances). Additionally, you can connect the virtual network to your on-premises network using one of the connectivity options available in Azure. In essence, you can expand your network to Azure, with complete control on IP address blocks with the benefit of enterprise scale Azure provides.

Network architecture for NetScaler VPX instances on Microsoft Azure

May 2, 2023

In Azure Resource Manager (ARM), a NetScaler VPX virtual machine (VM) resides in a virtual network. A single network interface can be created in a given subnet of the Virtual Network and can be attached to the VPX instance. You can filter network traffic to and from a VPX instance in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to or outbound network traffic from a VPX instance. For more information, see [Security groups](#).

Network security group filters the requests to the NetScaler VPX instance, and the VPX instance sends them to the servers. The response from a server follows the same path in reverse. The Network security group can be configured to filter a single VPX VM, or, with subnets and virtual networks, can filter

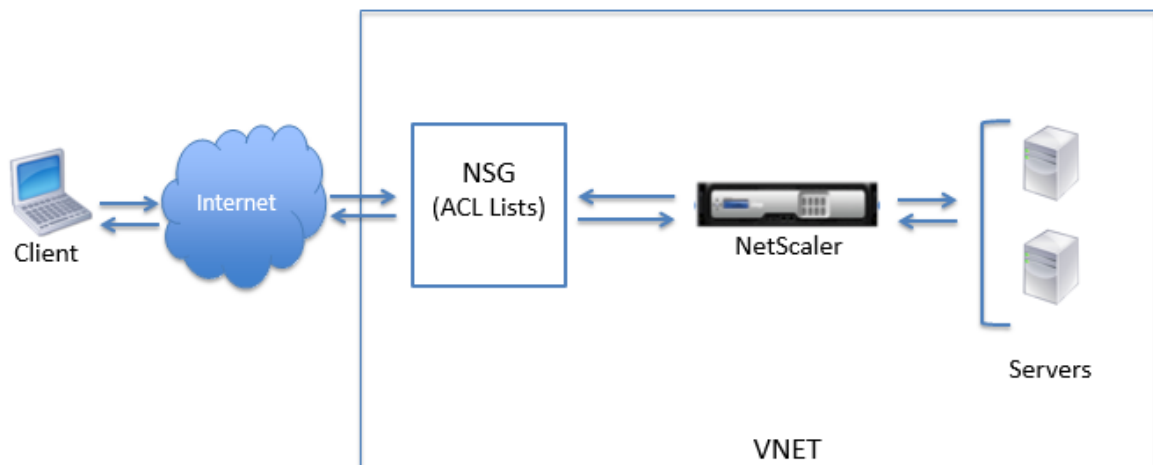

traffic in deployment of multiple VPX instances.

The NIC contains network configuration details such as the virtual network, subnets, internal IP address, and Public IP address.

While on ARM, it is good to know the following IP addresses that are used to access the VMs deployed with a single NIC and a single IP address:

- Public IP (PIP) address is the internet-facing IP address configured directly on the virtual NIC of the NetScaler VM. This allows you to directly access a VM from the external network.
- NetScaler IP (also known as NSIP) address is the internal IP address configured on the VM. It is non-routable.
- Virtual IP address (VIP) is configured by using the NSIP and a port number. Clients access NetScaler services through the PIP address, and when the request reaches the NIC of the NetScaler VPX VM or the Azure load balancer, the VIP gets translated to internal IP (NSIP) and internal port number.
- Internal IP address is the private internal IP address of the VM from the virtual network's address space pool. This IP address cannot be reached from the external network. This IP address is by default dynamic unless you set it to static. Traffic from the internet is routed to this address according to the rules created on the network security group. The network security group integrates with the NIC to selectively send the right type of traffic to the right port on the NIC, which depends on the services configured on the VM.

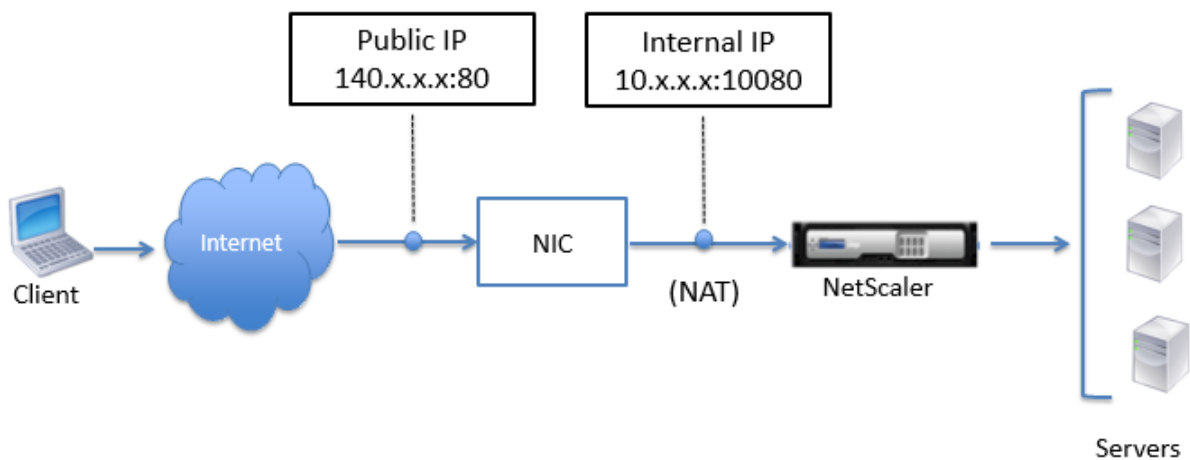

The following figure shows how traffic flows from a client to a server through a NetScaler VPX instance provisioned in ARM.

Traffic flow through network address translation

You can also request a public IP (PIP) address for your NetScaler VPX instance (instance level). If you use this direct PIP at the VM level, you need not define inbound and outbound rules to intercept the network traffic. The incoming request from the Internet is received on the VM directly. Azure performs network address translation (NAT) and forwards the traffic to the internal IP address of the VPX instance.

The following figure shows how Azure performs network address translation to map the NetScaler internal IP address.

In this example, the Public IP assigned to the network security group is 140.x.x.x and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler VPX instance listens. The client request is received on the Public IP address (140.x.x.x). Azure performs network address translation to map the PIP to the internal IP address 10.x.x.x on port 10080, and forwards the client request.

Note

NetScaler VPX VMs in high availability are controlled by external or internal load balancers that have inbound rules defined on them to control the load balancing traffic. The external traffic is first intercepted by these load balancers and the traffic is diverted according to the load balancing rules configured, which has back-end pools, NAT rules, and health probes defined on the load balancers.

Port usage guidelines

You can configure more inbound and outbound rules in network security group while creating the NetScaler VPX instance or after the virtual machine is provisioned. Each inbound and outbound rule

is associated with a public port and a private port.

Before configuring network security group rules, note the following guidelines regarding the port numbers you can use:

1. The NetScaler VPX instance reserves the following ports. You cannot define these as private ports when using the Public IP address for requests from the internet.

Ports 21, 22, 80, 443, 8080, 67, 161, 179, 500, 520, 3003, 3008, 3009, 3010, 3011, 4001, 5061, 9000, 7000.

However, if you want internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the network security group. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.

For example, a VIP service might be running on port 8443 on the VPX instance but be mapped to public port 443. So, when the user accesses port 443 through the Public IP, the request is directed to private port 8443.

2. Public IP address does not support protocols in which port mapping is opened dynamically, such as passive FTP or ALG.
3. High availability does not work for traffic that uses a public IP address (PIP) associated with a VPX instance, instead of a PIP configured on the Azure load balancer.

Note

In Azure Resource Manager, a NetScaler VPX instance is associated with two IP addresses - a public IP address (PIP) and an internal IP address. While the external traffic connects to the PIP, the internal IP address or the NSIP is non-routable. To configure VIP in VPX, use the internal IP address and any of the free ports available. Do not use the PIP to configure VIP.

Configure a NetScaler VPX standalone instance

May 2, 2023

You can provision a single NetScaler VPX instance in Azure Resource Manager (ARM) portal in a standalone mode by creating the virtual machine and configuring other resources.

Before you begin

Ensure that you have the following:

- A Microsoft Azure user account
- Access to Microsoft Azure Resource Manager
- Microsoft Azure SDK
- Microsoft Azure PowerShell

On the [Microsoft Azure Portal](#) page, log on to the Azure Resource Manager portal by providing your user name and password.

Note

In ARM portal, clicking an option in one pane opens a new pane to the right. Navigate from one pane to another to configure your device.

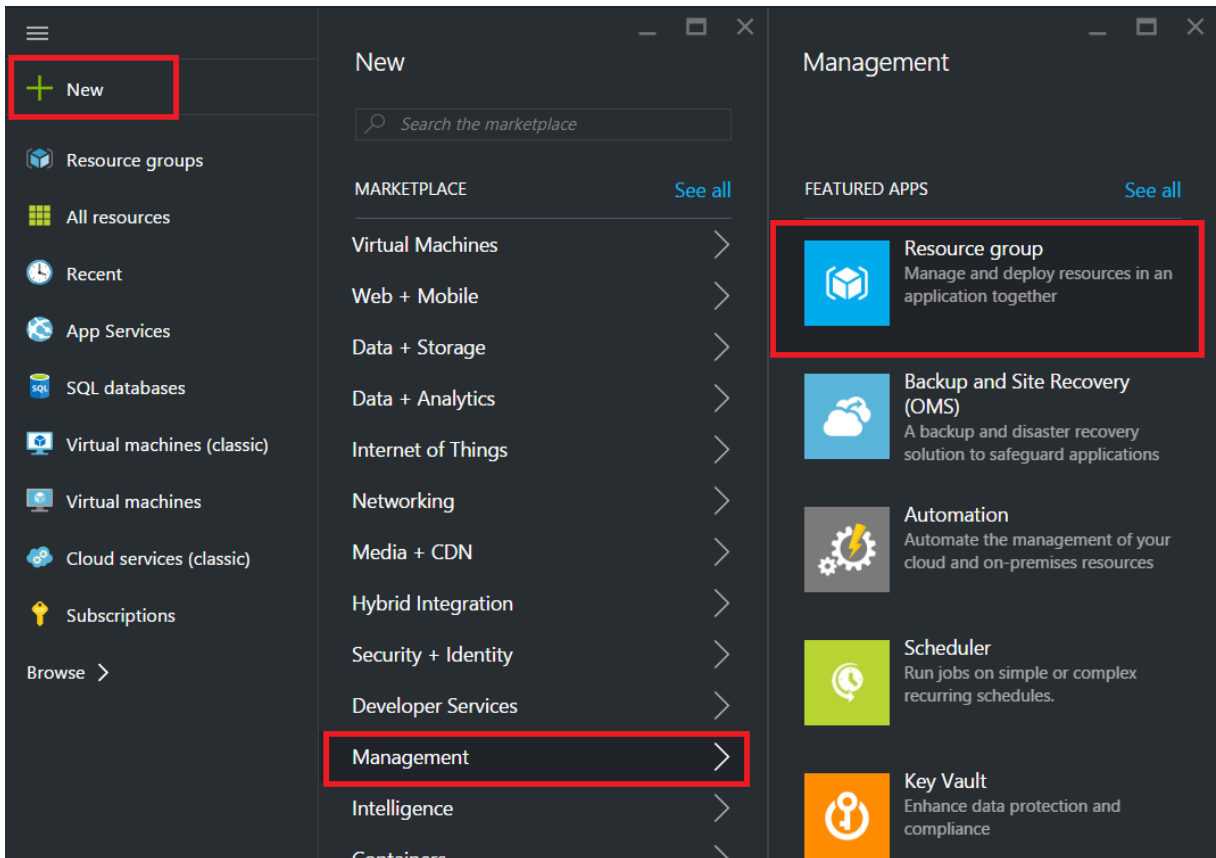

Summary of configuration steps

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance.

Configure a resource group

Create a new resource group that is a container for all your resources. Use the resource group to deploy, manage, and monitor your resources as a group.

1. Click **New > Management > Resource group**.
2. In the **Resource group** pane, enter the following details:
 - Resource group name
 - Resource group location
3. Click **Create**.

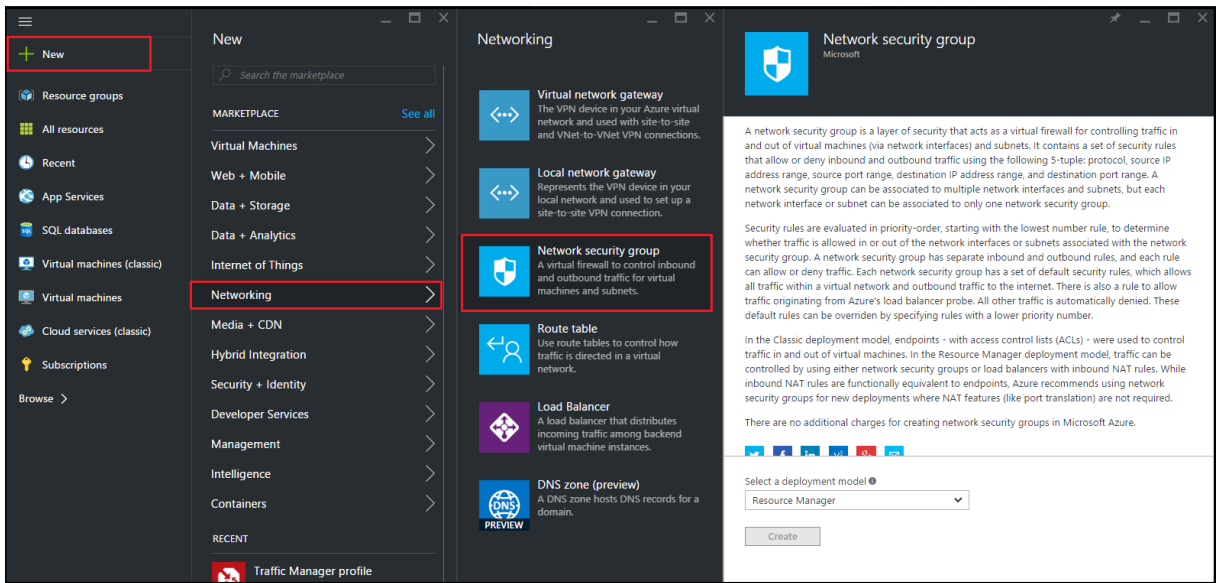

Configure a network security group

Create a network security group to assign inbound and outbound rules to control the incoming and outgoing traffic within the virtual network. Network security group allows you to define security rules for a single virtual machine and also to define security rules for a virtual network subnet.

1. Click **New > Networking > Network security group**.
2. In the **Create network security group** pane, enter the following details, and then click **Create**.
 - Name - type a name for the security group
 - Resource group - select the resource group from the drop-down list

Note

Ensure that you have selected the correct location. The list of resources that appear in the drop-down list is different for different locations.

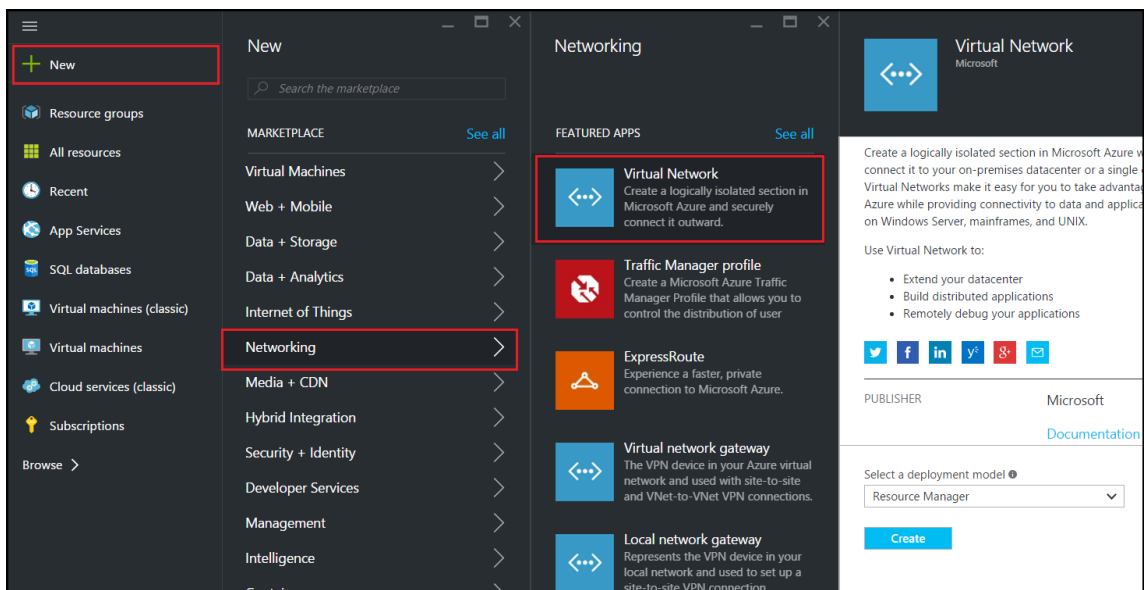

Configure a virtual network and subnets

Virtual networks in ARM provide a layer of security and isolation to your services. VMs and services that are part of the same virtual network can access each other.

For these steps to create a virtual network and subnets.

1. Click **New > Networking > Virtual Network**.
2. In the **Virtual Network** pane, ensure the deployment mode is **Resource Manager** and click **Create**.

3. In the **Create virtual network** pane, enter the following values, and then click **Create**.

- Name of the virtual network
- Address space - type the reserved IP address block for the virtual network
- Subnet - type the name of the first subnet (you create the second subnet later in this step)
- Subnet address range - type the reserved IP address block of the subnet
- Resource group - select the resource group created earlier from the drop-down list

Create virtual network

Pin to dashboard

Create [Automation options](#)

Configure the second subnet

1. Select the newly created virtual network from **All resources** pane and in the **Settings** pane, click **Subnets**.

2. Click **+Subnet** and create the second subnet by entering the following details.
 - Name of the second subnet
 - Address range - type the reserved IP address block of the second subnet
 - Network security group - select the network security group from the drop-down list
3. Click **Create**.

Configure a storage account

The ARM IaaS infrastructure storage includes all services where we can store data in the form of blobs, tables, queues, and files. You can also create applications using these forms of storage data in ARM.

Create a storage account to store all your data.

1. Click **+New > Data + Storage > Storage account**.
2. In the **Create storage account** pane, enter the following details:
 - Name of the account
 - Deployment mode - make sure to select **Resource Manager**
 - Account kind - select **General purpose** from the drop-down list
 - Replication - select **Locally redundant storage** from the drop-down list
 - Resource group - select the newly created resource group from the drop-down list
3. Click **Create**.

Configure an availability set

An availability set guarantee that at least one VM is kept up and running in case of planned or unplanned maintenance. Two or more VMs under the same 'availability set' are placed on different fault

domains to achieve redundant services.

1. Click **+New**.
2. Click **See all** in the MARKETPLACE pane and click **Virtual Machines**.
3. Search for availability set, and then select **Availability set** entity from the list displayed.

4. Click **Create**, and in the **Create availability set** pane, enter the following details:
 - Name of the set
 - Resource group - select the newly created resource group from the drop-down list
5. Click **Create**.

The screenshot shows a 'Create availability set' window with the following fields and values:

- Name:** AvSet (with a green checkmark)
- Fault domains:** 3 (represented by a slider and a text box)
- Update domains:** 5 (represented by a slider and a text box)
- Subscription:** Microsoft Azure Enterprise (dropdown menu)
- Resource group:** ResGroup (dropdown menu, with radio buttons for 'Create new' and 'Use existing', where 'Use existing' is selected)
- Location:** Southeast Asia (dropdown menu)

A blue 'Create' button is located at the bottom of the form.

Configure a NetScaler VPX instance

Create an instance of NetScaler VPX in the virtual network. Obtain the NetScaler VPX image from the Azure Marketplace, and then use the Azure Resource Manager portal to create a NetScaler VPX instance.

Before you begin creating the NetScaler VPX instance, make sure that you have created a virtual network with required subnets in which the instance resides. You can create virtual networks during VM

provisioning, but without the flexibility to create different subnets. For information about creating virtual networks, see <http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/>.

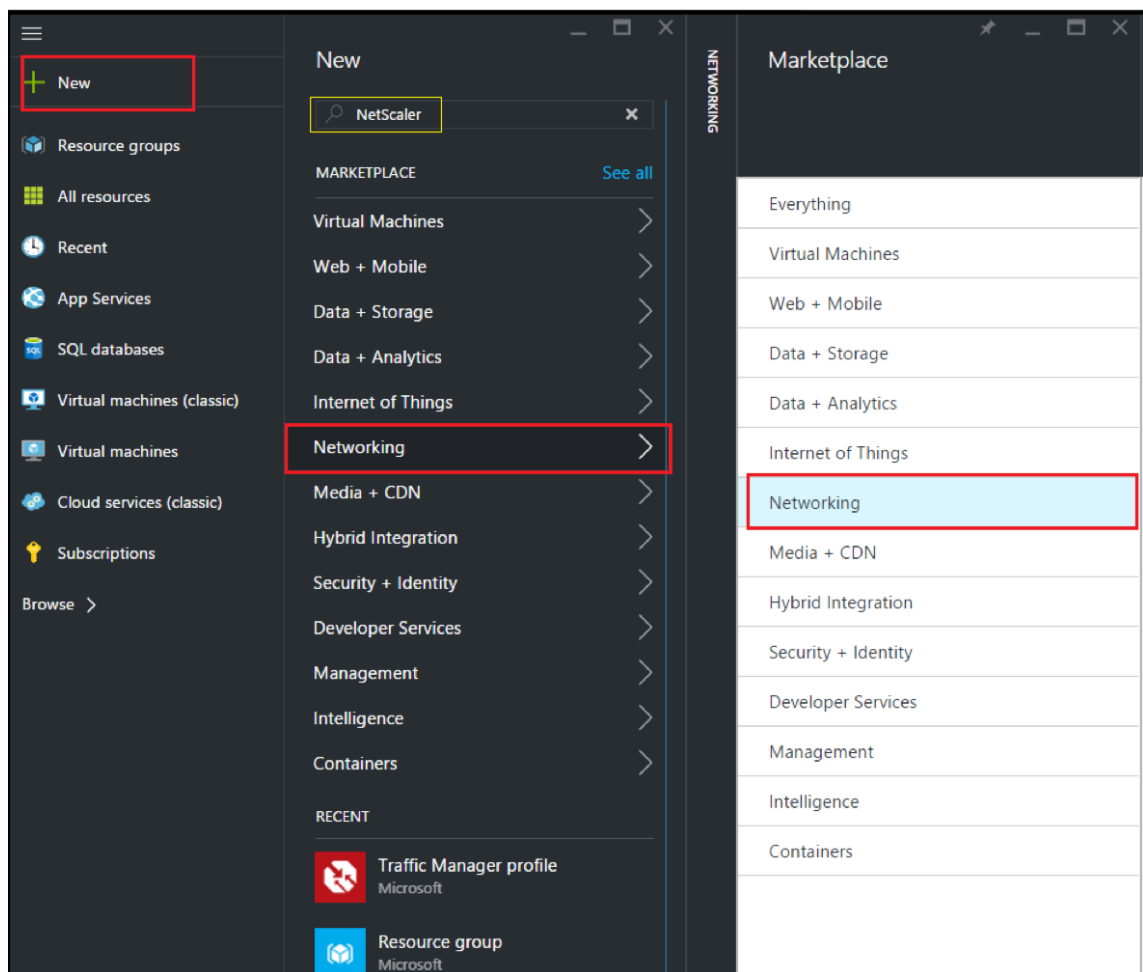

Optionally, configure DNS server and VPN connectivity that allows a virtual machine to access internet resources.

Note

Citrix recommends that you create resource group, network security group, virtual network, and other entities before you provision the NetScaler VPX VM, so that the network information is available during provisioning.

1. Click **+New > Networking**.
2. Click **See All** and in the Networking pane, click **NetScaler 13.0**.
3. Select **NetScaler 13.0 VPX Bring Your Own License** from the list of software plans.

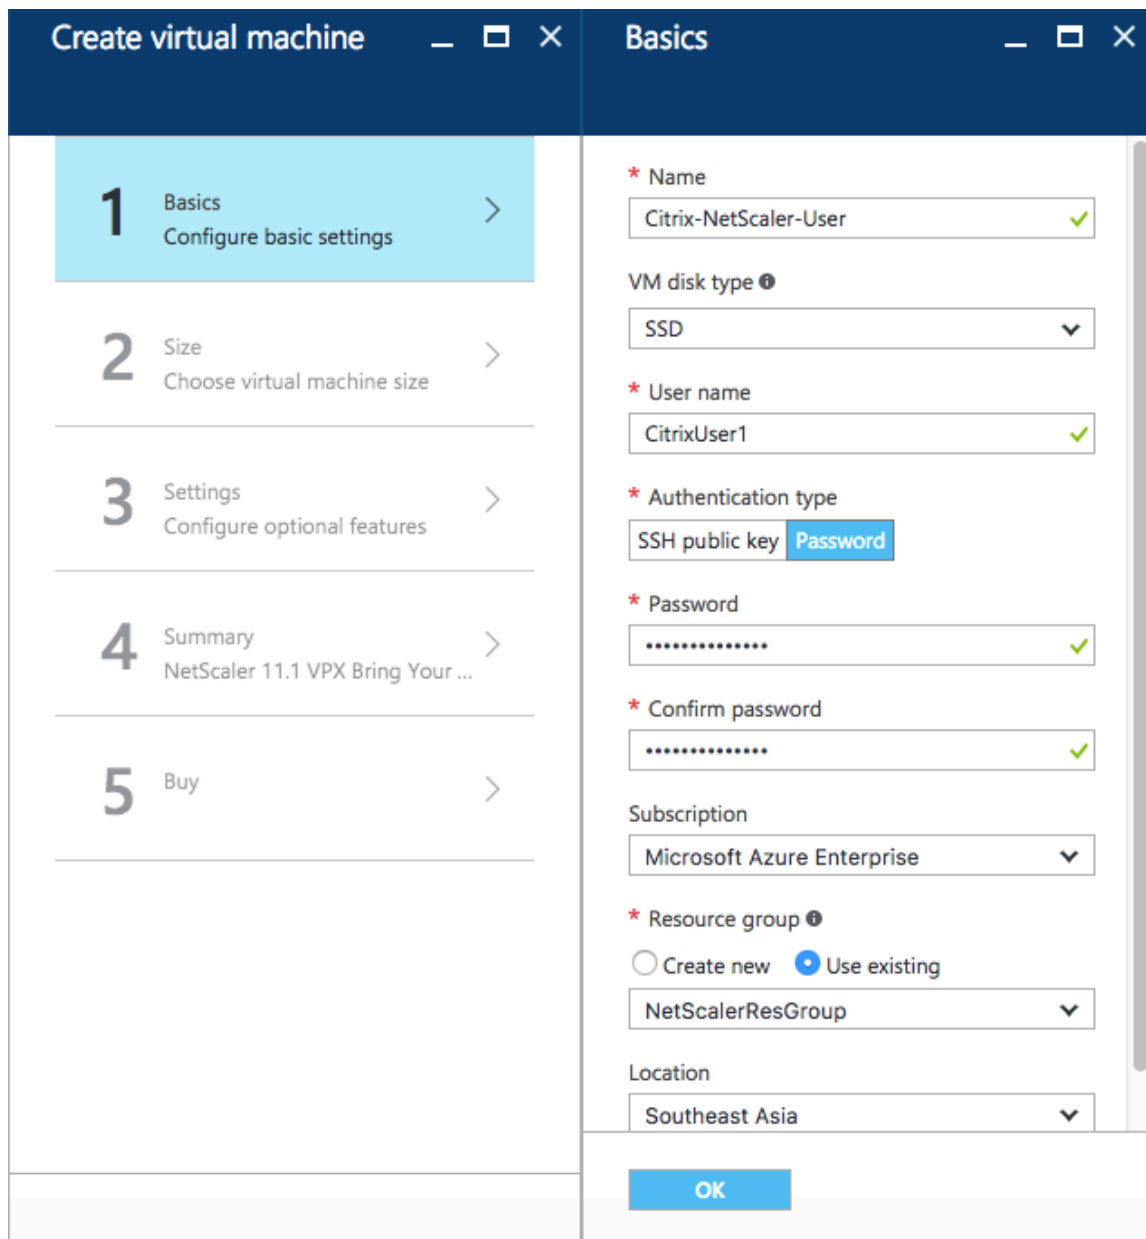

As a quick way to find any entity on ARM portal, you can also type the name of the entity in the Azure Marketplace search box and press <Enter>. Type NetScaler in the search box to find the NetScaler images.

Note

Ensure to select the latest image. Your NetScaler image might have the release number in the name.

4. On the **NetScaler VPX Bring Your Own License** page, from the drop-down list, select **Resource Manager** and click **Create**.

5. In the **Create virtual machine** pane, specify the required values in each section to create a virtual machine. Click **OK** in each section to save your configuration.

Basic:

- Name - specify a name for the NetScaler VPX instance
- VM disk type - select SSD (default value) or HDD from the drop-down menu
- User name and Password - specify a user name and password to access the resources in the resource group that you have created
- Authentication Type - select SSH Public Key or Password
- Resource group - select the resource group you have created from the drop-down list

You can create a resource group here, but Citrix recommends that you create a resource group from Resource groups in Azure Resource Manager and then select the group from the drop-down list.

Note

In an Azure stack environment, in addition to the basic parameters, specify the following parameters:

- Azure stack domain
- Azure stack tenant (Optional)
- Azure client (Optional)
- Azure client secret (Optional)

Size:

Depending on the VM disk type, SDD, or HDD, you selected in Basic settings, the disk sizes are displayed.

- Select a disk size according to your requirement and click **Select**.

Settings:

- Select the default (Standard) disk type
- Storage account - select the storage account
- Virtual network - select the virtual network
- Subnet - set the subnet address
- Public IP address - select the type of IP address assignment
- Network security group - select the security group that you have created. Ensure that inbound and outbound rules are configured in the security group.
- Availability Set - select the availability set from the drop-down menu box

Summary:

The configuration settings are validated and the Summary page displays the result of the validation. If the validation fails, the Summary page displays the reason of the failure. Go back to the particular section and make changes as required. If the validation passes, click **OK**.

Buy:

Review the offer details and legal terms on the Purchase page and click **Purchase**.

For high availability deployment, create two independent instances of NetScaler VPX in the same availability set and in the same resource group to deploy them in active-standby configuration.

Configure multiple IP addresses for a NetScaler VPX standalone instance

May 2, 2023

This section explains how to configure a standalone NetScaler VPX instance with multiple IP addresses, in Azure Resource Manager (ARM). The VPX instance can have one or more NIC attached to it, and each NIC can have one or more static or dynamic public and private IP addresses assigned to it. You can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.

For more information, see the Azure documentation [Assign multiple IP addresses to virtual machines using the Azure portal](#).

If you want to use PowerShell commands, see [Configuring multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands](#).

Use case

In this use case, a standalone NetScaler VPX appliance is configured with a single NIC that is connected to a virtual network (VNET). The NIC is associated with three IP configurations (ipconfig), each server a different purpose - as shown in the table.

IP config	Associated with	Purpose
ipconfig1	Static public IP address; static private IP address	Serves management traffic
ipconfig2	Static public IP address; static private address	Serves client-side traffic
ipconfig3	Static private IP address	Communicates with back-end servers

Note

IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP associated with the primary (first) `IPConfig` of the primary (first) NIC is automatically added as the management NSIP of the appliance. The remaining private IP addresses associated with `IPConfigs` need to be added in the VPX instance as a VIP or SNIP by using the `add ns ip` command, according to your requirement.

Before you begin

Before you begin, create a VPX instance by following the steps given at this link:

[Configure a NetScaler VPX standalone instance](#)

For this use case, the NSDoc0330VM VPX instance is created.

Procedure to configure multiple IP addresses for a NetScaler VPX instance in standalone mode.

For configuring multiple IP addresses for a NetScaler VPX appliance in standalone mode:

1. Add IP addresses to the VM

2. Configure NetScaler -owned IP addresses

Step 1: Add IP addresses to the VM

1. In the portal, click **More services > type virtual machines** in the filter box, and then click **Virtual machines**.
2. In the **Virtual machines** blade, click the VM you want to add IP addresses to. Click **Network interfaces** in the virtual machine blade that appears, and then select the network interface.

In the blade that appears for the NIC you selected, click **IP configurations**. The existing IP configuration that was assigned when you created the VM, **ipconfig1**, is displayed. For this use case, make sure the IP addresses associated with ipconfig1 are static. Next, create two more IP configurations: ipconfig2 (VIP) and ipconfig3 (SNIP).

To create more **ipconfigs**, create **Add**.

nsdoc0330vm923 - IP configurations
Network interface

Search (Ctrl+/)

- Overview
- Activity log

IP forwarding settings

- IP forwarding
- Virtual network
- IP configurations
- * Subnet

Search IP configurations

NAME	IP VERSION
ipconfig1	IPv4

In the **Add IP configuration** window, enter a **Name**, specify allocation method as **Static**, enter an IP address (192.0.0.5 for this use case), and enable **Public IP address**.

Note

Before adding a static private IP address, check for IP address availability and make sure the IP address belongs to the same subnet to which the NIC is attached.

The screenshot shows the 'Add IP configuration' window for a NetScaler device (nsdoc0330vm923). The configuration is for a secondary IP address named 'ipconfig2'. The IP address is set to 192.0.0.5, and the allocation is set to static. A message states 'Primary IP configuration already exists'. At the bottom, there is a button labeled 'Configure required settings'.

Next, click **Configure required settings** to create a static public IP address for ipconfig2.

By default, public IPs are dynamic. To make sure that the VM always uses the same public IP address, create a static Public IP.

In the Create public IP address blade, add a Name, under Assignment click **Static**. And then click **OK**.

Create public IP address

* Name
 ✓

Assignment
 Dynamic Static

Note

Even when you set the allocation method to static, you cannot specify the actual IP address assigned to the public IP resource. Instead, it gets allocated from a pool of available IP addresses in the Azure location the resource is created in.

Follow the steps to add one more IP configuration for ipconfig3. Public IP is not mandatory.

Search IP configurations					
NAME	IP VERSION	TYPE	PRIVATE IP ADDRESS	PUBLIC IP ADDRESS	
ipconfig1	IPv4	Primary	192.0.0.4 (Static)	13.78.187.150 (NSDoc0330VM-ip)	
ipconfig2	IPv4	Secondary	192.0.0.5 (Static)	13.78.183.123 (ipconfig2_PIP2)	
ipconfig3	IPv4	Secondary	192.0.0.6 (Static)	-	

Step 2: Configure NetScaler-owned IP addresses

Configure the NetScaler-owned IP addresses by using the GUI or the command `add ns ip`. For more information, see [Configuring NetScaler-Owned IP Addresses](#).

Configure a high-availability setup with multiple IP addresses and NICs

October 26, 2023

In a Microsoft Azure deployment, a high-availability configuration of two NetScaler VPX instances is achieved by using the Azure Load Balancer (ALB). This is achieved by configuring a health probe on ALB, which monitors each VPX instance by sending a health probe at every 5 seconds to both primary and secondary instances.

In this setup, only the primary node responds to health probes and the secondary does not. Once the primary sends the response to the health probe, the ALB starts sending the data traffic to the instance. If the primary instance misses two consecutive health probes, ALB does not redirect traffic to that instance. On failover, the new primary starts responding to health probes and the ALB redirects traffic to it. The standard VPX high availability failover time is three seconds. The total failover time that might take for traffic switching can be a maximum of 13 seconds.

You can deploy a pair of NetScaler VPX instances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain multiple IP addresses.

The following options are available for a multi-NIC high availability deployment:

- High availability using Azure availability set
- High availability using Azure availability zones

For more information about Azure Availability Set and Availability Zones, see the Azure documentation [Manage the availability of Linux virtual machines](#).

High availability using availability set

A high availability setup using a availability set must meet the following requirements:

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) in Direct Server Return (DSR) mode

All traffic goes through the primary node. The secondary node remains in standby mode until the primary node fails.

Note

For a NetScaler VPX high availability deployment on the Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two VPX nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Diagram: Example of a high availability deployment architecture, using Azure Availability Set

In an active-passive deployment, the ALB front end public IP (PIP) addresses are added as the VIP addresses in each VPX node. In HA-INC configuration, the VIP addresses are floating and SNIP addresses are instance specific.

You can deploy a VPX pair in active-passive high availability mode in two ways by using:

- **NetScaler VPX standard high availability template:** use this option to configure an HA pair with the default option of three subnets and six NICs.
- **Windows PowerShell commands:** use this option to configure an HA pair according to your subnet and NIC requirements.

This topic describes how to deploy a VPX pair in active-passive HA setup by using the Citrix template. If you want to use PowerShell commands, see [Configuring an HA Setup with Multiple IP Addresses and NICs by Using PowerShell Commands](#).

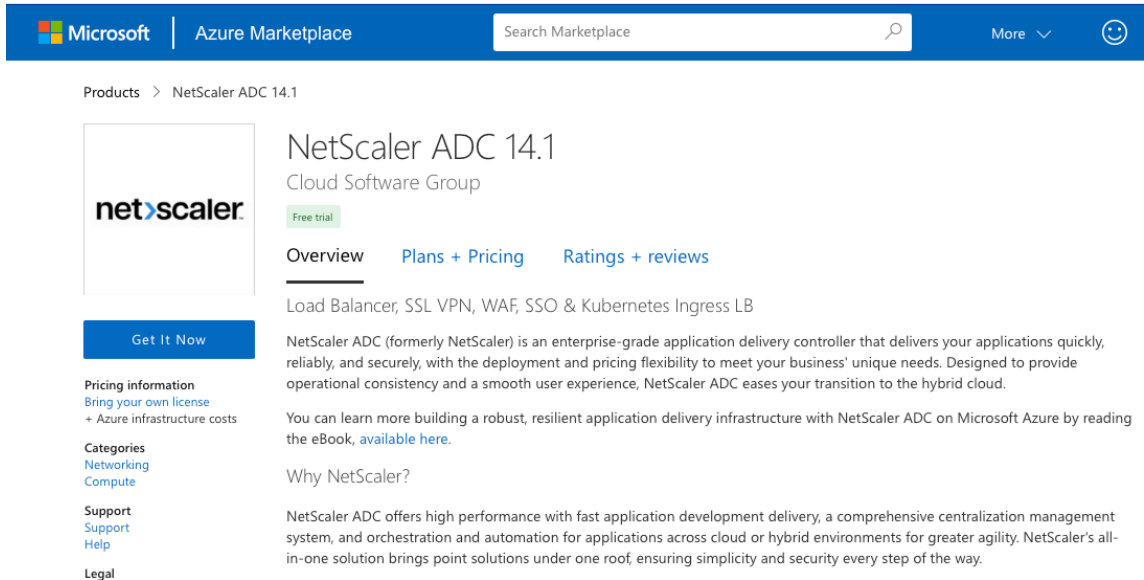

Configure HA-INC nodes by using the NetScaler high availability template

You can quickly and efficiently deploy a pair of VPX instances in HA-INC mode by using the standard template. The template creates two nodes, with three subnets and six NICs. The subnets are for management, client, and server-side traffic, and each subnet has two NICs for both the VPX instances.

You can get the NetScaler HA Pair template at the [Azure Marketplace](#).

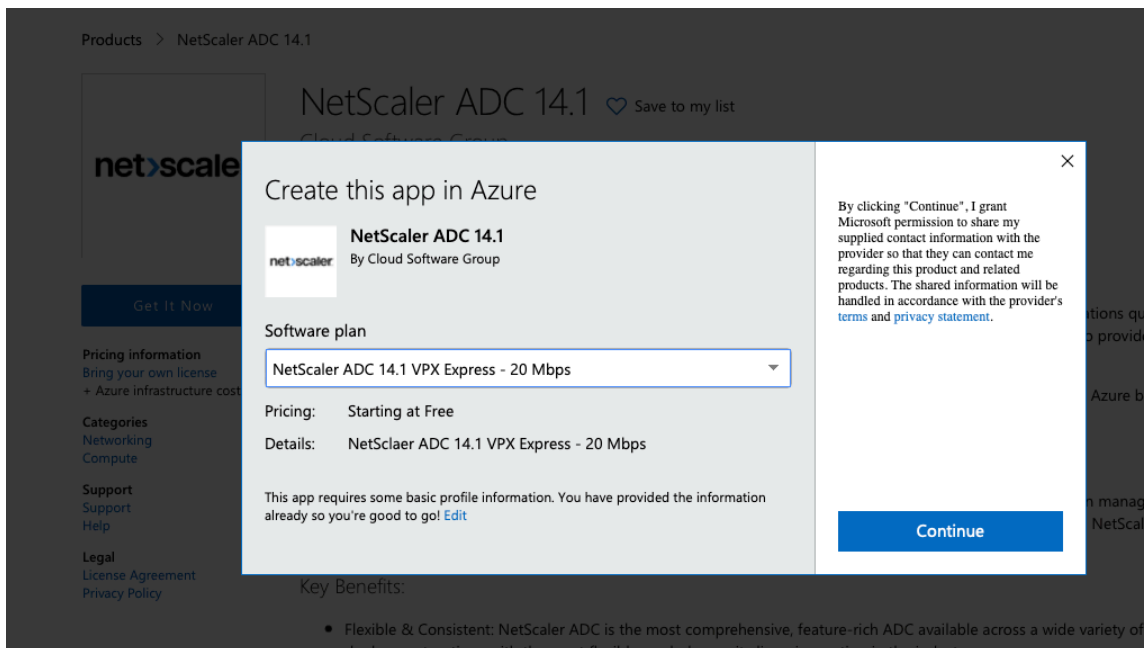

Complete the following steps to launch the template and deploy a high availability VPX pair, by using Azure availability sets.

1. From Azure Marketplace, search **NetScaler**.

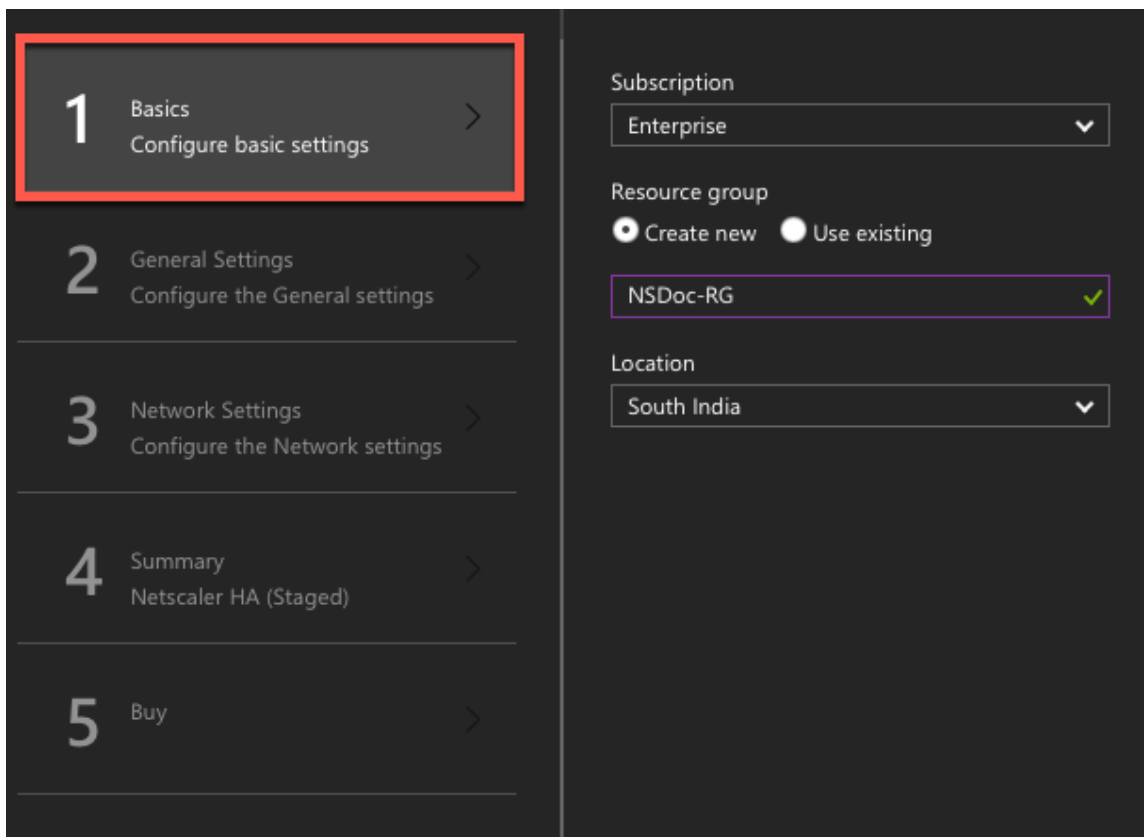

2. Click **GET IT NOW**.

3. Select the required HA deployment along with license, and click **Continue**.

4. The **Basics** page appears. Create a Resource Group and select **OK**.

5. The **General Settings** page appears. Type the details and select **OK**.

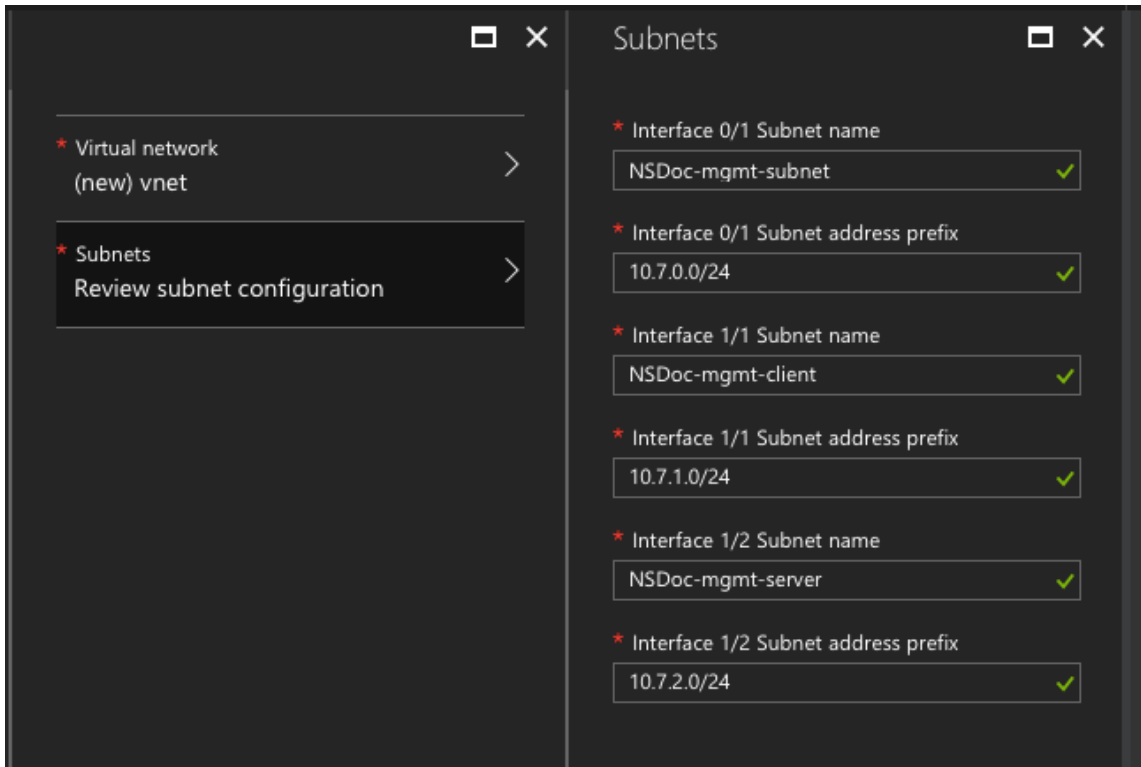

Note:

By default, the **Publishing Monitoring Metrics** option is set to **false**. If you want to enable this option, select **true**.

Create an Azure Active Directory (ADD) application and service principal that can access resources. Assign contributor role to the newly created AAD application. For more information, see [Use portal to create an Azure Active Directory application and service principal that can access resources](#).

- The **Network Settings** page appears. Check the VNet and subnet configurations, edit the required settings, and select **OK**.

- The **Summary** page appears. Review the configuration and edit accordingly. Select **OK** to confirm.
- The **Buy** page appears. Select **Purchase** to complete the deployment.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the **Resource Group** in the Azure portal to see the configuration details, such as LB rules, back-end pools, health probes. The high availability pair appears as ns-vpx0 and ns-vpx1.

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

High availability using availability zones

Azure Availability Zones are fault-isolated locations within an Azure region, providing redundant power, cooling, and networking and increasing resiliency. Only specific Azure regions support Availability Zones. For more information, see the Azure documentation [What are Availability Zones in Azure].

Diagram: Example of a high availability deployment architecture, using Azure Availability Zones

You can deploy a VPX pair in high availability mode by using the template called “NetScaler 13.0 HA using Availability Zones,” available in Azure Marketplace.

Complete the following steps to launch the template and deploy a high availability VPX pair, by using Azure Availability Zones.

1. From Azure Marketplace, select and initiate the Citrix solution template.

2. Ensure deployment type is Resource Manager and select **Create**.
3. The **Basics** page appears. Enter the details and click **OK**.

Note: Ensure that you select an Azure region that supports Availability Zones. For more information about regions that support Availability Zones, see Azure documentation [What are Availability Zones in Azure?](#)

4. The **General Settings** page appears. Type the details and select **OK**.
5. The **Network Setting** page appears. Check the VNet and subnet configurations, edit the required settings, and select **OK**.
6. The **Summary** page appears. Review the configuration and edit accordingly. Select **OK** to confirm.
7. The **Buy** page appears. Select **Purchase** to complete the deployment.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the **Resource Group** to see the configuration details, such as LB rules, back-end pools, health probes, and so on, in the Azure portal. The high availability pair appears as ns-vpx0 and ns-vpx1. Also, you can see the location under the **Location** column.

Filter by name... All types All locations No grouping

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

Monitor your instances using metrics in Azure monitor

You can use metrics in the Azure monitor data platform to monitor a set of NetScaler VPX resources such as CPU, memory utilization, and throughput. Metrics service monitors NetScaler VPX resources that run on Azure, in real time. You can use **Metrics Explorer** to access the collected data. For more information, see [Azure Monitor Metrics overview](#).

Points to note

- If you deploy a NetScaler VPX instance on Azure by using the Azure Marketplace offer, Metrics service is disabled by default.
- The Metrics service is not supported in Azure CLI.
- Metrics are available for CPU (management and packet CPU usage), memory, and throughput (inbound and outbound).

How to view metrics in Azure monitor

To view metrics in the Azure monitor for your instance, perform these steps:

1. Log on to **Azure Portal > Virtual Machines**.
2. Select the virtual machine that is the Primary Node.
3. In the **Monitoring** section, click **Metrics**.
4. From the **Metric Namespace** drop-down menu, click **NetScaler**.
5. Under **All metrics** in **Metrics** drop-down menu, click the metrics you want to view.
6. Click **Add metric** to view another metric on the same chart. Use the Chart options to customize your chart.

Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands

May 2, 2023

You can deploy a pair of NetScaler VPX instances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain multiple IP addresses.

An active-passive deployment requires:

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) in Direct Server Return (DSR) mode

All traffic goes through the primary node. The secondary node remains in standby mode until the primary node fails.

Note

For a NetScaler VPX high availability deployment on an Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two high-availability nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Diagram: Example of an active-passive deployment architecture

In an active-passive deployment, the ALB floating public IP (PIP) addresses are added as the VIP addresses in each VPX node. In HA-INC configuration, the VIP addresses are floating and SNIP addresses are instance specific.

ALB monitors each VPX instance by sending health probe at every 5 seconds and redirects traffic to that instance only that sends health probes response on regular interval. So in an HA setup, the primary node responds to health probes and secondary does not. If the primary instances miss two consecutive health probes, ALB does not redirect traffic to that instance. On failover, the new primary starts responding to health probes and the ALB redirects traffic to it. The standard VPX high availability failover time is three seconds. The total failover time that might take for traffic switching can be maximum of 13 seconds.

You can deploy a VPX pair in active-passive HA setup in two ways by using:

- **NetScaler VPX Standard high availability template:** use this option to configure an HA pair with the default option of three subnets and six NICs.
- **Windows PowerShell commands:** use this option to configure an HA pair according to your subnet and NIC requirements.

This topic describes how to deploy a VPX pair in active-passive HA setup by using PowerShell commands. If you want to use the NetScaler VPX Standard HA template, see [Configuring an HA Setup with Multiple IP Addresses and NICs](#).

Configure HA-INC nodes by using PowerShell Commands

Scenario: HA-INC PowerShell deployment

In this scenario, you deploy a NetScaler VPX pair by using the topology given in the table. Each VPX instance contains three NICs, with each NIC is deployed in a different subnet. Each NIC is assigned an IP configuration.

ALB	VPX1	VPX2
ALB is associated with public IP 3 (pip3)	Management IP is configured with IPConfig1, which includes one public IP (pip1) and one private IP (12.5.2.24); nic1; Mgmtsubnet=12.5.2.0/24	Management IP is configured with IPConfig5, which includes one public IP (pip3) and one private IP (12.5.2.26);nic4;Mgmtsubnet=12.5.2.0/24
LB rules and port configured are HTTP (80),SSL (443), health probe (9000)	Client-side IP is configured with IPConfig3, which includes one private IP(12.5.1.27);nic2; FrontEndsubnet=12.5.1.0/24	Client-side IP is configured with IPConfig7, which includes one private IP (12.5.1.28);nic5;FrontEndsubnet=12.5.1.0/24
-	Server-side IP is configured with IPConfig4, which includes one private IP(12.5.3.24); nic3;BackendSubnet=12.5.3.0/24	Server-side IP is configured with IPConfig8, which includes one private IP(12.5.3.28);nic6;BackendSubnet=12.5.3.0/24
-	Rules and ports for NSG are SSH (22),HTTP (80),HTTPS (443)	-

Parameter settings

The following parameter settings are used in this scenario.

\$locName= "South east Asia"

\$rgName = "MulitIP-MultiNIC-RG"

\$nicName1= "VM1-NIC1"

\$nicName2 = "VM1-NIC2"

```
$nicName3= "VM1-NIC3"  
$nicName4 = "VM2-NIC1"  
$nicName5= "VM2-NIC2"  
$nicName6 = "VM2-NIC3"  
$vNetName = "Azure-MultiIP-ALB-vnet"  
$vNetAddressRange= "12.5.0.0/16"  
$frontEndSubnetName= "frontEndSubnet"  
$frontEndSubnetRange= "12.5.1.0/24"  
$mgmtSubnetName= "mgmtSubnet"  
$mgmtSubnetRange= "12.5.2.0/24"  
$backEndSubnetName = "backEndSubnet"  
$backEndSubnetRange = "12.5.3.0/24"  
$prmStorageAccountName = "multiipmultinicbstorage"  
$avSetName = "multiple-avSet"  
$vmSize= "Standard_DS4_V2"  
$publisher = "Citrix"  
$offer = "netscalervpx-120"  
$sku = "netscalerbyol"  
$version="latest"  
$pubIPName1="VPX1MGMT"  
$pubIPName2="VPX2MGMT"  
$pubIPName3="ALBPIP"  
$domName1="vpx1dns"  
$domName2="vpx2dns"  
$domName3="vpxalbdns"  
$vmNamePrefix="VPXMultiIPALB"  
$osDiskSuffix1="osmultiipalbdiskdb1"  
$osDiskSuffix2="osmultiipalbdiskdb2"  
$lbName= "MultiIPALB"
```

```
$frontEndConfigName1= "FrontEndIP"
```

```
$backendPoolName1= "BackendPoolHttp"
```

```
$lbRuleName1= "LBRuleHttp"
```

```
$healthProbeName= "HealthProbe"
```

```
$nsgName="NSG-MultiIP-ALB"
```

```
$rule1Name="Inbound-HTTP"
```

```
$rule2Name="Inbound-HTTPS"
```

```
$rule3Name="Inbound-SSH"
```

To complete the deployment, complete the following steps by using PowerShell commands:

1. Create a resource group, storage account, and availability set
2. Create a network security group and add rules
3. Create a virtual network and three subnets
4. Create public IP addresses
5. Create IP configurations for VPX1
6. Create IP configurations for VPX2
7. Create NICs for VPX1
8. Create NICs for VPX2
9. Create VPX1
10. Create VPX2
11. Create ALB

Create a resource group, storage account, and availability set.

```
1 New-AzureRmResourceGroup -Name $rgName -Location $locName
2
3
4 $prmStorageAccount=New-AzureRMStorageAccount -Name
   $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS
   -Location $locName
5
6
7 $avSet=New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName
   $rgName -Location $locName
```

Create a network security group and add rules.

```
1 $rule1 = New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -
   Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction
   Inbound -Priority 101
2
3
```

```
4 -SourceAddressPrefix Internet -SourcePortRange * -
   DestinationAddressPrefix * -DestinationPortRange 80
5
6
7 $rule2 = New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -
   Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction
   Inbound -Priority 110
8
9
10 -SourceAddressPrefix Internet -SourcePortRange * -
    DestinationAddressPrefix * -DestinationPortRange 443
11
12
13 $rule3 = New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name -
   Description "Allow SSH" -Access Allow -Protocol Tcp -Direction
   Inbound -Priority 120
14
15
16 -SourceAddressPrefix Internet -SourcePortRange * -
    DestinationAddressPrefix * -DestinationPortRange 22
17
18
19 $nsg = New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -
    Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

Create a virtual network and three subnets.

```
1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
   $frontEndSubnetName -AddressPrefix $frontEndSubnetRange (this
   parameter value should be as per your requirement)
2
3
4 $mgmtSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name $mgmtSubnetName
   -AddressPrefix $mgmtSubnetRange
5
6
7 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
   $backEndSubnetName -AddressPrefix $backEndSubnetRange
8
9
10 $vnet =New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName
   $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet
   $frontendSubnet,$backendSubnet, $mgmtSubnet
11
12
13 $subnetName ="frontEndSubnet"
14
15
16 \($subnet1=\$vnet.Subnets|?{
17   \$\_.Name -eq $subnetName }
18
19
20
```

```
21 $subnetName="backEndSubnet"
22
23
24 \($subnet2=\$vnet.Subnets|?{
25   \$_Name -eq \$subnetName }
26
27
28
29 $subnetName="mgmtSubnet"
30
31
32 \($subnet3=\$vnet.Subnets|?{
33   \$_Name -eq \$subnetName }
```

Create public IP addresses.

```
1 $pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName
   $rgName -DomainNameLabel $domName1 -Location $locName -
   AllocationMethod Dynamic
2
3 $pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName
   $rgName -DomainNameLabel $domName2 -Location $locName -
   AllocationMethod Dynamic
4
5 $pip3=New-AzureRmPublicIpAddress -Name $pubIPName3 -ResourceGroupName
   $rgName -DomainNameLabel $domName3 -Location $locName -
   AllocationMethod Dynamic
```

Create IP configurations for VPX1.

```
1 $IPConfigName1 = "IPConfig1"
2
3
4 $IPAddress = "12.5.2.24"
5
6
7 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
   Subnet $subnet3 -PrivateIpAddress $IPAddress -PublicIpAddress $pip1
   -Primary
8
9
10 $IPConfigName3="IPConfig-3"
11
12
13 $IPAddress="12.5.1.27"
14
15
16 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
   Subnet $subnet1 -PrivateIpAddress $IPAddress -Primary
17
18
19 $IPConfigName4 = "IPConfig-4"
20
```

```
21
22 $IPAddress = "12.5.3.24"
23
24
25 $IPConfig4 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -
    Subnet $subnet2 -PrivateIpAddress $IPAddress -Primary
```

Create IP configurations for VPX2.

```
1 $IpConfigName5 = "IPConfig5"
2
3
4 $IPAddress="12.5.2.26"
5
6
7 $IPConfig5=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName5 -
    Subnet $subnet3 -PrivateIpAddress $IPAddress -PublicIpAddress $pip2
    -Primary
8
9
10 $IPConfigName7="IPConfig-7"
11
12
13 $IPAddress="12.5.1.28"
14
15
16 $IPConfig7=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName7 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress -Primary
17
18
19 $IPConfigName8="IPConfig-8"
20
21
22 $IPAddress="12.5.3.28"
23
24
25 $IPConfig8=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName8 -
    Subnet $subnet2 -PrivateIpAddress $IPAddress -Primary
```

Create NICs for VPX1.

```
1 $nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig1 -
    NetworkSecurityGroupId $nsg.Id
2
3
4 $nic2=New-AzureRmNetworkInterface -Name $nicName2 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig3 -
    NetworkSecurityGroupId $nsg.Id
5
6
7 $nic3=New-AzureRmNetworkInterface -Name $nicName3 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig4 -
```

```
NetworkSecurityGroupId $nsg.Id
```

Create NICs for VPX2.

```
1 $nic4=New-AzureRmNetworkInterface -Name $nicName4 -ResourceGroupName
   $rgName -Location $locName -IpConfiguration $IpConfig5 -
   NetworkSecurityGroupId $nsg.Id
2
3
4 $nic5=New-AzureRmNetworkInterface -Name $nicName5 -ResourceGroupName
   $rgName -Location $locName -IpConfiguration $IpConfig7 -
   NetworkSecurityGroupId $nsg.Id
5
6
7 $nic6=New-AzureRmNetworkInterface -Name $nicName6 -ResourceGroupName
   $rgName -Location $locName -IpConfiguration $IpConfig8 -
   NetworkSecurityGroupId $nsg.Id
```

Create VPX1.

This step includes the following substeps:

- Create VM config object
- Set credentials, OS, and image
- Add NICs
- Specify OS disk and create VM

```
1 $suffixNumber = 1
2
3 $vmName=$vmNamePrefix + $suffixNumber
4

    $locName
42 <!--NeedCopy--> ````
```

To view private and public IP addresses assigned to the NICs, type the following commands:

```
1 ````
2 $nic1.IPConfig
3
4
5 $nic2.IPConfig
6
7
8 $nic3.IPConfig
9
10
11 $nic4.IPConfig
12
13
14 $nic5.IPConfig
15
16
17 $nic6.IPConfig
18 <!--NeedCopy--> ````
```

Create Azure load balance (ALB).

This step includes the following substeps:

- Create front end IP config
- Create health probe
- Create back end address pool
- Create load-balancing rules (HTTP and SSL)
- Create ALB with front end IP config, back end address pool, and LB rule
- Associate IP config with back end pools

```
$frontEndIP1=New-AzureRmLoadBalancerFrontendIpConfig -Name
$frontEndConfigName1 -PublicIpAddress $pip3

$healthProbe=New-AzureRmLoadBalancerProbeConfig -Name $healthProbeName
-Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

$beAddressPool1=New-AzureRmLoadBalancerBackendAddressPoolConfig -
Name $backendPoolName1

$lbRule1=New-AzureRmLoadBalancerRuleConfig -Name $lbRuleName1
-FrontendIpConfiguration $frontEndIP1 -BackendAddressPool
$beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort
80 -BackendPort 80 -EnableFloatingIP

$lb=New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name
$lbName -Location $locName -FrontendIpConfiguration $frontEndIP1
-LoadBalancingRule $lbRule1 -BackendAddressPool $beAddressPool1 -
Probe $healthProbe

$nic2.IpConfigurations[0].LoadBalancerBackendAddressPools.Add($lb
.BackendAddressPools[0])

$nic5.IpConfigurations[0].LoadBalancerBackendAddressPools.Add($lb
.BackendAddressPools[0])

$lb=$lb | Set-AzureRmLoadBalancer

$nic2=$nic2 | Set-AzureRmNetworkInterface

$nic5=$nic5 | Set-AzureRmNetworkInterface
```

After you've successfully deployed the NetScaler VPX pair, log on to each VPX instance to configure HA-INC, and SNIP and VIP addresses.

1. Type the following command to add HA nodes.

```
add ha node 1 PeerNodeNSIP -inc Enabled
```

2. Add private IP addresses of client-side NICs as SNIPs for VPX1 (NIC2) and VPX2 (NIC5)

```
add nsip privateIPofNIC2 255.255.255.0 -type SNIP
add nsip privateIPofNIC5 255.255.255.0 -type SNIP
```

3. Add load-balancing virtual server on the primary node with front-end IP address (public IP) of ALB.

```
add lb virtual server v1 HTTP FrontEndIPofALB 80
```

[Configuring GSLB on Active-Standby HA Deployment on Azure](#)

Deploy a NetScaler high-availability pair on Azure with ALB in the floating IP-disabled mode

October 9, 2023

You can deploy a pair of NetScaler VPX instances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain many IP addresses.

An active-passive deployment requires:

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) with:
 - Floating IP-enabled mode or Direct Server Return (DSR) mode
 - Floating IP-disabled mode

For more information about ALB floating IP options, refer to the [Azure documentation](#).

If you want to deploy a VPX pair in active-passive HA setup on Azure with ALB floating IP enabled, see [Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands](#).

HA deployment architecture with ALB in the floating IP-disabled mode

In an active-passive deployment, the private IP addresses of the client interface of each instance are added as VIP addresses in each VPX instance. Configure in the HA-INC mode with VIP addresses being shared using IPSet and SNIP addresses being instance specific. All traffic goes through the primary instance. The secondary instance is in standby mode until the primary instance fails.

Diagram: Example of an active-passive deployment architecture

Prerequisites

You must be familiar with the following information before deploying a NetScaler VPX instance on Azure.

- Azure terminology and network details. For more information, see [Azure terminology](#).
- Working of a NetScaler appliance. For more information, see [NetScaler documentation](#).
- NetScaler networking. For more information, see the [ADC Networking](#).
- Azure load balancer and load-balancing rule configuration. For more information, see the [Azure ALB documentation](#).

How to deploy a VPX HA pair on Azure with ALB floating IP disabled

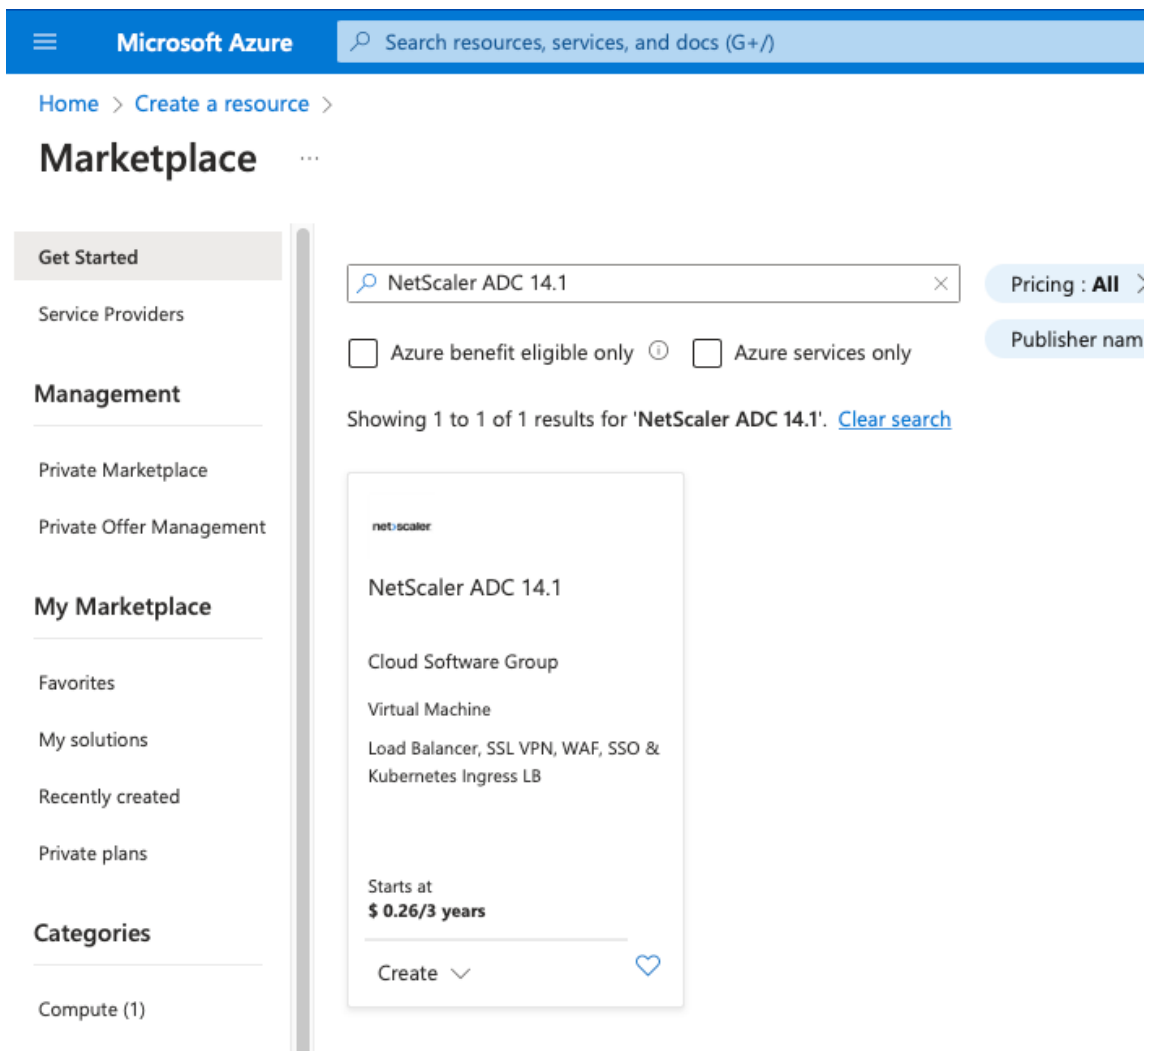

Here’s a summary of the HA and ALB deployment steps:

1. Deploy two VPX instances (primary and secondary instances) on Azure.
2. Add client and server NIC on both the instances.
3. Deploy an ALB with load balancing rule whose floating IP mode is disabled.
4. Configure HA settings on both instances by using the NetScaler GUI.

Step 1. Deploy two VPX instances on Azure.

Create two VPX instances by following these steps:

1. Select the NetScaler version from Azure Marketplace (in this example, NetScaler release 13.1 is used).

2. Select the required ADC licensing mode, and click **Create**.

In the **Networking** tab, create a new Virtual network with 3 subnets, one each for: management, client, and server NICs. Otherwise, you can also use an existing Virtual network. Management NIC is created during the VM deployment. Client and server NICs are created and attached after the VM is created. For the NIC network security group, you can do one of the following:

- Select **Advanced** and use an existing network security group that suits your requirements.
- Select **Basic** and select the required ports.

Note:

You can also change the network security group settings after the VM deployment is completed.

5. After the deployment is completed, Click **Go to Resource** to see the configuration details.

Similarly, deploy a second NetScaler VPX instance.

Step 2. Add client and server NICs on both instances.

Note:

To attach more NICs, you must first stop the VM. In the Azure portal, select the VM that you want to stop. In the **Overview** tab, click **Stop**. Wait for Status to show as **Stopped**.

To add a client NIC on the primary instance, follow these steps:

1. Navigate to **Networking > Attach Network Interface**.
You can select an existing NIC or create and attach a new interface.
2. For the NIC Network Security Group, you can use an existing network security group by selecting **Advanced** or create one by selecting **Basic**.

To add a server NIC, follow the same steps as for adding a client NIC.

The NetScaler VPX instance has all three NICs (management NIC, client NIC, and server NIC) attached.

Repeat the preceding steps for adding NICs on the secondary instance.

After you create and attach NICs on both the instances, restart both the instances by going to **Overview > Start**.

Note:

You must allow traffic through the port in client NIC inbound rule, which is used later to create a load balancing virtual server while configuring the NetScaler VPX instance.

Step 3. Deploy an ALB with load balancing rule whose floating IP mode is disabled.

To start the configuration of ALB, follow these steps:

1. Go to the **Load balancers** page and click **Create**.
2. In the **Create load balancer** page, provide the details as required.

In the following example, we deploy a regional public load balancer of Standard SKU.

Step 4. Configure HA settings on both NetScaler VPX instances by using the NetScaler GUI.

After you have created the NetScaler VPX instances on Azure, you can configure HA by using the NetScaler GUI.

Step 1. Set up high availability in INC mode on both the instances.

On the primary instance, do the following steps:

1. Log on to the instance with user name `nsroot` and password provided while deploying the instance.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the secondary instance, for example: 10.4.1.5.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** checkbox.
5. Click **Create**.

Step 2. Add virtual IP address and subnet IP address on both the instances.

On the primary instance, perform the following steps:

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. Add a primary VIP address by following these steps:
 - a) Enter the private IP address of the client NIC of the primary instance and the netmask configured for the client subnet in the VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
 - c) Click **Create**.
3. Add a primary SNIP address by following these steps:
 - a) Enter the internal IP address of the server NIC of the primary instance, and the netmask configured for the server subnet in the primary instance.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.
4. Add a secondary VIP address by following these steps:
 - a) Enter the internal IP address of the client NIC of the secondary instance, and the netmask configured for the client subnet in the VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
 - c) Click **Create**.

Total 4 25 Per Page Page 1 of 1

On the secondary instance, perform the following steps:

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. Add a secondary VIP address by following these steps:
 - a) Enter the internal IP address of the client NIC of the secondary instance, and the netmask configured for the client subnet in the VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
3. Add a secondary SNIP address by following these steps:
 - a) Enter the internal IP address of the server NIC of the secondary instance, and the netmask configured for the server subnet in the secondary instance.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.

Step 3. Add IP set and bind IP set to the secondary VIP on both the instances.

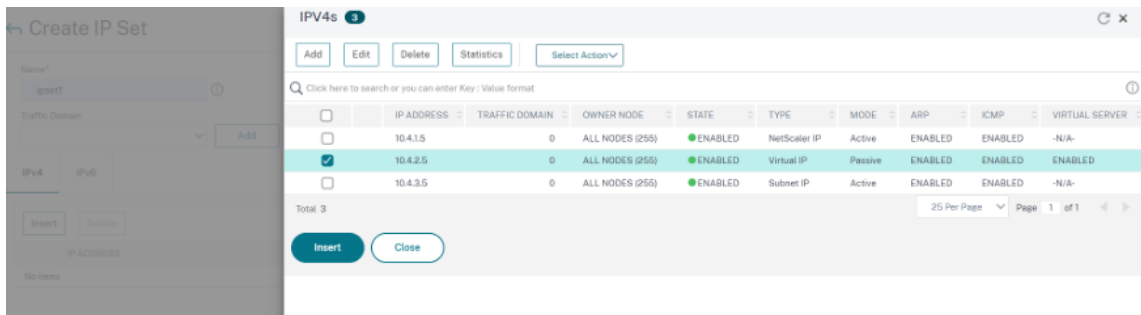

On the primary instance, do the following steps:

1. Navigate to **System > Network > IP Sets > Add**.
2. Add an IP set name and click **Insert**.
3. From the **IPv4s** page, select the virtual IP (secondary VIP) and click **Insert**.
4. Click **Create** to create the IP set.

On the secondary instance, do the following steps:

1. Navigate to **System > Network > IP Sets > Add**.
2. Add an IP set name and click **Insert**.
3. From the **IPv4s** page, select the virtual IP (secondary VIP) and click **Insert**.
4. Click **Create** to create the IP set.

Note:

The IP set name must be the same on both the primary and secondary instances.

Step 4. Add a load balancing virtual server on the primary instance.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers > Add**.
2. Add the required values for Name, Protocol, IP Address Type (IP Address), IP address (primary VIP), and Port.
3. Click **More**. Navigate to **IP Range IP Set Settings**, select **IPset** from the drop-down menu, and provide the IPset created in **Step 3**.
4. Click **OK** to create the load balancing virtual server.

← Load Balancing Virtual Server

Basic Settings

Create a virtual server by specifying a name, an IP address, a port, and a protocol type. If an application is accessible from the internet, the virtual server IP (VIP) address is a public IP address. If the application is accessible only from the local area network (LAN) or wide area network (WAN), the VIP is usually a private (RFC1918 non-routable) IP address. You can configure multiple virtual servers to receive client requests, thereby increasing the availability of resources to process client requests.

Step 7. Save the configuration.

Otherwise, all the configuration is lost after a reboot or if there is an instant restart.

Step 8. Verify the configuration.

Make sure that the ALB frontend IP address is reachable after a failover.

1. Copy the ALB frontend IP address.
2. Paste the IP address on the browser and make sure that the back-end servers are reachable.
3. On the primary instance, perform failover:

From NetScaler GUI, navigate to **Configuration > System > High Availability > Action > Force Failover.**

4. Make sure that back-end servers are reachable after failover through ALB frontend IP used earlier.

Deploy a NetScaler for Azure DNS private zone

August 17, 2023

Azure DNS is a service on the Microsoft Azure infrastructure for hosting DNS domains and providing name resolution.

Azure DNS private zones are a service focused on resolving domain names in a private network. With private zones, customers can use their own custom domain names rather than the Azure-provided names available today.

NetScaler, the leading application delivery solution, is best suited to provide load balancing and GSLB capabilities for an Azure DNS private zone. By subscribing to Azure DNS private zone, the business can rely on NetScaler Global Server Load Balancing’s (GSLB) power and intelligence to distribute intranet traffic across workloads in multiple geographies and across data centers, connected via secure VPN tunnels. This collaboration guarantees businesses seamless access to part of their workload that they want to move to Azure public cloud.

Overview of Azure DNS

The Domain Name System (DNS) is responsible for translating or resolving a service name to its IP address. A hosting service for DNS domains, Azure DNS provides name resolution by using the Microsoft Azure infrastructure. In addition to supporting internet-facing DNS domains, Azure DNS now also supports private DNS domains.

Azure DNS provides a reliable, secure DNS service to manage and resolve domain names in a virtual network without needing a custom DNS solution. By using private DNS zones, you can use your own custom domain names rather than the Azure-provided names. Using custom domain names helps you to tailor your virtual network architecture to best suit your organization's needs. It provides name resolution for virtual machines (VMs) within a virtual network and between virtual networks. Also, customers can configure zone names with a split-horizon view, which allows a private and a public DNS zone to share a name.

Why NetScaler GSLB for Azure DNS private zone?

In today's world, businesses want to transition their workloads from On-premises to Azure cloud. The transition to cloud allows them to apply time to market, capital expenses/price, ease of deployment and security. Azure DNS private zone service provides a unique proposition for the businesses that are transitioning part of their workloads to the Azure Cloud. These businesses can create their private DNS Name, which they had for years in On-premises deployments, when they use the private zone service. With this hybrid model of intranet application servers being in On-premises and Azure cloud connected via secure VPN tunnels, the one challenge is to have a seamless access to these intranet applications. NetScaler solves this unique use case with its global load balancing feature, which routes the application traffic to the most optimal distributed workloads/servers either On-premises or on Azure cloud, and provides application server health status.

Use case

Users in an On-prem network and in different Azure VNets are able to connect to the most optimal servers in an internal network for accessing the required content. This ensures that the application is always available, cost is optimized and user experience is good. Azure private traffic management (PTM) is the primary requirement here. Azure PTM ensures that users' DNS queries resolve to an appropriate private IP address of the application server.

Use case solution

NetScaler includes the global server load balancing (GSLB) feature to meet the Azure PTM requirement. GSLB acts like a DNS server, which gets the DNS requests and resolves the DNS request into an

appropriate IP address to provide:

- Seamless DNS-based failover.
- Phased migration from On-premises to cloud.
- A/B testing a new feature.

Among the many load balancing methods supported, following methods can be useful in this solution:

1. Round Robin
2. Static proximity (Location based server selection). It can be deployed in two ways:
 - a) EDNS Client Subnet (ECS) based GSLB on NetScaler.
 - b) Deploy a DNS forwarder for every virtual network.

Topology

The following figure depicts the NetScaler GSLB deployment for an Azure private DNS zone.

A user can access any application server either on Azure or On-prem based on the NetScaler GSLB method in an Azure private DNS zone. All traffic between On-prem and Azure virtual network is through a secure VPN tunnel only. Application traffic, DNS traffic, and monitoring traffic are shown in the preceding topology. Depending on the required redundancy, NetScaler and DNS forwarder can be deployed in the virtual networks and data centers. For simplicity purpose, only one NetScaler is shown here but we recommend at least one set of NetScaler and DNS forwarder for the Azure region. All user DNS queries first go to the DNS forwarder that has rules defined for forwarding the queries to an appropriate DNS server.

Configuring NetScaler for Azure DNS private zone

Products and Versions tested:

Product	Version
Azure	Cloud Subscription
NetScaler VPX	BYOL (Bring your own license)

Note:

The deployment is tested and remains the same with NetScaler version 12.0 and above.

Prerequisites

The following are general prerequisites.

- Microsoft Azure portal account with a valid subscription.
- Ensure connectivity (Secure VPN Tunnel) between On-prem and Azure cloud. To set up a secure VPN tunnel in Azure, see [Step-By-Step: Configuring a site-to-site VPN Gateway between Azure and on-premises](#).

Solution description

If you want to host one application Azure DNS private zone (rr.ptm.mysite.net) which runs on HTTPs and is deployed across Azure and On-premises with intranet access based on the round robin GSLB load balancing method. To achieve this deployment enable GSLB for the Azure private DNS zone with NetScaler that consists of the following configurations:

1. Configure Azure and On-premises Setup.
2. NetScaler appliance on Azure virtual network.

Configure Azure and On-premises Setup

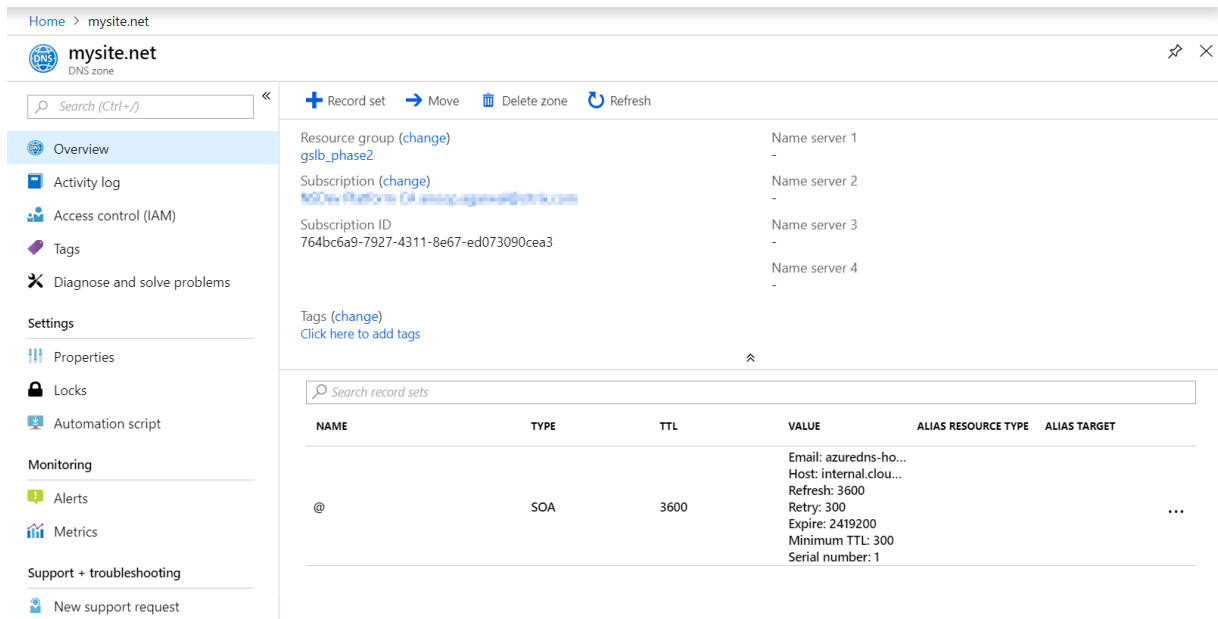

As shown in the topology, set up Azure virtual network (VNet A, VNet B in this case) and On-premises setup.

1. Create an Azure private DNS zone with domain name (mysite.net).
2. Create two virtual networks (VNet A, VNet B) in a Hub and Spoke model in an Azure region.
3. Deploy App Server, DNS forwarder, Windows 10 Pro client, NetScaler in VNet A.
4. Deploy an App Server and deploy a DNS forwarder if any clients are in VNet B.
5. Deploy an App server, DNS forwarder, and Windows 10 pro client on On-premises.

Azure private DNS zone

Create an Azure private DNS zone with domain name.

1. Log in to the Azure portal and select or create a dashboard.
2. Click **create a resource** and search for DNS zone to create (mysite.net in this case) Azure private DNS zone with domain name (mysite.net).

Azure virtual networks (VNet A, VNet B) in Hub and spoke model

Create two virtual networks (VNet A, VNet B) in a Hub and Spoke model in an Azure region.

1. Create two virtual networks.
2. Select the same dashboard and click **create a resource** and search for virtual networks to create two virtual networks namely VNet A, VNet B in the same region and peer them to form a Hub and Spoke model as shown in the following image.
For more information on how to set up a hub and spoke topology, See [Implement a hub-spoke network topology in Azure](#).

VNet A to VNet B peering

To peer VNet A and VNet B:

1. Click **Peerings** from the **Settings** menu of VNet A and peer VNet B.
2. Enable **Allow forwarded traffic** and **Allow gateway transit** as shown in the following image.

Home > Virtual_Network_A_10_8 - Peerings > Vnet_A_to_B

VNet B to VNet A peering

To peer VNet B and VNet A:

1. Click **Peerings** from the **Settings** menu of VNet B and peer VNet A.
2. Enable **Allow forwarded traffic** and use remote gateways as shown in the following image.

```
1 ! [VNet B to A] (/en-us/citrix-adc/media/image-07.png)
```

The following image depicts the successful peering of VNet B to VNet A.

Deploy App server, DNS forwarder, Windows 10 Pro client, NetScaler in VNet A

We discuss briefly about App server, DNS forwarder, Windows 10 pro client, and NetScaler on VNet A.

1. Select the same dashboard, click **Create a resource**.
2. Search for the respective instances and assign an IP from VNet A subnet.

App server App server is nothing but the web server (HTTP server) where an Ubuntu server 16.04 is deployed as an instance on the Azure or On-premises VM. To make it as a web server, at the command prompt, type:

```
sudo apt install apache2
```

Windows 10 Pro Client Launch Windows 10 pro instance as client machine on VNet A and On-premises.

NetScaler NetScaler compliments the Azure DNA private zone by health check and Analytics from NetScaler MAS. Launch a NetScaler from Azure Marketplace based on your requirement, here we have used NetScaler (BYOL) for this deployment.

For the detailed steps on how to deploy NetScaler on Microsoft Azure. See [Deploy a NetScaler VPX Instance on Microsoft Azure](#).

After deployment, use NetScaler IP to configure NetScaler GSLB.

DNS forwarder It is used to forward the client requests of hosted domains bound to NetScaler GSLB (ADNS IP). Launch an Ubuntu server 16.04 as Linux instance (Ubuntu server 16.04) and refer below URL on how to set up it as a DNS forwarder.

Note:

For Round Robin GSLB load balancing method one DNS forwarder for Azure Region is sufficient but for Static proximity we need one DNS forwarder per virtual network.

1. After deploying forwarder, change the DNS server settings of virtual network A from default to custom with VNet A DNS forwarder IP as shown in the following image.
2. Modify the `named.conf.options` file in VNet A DNS forwarder to add forwarding rules for domain (`mysite.net`) and subdomain (`ptm.mysite.net`) to the ADNS IP of NetScaler GSLB.
3. Restart the DNS forwarder to reflect the changes made in the file `named.conf.options`.

VNet A DNS forwarder settings

```
1     zone "mysite.net" {
2
3         type forward;
4     forwarders {
5     168.63.129.16; }
6     ;
7     }
8     ;
9     zone "ptm.mysite.net" {
10
11         type forward;
12     forwarders {
13     10.8.0.5; }
14     ;
15     }
16     ;
17     <!--NeedCopy-->
```

Note:

For the domain (“mysite.net”) zone IP address, use the DNS IP address of your Azure region. For the subdomain (“ptm.mysite.net”) zone IP address, use all ADNS IP addresses of your GSLB instances.

Deploy App server and a DNS forwarder if any clients are in VNet B

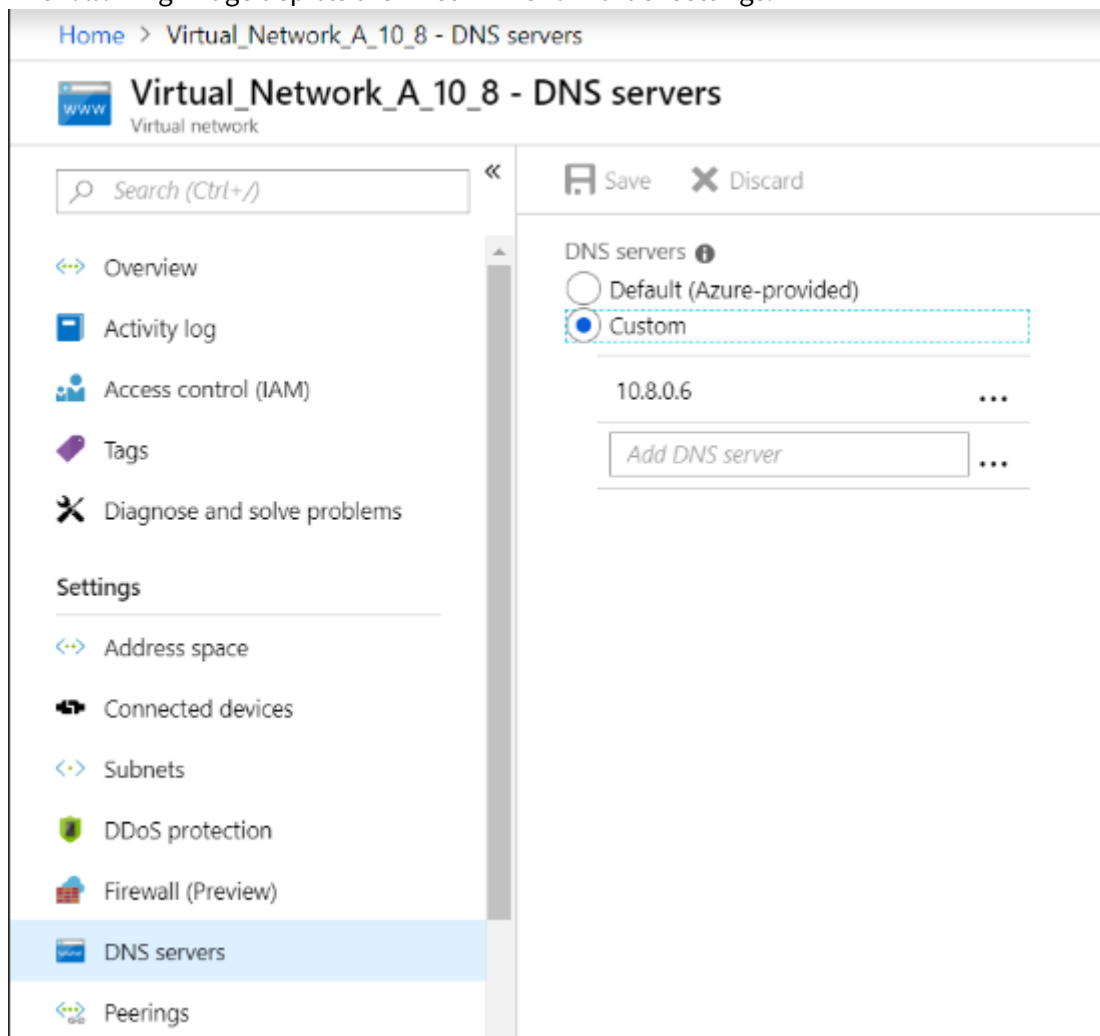

1. For virtual network B, select the same dashboard, click **create a resource**.
2. Search for the respective instances, and assign an IP from VNet B subnet.

3. Launch App server and DNS forwarder if there is static proximity GSLB load balancing similar to VNet A.
4. Edit the VNet B DNS forwarder settings in `named.conf.options` as shown in the following setting:

VNet B DNS forwarder settings:

```
1     zone "ptm.mysite.net" {
2
3         type forward;
4         forwarders {
5     10.8.0.5; }
6     ;
7     }
8 ;
9 <!--NeedCopy-->
```

The following image depicts the VNet B DNS forwarder settings:

Deploy app server, DNS forwarder, and Windows 10 pro client on On-premises

1. For On-premises, launch the VMs on bare metal and bring the App server, DNS forwarder and Windows 10 pro client similar to VNet A.
2. Edit the On-premises DNS forwarder settings in the `named.conf.options` as shown in the following example.

On-Premises DNS forwarder settings

```
1     zone "mysite.net" {
2
3         type forward;
4         forwarders {
5     10.8.0.6; }
6     ;
7     }
8     ;
9     zone "ptm.mysite.net" {
10
11         type forward;
12         forwarders {
13     10.8.0.5; }
14     ;
15     }
16     ;
17 <!--NeedCopy-->
```

For `mysite.net`, we have given DNS forwarder IP of VNet A instead of Azure private DNS zone server IP because it is a special IP address that is not reachable from On-premises. Hence this change is required in the DNS forwarder setting of On-premises.

Configure the NetScaler on Azure virtual network

As shown in the topology, deploy the NetScaler on the Azure virtual network (VNet A in this case) and access it through the NetScaler GUI.

Configuring NetScaler GSLB

1. Create ADNS Service.
2. Create local and remote sites.
3. Create services for the local virtual servers.
4. Create virtual servers for the GSLB services.

Add ADNS service

1. Log in to the NetScaler GUI.
2. In the **Configuration** tab, navigate to **Traffic Management > Load Balancing > Services**.
3. Add a service.

We recommended you to configure the ADNS service both in TCP and UDP as shown in the following image:

← Load Balancing Service

☐	s_adns	UP	10.8.0.5	53	ADNS	0	0	SERVER	

Add GSLB sites

1. Add local and remote sites between which GSLB will be configured.
2. On the **Configuration** tab, navigate to **Traffic Management > GSLB > GSLB Sites**.
Add a site as shown in the following example and repeat the same procedure for other sites.

Add GSLB services

1. Add GSLB services for the local and remote virtual servers which load balances App servers.
2. On the **Configuration** tab, navigate to **Traffic Management > GSLB > GSLB Services**.
3. Add the services as shown in the following examples.
4. Bind HTTP monitor to check server status.

	Name	State	Protocol	% Health
<input type="checkbox"/>	vserver_rr	UP	HTTP	100.00% 3 UP/0 DOWN
<input type="checkbox"/>	vserver_sp	UP	HTTP	100.00% 3 UP/0 DOWN

To test the deployment, access the domain URL `rr.ptm.mysite.net` from either cloud client machine or On-premises client machine. If you access it from cloud windows client machine ensure that the on-premises App server is accessed in a private DNS zone without any need for third party or custom DNS solutions.

Configure a NetScaler VPX instance to use Azure accelerated networking

August 30, 2023

Accelerated networking enables the single root I/O virtualization (SR-IOV) virtual function (VF) NIC to a virtual machine, which improves the networking performance. You can use this feature with heavy workloads that need to send or receive data at higher throughput with reliable streaming and lower CPU utilization.

When a NIC is enabled with accelerated networking, Azure bundles the NIC's existing para virtualized (PV) interface with an SR-IOV VF interface. The support of SR-IOV VF interface enables and enhances the throughput of the NetScaler VPX instance.

Accelerated networking provides the following benefits:

- Lower latency
- Higher packets per second (pps) performance
- Enhanced throughput
- Reduced jitter
- Decreased CPU utilization

Note

Azure accelerated networking is supported on NetScaler VPX instances from release 13.0 build 76.29 onwards.

Prerequisites

- Ensure that your VM size matches the requirements for Azure accelerated networking.
- Stop VMs (individual or in an availability set) before enabling accelerated networking on any NIC.

Limitations

Accelerated networking can be enabled only on some instance types. For more information, see [Supported instance types](#).

NICs supported for accelerated networking

Azure provides Mellanox ConnectX3, ConnectX4, and ConnectX5 NICs in the SR-IOV mode for accelerated networking.

When accelerated networking is enabled on a NetScaler VPX interface, Azure bundles either ConnectX3, ConnectX4, or ConnectX5 interface with the existing PV interface of a NetScaler VPX appliance.

For more information about enabling accelerated networking before attaching an interface to a VM, see [Create a network interface with accelerated networking](#).

For more information about enabling accelerated networking on an existing interface on a VM, see [Enable existing interfaces on a VM](#).

How to enable accelerated networking on a NetScaler VPX instance using the Azure console

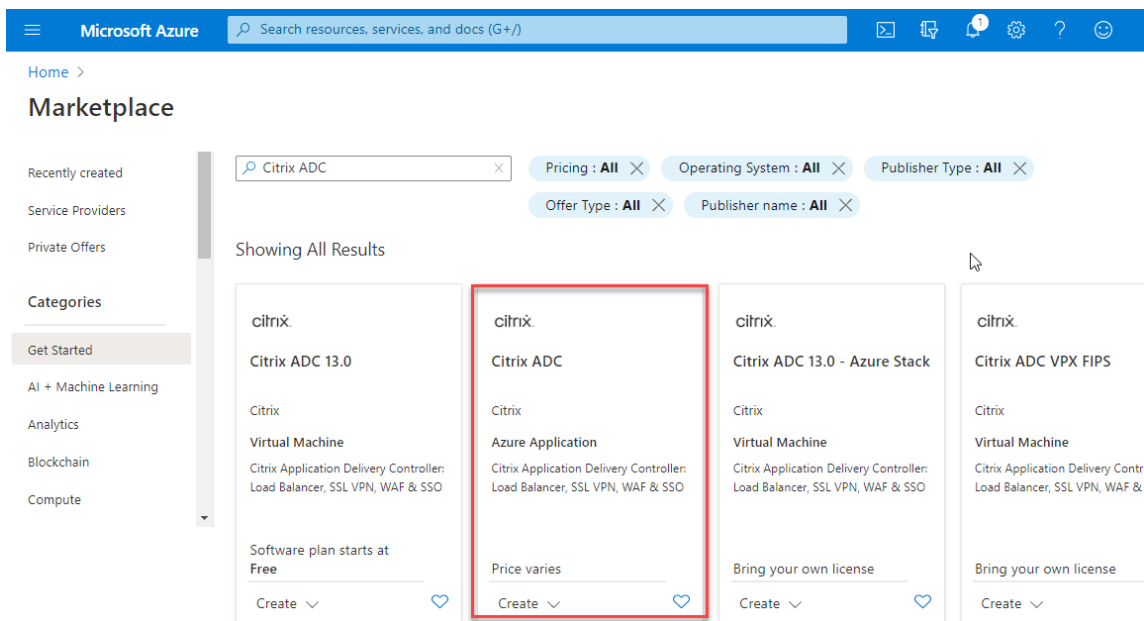

You can enable accelerated networking on a specific interface using the Azure console or the Azure PowerShell.

Do the following steps to enable accelerated networking by using Azure availability sets or availability zones.

1. Log in to [Azure portal](#), and navigate to **Azure Marketplace**.

2. From the **Azure Marketplace**, search **NetScaler**.

3. Select a non-FIPS NetScaler plan along with license, and click **Create**.

The screenshot shows the Microsoft Azure portal interface. At the top, there is a blue header with the Microsoft Azure logo and a search bar. Below the header, the page title is "NetScaler ADC 14.1" with a star icon and a menu icon. Underneath, it says "Cloud Software Group". The main content area features the NetScaler logo, the product name "NetScaler ADC 14.1", and a "Free trial" badge. Below this, there is a "Plan" section with a dropdown menu showing "NetScaler ADC 14.1 VPX Bring Your O..." and a blue "Create" button. To the right of the "Create" button is a button labeled "Start with a pre-set configuration". Below the "Create" button, there is a link "Want to deploy programmatically? Get started". At the bottom of the page, there are navigation tabs: "Overview", "Plans + Pricing", "Usage Information + Support", and "Ratings + Reviews". The "Overview" tab is selected. The main text describes NetScaler ADC as an enterprise-grade application delivery controller. At the bottom, there is a link to learn more about building a robust, resilient application delivery infrastructure with NetScaler ADC on Microsoft Azure.

The **Create NetScaler** page appears.

4. In the **Basics** tab, create a Resource Group. Under the **Parameters** tab, enter details for the Region, Admin user name, Admin Password, license type (VM SKU), and other fields.

Create a virtual machine ...

Inbound port rules

Select which virtual machine network ports are accessible from the public internet. You can specify more limited or granular network access on the Networking tab.

Public inbound ports * ⓘ	<p><input type="radio"/> None <input checked="" type="radio"/> Allow selected ports</p>
Select inbound ports *	<input type="text" value="SSH (22)"/>

All traffic from the internet will be blocked by default. You will be able to change inbound port rules in the VM > Networking page.

5. Click **Next : VM Configurations >**.

On the **VM Configurations** page, perform the following:

- a) Configure a public IP domain name suffix.
- b) Enable or disable **Azure Monitoring Metrics**.
- c) Enable or disable **Backend Autoscale**.

6. Click **Next: Network and Additional settings >**.

On the **Network and Additional Settings** page, create a Boot diagnostics account and configure the network settings.

Under the **Accelerated Networking** section, you have the option to enable or disable the accelerated networking separately for the Management interface, Client interface, and Server interface.

Create a virtual machine ...

Basics Disks **Networking** Management Monitoring Advanced Tags Review + create

Define network connectivity for your virtual machine by configuring network interface card (NIC) settings. You can control ports, inbound and outbound connectivity with security group rules, or place behind an existing load balancing solution. [Learn more](#)

Network interface

When creating a virtual machine, a network interface will be created for you.

Virtual network *	<input type="text" value="(new) vpx-aan-vnet"/>
	Create new
Subnet *	<input type="text" value="(new) default (10.6.0.0/24)"/>
Public IP	<input type="text" value="(new) vpx-aan-ip"/>
	Create new
NIC network security group	<input type="radio"/> None <input checked="" type="radio"/> Basic <input type="radio"/> Advanced
Public inbound ports *	<input type="radio"/> None <input checked="" type="radio"/> Allow selected ports
Select inbound ports *	<input type="text" value="SSH (22)"/>

⚠ This will allow all IP addresses to access your virtual machine. This is only recommended for testing. Use the Advanced controls in the Networking tab to create rules to limit inbound traffic to known IP addresses.

Delete public IP and NIC when VM is deleted	<input type="checkbox"/>
Enable accelerated networking	<input checked="" type="checkbox"/>

Load balancing

You can place this virtual machine in the backend pool of an existing Azure load balancing solution. [Learn more](#)

Load balancing options	<input checked="" type="radio"/> None <input type="radio"/> Azure load balancer <small>Supports all TCP/UDP network traffic, port-forwarding, and outbound flows.</small> <input type="radio"/> Application gateway <small>Web traffic load balancer for HTTP/HTTPS with URL-based routing, SSL termination, session persistence, and web application firewall.</small>
------------------------	---

7. Click **Next: Review + create >**.

After the validation is successful, review the basic settings, VM configurations, network and additional settings, and click **Create**. It might take some time for the Azure Resource Group to be created with the required configurations.

8. After the deployment is completed, select the **Resource Group** to see the configuration details.

9. To verify the Accelerated Networking configurations, select **Virtual machine > Networking**. The Accelerated Networking status is displayed as **Enabled** or **Disabled** for each NIC.

Enable accelerated networking using Azure PowerShell

If you need to enable accelerated networking after the VM creation, you can do so using Azure PowerShell.

Note:

Ensure to stop the VM before you enable Accelerated Networking using Azure PowerShell.

Perform the following steps to enable accelerated networking by using Azure PowerShell.

1. Navigate to **Azure portal**, click the **PowerShell** icon on the right-hand top corner.

Note:

If you are in the Bash mode, change to the PowerShell mode.

2. At the command prompt, run the following command:

```
1 az network nic update --name <nic-name> --accelerated-networking [
  true | false] --resource-group <resourcegroup-name>
2 <!--NeedCopy-->
```

The accelerated networking parameter accepts either of the following values:

- **True:** Enables accelerated networking on the specified NIC.
- **False:** Disables accelerated networking on the specified NIC.

To enable accelerated networking on a specific NIC:

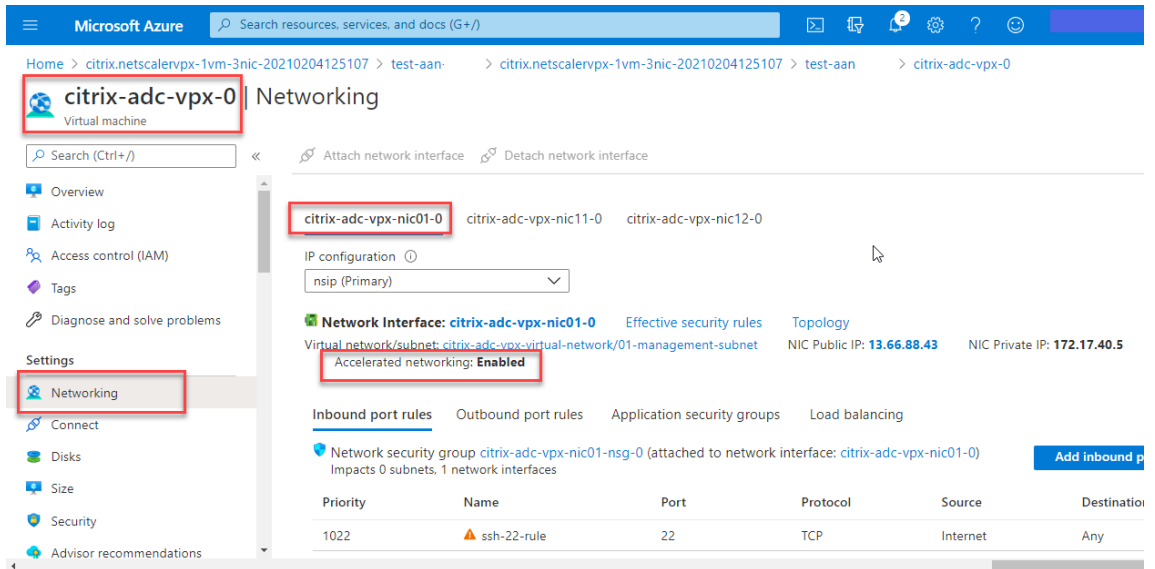

```
1 az network nic update --name citrix-adc-vpx-nic01-0 --accelerated-
  networking true --resource-group rsgp1-aan
2 <!--NeedCopy-->
```

To disable accelerated networking on a specific NIC:

```
1 az network nic update --name citrix-adc-vpx-nic01-0 --accelerated-
  networking false --resource-group rsgp1-aan
2 <!--NeedCopy-->
```

3. To verify that the Accelerated Networking status after the deployment is completed, Navigate to **VM > Networking**.

In the following example, you can see that Accelerated Networking is **Enabled**.

In the following example, you can see that Accelerated Networking is **Disabled**.

To verify accelerated networking on an interface by using FreeBSD Shell of NetScaler

You can log in to the FreeBSD shell of NetScaler, and run the following commands to verify the accelerated networking status.

Example for ConnectX3 NIC:

The following example shows the “ifconfig” command output of the Mellanox ConnectX3 NIC. The “50/n” indicates the VF interfaces of the Mellanox ConnectX3 NICs. 0/1 and 1/1 indicates the PV interfaces of the NetScaler VPX instance. You can observe that both PV interface (1/1) and CX3 VF interface

(50/1) have the same MAC addresses (00:22:48:1c:99:3e). This indicates that the two interfaces are bundled together.

```
root@nvr-us-cx3# ifconfig
lo0: flags=8049<UP,LOOPBACK,RUNNING,MULTICAST> metric 0 mtu 1500
    options=3<RXCSUM,TXCSUM>
    inet 127.0.0.1 netmask 0xff000000
    inet6 ::1 prefixlen 128
    inet6 fe80::1%lo0 prefixlen 64 scopeid 0x1
    nd6 options=3<PERFORMNUD,ACCEPT_RTADV>
0/1: flags=8843<UP,BROADCAST,RUNNING,SIMPLEX,MULTICAST> metric 0 mtu 1500
    options=80019<RXCSUM,VLAN_MTU,VLAN_HWTAGGING,LINKSTATE>
    ether 00:0d:3a:98:71:be
    inet 172.16.27.11 netmask 0xfffff00 broadcast 172.16.27.255
    inet6 fe80::20d:3aff:fe98:71be%0/1 prefixlen 64 autoconf scopeid 0x2
    nd6 options=3<PERFORMNUD,ACCEPT_RTADV>
    media: Ethernet autoselect (10Gbase-T <full-duplex>)
    status: active
1/1: flags=8802<BROADCAST,SIMPLEX,MULTICAST> metric 0 mtu 1500

status: active

100/2: flags=8a03<UP,BROADCAST,ALLMULTI,SIMPLEX,MULTICAST> metric 0 mtu 1500
ether 00:0d:3a:1e:d2:23
media: Ethernet autoselect <full-duplex rxpause txpause> (autoselect
<full-duplex rxpause>)
status: active

```

To verify accelerated networking on an interface by using ADC CLI

Example for ConnectX3 NIC:

The following show interface command output indicates that the PV interface 1/1 is bundled with virtual function 50/1, which is an SR-IOV VF NIC. The MAC addresses of both 1/1 and 50/1 NICs are the same. After accelerated networking is enabled, the data of the 1/1 interface is sent through datapath of the 50/1 interface, which is a ConnectX3 interface. You can see that the “show interface” output of the PV interface (1/1) points to the VF (50/1). Similarly, the “show interface” output of VF interface (50/1) points to the PV interface (1/1).

```
> show interface 1/1
Interface 1/1 (NetScaler Virtual Interface, SmartNIC, VF 50/1 Datapath 50/1) #1
Flags=0xe060 <ENABLED, UP, UP, HEARTBEAT, 802.1q>
MTU=1500, native vlan=1, MAC=00:22:48:1c:99:3e, uptime 0h00m07s

RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
NIC: InDisc(0) OutDisc(0) FcTls(0) Stalls(0) Hangs(0) Muted(0)
Bandwidth thresholds are not set.

Done

> show interface 50/1
Interface 50/1 (CX3 VF Interface, SmartNIC, PV 1/1) #2
Flags=0xe400 <ENABLED, UP, UP, 802.1q>
MTU=1500, native vlan=1, MAC=00:22:48:1c:99:3e, uptime 0h00m08s
Actual: media NONE, speed 50000, duplex FULL, FcTl NONE, throughput 50000
LLDP Mode: NONE, LR Priority: 1024

RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
NIC: InDisc(0) OutDisc(0) FcTls(0) Stalls(0) Hangs(0) Muted(0)
Bandwidth thresholds are not set.
```

Example for ConnectX4 NIC:

The following show interface command output indicates that the PV interface 1/1 is bundled with virtual function 100/1, which is an SR-IOV VF NIC. The MAC addresses of both 1/1 and 100/1 NICs are the same. After accelerated networking is enabled, the data of 1/1 interface is sent through the data path of 100/1 interface, which is a ConnectX4 interface. You can see that the “show interface” output of PV interface (1/1) points to the VF (100/1). Similarly, the “show interface” output of VF interface (100/1) points to the PV interface (1/1).

```

> show interface 1/1
1) Interface 1/1 (NetScaler Virtual Interface, SmartNIC, VF 100/1, Datapath 100/1) #0
   flags=0xe060 <ENABLED, UP, UP, HEARTBEAT, 802.1q>
   MTU=1500, native vlan=10, MAC=00:0d:3a:9b:f2:1d, uptime 10h49m10s
   LLDP Mode: NONE, LR Priority: 1024

   RX: Pkts(310366) Bytes(98476082) Errs(0) Drops(0) Stalls(0)
   TX: Pkts(44) Bytes(6368) Errs(0) Drops(0) Stalls(0)
   NIC: InDisc(0) OutDisc(0) FcTls(0) Stalls(0) Hangs(0) Muted(0)
   Bandwidth thresholds are not set.

Done
> show interface 100/1
1) Interface 100/1 (CX4 VF Interface, SmartNIC, PV 1/1) #3
   flags=0xe460 <ENABLED, UP, UP, 802.1q>
   MTU=1500, native vlan=10, MAC=00:0d:3a:9b:f2:1d, uptime 10h49m11s
   Actual: media FIBER, speed NONE, duplex FULL, fctl NONE, throughput
0

   Bandwidth thresholds are not set.

Done
>

```

Points to note in NetScaler

- PV interface is considered as the primary or main interface for all the necessary operations. Configurations must be performed on PV interfaces only.
- All the 'set' operations on a VF interface are blocked except the following:
 - enable interface
 - disable interface
 - reset interface
 - clear stats

Note:

Citrix recommends that you do not perform any operations on the VF interface.

- You can verify the binding of PV interface with VF interface using the `show interface` command.
- From NetScaler release 13.1-33.x, a NetScaler VPX instance can seamlessly handle dynamic NIC removals and reattachment of the removed NICs in Azure accelerated networking. Azure can remove SR-IOV VF NIC of accelerated networking for their host maintenance activities. Whenever a NIC is removed from Azure VM, the NetScaler VPX instance shows the interface status as

“Link Down” and the traffic goes through the virtual interface only. After the removed NIC is reattached, the VPX instances use the reattached SR-IOV VF NIC. This process happens seamlessly and does not require any configuration.

Configure a VLAN to a PV interface

When a PV interface is bound to a VLAN, the associated accelerated VF interface is also bound to the same VLAN as the PV interface. In this example, the PV interface (1/1) is bound to VLAN (20). The VF interface (100/1) that is bundled with the PV interface (1/1) is also bound to VLAN 20.

Example:

1. Create a VLAN.

```
1 add vlan 20
2 <!--NeedCopy-->
```

2. Bind a VLAN to the PV interface.

```
1 bind vlan 20 -ifnum 1/1
2
3 show vlan
4
5 1)  VLAN ID: 1
6     Link-local IPv6 addr: fe80::20d:3aff:fe9b:f21d/64
7     Interfaces : L0/1
8
9 2)  VLAN ID: 10      VLAN Alias Name:
10   Interfaces : 0/1 100/1
11   IPs : 10.0.1.29  Mask: 255.255.255.0
12
13 3)  VLAN ID: 20      VLAN Alias Name:
14   Interfaces : 1/1 100/2
15
16 <!--NeedCopy-->
```

Note

VLAN binding operation is not permitted on an accelerated VF interface.

```
1 bind vlan 1 -ifnum 100/1
2 ERROR: Operation not permitted
3 <!--NeedCopy-->
```

Configure HA-INC nodes by using the NetScaler high availability template with Azure ILB

May 2, 2023

You can quickly and efficiently deploy a pair of VPX instances in HA-INC mode by using the standard template for intranet applications. The Azure internal load balancer (ILB) uses an internal or private IP address for the front end as shown in Figure 1. The template creates two nodes, with three subnets and six NICs. The subnets are for management, client, and server-side traffic with each subnet belonging to a different NIC on each device.

Figure 1: NetScaler HA pair for clients in an internal network

You can also use this deployment when the NetScaler HA pair is behind a firewall as shown in Figure 2. The public IP address belongs to the firewall and is NAT'd to the front-end IP address of the ILB.

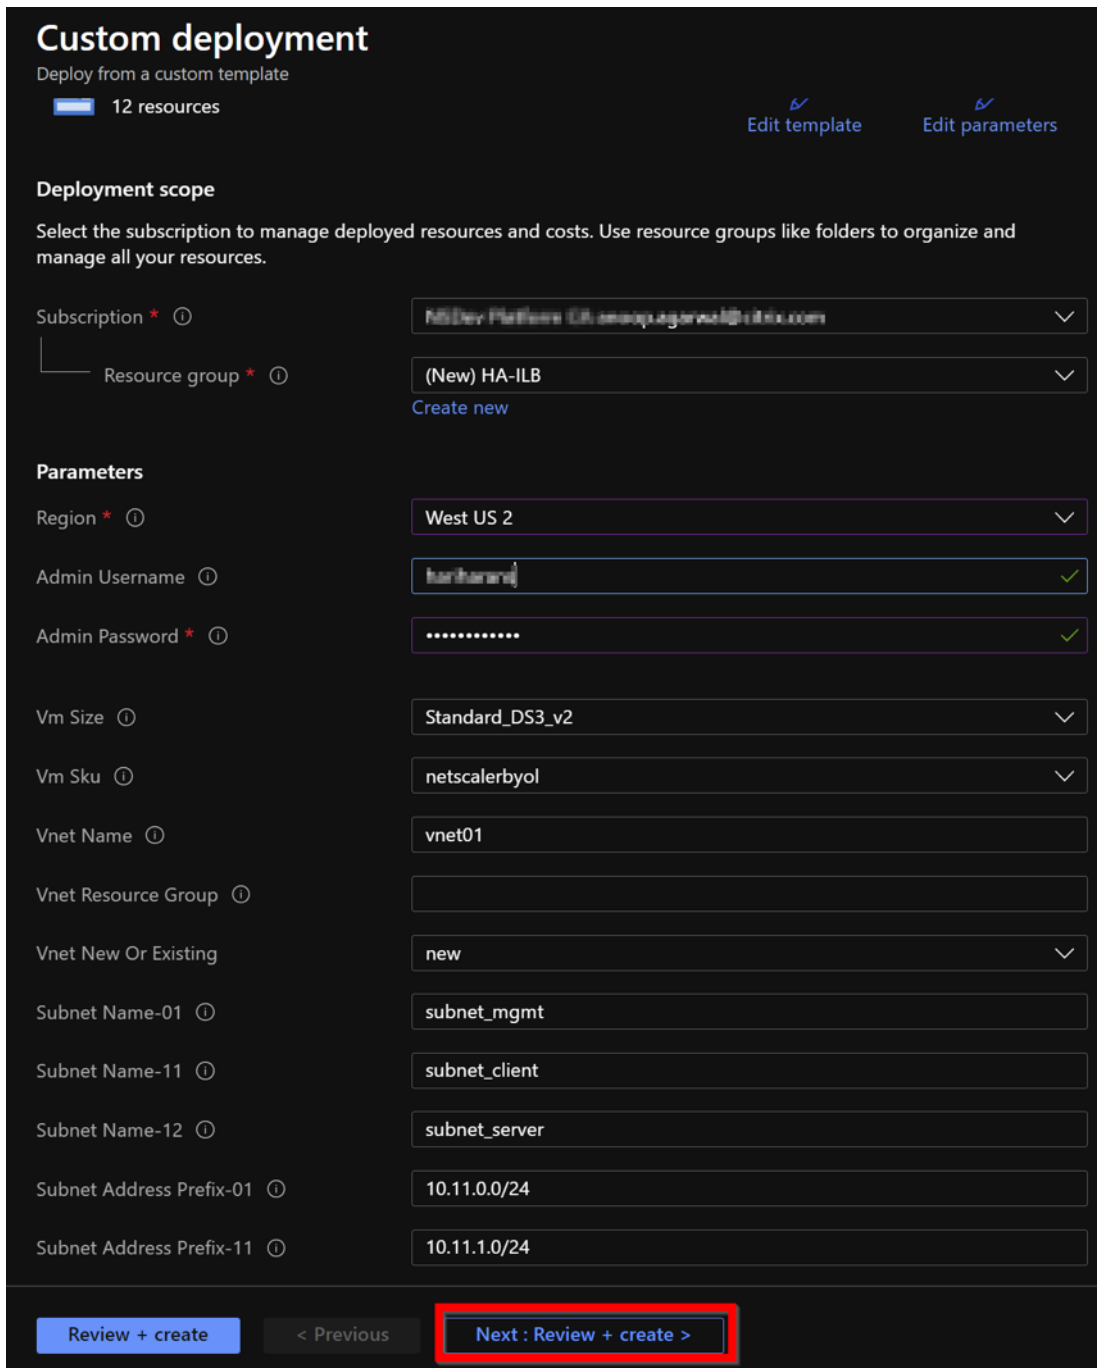

Figure 2: NetScaler HA pair with firewall having public IP address

You can get the NetScaler HA pair template for intranet applications at the [Azure portal](#)

Complete the following steps to launch the template and deploy a high availability VPX pair by using Azure Availability Sets.

1. From the Azure portal, navigate to the **Custom deployment** page.
2. The **Basics** page appears. Create a Resource Group. Under the **Parameters** tab, enter details for the Region, Admin user name, Admin Password, license type (**VM sku**), and other fields.

3. Click **Next : Review + create >**.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the Resource Group in the Azure portal to see the configuration details, such as LB rules, back-end pools, health probes. The high availability pair appears as

ADC-VPX-0 and ADC-VPX-1.

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

Once the required configuration is complete, the following resources are created.

4. Log on to **ADC-VPX-0** and **ADC-VPX-1** nodes to validate the following configuration:

- NSIP addresses for both nodes must be in the management subnet.
- On the primary (ADC-VPX-0) and secondary (ADC-VPX-1) nodes, you must see two SNIP addresses. One SNIP (client subnet) is used for responding to ILB probes and the other SNIP (server subnet) is used for back-end server communication.

Note

In the HA-INC mode, the SNIP address of the ADC-VPX-0 and ADC-VPX-1 VMs are different while in the same subnet, unlike with the classic on-premises ADC HA deployment where both are the same.

To support deployments when the VPX pair SNIP is in different subnets, or anytime the VIP is not in the same subnet as a SNIP, you must either enable Mac-Based Forwarding (MBF), or add a static host route for each VIP to each VPX node.

On the primary node (ADC-VPX-0)

```
> sh ip
-----
Ipaddress      Traffic Domain  Type           Mode   Arp   Icmp   Vserver  State

```

5. After the primary and secondary nodes are UP and the Synchronization status is **SUCCESS**, you must configure the load balancing virtual server or the gateway virtual server on the primary node (ADC-VPX-0) with the private floating IP (FIP) address of the ADC Azure load balancer. For more information, see the [Sample configuration](#) section.
6. To find the private IP address of ADC Azure load balancer, navigate to **Azure portal > ADC Azure Load Balancer > Frontend IP configuration**.

7. In the **Azure Load Balancer** configuration page, the ARM template deployment helps create the LB rule, back-end pools, and health probes.

- The LB Rule (lbRule1) uses port 80, by default.

lbRule1
ADC-Azure-Load-Balancer

None ▼

Idle timeout (minutes) ⓘ
4

Floating IP ⓘ
Enabled

To add more VIP addresses on the ADC, perform the following steps:

1. Navigate to **Azure Load Balancer > Frontend IP configuration**, and click **Add** to create a new internal load balancer IP address.

2. In the **Add frontend IP address** page, enter a name, choose the client subnet, assign either dynamic or static IP address, and click **Add**.

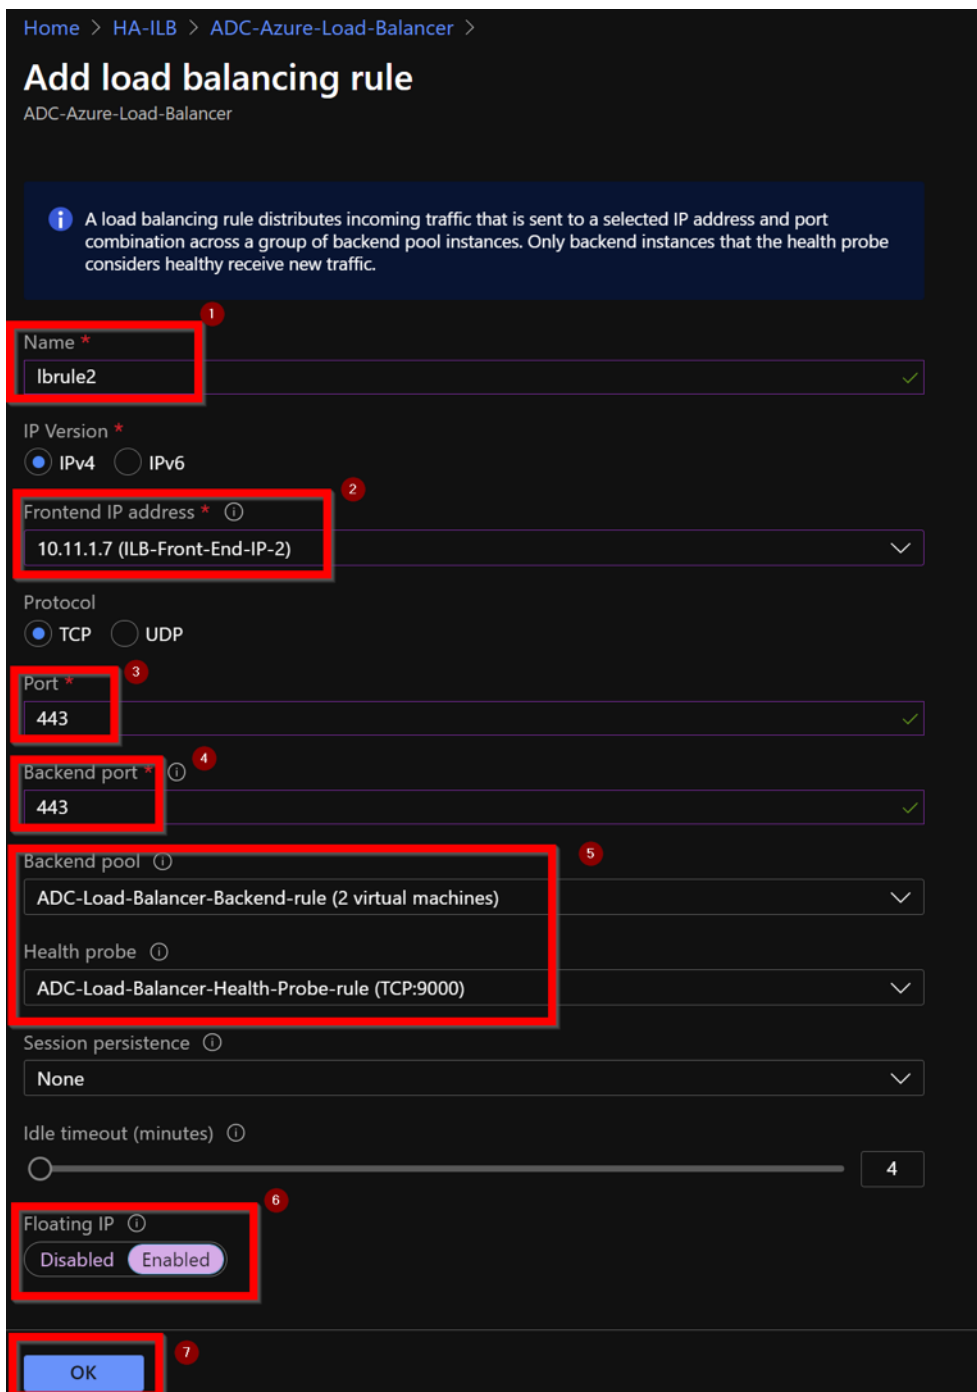

3. The front-end IP address is created but an LB Rule is not associated. Create a new load balancing rule, and associate it with the front-end IP address.

4. In the **Azure Load Balancer** page, select **Load balancing rules**, and then click **Add**.

5. Create a new LB Rule by choosing the new front-end IP address and the port. **Floating IP** field must be set to **Enabled**.

6. Now the **Frontend IP configuration** shows the LB rule that is applied.

Sample configuration

To configure a gateway VPN virtual server and load balancing virtual server, run the following commands on the primary node (ADC-VPX-0). The configuration auto synchronizes to the secondary node (ADC-VPX-1).

Gateway sample configuration

```

1 enable feature aaa LB SSL SSLVPN
2 enable ns mode MBF
3 add vpn vserver vpn_ssl SSL 10.11.1.4 443
4 add ssl certKey ckp -cert wild-cgwsanity.cer -key wild-cgwsanity.key
5 bind ssl vserver vpn_ssl -certkeyName ckp
6 <!--NeedCopy-->
    
```

Load balancing sample configuration

```

1 enable feature LB SSL
2 enable ns mode MBF
3 add lb vserver lb_vs1 SSL 10.11.1.7 443
4 bind ssl vserver lb_vs1 -certkeyName ckp
5 <!--NeedCopy-->
    
```

You can now access the load balancing or VPN virtual server using the fully qualified domain name (FQDN) associated with the internal IP address of ILB.

See the **Resources** section for more information about how to configure the load-balancing virtual server.

Configure HA-INC nodes by using the NetScaler high availability template for internet-facing applications

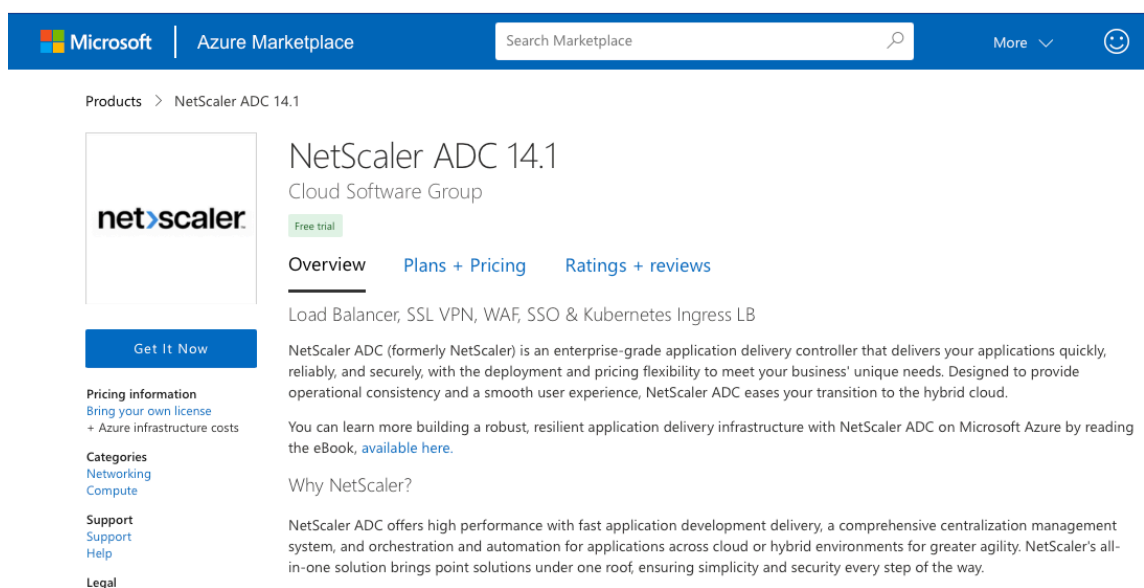

May 2, 2023

You can quickly and efficiently deploy a pair of VPX instances in HA-INC mode by using the standard template for internet-facing applications. The Azure load balancer (ALB) uses a public IP address for the front end. The template creates two nodes, with three subnets and six NICs. The subnets are for management, client, and server-side traffic. Each subnet has two NICs for both the VPX instances.

You can get the NetScaler HA pair template for internet-facing applications at the [Azure Marketplace](#).

Complete the following steps to launch the template and deploy a high availability VPX pair by using Azure availability sets or availability zone.

1. From the Azure Marketplace, search **NetScaler**.
2. Click **GET IT NOW**.

3. Select the required HA deployment along with license, and click **Continue**.

4. The **Basics** page appears. Create a Resource Group. Under the **Parameters** tab, enter details for the Region, Admin user name, Admin Password, license type (VM SKU), and other fields.

12. After the primary and secondary nodes are UP and the Synchronization status is **SUCCESS**, you must configure the load balancing virtual server or the gateway virtual server on the primary node (citrix-adc-vpx-0) with the public IP address of the ALB virtual server. For more information, see the [Sample configuration](#) section.
13. To find the public IP address of ALB virtual server, navigate to **Azure portal > Azure Load Balancer > Frontend IP configuration**.

14. Add the inbound security rule for virtual server port 443 on the network security group of both the client interfaces.

- Configure the ALB port that you want to access, and create inbound security rule for the specified port. The Backend port is your load balancing virtual server port or the VPN virtual server port.

Microsoft Azure Search resources, services, and docs (G+)

16. Now, you can access the load balancing virtual server or the VPN virtual server using the fully qualified domain name (FQDN) associated with the ALB public IP address.

Sample configuration

To configure a gateway VPN virtual server and load balancing virtual server, run the following commands on the primary node (ADC-VPX-0). The configuration auto synchronizes to the secondary node (ADC-VPX-1).

Gateway sample configuration

```
1 enable feature aaa LB SSL SSLVPN
2 add ip 52.172.55.197 255.255.255.0 -type VIP
3 add vpn vserver vpn_ssl SSL 52.172.55.197 443
4 add ssl certKey ckp -cert cgwsanity.cer -key cgwsanity.key
5 bind ssl vserver vpn_ssl -certkeyName ckp
6 <!--NeedCopy-->
```

Load balancing sample configuration

```
1 enable feature LB SSL
2 enable ns mode MBF
3 add lb vserver lb_vs1 SSL 52.172.55.197 443
4 bind ssl vserver lb_vs1 -certkeyName ckp
5 <!--NeedCopy-->
```

You can now access the load balancing or VPN virtual server using the FQDN associated with the public IP address of ALB.

See the **Resources** section for more information about how to configure the load balancing virtual server.

Configure a high-availability setup with Azure external and internal load balancers simultaneously

May 2, 2023

The high availability pair on Azure supports both external and internal load balancers simultaneously.

You have the following two options to configure a high availability pair using both Azure external and internal load balancers:

- Using two LB virtual servers on the NetScaler appliance.
- Using one LB virtual server and an IP set. The single LB virtual server serves traffic to multiple IPs, which are defined by the IPset.

Perform the following steps to configure a high availability pair on Azure using both the external and internal load balancers simultaneously:

For Steps 1 and 2, use the Azure portal. For Steps 3 and 4, use the NetScaler VPX GUI or the CLI.

Step 1. Configure an Azure load balancer, either an external load balancer or an internal load balancer.

For more information on configuring high-availability setup with Azure external load balancers, see [Configure a high-availability setup with multiple IP addresses and NIC](#).

For more information on configuring high-availability setup with Azure internal load balancers, see [Configure HA-INC nodes by using the NetScaler high availability template with Azure ILB](#).

Step 2. Create an extra load balancer (ILB) in your resource group. In Step 1, if you have created an external load balancer, you now create an internal load balancer and conversely.

- To create an internal load balancer, choose the load balancer type as **Internal**. For the **Subnet** field, you must choose your NetScaler client subnet. You can choose to provide a static IP address in that subnet, provided there are no conflicts. Otherwise, choose the dynamic IP address.

[Review + create](#) [< Previous](#) [Next: Tags >](#) [Download a template for automation](#)

1. After you have created the Azure Load Balancer, navigate to **Frontend IP configuration** and note down the IP address shown here. You must use this IP address while creating the ADC load balancing virtual server as in Step 3.

2. In the **Azure Load Balancer configuration** page, the ARM template deployment helps create the LB rule, back-end pools, and health probes.
3. Add the high availability pair client NICs to the backend pool for the ILB.
4. Create a health probe (TCP, 9000 port)
5. Create two load balancing rules:
 - One LB rule for HTTP traffic (webapp use case) on port 80. The rule must also use the backend port 80. Select the created backend pool and the health probe. Floating IP must be enabled.
 - Another LB rule for HTTPS or CVAD traffic on port 443. The process is the same as the HTTP traffic.

Step 3. On the primary node of NetScaler appliance, create a load balancing virtual server for ILB.

1. Add a load balancing virtual server.

```

1 add lb vserver <name> <serviceType> [<ILB Frontend IP address>] [<
  port>]
2 <!--NeedCopy-->
    
```

Example:

```

1 add lb vserver vserver_name HTTP 52.172.96.71 80
2 <!--NeedCopy-->
    
```

Note:
Use the load balancer frontend IP address, which is associated with the additional Load

balancer that you create in Step 2.

2. Bind a service to a load balancing virtual server.

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

Example:

```
1 bind lb vserver Vserver-LB-1 Service-HTTP-1
2 <!--NeedCopy-->
```

For more information, see [Set up basic load balancing](#)

Step 4: As an alternative to Step 3, you can create a load balancing virtual server for ILB using IPsets.

1. Add an IP address of type virtual server IP (VIP).

```
1 add nsip <ILB Frontend IP address> -type <type>
2 <!--NeedCopy-->
```

Example:

```
1 add nsip 52.172.96.71 -type vip
2 <!--NeedCopy-->
```

2. Add an IPset on both primary and secondary nodes.

```
1 add ipset <name>
2 <!--NeedCopy-->
```

Example:

```
1 add ipset ipset1
2 <!--NeedCopy-->
```

3. Bind IP addresses to the IP set.

```
1 bind ipset <name> <ILB Frontend IP address>
2 <!--NeedCopy-->
```

Example:

```
1 bind ipset ipset1 52.172.96.71
2 <!--NeedCopy-->
```

4. Set the existing LB virtual server to use the IPset.

```
1 set lb vserver <vserver name> -ipset <ipset name>
2 <!--NeedCopy-->
```

Example:

```
1 set lb vserver vserver_name -ipset ipset1
2 <!--NeedCopy-->
```

For more information, see [Configure a multi-IP virtual server](#).

Install a NetScaler VPX instance on Azure VMware Solution

October 26, 2023

Azure VMware Solution (AVS) provides you with private clouds that contain vSphere clusters, built from dedicated bare-metal Azure infrastructure. The minimum initial deployment is three hosts, but additional hosts can be added one at a time, up to a maximum of 16 hosts per cluster. All provisioned private clouds have vCenter Server, vSAN, vSphere, and NSX-T.

The VMware Cloud (VMC) on Azure enables you to create cloud software-defined data centers (SDDC) on Azure with the number of ESX hosts that you want. The VMC on Azure supports NetScaler VPX deployments. VMC provides a user interface same as on-prem vCenter. It functions similar to the ESX-based NetScaler VPX deployments.

The following diagram shows the Azure VMware solution on the Azure public cloud that an administrator or a client can access over the internet. An administrator can create, manage, and configure workload or server VMs using Azure VMware solution. The admin can access the AVS's web-based vCenter and NSX-T Manager from a Windows Jumpbox. You can create the NetScaler VPX instances (stand-alone or high availability pair) and server VMs within Azure VMware Solution using vCenter, and manage the corresponding networking using NSX-T manager. The NetScaler VPX instance on AVS works similar to the on-prem VMware cluster of hosts. AVS is managed from a Windows Jumpbox that is created in the same virtual network.

A client can only access the AVS service by connecting to the VIP of ADC. Another NetScaler VPX instance outside Azure VMware Solution but in the same Azure virtual network helps add the VIP of the NetScaler VPX instance within Azure VMware Solution as a service. As per requirement, you can configure the NetScaler VPX instance to provide service over the internet.

Prerequisites

Before you begin installing a virtual appliance, do the following:

- For more information on Azure VMware solution and its prerequisites, see [Azure VMware Solution documentation](#).
- For more information on deploying Azure VMware solution, see [Deploy an Azure VMware Solution private cloud](#).
- For more information on creating a Windows Jump box VM to access and manage Azure VMware Solution, see [Access an Azure VMware Solution private cloud](#)
- In Windows Jump box VM, download the NetScaler VPX appliance setup files.
- Create appropriate NSX-T network segments on VMware SDDC to which the virtual machines connect. For more information, see [Add a network segment in Azure VMware Solution](#)
- Obtain VPX license files.
- Virtual machines (VMs) created or migrated to the Azure VMware Solution private cloud must be attached to a network segment.

VMware cloud hardware requirements

The following table lists the virtual computing resources that the VMware SDDC must provide for each VPX nCore virtual appliance.

Table 1. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (vCPU)	2
Virtual network interfaces	In VMware SDDC, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded to version 7 or higher.
Disk space	20 GB

Note

This is in addition to any disk requirements for the hypervisor.

For production use of the VPX virtual appliance, the full memory allocation must be reserved.

OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. The following table describes the system requirements for installing OVF tool.

Table 2. System requirements for OVF tool installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “OVF Tool User Guide” PDF file at http://kb.vmware.com/ .
CPU	750 MHz minimum, 1 GHz or faster recommended
RAM	1 GB Minimum, 2 GB recommended
NIC	100 Mbps or faster NIC

For information about installing OVF, search for the “OVF Tool User Guide” PDF file at <http://kb.vmware.com/>.

Downloading the NetScaler VPX setup files

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from the Citrix website. You need a Citrix account to log

on. If you do not have a Citrix account, access the home page at <http://www.citrix.com>. Click the **New Users link**, and follow the instructions to create a new Citrix account.

Once logged on, navigate the following path from the Citrix home page:

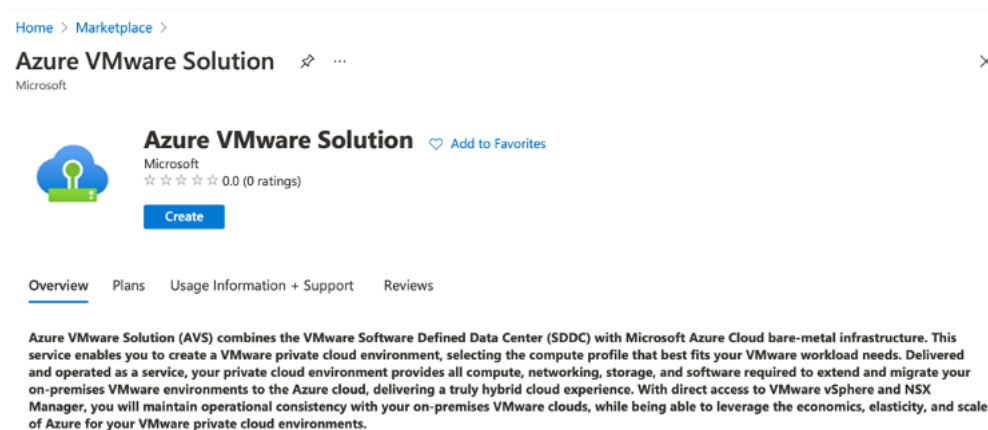

Citrix.com > **Downloads > NetScaler > Virtual Appliances.**

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-13.0-79.64-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-13.0-79.64.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-13.0-79.64.mf)

Deploy Azure VMware solution

1. Log in to your [Microsoft Azure portal](#), and navigate to **Azure Marketplace**.
2. From the **Azure Marketplace**, search **Azure VMware Solution** and click **Create**.

3. In the **Create a private cloud** page, enter the following details:
 - Select a minimum of 3 ESXi hosts to create the default cluster of your private cloud.
 - For the **Address block** field, use **/22** address space.
 - For the **Virtual Network**, make sure that the CIDR range doesn't overlap with any of your on-premises or other Azure subnets (virtual networks) or with the gateway subnet.
 - Gateway subnet is used to express route the connection with private cloud.

[Create new](#)
Only Virtual Networks with a valid subnet with the name "GatewaySubnet" are available for selection. For details about adding subnet in a virtual network, refer to details [here](#)

[Review + create](#) [Previous](#) [Next : Tags >](#)

4. Click **Review + Create**.
5. Review the settings. If you must change any settings, click **Previous**.

6. Click **Create**. Private cloud provisioning process starts. It can take up to two hours for the private cloud to be provisioned.

7. Click **Go to resource**, to verify the private cloud that is created.

Note

To access this resource, you need a VM in Windows that acts as a Jump box.

Connect to an Azure virtual machine running Windows

This procedure shows you how to use the Azure portal to deploy a virtual machine (VM) in Azure that runs Windows Server 2019. To see your VM in action, you then RDP to the VM and install the IIS web server.

To access the private cloud that you have created, you need to create a Windows Jump box within the same virtual network.

1. Go to the **Azure portal**, and click **Create a Resource**.

2. Search for **Microsoft Windows 10**, and click **Create**.

3. Create a virtual machine (VM) that runs Windows Server 2019. The **Create a virtual machine** page appears. Enter all the details in **Basics** tab, and select the **Licensing** check box. Leave the remaining defaults and then select the **Review + create** button at the bottom of the page.

Licensing

I confirm I have an eligible Windows 10 license with multi-tenant hosting rights. [Review multi-tenant hosting rights for Windows 10 compliance](#)

[Review + create](#) | [< Previous](#) | [Next: Disks >](#)

4. After validation runs, select the **Create** button at the bottom of the page.
5. After the deployment is complete, select **Go to resource**.
6. Go to the Windows VM that you have created. Use the public IP address of the Windows VM and connect using RDP.

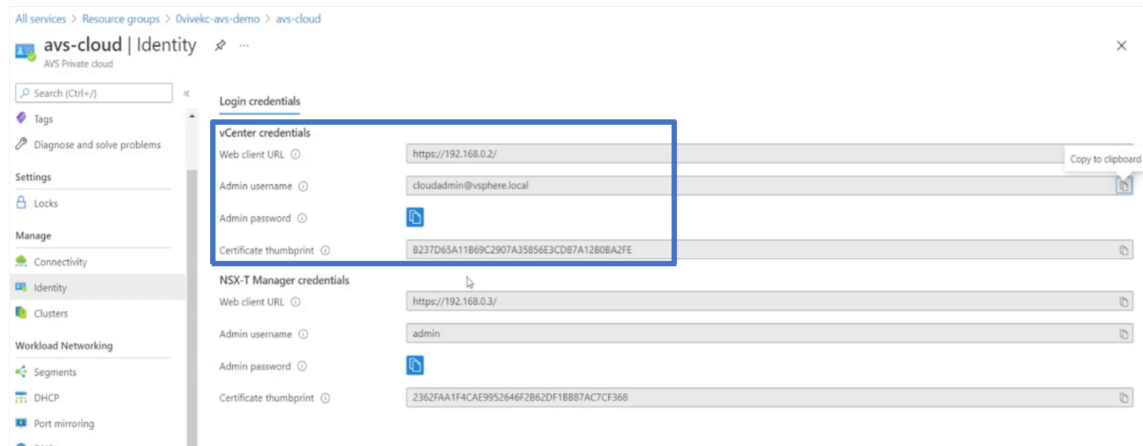

Use the **Connect** button in the Azure portal to start a Remote Desktop (RDP) session from a Windows desktop. First you connect to the virtual machine, and then you sign on.

To connect to a Windows VM from a Mac, you must install an RDP client for Mac such as Microsoft

Remote Desktop. For more information, see [How to connect and sign on to an Azure virtual machine running Windows](#).

Access your Private Cloud vCenter portal

1. In your Azure VMware Solution private cloud, under **Manage**, select **Identity**. Make note of the vCenter credentials.

2. Launch the vSphere client by typing the vCenter web client URL.

3. Log in to VMware vSphere using the vCenter credentials of your Azure VMware Solution private cloud.

4. In the vSphere client, you can verify the ESXi hosts that you created in Azure portal.

For more information, see [Access your Private Cloud vCenter portal.](#)

Create an NSX-T segment in the Azure portal

You can create and configure an NSX-T segment from the Azure VMware Solution console in the Azure portal. These segments are connected to the default Tier-1 gateway, and the workloads on these seg-

ments get East-West and North-South connectivity. Once you create the segment, it displays in NSX-T Manager and vCenter.

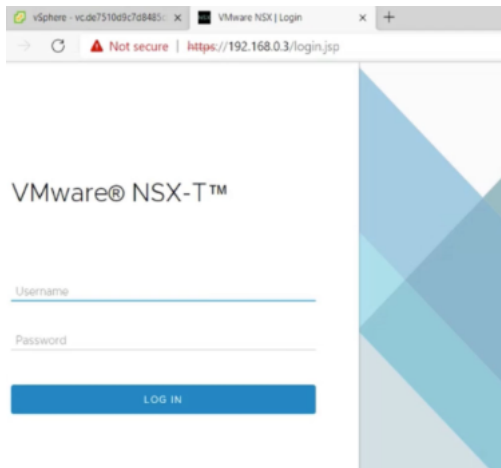

1. In your Azure VMware Solution private cloud, under **Workload Networking**, select **Segments > Add**. Provide the details for the new logical segment and select **OK**. You can create three separate segments for Client, Management, and Server interfaces.

2. In your Azure VMware Solution private cloud, under **Manage**, select **Identity**. Make note of the NSX-T Manager credentials.

3. Launch the VMware NSX-T Manager by typing the NSX-T web client URL.

4. In the NSX-T manager, under **Networking > Segments**, you can see all the segments that you have created. You can also verify the subnets.

For more information, see [Create an NSX-T segment in the Azure portal](#).

Install a NetScaler VPX instance on VMware cloud

After you have installed and configured VMware Software-Defined Data Center (SDDC), you can use the SDDC to install virtual appliances on the VMware cloud. The number of virtual appliances that you can install depends on the amount of memory available on the SDDC.

To install NetScaler VPX instances on VMware cloud, perform these steps in Windows Jumpbox VM:

1. Download the NetScaler VPX instance setup files for ESXi host from the NetScaler downloads site.
2. Open VMware SDDC in the Windows Jumpbox.

3. In the **User Name** and **Password** fields, type the administrator credentials, and then click **Login**.
4. On the **File** menu, click **Deploy OVF Template**.
5. In the **Deploy OVF Template** dialog box, in **Deploy from file** field, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click **Next**.

Note:

By default, the NetScaler VPX instance uses E1000 network interfaces. To deploy ADC with the VMXNET3 interface, modify the OVF to use VMXNET3 interface instead of E1000. Availability of VMXNET3 interface is limited by Azure infrastructure and might not be available in Azure VMware Solution.

6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the VMware SDDC. Click **OK**.

7. Click **Finish** to start installing a virtual appliance on VMware SDDC.

8. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have installed and, from the right-click menu, select **Power On**. Click the **Console** tab to emulate a console port.

9. You are now connected to the NetScaler VM from the vSphere client.

10. To access the NetScaler appliance by using the SSH keys, type the following command in the CLI:

```

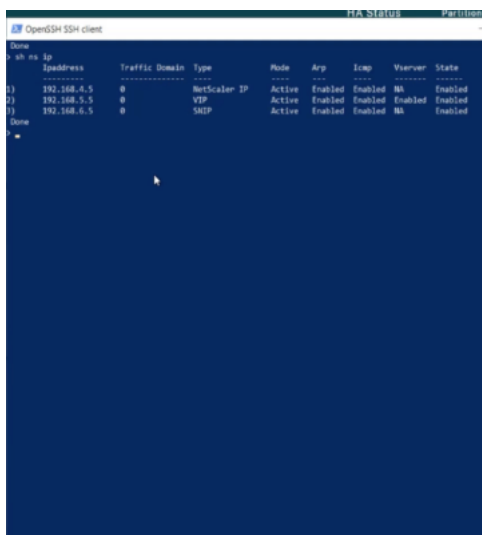

1 ssh nsroot@<management IP address>
2 <!--NeedCopy-->
    
```

Example:

```

1 ssh nsroot@192.168.4.5
2 <!--NeedCopy-->
    
```

11. You can verify the ADC configuration by using the `show ns ip` command.

Configure a NetScaler VPX standalone instance on Azure VMware solution

May 2, 2023

You can configure a NetScaler VPX standalone instance on Azure VMware solution (AVS) for internet facing applications.

The following diagram shows the NetScaler VPX standalone instance on Azure VMware Solution. A client can access the AVS service by connecting to the virtual IP (VIP) address of NetScaler inside the AVS. You can achieve this by provisioning a NetScaler load balancer or the Azure load balancer instance outside AVS but in the same Azure virtual network. Configure the load balancer to access the VIP of the NetScaler VPX instance within AVS service.

Prerequisites

Before you begin installing a virtual appliance, read the following Azure prerequisites:

- For more information on Azure VMware solution and its prerequisites, see [Azure VMware Solution documentation](#).
- For more information on deploying Azure VMware solution, see [Deploy an Azure VMware Solution private cloud](#).
- For more information on creating a Windows Jump box VM to access and manage Azure VMware Solution, see [Access an Azure VMware Solution private cloud](#).

- In Windows Jump box VM, download the NetScaler VPX appliance setup files.
- Create appropriate NSX-T network segments on VMware SDDC to which the virtual machines connect. For more information, see [Add a network segment in Azure VMware Solution](#)
- For more information on how to install a NetScaler VPX instance on VMware cloud, see [Install a NetScaler VPX instance on VMware cloud](#).

Configure a NetScaler VPX standalone instance on AVS using the NetScaler load balancer

Follow these steps to configure the NetScaler VPX standalone instance on AVS for internet facing applications using the NetScaler load balancer.

1. Deploy a NetScaler VPX instance on the Azure cloud. For more information, see [Configure a NetScaler VPX standalone instance](#).

Note:

Ensure that it is deployed on the same virtual network as the Azure VMware Cloud.

2. Configure the NetScaler VPX instance to access the VIP address of NetScaler VPX deployed on AVS.

- a) Add a load balancing virtual server.

```
1 add lb vserver <name> <serviceType> [<vip>] [<port>]
2 <!--NeedCopy-->
```

Example:

```
1 add lb vserver lb1 HTTPS 172.31.0.6 443
2 <!--NeedCopy-->
```

- b) Add a service that connects to the VIP of NetScaler VPX deployed on AVS.

```
1 add service <name> <ip> <serviceType> <port>
2 <!--NeedCopy-->
```

Example:

```
1 add service webserver1 192.168.4.10 HTTP 80
2 <!--NeedCopy-->
```

- c) Bind a service to the load balancing virtual server.

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

Example:

```
1 bind lb vserver lb1 webserver1
2 <!--NeedCopy-->
```

Configure NetScaler VPX standalone instance on AVS using the Azure load balancer

Follow these steps to configure the NetScaler VPX standalone instance on AVS for internet facing applications using the Azure load balancer.

1. Configure an Azure Load Balancer instance on Azure cloud. For more information, see [Azure documentation on creating load balancer](#).
2. Add the VIP address of the NetScaler VPX instance that is deployed on AVS to the back-end pool.

The following Azure command adds one back-end IP address into the load balance back-end address pool.

```
1 az network lb address-pool address add
2     --resource-group <Azure VMC
3     Resource Group>
4     --lb-name <LB Name>
5     --pool-name <Backend pool name
6     >
7     --vnet <Azure VMC Vnet>
8     --name <IP Address name>
9     --ip-address <VIP of ADC in
10    VMC>
11 <!--NeedCopy-->
```

Note:

Ensure that the Azure load balancer is deployed in the same virtual network as the Azure VMware cloud.

Configure a NetScaler VPX high availability setup on Azure VMware solution

May 2, 2023

You can configure a NetScaler VPX HA setup on Azure VMware solution (AVS) for internet facing applications.

The following diagram shows the NetScaler VPX HA pair on AVS. A client can access the AVS service by connecting to the VIP of the primary ADC node inside the AVS. You can achieve this by provisioning a

NetScaler load balancer or the Azure load balancer instance outside AVS but in the same Azure virtual network. Configure the load balancer to access the VIP of primary ADC node within AVS service.

Prerequisites

Before you begin installing a virtual appliance, read the following Azure prerequisites:

- For more information on Azure VMware solution and its prerequisites, see [Azure VMware Solution documentation](#).
- For more information on deploying Azure VMware solution, see [Deploy an Azure VMware Solution private cloud](#).
- For more information on creating a Windows Jump box VM to access and manage Azure VMware Solution, see [Access an Azure VMware Solution private cloud](#).
- In Windows Jump box VM, download the NetScaler VPX appliance setup files.
- Create appropriate NSX-T network segments on VMware SDDC to which the virtual machines connect. For more information, see [Add a network segment in Azure VMware Solution](#).

Configuration steps

Follow these steps to configure the NetScaler VPX high availability setup in AVS for internet facing applications.

1. Create two NetScaler VPX instances on VMware cloud. For more information, see [Install a NetScaler VPX instance on VMware cloud](#).

2. Configure the NetScaler HA setup. For more information, see [Configuring high availability](#).
3. Configure the NetScaler HA setup to be accessible for internet facing applications.
 - To configure the NetScaler VPX instance using the NetScaler load balancer, see [Configure a NetScaler VPX standalone instance on AVS using the NetScaler load balancer](#).
 - To configure the NetScaler VPX instance using the Azure load balancer, see [Configure NetScaler VPX standalone instance on AVS using the Azure load balancer](#).

Configure Azure route server with NetScaler VPX HA pair

May 2, 2023

You can configure Azure route server with NetScaler VPX instance to exchange the VIP routes configured with virtual network using the BGP protocol. The NetScaler can be deployed in standalone or in HA-INC mode, and then configured with BGP. This deployment doesn't require an Azure load balancer (ALB) in front of the ADC HA pair.

The following diagram depicts how a VPX HA topology is integrated with the Azure route server. Each of the ADC instances has 3 interfaces: one for management, one for client traffic, and one for server traffic.

The topology diagram uses the following IP addresses.

Sample IP configuration for primary ADC instance:

```

1 NSIP: 10.0.0.4/24
2 SNIP on 1/1: 10.0.1.4/24
3 SNIP on 1/2: 10.0.2.4/24
4 VIP: 172.168.1.1/32
5 <!--NeedCopy-->
    
```

Sample IP configuration for secondary ADC instance:

```

1 NSIP: 10.0.0.5/24
2 SNIP on 1/1: 10.0.1.5/24
3 SNIP on 1/2: 10.0.2.5/24
4 VIP: 172.168.1.1/32
5 <!--NeedCopy-->
    
```

Prerequisites

You must be familiar with the following information before deploying a NetScaler VPX instance on Azure.

- Azure terminology and network details. For more information, see [Azure terminology](#).

- Overview of Azure Route Server. For more information, see [What is Azure Route Server?](#).
- Working of a NetScaler appliance. For more information, see [NetScaler documentation](#).
- NetScaler networking. For more information, see the [ADC Networking](#).

How to configure an Azure route server with NetScaler VPX HA pair

1. Create a route server in the Azure portal. For more information, see [Create and configure a Route Server using the Azure portal](#).

In the following example, subnet 10.0.3.0/24 is used for deploying Azure server. Once the route server is created, get the route server IP addresses, for example: 10.0.3.4, 10.0.3.5.

2. Set up peering with network virtual appliance (NVA) in the Azure portal. Add your NetScaler VPX instance as the NVA. For more information, see [Set up peering with NVA](#).

In the following example, the ADC SNIP on 1/1 interfaces: 10.0.1.4 and 10.0.1.5, and the ASN: 400 and 500, are used while adding the peer.

3. Add two NetScaler VPX instances for the HA configuration.

Complete the following steps:

- a) Deploy two VPX instances (primary and secondary instances) on Azure.
- b) Add client and server NIC on both the instances.

- c) Configure HA settings on both instances by using the NetScaler GUI.
4. Configure dynamic routing in the primary ADC instance.

Sample configuration:

```
1 enable ns mode L3 MBF USNIP SRADV DRADV PMTUD
2 enable ns feature LB BGP
3 add ns ip 10.0.1.4 255.255.255.0 -vServer DISABLED -dynamicRouting
  ENABLED
4 VTYSH
5 configure terminal
6 router BGP 400
7 timers bgp 1 3
8 neighbor 10.0.3.4 remote-as 65515
9 neighbor 10.0.3.4 advertisement-interval 3
10 neighbor 10.0.3.4 fall-over bfd
11 neighbor 10.0.3.5 remote-as 65515
12 neighbor 10.0.3.5 advertisement-interval 3
13 neighbor 10.0.3.5 fall-over bfd
14 address-family ipv4
15 redistribute kernel
16 redistribute static
17 <!--NeedCopy-->
```

5. Configure dynamic routing in the secondary ADC instance.

Sample configuration:

```
1 enable ns mode L3 MBF USNIP SRADV DRADV PMTUD
2 enable ns feature LB BGP
3 add ns ip 10.0.1.5 255.255.255.0 -vServer DISABLED -dynamicRouting
  ENABLED
4 VTYSH
5 configure terminal
6 router BGP 500
7 timers bgp 1 3
8 neighbor 10.0.3.4 remote-as 65515
9 neighbor 10.0.3.4 advertisement-interval 3
10 neighbor 10.0.3.4 fall-over bfd
11 neighbor 10.0.3.5 remote-as 65515
12 neighbor 10.0.3.5 advertisement-interval 3
13 neighbor 10.0.3.5 fall-over bfd
14 address-family ipv4
15 redistribute kernel
16 redistribute static
17 <!--NeedCopy-->
```

6. Verify the BGP peers established using the BGP commands in the VTY shell interface. For more information, see [Verifying the BGP Configuration](#).

```
1 show ip bgp neighbors
2 <!--NeedCopy-->
```

7. Configure LB virtual server in the primary ADC instance.

Sample configuration:

```
1 add ns ip 172.16.1.1 255.255.255.255 -type VIP -hostRoute ENABLED
2 add lbvserver v1 HTTP 172.16.1.1 80
3 add service s1 10.0.2.6 HTTP 80
4 bind lbvserver v1 s1
5 enable ns feature lb
6 <!--NeedCopy-->
```

A client in the same virtual network as of the NetScaler VPX instance can now access the LB virtual server. In this case, the NetScaler VPX instance advertises the VIP route to the Azure route server.

Add back-end Azure Autoscaling service

November 24, 2023

Efficient hosting of applications in a cloud involves easy and cost-effective management of resources depending on the application demand. To meet increasing demand, you have to scale up network resources. Whether demand subsides, you must scale down to avoid the unnecessary cost of idle resources. To minimize the cost of running the application, you have to constantly monitor traffic, memory and CPU use, and so on. However, monitoring traffic manually is cumbersome. For the application environment to scale up or down dynamically, you must automate the processes of monitoring traffic and scaling resources up and down whenever necessary.

You can use Autoscale with Azure virtual machine scale sets (VMSS) for VPX multi-IP standalone and high availability deployment on Azure.

Integrated with the Azure VMSS and Autoscale feature, the NetScaler VPX instance provides the following advantages:

- **Load balance and management:** Auto configures servers to scale up and scale down, depending on demand. The NetScaler VPX instance auto detects the VMSS Autoscale setting in the same virtual network where the VPX instance is deployed, or the peered virtual networks that are in the same Azure subscription. You can select the VMSS Autoscale setting to balance the load. This is done by auto configuring NetScaler virtual IP address and subnet IP address on the VPX instance.
- **High availability:** Detects Autoscale groups and load balances servers.
- **Better network availability:** The VPX instance supports back-end servers on different virtual networks (VNETs).

For more information, see the following Azure topic

- [Virtual Machine Scale Sets Documentation](#)
- [Overview of Autoscale in Microsoft Azure Virtual Machines, Cloud Services, and Web Apps](#)

Before you begin

- Read Azure-related usage guidelines. For more information, see [Deploy a NetScaler VPX instance on Microsoft Azure](#).
- Create one or more NetScaler VPX instances with three network interfaces on Azure according to your requirement (standalone or high availability deployment).
- Open the TCP 9001 port on the network security group of the 0/1 interface of the VPX instance. The VPX instance uses this port to receive the scale-out and scale-in notification.
- Create an Azure VMSS in the same virtual network, where the NetScaler VPX instance is deployed. If the VMSS and NetScaler VPX instance are deployed in different Azure virtual networks, the following conditions have to be met:
 - Both the virtual networks must be in the same Azure subscription.
 - The two virtual networks must be connected using the virtual network peering feature of Azure.

If you don't have an existing VMSS configuration, complete the following tasks:

- Create a VMSS
- Enable Autoscale on VMSS
- Create scale-in and scale-out policies in VMSS Autoscale setting

For more information, see [Overview of Autoscale with Azure virtual machine scale sets](#).

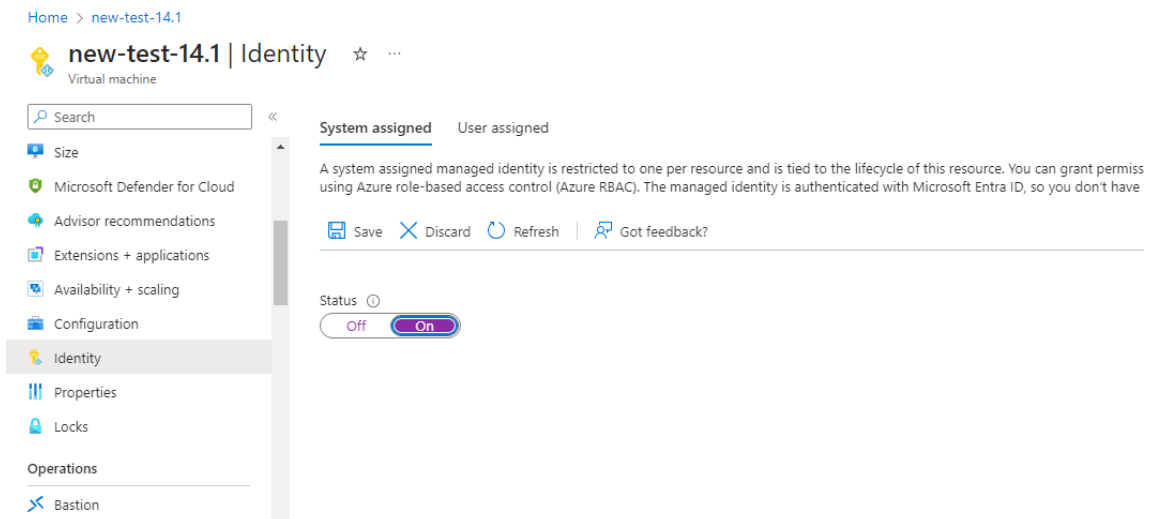

- NetScaler VPX supports VMSS with Uniform orchestration only. VMSS with Flexible orchestration is not supported. For more information, see [Orchestration modes for Virtual Machine Scale Sets in Azure](#).
- Starting from NetScaler release 14.1-12.x, NetScaler VPX supports managed identity in the Azure cloud. Managed identities link a Service Principal to an Azure resource like a virtual machine. With managed identity, you don't need to manage the cloud credentials (Application ID, Application secret, and Tenant ID) thus avoiding security risks. Currently, NetScaler VPX supports only the system-assigned and a single-user assigned managed identity. Multiple-user assigned managed identity is not supported.

For NetScaler releases prior to 14.1-12.x, you must manually manage the cloud credentials in NetScaler VPX through Azure Active Directory (AAD). Assign a contributor role to the newly created AAD application. The cloud credentials must be recreated periodically after it expires. For more information, see [Create an Azure Active Directory application and service principal](#).

When you configure managed identity on Azure console and cloud credentials in NetScaler, managed identity takes precedence over cloud credentials.

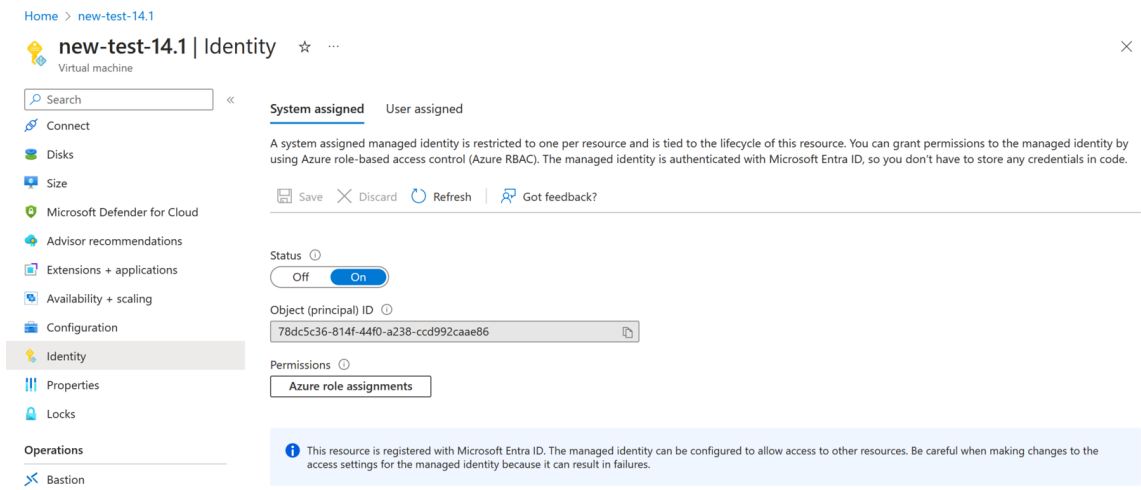

Configure a managed identity on a virtual machine

1. Sign in to the Azure portal.
2. Navigate to your virtual machine and select **Identity**.
3. Choose either **System assigned** or **User assigned** based on your requirements.
4. Under **Status**, select **On** and then click **Save**.

Once the status is saved, you see a service principal object is created and assigned to the VM.

5. Click **Azure role assignments**.

6. In the **Add role assignment** window, select a scope. You can select from the following options:

- Subscription

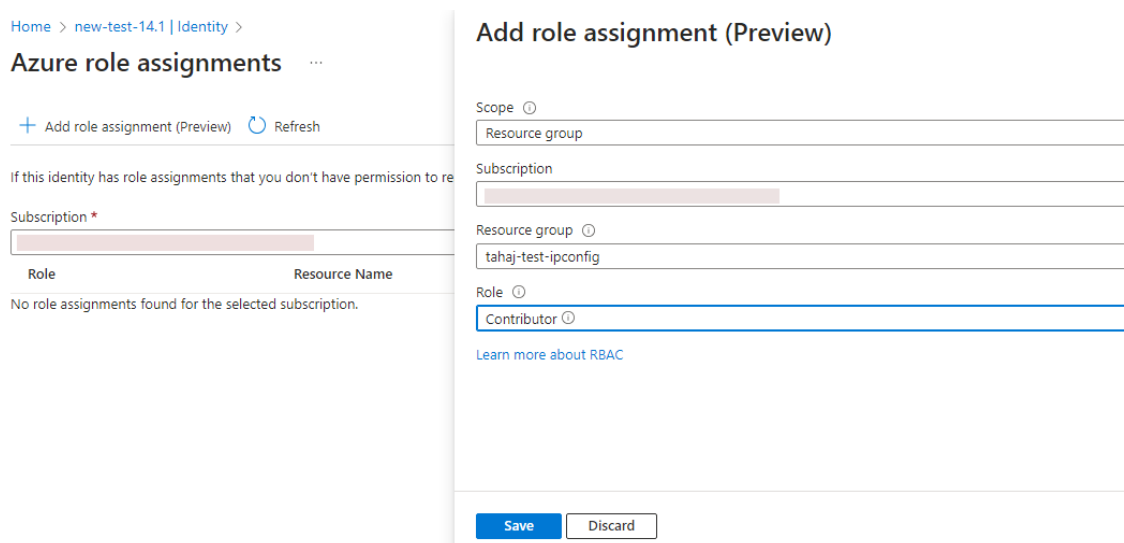

If the VMSS and VM are in different resource groups, use **Subscription** as the scope.

- Resource group

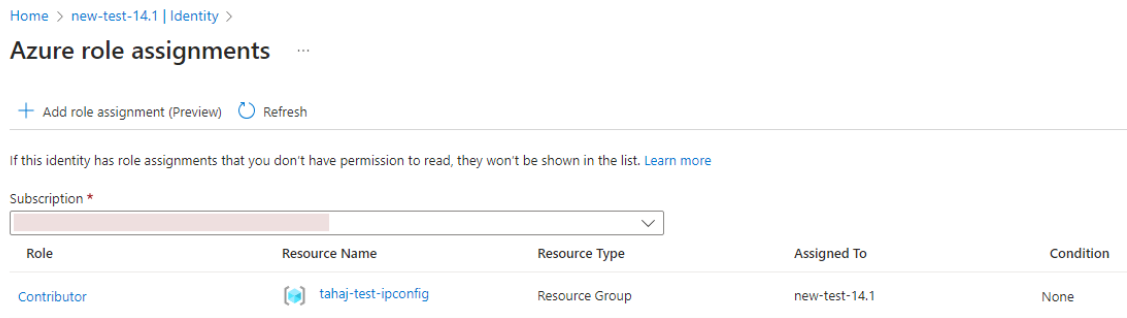

If the VMSS is in the same resource group as your VM, use **Resource group** as the scope.

- Key Vault
- Storage
- SQL

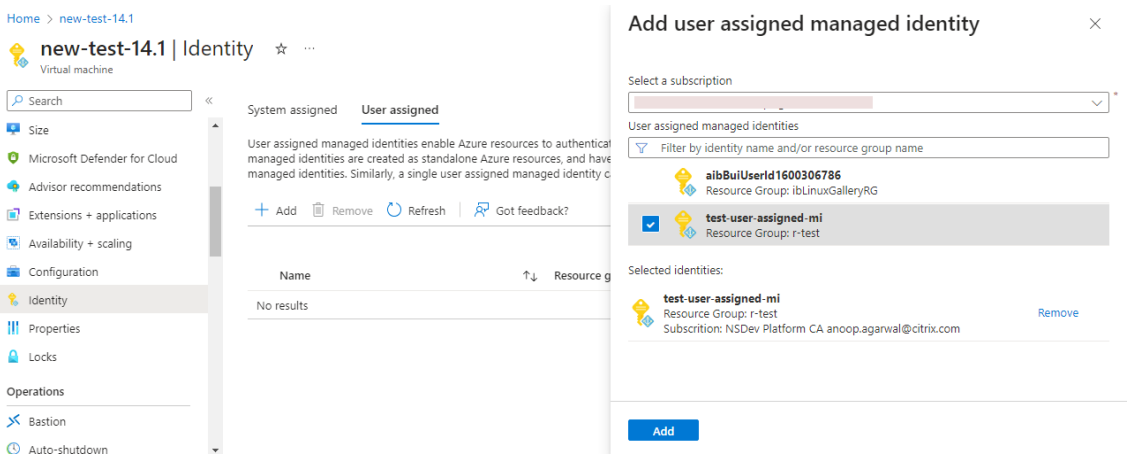

Based on your scope selection, fill in the details for other fields. Assign a **Contributor** role and **Save** the configuration.

The **Azure role assignments** page displays the managed identity that you created.

7. To create a user assigned managed identity, select a subscription, choose a user assigned managed identity, and click **Add**.

Add VMSS to a NetScaler VPX instance

Complete the following steps to add the Autoscale setting to the VPX instance:

1. Log on to the VPX instance.
2. Navigate to **Configuration > Azure > Set Credentials**. Add the required Azure credentials for the Autoscale feature to work.

← Set Credentials

Tenant ID

Application ID

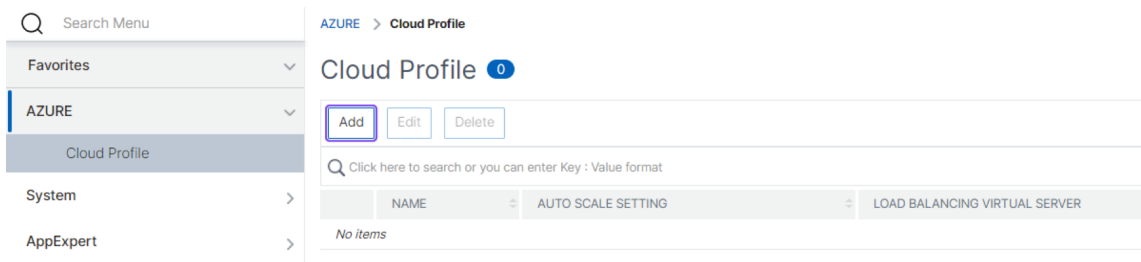

Application Secret

OK **Cancel**

Note:

If you are using Azure managed identity, it is not required to set credentials.

- Go to **System > Azure > Cloud Profile** and click **Add** to create a cloud profile.

The **Create Cloud Profile** configuration page appears.

← Create Cloud Profile

Name	<input type="text" value="_CloudProfile_"/>
Virtual Server IP Address*	<input type="text" value="10.0.1.4"/>
Type	<input type="text" value="AUTOSCALE"/>
Load Balancing Server Protocol	<input type="text" value="HTTP"/>
Load Balancing Server Port	<input type="text" value="80"/>
Auto Scale Setting*	<input type="text"/>
Auto Scale Setting Protocol	<input type="text" value="HTTP"/>
Auto Scale Setting Port	<input type="text" value="80"/>

Cloud profile creates a NetScaler load balancing virtual server and a service group with members (servers) as the servers of the Auto Scaling Group. Your back-end servers must be reachable through the SNIP configured on the VPX instance.

Points to keep in mind while creating a cloud profile

- The virtual server IP address is auto-populated from the free IP address available to the VPX instance. For more information, see [Assign multiple IP addresses to virtual machines using the Azure portal](#).
- The autoscale setting is prepopulated from the VMSS instance that is connected to the NetScaler VPX instance either in the same virtual network or peered virtual networks. For more information, see [Overview of Autoscale with Azure virtual machine scale sets](#).
- While selecting the **Auto Scale Setting Protocol** and **Auto Scale Setting Port**, ensure that your servers listen on the protocols and ports, and you bind the correct monitor in the service group. By default, the TCP monitor is used.
- For SSL Protocol type autoscaling, after you create the cloud profile, the load balance virtual server or service group is down because of a missing certificate. You can bind the certificate to the virtual server or service group manually.

Note:

From NetScaler release 13.1-42.x onwards, you can create different cloud profiles for different services (using different ports) with the same VMSS in Azure. Thus, the NetScaler VPX instance supports multiple services with the same Autoscaling group in the public cloud.

To view autoscale-related information in the Azure portal, go to **Virtual machine scale sets**, and select **virtual machine scale set > Scaling**.

References

For information on autoscaling of NetScaler VPX in Microsoft Azure using NetScaler Console, see [Azure Autoscale using NetScaler ADM](#).

Azure tags for NetScaler VPX deployment

May 2, 2023

In the Azure cloud portal, you can tag resources with a name: value pair (such as Dept: Finance) to categorize and view resources across resource groups and, within the portal, across subscriptions. Tagging is helpful when you need to organize resources for billing or management or automation.

How Azure tag works for VPX deployment

For NetScaler VPX standalone and high-availability instances deployed on Azure Cloud, now you can create load balancing service groups associated with an Azure tag. The VPX instance constantly monitors Azure virtual machines (back-end servers) and network interfaces (NICs), or both, with the respective tag and updates the service group accordingly.

The VPX instance creates the service group that load balances the back-end servers using tags. The instance queries the Azure API for all resources that are tagged with a particular tag name and tag value. Depending on the assigned poll period (by default 60 seconds), the VPX instance periodically polls the Azure API and retrieves the resources available with the tag name and tag values assigned in the VPX GUI. Whenever a VM or NIC with the appropriate tag is added or deleted, the ADC detects the respective change and adds or deletes the VM or NIC IP address from the service group automatically.

Before you begin

Before creating NetScaler load balancing service groups, add a tag to the servers in Azure. You can assign the tag to either the virtual machine or to NIC.

Name	Value	
Creator	: d34eed9579934591afbbdf28c92caf51	
info_no_auto_shutdown	: temporarily disable automated vm shutdown, if set to 'true', default value is 'false'. A 3 day lease by default will be provided during next run of on auto script if no view/update lease datetime. only valid if no_auto_shutdown tag set to 'true'. max 14 days lease is allowed. all generic date/time string are valid (eg. 'Tue Jun 20	
info_no_auto_shutdown_lease_datetime_UTC	:	
no_auto_shutdown	: false	
no_auto_shutdown_lease_datetime_UTC	:	
tag1	: false	
	:	

For more information about adding Azure tags, see Microsoft document [Use tags to organize your Azure resources.](#)

Note

ADC CLI commands to add Azure tag settings support tag names and tag values that start only with numerals or alphabets and not other keyboard characters.

How to add Azure tag settings by using VPX GUI

You can add the Azure tag cloud profile to a VPX instance by using the VPX GUI so that the instance can load balance the back-end servers using the specified tag. Follow these steps:

1. From the VPX GUI, go to **Configuration > Azure > Cloud Profile**.
2. Click Add to create a cloud profile. The cloud profile window opens.

Create Cloud Profile

Name

Virtual Server IP Address*

Type

Azure Tag Name

Azure Tag Value

Azure Poll Periods

Load Balancing Server Protocol

Load Balancing Server Port

Azure Tag Setting*

Azure Tag Setting Protocol

Azure Tag Setting Port

1. Enter values for the following fields:

- Name: Add a name for your profile
- Virtual Server IP Address: The virtual server IP address is auto-populated from the free IP address available to the VPX instance. For more information, see [Assign multiple IP addresses to virtual machines using the Azure portal](#).
- Type: From the menu, select AZURETAGS.
- Azure Tag Name: Enter the name that you have assigned to the VMs or NICs in the Azure portal.
- Azure Tag Value: Enter the value that you have assigned to the VMs or NICs in Azure portal.
- Azure Poll Periods: By default the poll period is 60 seconds, which is the minimum value. You can change it according to your requirement.
- Load Balancing Server Protocol: Select the protocol that your load balancer listens on.
- Load Balancing Server Port: Select the port that your load balancer listens on.
- Azure tag setting: The name of the service group that will be created for this cloud profile.
- Azure Tag Setting Protocol: Select the protocol that your back-end servers listen on.
- Azure Tag Setting Port: Select the port that your back-end servers listen on.

2. Click **Create**.

A load-balancer virtual server and a service group are created for the tagged VMs or NICs. To see the load balancer virtual server, from the VPX GUI, navigate to **Traffic Management > Load Balancing > Virtual Servers**.

How to add Azure tag settings by using VPX CLI

Type the following command on NetScaler CLI to create a cloud profile for Azure tags.

```

1 add cloud profile `<profile name>` -type azuretags -vServerName `<
  vserver name>` -serviceType HTTP -IPAddress `<vserver IP address>` -
  port 80 -serviceGroupName `<service group name>` -
  boundServiceGroupSvcType HTTP -vsrvbindsvcpport 80 -azureTagName `<
  Azure tag specified on Azure portal>` -azureTagValue `<Azure value
  specified on the Azure portal>` -azurePollPeriod 60
2
3 <!--NeedCopy-->

```

Important

You must save all configurations; otherwise, the configurations are lost after you restart the instance. Type `save config`.

Example 1: Here's a sample command for a cloud profile for HTTP traffic of all Azure VMs/NICs tagged with the "myTagName/myTagValue" pair:

```

1 add cloud profile MyTagCloudProfile -type azuretags -vServerName
  MyTagVServer -serviceType HTTP -IPAddress 40.115.116.57 -port 80 -
  serviceGroupName MyTagsServiceGroup -boundServiceGroupSvcType HTTP -
  vsvrbindsvcpport 80 -azureTagName myTagName -azureTagValue myTagValue
  -azurePollPeriod 60
2 Done
3 <!--NeedCopy-->

```

To display the cloud profile, type `show cloudprofile`.

Example 2: The following CLI command prints information about the newly added cloud profile in example 1.

```

1 show cloudprofile
2 1)   Name: MyTagCloudProfile Type: azuretags      VServerName:
      MyTagVServer ServiceType: HTTP      IPAddress: 52.178.209.133
      Port: 80      ServiceGroupName: MyTagsServiceGroup
      BoundServiceGroupSvcType: HTTP
3     Vsvrbindsvcpport: 80   AzureTagName: myTagName AzureTagValue:
      myTagValue AzurePollPeriod: 60   GraceFul: NO
      Delay: 60
4 <!--NeedCopy-->

```

To remove a cloud profile, type `rm cloud profile <cloud profile name>`

Example 3: The following command removes the cloud profile created in example 1.

```

1 > rm cloudprofile MyTagCloudProfile
2 Done
3 <!--NeedCopy-->

```

Troubleshooting

Issue: In very rare cases, the “rm cloud profile” CLI command might fail to remove service group and servers associated with the deleted cloud profile. This happens when the command is issued seconds before the poll period of the cloud profile being deleted elapses.

Solution: Manually delete the remaining service groups by entering the following CLI command for each of the remaining service groups:

```

1 #> rm servicegroup <serviceName>
2
3 <!--NeedCopy-->

```

Also remove each of the remain servers by entering the following CLI command for each of the remaining servers:

```

1 #> rm server <name>
2 <!--NeedCopy-->

```

Issue: If you add an Azure tag setting to a VPX instance by using CLI, the `rain_tags` process continues to run on an HA pair node after a warm reboot.

Solution: Manually terminate the process on the secondary node after a warm reboot. From the CLI of the secondary HA node exit to the shell prompt:

```
1 #> shell
2
3 <!--NeedCopy-->
```

Use the following command to kill the `rain_tags` process:

```
1 # PID=`ps -aux | grep rain_tags | awk '{
2   print $2 }
3   `; kill -9 $PID
4
5 <!--NeedCopy-->
```

Issue: Back-end servers might not be reachable and reported as DOWN by the VPX instance, in spite of being healthy.

Solution: Make sure that the VPX instance can reach the tagged IP address corresponding to the back-end server. For a tagged NIC, this is the NIC IP address; whereas for a tagged VM, this is the VM's primary IP address. If the VM/NIC resides on a different Azure VNet, make sure that VNet peering is enabled.

Configure GSLB on NetScaler VPX instances

May 9, 2023

NetScaler appliances configured for global server load balancing (GSLB) provide disaster recovery and continuous availability of applications by protecting against points of failure in a WAN. GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers if there is an outage.

This section describes how to enable GSLB on VPX instances on two sites in a Microsoft Azure environment, by using Windows PowerShell commands.

Note

For more information about GSLB, see [Global Server Load Balancing](#).

You can configure GSLB on a NetScaler VPX instance on Azure, in two steps:

1. Create a VPX instance with multiple NICs and multiple IP addresses, on each site.
2. Enable GSLB on the VPX instances.

Note

For more information about configuring multiple NICs and IP addresses see: [Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands](#)

Scenario

This scenario includes two sites - Site 1 and Site 2. Each site has a VM (VM1 and VM2) configured with multiple NICs, multiple IP addresses, and GSLB.

Figure. GSLB setup implemented across two sites - Site 1 and Site 2.

In this scenario, each VM has three NICs - NIC 0/1, 1/1, and 1/2. Each NIC can have multiple private and public IP addresses. The NICs are configured for the following purposes.

- NIC 0/1: to serve management traffic
- NIC 1/1: to serve client-side traffic
- NIC 1/2: to communicate with back-end servers

For information about the IP addresses configured on each NIC in this scenario, see the IP configuration details section.

Parameters

Following are sample parameters settings for this scenario in this document. You can use different settings if you want.

```
1 $location="West Central US"
```

```
2
3 $vnetName="NSVPX-vnet"
4
5 $RGName="multiIP-RG"
6
7 $prmStorageAccountName="multiipstorageacctnt"
8
9 $avSetName="MultiIP-avset"
10
11 $vmSize="Standard\_DS3\_V2"
12
13 <!--NeedCopy-->
```

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2 GB RAM.

```
1 $publisher="citrix"
2
3 $offer="netscalervpx111"
4
5 $sku="netscalerbyol"
6
7 $version="latest"
8
9 $vmNamePrefix="MultiIPVPX"
10
11 $nicNamePrefix="MultiipVPX"
12
13 $osDiskSuffix="osdiskdb"
14
15 $numberOfVMs=1
16
17 $ipAddressPrefix="10.0.0."
18
19 $ipAddressPrefix1="10.0.1."
20
21 $ipAddressPrefix2="10.0.2."

23 $pubIPName1="MultiIP-pip1"
24
25 $pubIPName2="MultiIP-pip2"
26
27 $IPConfigName1="IPConfig1"
28
29 $IPConfigName2="IPConfig-2"
30
31 $IPConfigName3="IPConfig-3"
32
33 $IPConfigName4="IPConfig-4"
34
35 $frontendSubnetName="default"
36
37 $backendSubnetName1="subnet\_1"
38
```

```
39 $backendSubnetName2="subnet\_2"  
40  
41 $suffixNumber=10  
42 <!--NeedCopy-->
```

Create a VM

Follow steps 1–10 to create VM1 with multiple NICs and multiple IP addresses, by using PowerShell commands:

1. [Create resource group](#)
2. [Create storage account](#)
3. [Create availability set](#)
4. [Create virtual network](#)
5. [Create public IP address](#)
6. [Create NICs](#)
7. [Create VM config object](#)
8. [Get credentials and set OS properties for the VM](#)
9. [Add NICs](#)
10. [Specify OS disk and create VM](#)

After you complete all the steps and commands to create VM1, repeat these steps to create VM2 with parameters specific to it.

Create resource group

```
1 New-AzureRMResourceGroup -Name $RGName -Location $location  
2 <!--NeedCopy-->
```

Create storage account

```
1 $prmStorageAccount=New-AzureRMStorageAccount -Name  
    $prmStorageAccountName -ResourceGroupName $RGName -Type Standard_LRS  
    -Location $location  
2 <!--NeedCopy-->
```

Create availability set

```
1 $avSet=New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName
  $RGName -Location $location
2 <!--NeedCopy-->
```

Create virtual network

1. Add subnets.

```
1 $subnet1=New-AzureRmVirtualNetworkSubnetConfig -Name
  $frontendSubnetName -AddressPrefix "10.0.0.0/24"
2 $subnet2=New-AzureRmVirtualNetworkSubnetConfig -Name
  $backendSubnetName1 -AddressPrefix "10.0.1.0/24"
3 $subnet3=New-AzureRmVirtualNetworkSubnetConfig -Name
  $backendSubnetName2 -AddressPrefix "10.0.2.0/24"
4 <!--NeedCopy-->
```

2. Add virtual network object.

```
1 $vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
  $RGName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet
  $subnet1, $subnet2, $subnet3
2 <!--NeedCopy-->
```

3. Retrieve subnets.

```
1 $frontendSubnet=$vnet.Subnets|?{
2   $_.Name -eq $frontendSubnetName }
3
4 $backendSubnet1=$vnet.Subnets|?{
5   $_.Name -eq $backendSubnetName1 }
6
7 $backendSubnet2=$vnet.Subnets|?{
8   $_.Name -eq $backendSubnetName2 }
9
10 <!--NeedCopy-->
```

Create public IP address

```
1 $pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName
  $RGName -Location $location -AllocationMethod Dynamic
2 $pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName
  $RGName -Location $location -AllocationMethod Dynamic
3 <!--NeedCopy-->
```

Create NICs

Create NIC 0/1

```

1 $nic1Name=$nicNamePrefix + $suffixNumber + "--Mgmt"
2 $ipAddress1=$ipAddressPrefix + $suffixNumber
3 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
    SubnetId $frontendSubnet.Id -PublicIpAddress $pip1 -PrivateIpAddress
    $ipAddress1 -Primary
4 $nic1=New-AzureRMNetworkInterface -Name $nic1Name -ResourceGroupName
    $RGName -Location $location -IpConfiguration $IpConfig1
5 <!--NeedCopy-->

```

Create NIC 1/1

```

1 $nic2Name $nicNamePrefix + $suffixNumber + "--frontend"
2 $ipAddress2=$ipAddressPrefix1 + ($suffixNumber)
3 $ipAddress3=$ipAddressPrefix1 + ($suffixNumber + 1)
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -
    PublicIpAddress $pip2 -SubnetId $backendSubnet1.Id -
    PrivateIpAddress $ipAddress2 -Primary
5 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
    SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress3 -
6 nic2=New-AzureRMNetworkInterface -Name $nic2Name -ResourceGroupName
    $RGName -Location $location -IpConfiguration $IpConfig2, $IpConfig3
7 <!--NeedCopy-->

```

Create NIC 1/2

```

1 $nic3Name=$nicNamePrefix + $suffixNumber + "--backend"
2 $ipAddress4=$ipAddressPrefix2 + ($suffixNumber)
3 $IPConfig4=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -
    SubnetId $backendSubnet2.Id -PrivateIpAddress $ipAddress4 -Primary
4 $nic3=New-AzureRMNetworkInterface -Name $nic3Name -ResourceGroupName
    $RGName -Location $location -IpConfiguration $IpConfig4
5 <!--NeedCopy-->

```

Create VM config object

```

1 $vmName=$vmNamePrefix
2 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avSet.Id
3 <!--NeedCopy-->

```

Get credentials and set OS properties

```

1 $cred=Get-Credential -Message "Type the name and password for VPX login
    ."

```

```

2 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
  ComputerName $vmName -Credential $cred
3 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
  $publisher -Offer $offer -Skus $sku -Version $version
4 <!--NeedCopy-->

```

Add NICs

```

1 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -
  Primary
2 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id
3 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id
4 <!--NeedCopy-->

```

Specify OS disk and create VM

```

1 $osDiskName=$vmName + "-" + $osDiskSuffix
2 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
  + $osDiskName + ".vhd"
3 $vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri
  $osVhdUri -CreateOption fromImage
4 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -
  Name $sku
5 New-AzureRMVM -VM $vmConfig -ResourceGroupName $RGName -Location
  $location
6 <!--NeedCopy-->

```

Note

Repeat steps 1–10 listed in “Create Multi-NIC VMs by Using PowerShell Commands” to create VM2 with parameters specific to VM2.

IP configuration details

The following IP addresses are used.

Table 1. IP addresses used in VM1

NIC	Private IP	Public IP (PIP)	Description
0/1	10.0.0.10	PIP1	Configured as NSIP (management IP)
1/1	10.0.1.10	PIP2	Configured as SNIP/GSLB Site IP

NIC	Private IP	Public IP (PIP)	Description
-	10.0.1.11	-	Configured as LB server IP. Public IP is not mandatory
1/2	10.0.2.10	-	Configured as SNIP for sending monitor probes to services; public IP is not mandatory

Table 2. IP addresses used in VM2

NIC	Internal IP	Public IP (PIP)	Description
0/1	20.0.0.10	PIP4	Configured as NSIP (management IP)
1/1	20.0.1.10	PIP5	Configured as SNIP/GSLB Site IP
-	20.0.1.11	-	Configured as LB server IP. Public IP is not mandatory
1/2	20.0.2.10	-	Configured as SNIP for sending monitor probes to services; public IP is not mandatory

Here are sample configurations for this scenario, showing the IP addresses and initial LB configurations as created through the NetScaler VPX CLI for VM1 and VM2.

Here's an example configuration on VM1.

```

1 add ns ip 10.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2 Add nsip 10.0.2.10 255.255.255.0
3 add service svc1 10.0.1.10 ADNS 53
4 add lb vserver v1 HTTP 10.0.1.11 80
5 add service s1 10.0.2.120 http 80
6 Add service s2 10.0.2.121 http 80
7 Bind lb vs v1 s[1-2]
8 <!--NeedCopy-->

```

Here's an example configuration on VM2.

```
1 add ns ip 20.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2 Add nsip 20.0.2.10 255.255.255.0
3 add service svc1 20.0.1.10 ADNS 53
4 add lb vserver v1 HTTP 20.0.1.11 80
5 Add service s1 20.0.2.90 http 80
6 Add service s2 20.0.2.91 http 80
7 Bind lb vs v1 s[1-2]
8 <!--NeedCopy-->
```

Configure GSLB sites and other settings

Perform the tasks described in the following topic to configure the two GSLB sites and other necessary settings:

Global Server Load Balancing

For more information, see this support article: <https://support.citrix.com/article/CTX110348>

Here's an example GSLB configuration on VM1 and VM2.

```
1 enable ns feature LB GSLB
2 add gslb site site1 10.0.1.10 -publicIP PIP2
3 add gslb site site2 20.0.1.10 -publicIP PIP5
4 add gslb service site1_gslb_http_svc1 10.0.1.11 HTTP 80 -publicIP PIP3
  -publicPort 80 -siteName site1
5 add gslb service site2_gslb_http_svc1 20.0.1.11 HTTP 80 -publicIP PIP6
  -publicPort 80 -siteName site2
6 add gslb vserver gslb_http_vip1 HTTP
7 bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
8 bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
9 bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
10 <!--NeedCopy-->
```

You've configured GSLB on NetScaler VPX instances running on Azure.

Disaster recovery

Disaster is a sudden disruption of business functions caused by natural calamities or human caused events. Disasters affect data center operations, after which resources and the data lost at the disaster site must be fully rebuilt and restored. The loss of data or downtime in the data center is critical and collapses the business continuity.

One of the challenges that customers face today is deciding where to put their DR site. Businesses are looking for consistency and performance regardless of any underlying infrastructure or network faults.

Possible reasons many organizations are deciding to migrate to the cloud are:

- Having an on-prem data center is very expensive. By using the cloud, the businesses can free up time and resource from expanding their own systems.
- Many of the automated orchestration enables faster recovery
- Replicate data by providing continuous data protection or continuous snapshots to guard against any outage or attack.
- Support use cases where customers need many different types of compliance and security control which are already present on the public clouds. These make it easier to achieve the compliance they need rather than building their own.

A NetScaler configured for GSLB forwards traffic to the least-loaded or best-performing data center. This configuration, referred to as an active-active setup, not only improves performance, but also provides immediate disaster recovery by routing traffic to other data centers if a data center that is part of the setup goes down. NetScaler thereby saves customers valuable time and money.

Multi-NIC Multi-IP (Three-NIC) deployment for disaster recovery

Customers would potentially deploy using three-NIC deployment if they are deploying into a production environment where security, redundancy, availability, capacity, and scalability are critical. With this deployment method, complexity and ease of management are not critical concerns to the users.

Single-NIC Multi-IP (One-NIC) deployment for disaster recovery

Customers would potentially deploy using one-NIC deployment if they are deploying into a non-production environment for the following reasons:

- Setting up the environment for testing, or they are staging a new environment before production deployment.
- Deploying directly to the cloud quickly and efficiently.
- While seeking the simplicity of a single subnet configuration.

Configure GSLB on an active-standby high-availability setup

May 2, 2023

You can configure global server load balancing (GSLB) on active-standby HA deployment on Azure in three steps:

1. Create a VPX HA pair on each GSLB site. See [Configure a high-availability setup with multiple IP addresses and NICs](#) for information about how to create an HA pair.
2. Configure the Azure Load Balancer (ALB) with the front-end IP address and rules to allow GSLB and DNS traffic.

This step involves the following substeps. See the scenario in this section for the PowerShell commands used to complete these substeps.

- a. Create a front-end `IPconfig` for GSLB site.
- b. Create a back-end address pool with IP address of NIC 1/1 of nodes in HA.
- c. Create load-balancing rules for following:

```

1 TCP/3009 - gslb communication
2 TCP/3008 - gslb communication
3 UDP/53 - DNS communication
    
```

- d. Associate back-end address pool with the LB rules created in step c.
 - e. Update the network security group of NIC 1/1 of nodes in both the HA pair to allow the traffic for TCP 3008, TCP 3009 and UDP 53 ports.
3. Enable GSLB on each HA pair.

Scenario

This scenario includes two sites - Site 1 and Site 2. Each site has an HA pair (HA1 and HA2) configured with multiple NICs, multiple IP addresses, and GSLB.

Figure: GLSB on Active-Standy HA Deployment on Azure

In this scenario, each VM has three NICs - NIC 0/1, 1/1, and 1/2. The NICs are configured for the following purposes.

NIC 0/1: to serve management traffic

NIC 1/1: to serve client-side traffic

NIC 1/2: to communicate with back-end servers

Parameter Settings

Following are sample parameters settings for the ALB. You can use different settings if you want.

```
1 $locName="South east Asia"
2
3 $rgName="MultiIP-MultiNIC-RG"
4
5 $pubIPName4="PIPFORGSLB1"
6
7 $domName4="vpxgslbdns"
8
9 $lbName="MultiIPALB"
10
11 $frontEndConfigName2="FrontEndIP2"
12
13 $backendPoolName1="BackendPoolHttp"
14
15 $lbRuleName2="LBRuleGSLB1"
16
17 $lbRuleName3="LBRuleGSLB2"
18
19 $lbRuleName4="LBRuleDNS"
20
21 $healthProbeName="HealthProbe"
```

Configure ALB with the front-end IP address and rules to allow GSLB and DNS traffic

Step 1. Create a public IP for GSLB site IP

```
1 $pip4=New-AzureRmPublicIpAddress -Name $pubIPName4 -ResourceGroupName
   $rgName -DomainNameLabel $domName4 -Location $locName -
   AllocationMethod Dynamic
2
3
4 Get-AzureRmLoadBalancer -Name \$lbName -ResourceGroupName \$rgName |
   Add-AzureRmLoadBalancerFrontendIpConfig -Name \$frontEndConfigName2
   -PublicIpAddress \$pip4 | Set-AzureRmLoadBalancer
```

Step 2. Create LB rules and update the existing ALB.

```
1 $alb = get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
2
3
4 $frontendipconfig2=Get-AzureRmLoadBalancerFrontendIpConfig -
    LoadBalancer $alb -Name $frontEndConfigName2
5
6
7 $backendPool=Get-AzureRmLoadBalancerBackendAddressPoolConfig -
    LoadBalancer $alb -Name $backendPoolName1
8
9
10 $healthprobe=Get-AzureRmLoadBalancerProbeConfig -LoadBalancer $alb -
    Name $healthProbeName
11
12
13 \ $alb | Add-AzureRmLoadBalancerRuleConfig -Name \$lbRuleName2 -
    BackendAddressPool \$backendPool -FrontendIPConfiguration \
    $frontendipconfig2 -Protocol \"Tcp\" -FrontendPort 3009 -BackendPort
    3009 -Probe \$healthprobe -EnableFloatingIP | Set-
    AzureRmLoadBalancer
14
15
16 \ $alb | Add-AzureRmLoadBalancerRuleConfig -Name \$lbRuleName3 -
    BackendAddressPool \$backendPool -FrontendIPConfiguration \
    $frontendipconfig2 -Protocol \"Tcp\" -FrontendPort 3008 -BackendPort
    3008 -Probe \$healthprobe -EnableFloatingIP | Set-
    AzureRmLoadBalancer
17
18
19 \ $alb | Add-AzureRmLoadBalancerRuleConfig -Name \$lbRuleName4 -
    BackendAddressPool \$backendPool -FrontendIPConfiguration \
    $frontendipconfig2 -Protocol \"Udp\" -FrontendPort 53 -BackendPort
    53 -Probe \$healthprobe -EnableFloatingIP | Set-AzureRmLoadBalancer
```

Enable GSLB on each high availability pair

Now you've two front-end IP addresses for each ALB: ALB 1 and ALB 2. One IP address is for the LB virtual server and the other for the GSLB site IP.

HA 1 has the following front-end IP addresses:

- FrontEndIPofALB1 (for LB virtual server)
- PIPFORGSLB1 (GSLB IP)

HA 2 has the following front-end IP addresses:

- FrontEndIPofALB2 (for LB virtual server)
- PIPFORGSLB2 (GSLB IP)

The following commands are used for this scenario.

```
1 enable ns feature LB GSLB
2
3 add service dnssvc PIPFORGSLB1 ADNS 53
4
5 add gslb site site1 PIPFORGSLB1 -publicIP PIPFORGSLB1
6
7 add gslb site site2 PIPFORGSLB2 -publicIP PIPFORGSLB2
8
9 add gslb service site1_gslb_http_svc1 FrontEndIPofALB1 HTTP 80 -
  publicIP FrontEndIPofALB1 -publicPort 80 -siteName site1
10
11 add gslb service site2_gslb_http_svc1 FrontEndIPofALB2 HTTP 80 -
  publicIP FrontEndIPofALB2 -publicPort 80 -siteName site2
12
13 add gslb vserver gslb_http_vip1 HTTP
14
15 bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
16
17 bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
18
19 bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
```

[Global Server Load Balancing](#)

Deploy NetScaler GSLB on Azure

February 22, 2024

With the increasing demand, businesses running an on-prem data center serving regional customers want to scale and deploy across globally using Azure cloud. With NetScaler on the network administrator's side, you can use the GSLB StyleBook to configure applications both on-prem and in the cloud. You can transfer the same configuration to the cloud with NetScaler Console. You can reach either on-prem or cloud resources depending on proximity with GSLB. This allows you have seamless experience no matter where the you are located in the world.

DBS overview

NetScaler GSLB supports using Domain-Based Services (DBS) for Cloud load balancers. This allows for the auto-discovery of dynamic cloud services using a cloud load balancer solution. This configuration allows the NetScaler to implement GSLB DBS in an Active-Active environment. DBS allows

the scaling of back end resources in Microsoft Azure environments from DNS discovery. This section covers integration between NetScalers in the Azure Autoscale environment.

Domain name-based services using Azure load balancer (ALB)

GLSB DBS utilizes the FQDN of the user ALB to dynamically update the GSLB service groups to include the back-end servers that are being created and deleted within Azure. To configure this feature, the user points the Citrix ADC to their ALB to dynamically route to different servers in Azure. They can do this without having to manually update the Citrix ADC every time an instance is created and deleted within Azure. The Citrix ADC DBS feature for GSLB service groups uses DNS-aware service discovery to determine the member service resources of the DBS namespace identified in the autoscale group.

The following image depicts the NetScaler GSLB DBS autoscale components with cloud load balancers:

Azure GSLB prerequisites

The prerequisites for the NetScaler GSLB service groups include a functioning Microsoft Azure environment with the knowledge and ability to configure security groups, Linux Web Servers, NetScaler appliances within AWS, Elastic IPs, and Elastic load balancers (ELB).

- GSLB DBS Service integration requires NetScaler version 12.0.57 for Microsoft Azure load balancer instances.
- GSLB service group entity: NetScaler version 12.0.57.
- GSLB service group is introduced which supports autoscale using DBS dynamic discovery.
- DBS Feature Components (domain-based service) must be bound to the GSLB service group.

Example:

```
1  ````
```

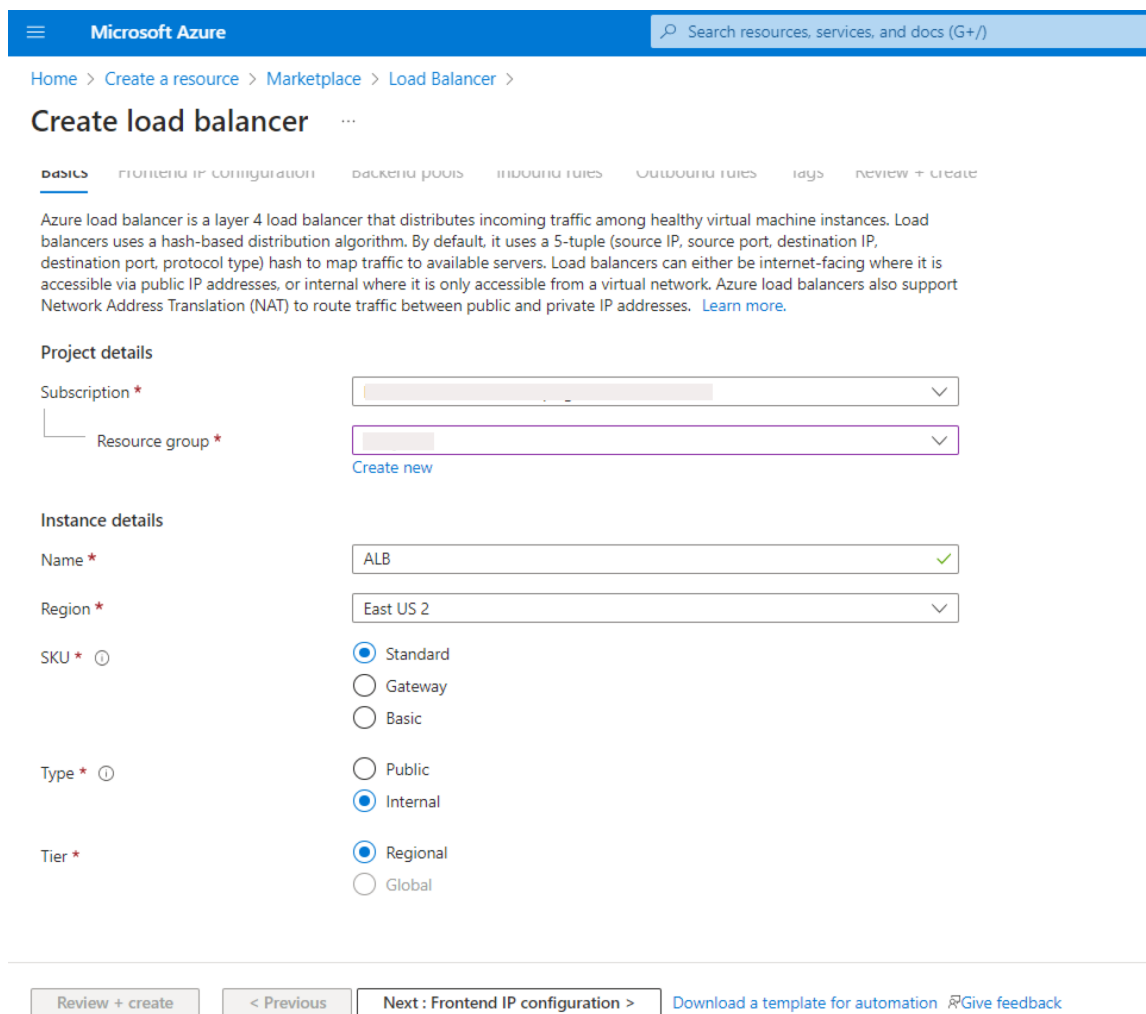

```

2 > add server sydney_server LB-Sydney-xxxxxxxxx.ap-southeast-2.elb.
    amazonaws.com
3 > add gslb serviceGroup sydney_sg HTTP -autoscale DNS -siteName sydney
4 > bind gslb serviceGroup sydney_sg sydney_server 80
5 <!--NeedCopy--> ``

```

Configure Azure components

1. Log in to the user Azure Portal and create a new virtual machine from a NetScaler template.
2. Create an Azure load balancer.

3. Add the created NetScaler back-end pools.

4. Create a health probe for port 80.

Create a load balancing rule utilizing the front-end IP created from the load balancer.

- Protocol: TCP
- Back-end Port: 80
- Back-end pool: NetScaler created in step 1
- Health Probe: Created in step 4
- Session Persistence: None

Configure NetScaler GSLB domain-based service

The following configurations summarize what is required to enable domain-based services for autoscaling ADCs in a GSLB enabled environment.

- [Traffic management configurations](#)
- [GSLB configurations](#)

Traffic management configurations

Note:

It is required to configure the NetScaler with either a nameserver or a DNS virtual server through which the ELB /ALB Domains are resolved for the DBS Service Groups. For more information on name servers or DNS virtual servers, see: [DNS nameServer](#)

1. Navigate to **Traffic Management > Load Balancing > Servers.**

2. Click **Add** to create a server, provide a name and FQDN corresponding to the A record (domain name) in Azure for the ALB.

← Create Server

3. Repeat step 2 to add the second ALB from the second resource in Azure.

GSLB configurations

1. Click the **Add** button to configure a GSLB site.
2. Specify the details for configuring the GSLB site

Name the site. Type is configured as remote or local based on which NetScaler you are configuring the site on. The site IP address is the IP address for the GSLB site. The GSLB site uses this IP address to communicate with the other GSLB sites. The public IP address is required when using a cloud service where a particular IP address is hosted on an external firewall or NAT device. The site should be configured as a parent site. Ensure that the **Trigger Monitors** are set to **ALWAYS**. Also, be sure to check the three boxes at the bottom for **Metric Exchange**, **Network Metric Exchange**, and **Persistence Session Entry Exchange**.

We recommend you set the **Trigger monitor** to **MEPDOWN**. For more information, see [Configure a GSLB Service Group](#).

[NetScaler Global Load Balancing for Hybrid and Multi-Cloud Deployments](#)

Deploy NetScaler Web App Firewall on Azure

March 22, 2024

NetScaler Web App Firewall is an enterprise grade solution offering state of the art protections for modern applications. NetScaler Web App Firewall mitigates threats against public-facing assets, including websites, web applications, and APIs. NetScaler Web App Firewall includes IP reputation-based filtering, Bot mitigation, OWASP Top 10 application threats protections, Layer 7 DDoS protection and more. Also included are options to enforce authentication, strong SSL/TLS ciphers, TLS 1.3, rate limiting and rewrite policies. Using both basic and advanced WAF protections, NetScaler Web App Firewall provides comprehensive protection for your applications with unparalleled ease of use. Getting up and running is a matter of minutes. Further, using an automated learning model, called dynamic profiling, NetScaler Web App Firewall saves users precious time. By automatically learning how a protected application works, NetScaler Web App Firewall adapts to the application even as developers deploy and alter the applications. NetScaler Web App Firewall helps with compliance for all major regulatory standards and bodies, including PCI-DSS, HIPAA, and more. With our CloudFormation templates, it has never been easier to get up and running quickly. With auto scaling, users can rest assured that their applications remain protected even as their traffic scales up.

NetScaler Web App Firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between customer servers and customer users, usually behind the customer company's router or firewall. For more information, see [Introduction to NetScaler Web App Firewall](#).

NetScaler Web App Firewall deployment strategy

1. Deploy the web application firewall is to evaluate which applications or specific data need maximum security protection, which ones are less vulnerable, and the ones for which security inspection can safely be bypassed. This helps users in coming up with an optimal configuration, and in designing appropriate policies and bind points to segregate the traffic. For example, users might want to configure a policy to bypass security inspection of requests for static web content, such as images, MP3 files, and movies, and configure another policy to apply advanced security checks to requests for dynamic content. Users can use multiple policies and profiles to protect different contents of the same application.
2. To baseline the deployment, create a virtual server and run test traffic through it to get an idea of the rate and amount of traffic flowing through the user system.
3. Deploy the Web Application Firewall. Use NetScaler Console and the Web Application Firewall StyleBook to configure the Web Application Firewall. See the StyleBook section below in this guide for details.
4. Implement the NetScaler Web App Firewall and OWASP Top Ten.

The three of the Web Application Firewall protections are especially effective against common types of Web attacks, and are therefore more commonly used than any of the others. Thus, they should be implemented in the initial deployment. They are:

- **HTML Cross-Site Scripting:** Examines requests and responses for scripts that attempt to access or modify content on a different website than the one on which the script is located. When this check finds such a script, it either renders the script harmless before forwarding the request or response to its destination, or it blocks the connection.
- **HTML SQL Injection:** Examines requests that contain form field data for attempts to inject SQL commands into a SQL database. When this check detects injected SQL code, it either blocks the request or renders the injected SQL code harmless before forwarding the request to the Web server.

Note:

Ensure that your Web App Firewall is correctly configured for the following conditions to apply in your configuration:

- 1 >* If users enable the HTML Cross-Site Scripting check or the HTML SQL Injection check (or both).
- 2 >
- 3 >* User **protected** websites accept file uploads or contain Web forms that can contain large POST body data.

For more information about configuring the Web Application Firewall to handle this case, see Configuring the Application Firewall: [Configuring the Web App Firewall](#).

- **Buffer Overflow:** Examines requests to detect attempts to cause a buffer overflow on the Web server.

Configuring the Web Application Firewall

Ensure that the NetScaler Web App Firewall is already enabled and functioning correctly. We recommend that you configure NetScaler Web App Firewall using the Web Application Firewall StyleBook. Most users find it the easiest method to configure the Web Application Firewall, and it is designed to prevent mistakes. Both the GUI and the command-line interface are intended for experienced users, primarily to modify an existing configuration or use advanced options.

SQL injection

The NetScaler Web App Firewall HTML SQL Injection check provides special defenses against the injection of unauthorized SQL code that might break user application security. NetScaler Web App Firewall

examines the request payload for injected SQL code in three locations: 1) POST body, 2) headers, and 3) cookies. For more information, see [HTML SQL injection check](#).

Cross-Site scripting

The HTML Cross-Site Scripting (cross-site scripting) check examines both the headers and the POST bodies of user requests for possible cross-site scripting attacks. If it finds a cross-site script, it either modifies (transforms) the request to render the attack harmless, or blocks the request. For more information, see [HTML cross-site scripting check](#).

Buffer overflow check

The Buffer Overflow check detects attempts to cause a buffer overflow on the web server. If the Web Application Firewall detects that the URL, cookies, or header are longer than the configured length, it blocks the request because it can cause a buffer overflow. For more information, see [Buffer overflow check](#).

Virtual patching/signatures

The signatures provide specific, configurable rules to simplify the task of protecting user websites against known attacks. A signature represents a pattern that is a component of a known attack on an operating system, web server, website, XML-based web service, or other resource. A rich set of preconfigured built-in or native rules offers an easy-to-use security solution, applying the power of pattern matching to detect attacks and protect against application vulnerabilities. For more information, see [Signatures](#).

NetScaler Web App Firewall supports both **Auto & Manual** update of signatures. We also suggest enabling **Auto-update** for signatures to stay up to date.

Automatic signatures updates

These signature files are hosted on the AWS Environment and it is important to allow outbound access to NetScaler IP address's from network firewalls to fetch the latest signature files. There is no effect of updating signatures to the NetScaler while processing real-time traffic.

Application security analytics

The **Application Security Dashboard** provides a holistic view of the security status of user applications. For example, it shows key security metrics such as security violations, signature violations, and threat indexes. The application security dashboard also displays attack-related information such as syn attacks, small window attacks, and DNS flood attacks for the discovered NetScaler.

Note:

To view the metrics of the application security dashboard, AppFlow for Security insight should be enabled on the NetScaler instances that users want to monitor.

To view the security metrics of a NetScaler instance on the application security dashboard:

1. Log in to NetScaler Console using the administrator credentials.
2. Navigate to **Applications > App Security Dashboard**, and select the instance IP address from the Devices list.

Users can further drill down on the discrepancies reported on the Application Security Investigator by clicking the bubbles plotted on the graph.

Centralized learning on ADM

NetScaler Web App Firewall protects user web applications from malicious attacks such as SQL injection and cross-site scripting (XSS). To prevent data breaches and provide the right security protection, users must monitor their traffic for threats and real-time actionable data on attacks. Sometimes, the attacks reported might be false-positives and those need to be provided as an exception.

The centralized learning on NetScaler Console is a repetitive pattern filter that enables WAF to learn the behavior (the normal activities) of user web applications. Based on monitoring, the engine generates a list of suggested rules or exceptions for each security check applied on the HTTP traffic.

It is much easier to deploy relaxation rules using the learning engine than to manually deploy it as necessary relaxations.

To deploy the learning feature, users must first configure a Web Application Firewall profile (set of security settings) on the user NetScaler. For more information, see [Creating Web App Firewall Profiles](#).

NetScaler Console generates a list of exceptions (relaxations) for each security check. As an administrator, you can review the list of exceptions in NetScaler Console and decide to deploy or skip.

Using the WAF learning feature in NetScaler Console, you can:

- Configure a learning profile with the following security checks.

- Buffer Overflow
- HTML Cross-Site Scripting

Note:

The cross-site script limitation of location is only FormField.

- HTML SQL Injection

Note:

For the HTML SQL Injection check, users must configure `set -sqlinjectionTransformSpec ON` and `set -sqlinjectiontype sqlspclcharorkeywords` in the NetScaler.

- Check the relaxation rules in NetScaler Console and decide to take the necessary action (deploy or skip).
- Get the notifications through email, slack, and ServiceNow.
- Use the dashboard to view relaxation details.

To use the WAF learning in NetScaler Console:

1. Configure the learning profile: [Configure the Learning Profile](#)
2. See the relaxation rules: [View Relaxation Rules and Idle Rules](#)
3. Use the WAF learning dashboard: [View WAF Learning Dashboard](#)

StyleBooks

StyleBooks simplify the task of managing complex NetScaler configurations for user applications. A StyleBook is a template that users can use to create and manage NetScaler configurations. Here, users are primarily concerned with the StyleBook used to deploy the Web Application Firewall. For more information on StyleBooks, see [StyleBooks](#).

Security insight analytics

Web and web service applications that are exposed to the Internet have become increasingly vulnerable to attacks. To protect applications from attack, users need visibility into the nature and extent of past, present, and impending threats, real-time actionable data on attacks, and recommendations on countermeasures. Security Insight provides a single-pane solution to help users assess user application security status and take corrective actions to secure user applications.

For more information, see [Security Insight](#).

Obtain detailed information about security breaches

Users might want to view a list of the attacks on an application and gain insights into the type and severity of attacks, actions taken by the ADC instance, resources requested, and the source of the attacks.

For example, users might want to determine how many attacks on Microsoft Lync were blocked, what resources were requested, and the IP addresses of the sources.

On the **Security Insight dashboard**, click **Lync > Total Violations**. In the table, click the filter icon in the **Action Taken** column header, and then select **Blocked**.

For information about the resources that were requested, review the **URL** column. For information about the sources of the attacks, review the **Client IP** column.

View log expression details

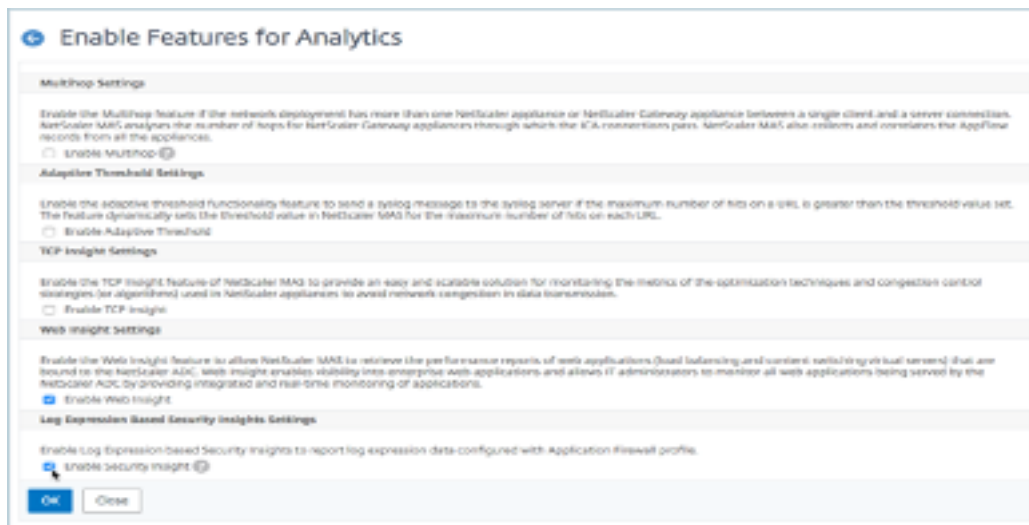

NetScaler use log expressions configured with the Application Firewall profile to take action for the attacks on an application in the user enterprise. In **Security Insight**, users can view the values returned for the log expressions used by the ADC instance. These values include, request header, request body and so on. In addition to the log expression values, users can also view the log expression name and the comment for the log expression defined in the Application Firewall profile that the ADC instance used to take action for the attack.

Prerequisites:

Ensure that users:

- Configure log expressions in the Application Firewall profile. For more information, see Application Firewall.
- Enable log expression-based Security Insights settings in NetScaler Console. Do the following:
 - Navigate to **Analytics > Settings**, and click **Enable Features for Analytics**.

- In the Enable Features for Analytics page, select **Enable Security Insight** under the **Log Expression Based Security Insight Setting** section and click **OK**.

For example, you might want to view the values of the log expression returned by the ADC instance for the action it took for an attack on Microsoft Lync in the user enterprise.

On the **Security Insight dashboard**, navigate to **Lync > Total Violations**. In the Application Summary table, click the URL to view the complete details of the violation in the **Violation Information** page including the log expression name, comment, and the values returned by the ADC instance for the action.

Log Expression Name	Log Expression Comment	Log Expression Value
LSDXPR7	http request contains keyword	false
LSDXPR8	http request contains header	false
LSDXPR6	http method expression	GET /xxf_Pu/Yu/vow?field=xxxx HTTP/1.1 User-Agent: curl/7.19.7 (x86_64-glibc-linux-gnu/libcurl/7.19.7 OpenSSL/0.9.8k zlib/1.2.3.3 libidn/1.15) Host: 10.102.60.249 Accept: */*
LSDXPR3	http method expression	true
LSDXPR4	http request contains header	
LSDXPR1	http request header contains user-agent	curl/7.19.7 (x86_64-glibc-linux-gnu/libcurl/7.19.7 OpenSSL/0.9.8k zlib/1.2.3.3 libidn/1.15)
LSDXPR2	http method expression	false
LSDXPR5	http method expression	

Determine the Safety Index before deploying the Configuration. Security breaches occur after users deploy the security configuration on an ADC instance, but users might want to assess the effectiveness of the security configuration before they deploy it.

For example, users might want to assess the safety index of the configuration for the SAP application on the ADC instance with IP address 10.102.60.27.

On the **Security Insight dashboard**, under **Devices**, click the IP address of the ADC instance that users configured. Users can see that both the threat index and the total number of attacks are 0. The threat index is a direct reflection of the number and type of attacks on the application. Zero attacks indicate that the application is not under any threat.

Click **Sap > Safety Index > SAP_Profile** and assess the safety index information that appears.

In the application firewall summary, users can view the configuration status of different protection settings. If a setting is set to log or if a setting is not configured, the application is assigned a lower safety index.

Security violations

Web applications that are exposed to the Internet have become vulnerable to attacks drastically. NetScaler Console enables you to visualize actionable violation details to protect applications from

attacks.

View application security violation details

Web applications that are exposed to the Internet have become drastically more vulnerable to attacks. NetScaler Console enables users to visualize actionable violation details to protect applications from attacks. Navigate to **Security > Security Violations** for a single-pane solution to:

- Access the application security violations based on their categories such as **Network, Bot, and WAF**
- Take corrective actions to secure the applications

To view the security violations in NetScaler Console, ensure:

- Users have a premium license for the NetScaler (for WAF and BOT violations).
- Users have applied for a license on the load balancing or content switching virtual servers (for WAF and BOT). For more information, refer to: [Manage Licensing on Virtual Servers](#).
- Users can enable more settings. For more information, see the procedure available at the Setting up section in the NetScaler product documentation: [Setting up](#).

Violation categories

NetScaler Console enables users to view the violations available in [All Violations](#):

Setting up

For violations, ensure whether **Metrics Collector** is enabled. By default, **Metrics Collector** is enabled on the NetScaler. For more information, see: [Configure Intelligent App Analytics](#).

Enable advanced security analytics

- Navigate to **Networks > Instances > NetScaler**, and select the instance type. For example, MPX.
- Select the NetScaler instance and from the **Select Action** list, select **Configure Analytics**.
- Select the virtual server and click **Enable Analytics**.
- On the **Enable Analytics** window:
 - Select **Web Insight**. After users select Web Insight, the read-only **Advanced Security Analytics** option is enabled automatically.

Note:

The **Advanced Security Analytics** option is displayed only for premium licensed ADC instances.

- Select **Logstream** as Transport Mode
- The Expression is true by default
- Click **OK**

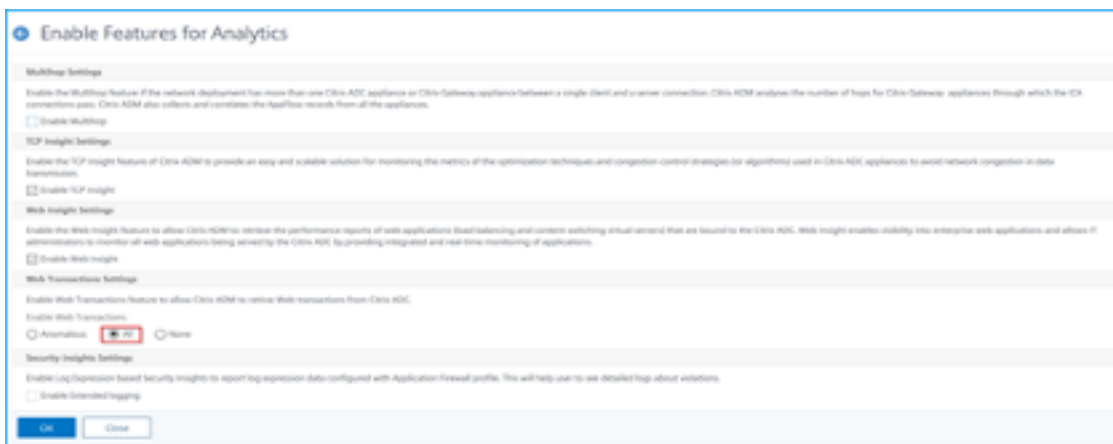

Enable web transaction settings

- Navigate to **Analytics > Settings**.

The **Settings** page is displayed.

- Click **Enable Features for Analytics**.
- Under **Web Transaction Settings**, select **All**.

- Click **Ok**.

Security violations dashboard

In the security violations dashboard, users can view:

- Total violations occurred across all NetScaler and applications. The total violations are displayed based on the selected time duration.

- Total violations under each category.

- Total ADCs affected, total applications affected, and top violations based on the total occurrences and the affected applications.

For more information on violations details, see [All violations](#).

Bot insight

Configure BOT insight in NetScaler. For more information, see [Bot](#).

View bots

Click the virtual server to view the **Application Summary**

1. Provides the Application Summary details such as:

- **Average RPS** –Indicates the average bot transaction requests per second (RPS) received on virtual servers.
- **Bots by Severity** –Indicates that the highest bot transactions occurred based on the severity. The severity is categorized based on **Critical, High, Medium,** and **Low**.

For example, if the virtual servers have 11770 high severity bots and 1550 critical severity bots, then NetScaler Console displays **Critical 1.55 K** under **Bots by Severity**.

- **Largest Bot Category** –Indicates that the highest bot attacks occurred based on the bot category.

For example, if the virtual servers have 8000 block-listed bots, 5000 allow listed bots, and 10000 Rate Limit Exceeded bots, then NetScaler Console displays **Rate Limit Exceeded 10 K** under **Largest Bot Category**.

- **Largest Geo Source** –Indicates that the highest bot attacks occurred based on a region.

For example, if the virtual servers have 5000 bot attacks in Santa Clara, 7000 bot attacks in London, and 9000 bot attacks in Bangalore, then NetScaler Console displays **Bangalore 9 K** under **Largest Geo Source**.

- **Average % Bot Traffic** –Indicates the human bot ratio.
2. Displays the severity of the bot attacks based on locations in the map view
 3. Displays the types of bot attacks (Good, Bad, and all)
 4. Displays the total bot attacks along with the corresponding configured actions. For example, if you have configured:
 - IP address range (192.140.14.9 to 192.140.14.254) as block list bots and selected Drop as an action for these IP address ranges
 - IP range (192.140.15.4 to 192.140.15.254) as block list bots and selected to create a log message as an action for these IP ranges

In this scenario, NetScaler Console displays:

- Total block listed bots
- Total bots under **Dropped**
- Total bots under Log

View CAPTCHA bots

In webpages, CAPTCHAs are designed to identify if the incoming traffic is from a human or an automated bot. To view the CAPTCHA activities in NetScaler Console, users must configure CAPTCHA as a bot action for IP reputation and device fingerprint detection techniques in a NetScaler Console instance. For more information, see: [Configure Bot Management](#).

The following are the CAPTCHA activities that NetScaler Console displays in Bot insight:

- **Captcha attempts exceeded** –Denotes the maximum number of CAPTCHA attempts made after login failures
- **Captcha client muted** –Denotes the number of client requests that are dropped or redirected because these requests were detected as bad bots earlier with the CAPTCHA challenge
- **Human** –Denotes the captcha entries performed from the human users
- **Invalid captcha response** –Denotes the number of incorrect CAPTCHA responses received from the bot or human, when NetScaler sends a CAPTCHA challenge

BOT CATEGORY	TOTAL ATTACKS	# DROPPED	# CAPTCHA	# ALLOWED	# RATE LIMIT	# REDIRECT	# LOG
Captcha Attempts Exceeded	11	11	0	0	0	0	0
Captcha Client Muted	2	0	0	0	0	2	0
Crawler	86	86	0	0	0	0	0
Feed Fetcher	8	8	0	0	0	0	0
Human	0	0	0	0	0	0	0
Invalid Captcha Response	40	33	0	0	0	0	7
Marketing	262	262	0	0	0	0	0
NULL	1	0	0	0	0	0	1
Scaper	33	33	0	0	0	0	0
Search Engine	155	155	0	0	0	0	0
Site Monitor	57	57	0	0	0	0	0
Tool	82	82	0	0	0	0	0
Uncategorized	0	0	0	0	0	0	0

View bot traps

To view bot traps in NetScaler Console, you must configure the bot trap in NetScaler. For more information, see: [Configure Bot Management](#).

Application	Total Bots	Total Human Requests	Bot Human Ratio	Signatured Bots	Fingerprinted Bots	Rate Based Bots	IP Reputation Bots	Whitelist Bots	Blocklist Bots	Bot Traps	TPI Bots
test_bot	440	0	100:0	0	0	0	0	0	0	0	440
test_virtual	9.33 K	0	100:0	0	0	0	0	0	0	5	9.32 K

To identify the bot trap, a script is enabled in the webpage and this script is hidden from humans, but not to bots. NetScaler Console identifies and reports the bot traps, when this script is accessed by the bots.

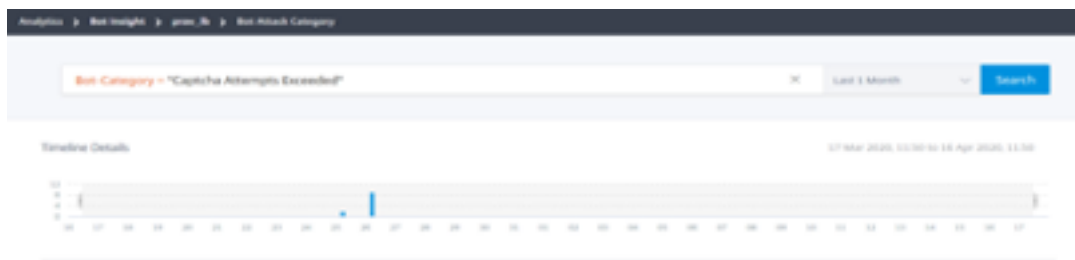

Click the virtual server and select **Zero Pixel Request**

BOT CATEGORY	TOTAL	# DROPPED	# CAPTCHA	# ALLOWED	# RATE LIMIT	# REDIRECT	# LOG
Invalid DeviceFP	33450	33450	0	0	0	0	0
Zero Pixel Request	246	0	0	0	0	0	246
Human	100	0	0	100	0	0	0

View bot details

For further details, click the bot attack type under **Bot Category**.

The details such as attack time and total number of bot attacks for the selected captcha category are displayed.

Users can also drag the bar graph to select the specific time range to be displayed with bot attacks.

To get additional information of the bot attack, click to expand.

Instance IP	Client IP	Bot Type	Severity	Attack Name	Bot Category	Bot Profile Name	Region	Request URL
10.106.154.240	10.106.154.240	Bad	Critical	Drop	BlackList	BlackList	Bangalore	/black_bot_test.html
Instance IP: 10.106.154.240		Total Dots: 1		Country Code: IN		Profile Name: bot_profile		
HTTP Request URL: /black_bot_test.html		Region: Karnataka						

- **Instance IP** –Indicates the NetScaler instance IP address.
- **Total Bots** –Indicates that the total bot attacks occurred for that particular time.
- **HTTP Request URL** –Indicates the URL that is configured for captcha reporting.
- **Country Code** –Indicates the country where the bot attack occurred.
- **Region** –Indicates the region where the bot attack occurred.
- **Profile Name** –Indicates the profile name that users provided during the configuration.

Advanced search

Users can also use the search text box and time duration list, where they can view bot details as per the user requirement. When users click the search box, the search box gives them the following list of search suggestions.

- **Instance IP** –NetScaler instance IP address.
- **Client-IP** –Client IP address.
- **Bot-Type** –Bot type such as Good or Bad.

- **Severity** –Severity of the bot attack.
- **Action-Taken** –Action taken after the bot attack such as Drop, No action, Redirect.
- **Bot-Category** –Category of the bot attack such as block list, allow list, fingerprint. Based on a category, users can associate a bot action to it.
- **Bot-Detection** –Bot detection types (block list, allow list, and so on) that users have configured on NetScaler.
- **Location** –Region/country where the bot attack has occurred
- **Request-URL** –URL that has the possible bot attacks

Users can also use operators in the user search queries to narrow the focus of the user search. For example, if users want to view all bad bots:

- Click the search box and select **Bot-Type**
- Click the search box again and select the operator =
- Click the search box again and select **Bad**
- Click **Search** to display the results

Unusually high request rate

Users can control the incoming and outgoing traffic from or to an application. A bot attack can perform an unusually high request rate. For example, if users configure an application to allow 100 requests/minute and if users observe 350 requests, then it might be a bot attack.

Using the **Unusually High Request Rate** indicator, users can analyze the unusual request rate received to the application.

Under **Event Details**, users can view:

- The affected application. Users can also select the application from the list if two or more applications are affected with violations.
- The graph indicating all violations
- The violation occurrence time
- The detection message for the violation, indicating the total requests received and % of excessive requests received than the expected requests
- The accepted range of expected request rates range from the application

Bot Detection

The NetScaler bot management system uses various techniques to detect the incoming bot traffic. The techniques are used as detection rules to detect the bot type.

Configuring Bot management by using GUI Users can configure NetScaler bot management by first enabling the feature on the appliance. For more information, see [Bot Detection](#).

IP reputation

IP reputation is a tool that identifies IP addresses that send unwanted requests. Using the IP reputation list you can reject requests that are coming from an IP address with a bad reputation.

Configure IP reputation by using GUI This configuration is a prerequisite for the bot IP reputation feature. For more information, see [IP Reputation](#).

Auto update for Bot signatures The bot static signature technique uses a signature lookup table with a list of good bots and bad bots. For more information, see [Signature auto update](#).

NetScaler Web App Firewall and OWASP top ten–2021

The Open Web Application Security Project(OWAP) released the OWASP Top 10 for 2021 for web application security. This list documents the most common web application vulnerabilities and is a great starting point to evaluate web security. This section explains on how to configure the NetScaler Web App Firewall to mitigate these flaws. WAF is available as an integrated module in the NetScaler (Premium Edition) and a complete range of appliances.

The full OWASP Top 10 document is available at [OWASP Top Ten](#).

OWASP Top-10 2021	NetScaler Web App Firewall Features
A1:2021 Broken Access Control	AAA, Authorization security features within AAA module of NetScaler, Form protections, and cookie tampering protections, StartURL, and ClosureURL
A2:2021 - Cryptographic Failures	Credit Card protection, Safe Commerce, Cookie proxying, and Cookie encryption
A3:2021- Injection	Injection attack prevention (SQL or any other custom injections such as OS Command injection, XPath injection, and LDAP injection), auto update signature feature
A5:2021 Security Misconfiguration	This protection including WSI checks, XML message validation & XML SOAP fault filtering check
A6:2021 - Vulnerability and Outdated Components	Vulnerability scan reports, Application Firewall Templates, and Custom Signatures
A7:2021 - Identification and Authentication Failure	AAA, Cookie tampering protection, Cookie proxying, Cookie encryption, CSRF tagging, Use SSL
A8:2021 –Software and Data Integrity Failures	XML Security checks, GWT content type, custom signatures, Xpath for JSON and XML
A9:2021 –Security Logging and Monitoring Failures	User configurable custom logging, Management and Analytics System

A1:2021 Broken Access Control

Restrictions on what authenticated users are allowed to do are often not properly enforced. Attackers can exploit these flaws to access unauthorized functionality and data, such as access other users' accounts, view sensitive files, modify other users' data, change access rights.

NetScaler Web App Firewall protections

- AAA feature that supports authentication, authorization, and auditing for all application traffic allows a site administrator to manage access controls with the ADC appliance.
- The Authorization security feature within the AAA module of the ADC appliance enables the appliance to verify, which content on a protected server it should allow each user to access.
- Form field consistency: If object references are stored as hidden fields in forms, then using form field consistency you can validate that these fields are not tampered on subsequent requests.
- Cookie proxying and cookie consistency: Object references that are stored in cookie values can be validated with these protections.
- Start URL check with URL closure: Allows user access to a predefined allow list of URLs. URL closure builds a list of all URLs seen in valid responses during the user session and automatically allows access to them during that session.

A2:2021 - Cryptographic failures

Many web applications and APIs do not properly protect sensitive data, such as financial, healthcare, and PII. Attackers may steal or modify such poorly protected data to conduct credit card fraud, identity theft, or other crimes. Sensitive data may be compromised without extra protection, such as encryption at rest or in transit, and requires special precautions when exchanged with the browser.

NetScaler Web App Firewall protections

- Web Application Firewall protects applications from leaking sensitive data like credit card details.
- Sensitive data can be configured as safe objects in Safe Commerce protection to avoid exposure.
- Any sensitive data in cookies can be protected by Cookie proxying and Cookie encryption.

A3:2021- Injection

Injection flaws, such as SQL, NoSQL, OS, and LDAP injection, occur when untrusted data is sent to an interpreter as part of a command or query. The attacker's hostile data can trick the interpreter into running unintended commands or accessing data without proper authorization.

XSS flaws occur whenever an application includes untrusted data in a new webpage without proper validation or escaping, or updates an existing webpage with user-supplied data using a browser API that can create HTML or JavaScript. XSS allows attackers to run scripts in the victim's browser, which can hijack user sessions, deface websites, or redirect the user to malicious sites.

NetScaler Web App Firewall protections

- SQL injection prevention feature protects against common injection attacks. Custom injection patterns can be uploaded to protect against any type of injection attack, including XPath and LDAP. This is applicable for both HTML and XML payloads.
- The auto update signature feature keeps the injection signatures up to date.
- The field format protection feature allows the administrator to restrict any user parameter to a regular expression. For instance, you can enforce that a zip-code field contains integers only or even 5-digit integers.
- Form field consistency validates each submitted user form against the user session form signature to ensure the validity of all form elements.
- Buffer overflow checks ensure that the URL, headers, and cookies are in the right limits blocking any attempts to inject large scripts or code.
- XSS protection protects against common XSS attacks. Custom XSS patterns can be uploaded to modify the default list of allowed tags and attributes. The ADC WAF uses a white list of allowed HTML attributes and tags to detect XSS attacks. This is applicable for both HTML and XML payloads.
- ADC WAF blocks all the attacks listed in the OWASP XSS Filter Evaluation Cheat Sheet.
- Field format check prevents an attacker from sending inappropriate web form data, which can be a potential XSS attack.
- Form field consistency.

A5:2021 - Security misconfiguration

Security misconfiguration is the most commonly seen issue. This is commonly a result of insecure default configurations, incomplete or improvised configurations, open cloud storage, misconfigured

HTTP headers, and verbose error messages containing sensitive information. Not only must all operating systems, frameworks, libraries, and applications be securely configured, but they must be patched and upgraded in a timely fashion.

Many older or poorly configured XML processors evaluate external entity references within XML documents. External entities can be used to disclose internal files using the file URI handler, internal file shares, internal port scanning, remote code execution, and denial of service attacks.

NetScaler Web App Firewall protections

- The PCI-DSS report generated by the Application Firewall, documents the security settings on the Firewall device.
- Reports from the scanning tools are converted to ADC WAF signatures to handle security misconfigurations.
- NetScaler Web App Firewall Web Application Firewall supports Cenxic, IBM AppScan (Enterprise and Standard), Qualys, TrendMicro, WhiteHat, and custom vulnerability scan reports.
- In addition to detecting and blocking common application threats that can be adapted for attacking XML-based applications (that is, cross-site scripting, command injection, and so on).
- NetScaler Web App Firewall Web Application Firewall includes a rich set of XML-specific security protections. These include schema validation to thoroughly verify SOAP messages and XML payloads, and a powerful XML attachment check to block attachments containing malicious executables or viruses.
- Automatic traffic inspection methods block XPath injection attacks on URLs and forms aimed at gaining access.
- NetScaler Web App Firewall Web Application Firewall also thwarts various DoS attacks, including external entity references, recursive expansion, excessive nesting, and malicious messages containing either long or many attributes and elements.

A6:2021 - Vulnerable and outdated components

Components, such as libraries, frameworks, and other software modules, run with the same privileges as the application. If a vulnerable component is exploited, such an attack can facilitate serious data loss or server takeover. Applications and APIs using components with known vulnerabilities may undermine application defenses and enable various attacks and impacts.

NetScaler Web App Firewall protections

- We recommend having the third-party components up to date.

- Vulnerability scan reports that are converted to ADC signatures can be used to virtually patch these components.
- Application firewall templates that are available for these vulnerable components can be used.
- Custom signatures can be bound with the firewall to protect these components.

A7:2021–Broken authentication

Application functions related to authentication and session management are often implemented incorrectly, allowing attackers to compromise passwords, keys, or session tokens, or to exploit other implementation flaws to assume other users' identities temporarily or permanently.

NetScaler Web App Firewall protections

- NetScaler AAA module performs user authentication and provides Single Sign-On functionality to back-end applications. This is integrated into the NetScaler AppExpert policy engine to allow custom policies based on user and group information.
- Using SSL offloading and URL transformation capabilities, the firewall can also help sites to use secure transport layer protocols to prevent stealing of session tokens by network sniffing.
- Cookie proxying and cookie encryption can be employed to completely mitigate cookie stealing.

A8:2021 - Software and data integrity failure

Insecure deserialization often leads to remote code execution. Even if deserialization flaws do not result in remote code execution, they can be used to perform attacks, including replay attacks, injection attacks, and privilege escalation attacks.

NetScaler Web App Firewall protections

- JSON payload inspection with custom signatures.
- XML security: protects against XML denial of service (xDoS), XML SQL and Xpath injection and cross-site scripting, format checks, WS-I basic profile compliance, XML attachments check.
- Field format checks and Cookie Consistency and Field Consistency can be used.

A9:2021 - Security logging and monitoring failures

Insufficient logging and monitoring, coupled with missing or ineffective integration with incident response, allows attackers to further attack systems, maintain persistence, pivot to more systems, and tamper, extract, or destroy data. Most breach studies show the time to detect a breach is over 200 days, typically detected by external parties rather than internal processes or monitoring.

NetScaler Web App Firewall protections

- When the log action is enabled for security checks or signatures, the resulting log messages provide information about the requests and responses that the application firewall has observed while protecting your websites and applications.
- The application firewall offers the convenience of using the built-in ADC database for identifying the locations corresponding to the IP addresses from which malicious requests are originating.
- Default format (PI) expressions give the flexibility to customize the information included in the logs with the option to add the specific data to capture in the application firewall-generated log messages.
- The application firewall supports CEF logs.

Configure address pools intranet IP for a NetScaler Gateway appliance

May 2, 2023

In some situations, users who connect with the NetScaler Gateway Plug-in need a unique IP address for a NetScaler Gateway appliance. When you enable address pools (also known as IP pooling) for a group, the NetScaler Gateway appliance can assign a unique IP address alias to each user. You configure address pools by using intranet IP (IIP) addresses.

You can configure address pools on a NetScaler Gateway appliance deployed on Azure by following this 2-step procedure:

- Registering the private IP addresses that are used in the address pool, in Azure
- Configuring address pools in the NetScaler Gateway appliance

Register a private IP address in the Azure portal

In Azure, you can deploy a NetScaler VPX instance with multiple IP addresses. You can add IP addresses to a VPX instance in two ways:

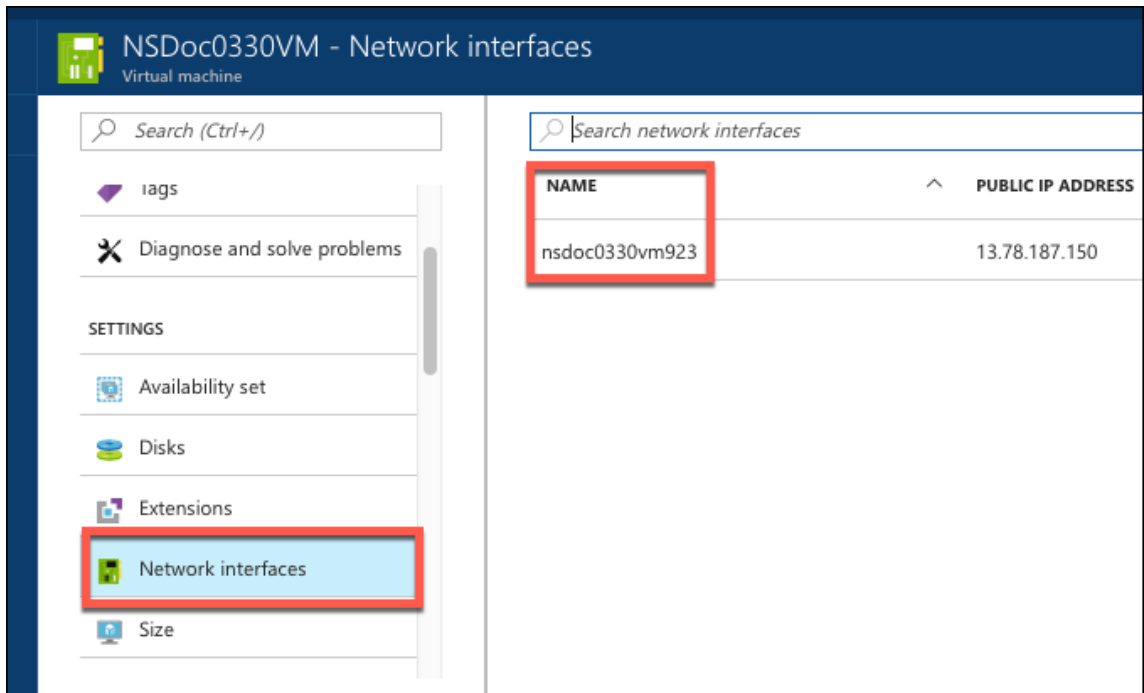

a. While provisioning a VPX instance

For more information about how to add multiple IP addresses while provisioning a VPX instance, see [Configure multiple IP addresses for a NetScaler standalone instance](#). To add IP addresses by using PowerShell commands while provisioning a VPX instance, see [Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands](#).

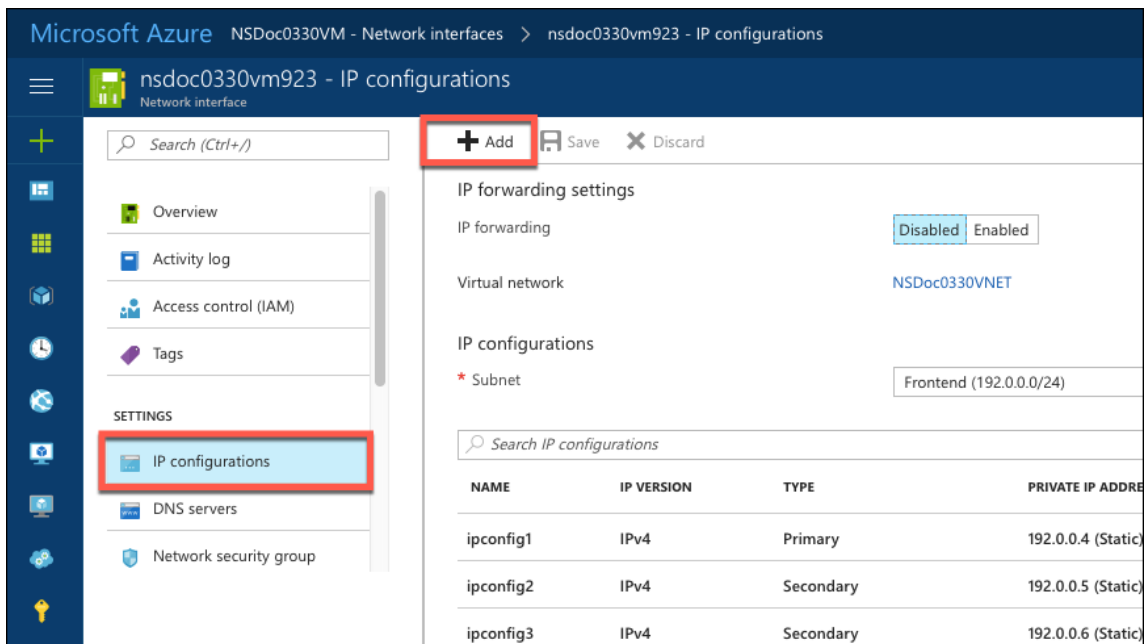

b. After provisioning a VPX instance

After you've provisioned a VPX instance, follow these steps to register a private IP address in the Azure portal, which you configure as an address pool in the NetScaler Gateway appliance.

1. From Azure Resource Manager (ARM), go to the already created NetScaler VPX instance > **Network interfaces**. Choose the network interface which is bound to a subnet to which the IIP that you want to register belongs.

2. Click **IP Configurations**, and then click **Add**.

3. Provide the required details as shown in the example below and click **OK**.

The screenshot shows a window titled "Add IP configuration" with the identifier "nsdoc0330vm923". The form contains the following fields and options:

- Name:** A text input field containing "PrivateIP5" with a green checkmark on the right.
- Type:** Two radio buttons, "Primary" (unselected) and "Secondary" (selected).
- Message:** A grey bar with an information icon and the text "Primary IP configuration already exists".
- Private IP address settings:**
 - Allocation:** Two radio buttons, "Dynamic" (unselected) and "Static" (selected).
 - IP address:** A text input field containing "192.0.0.8" with a green checkmark on the right.
 - Public IP address:** Two radio buttons, "Disabled" (selected) and "Enabled" (unselected).
- Buttons:** A blue "OK" button is located at the bottom center.

Configure address pools in the NetScaler Gateway appliance

For more information about how to configure address pools on the NetScaler Gateway, see this [Configuring Address Pools](#).

Limitation: You cannot bind a range of IIP addresses to users. Every IIP address that is used in an address pool must be registered.

Configure multiple IP addresses for a NetScaler VPX standalone instance by using PowerShell commands

May 2, 2023

In an Azure environment, a NetScaler VPX virtual appliance can be deployed with multiple NICs. Each NIC can have multiple IP addresses. This section describes how to deploy a NetScaler VPX instance with a single NIC and multiple IP addresses, by using PowerShell commands. You can use the same script for multi-NIC and multi-IP deployment.

Note

In this document, IP-Config refers to a pair of IP addresses, public IP, and private IP, that is associated with an individual NIC. For more information, see the [Azure terminology](#) section.

Use case

In this use case, a single NIC is connected to a virtual network (VNET). The NIC is associated with three IP configurations, as shown in the following table.

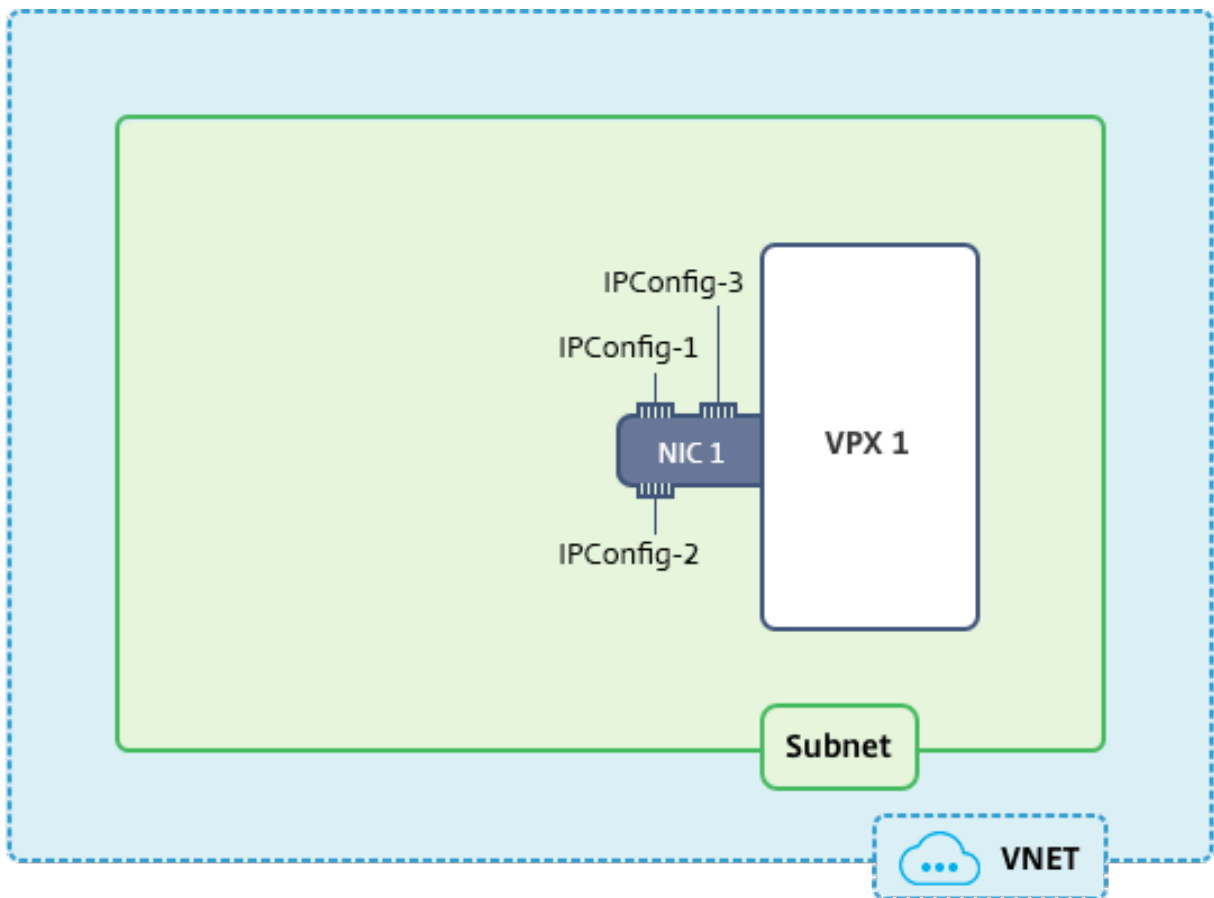

IP Config	Associated with
IPConfig-1	Static public IP address; static private IP address
IPConfig-2	Static public IP address; static private address
IPConfig-3	Static private IP address

Note

IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP address associated with the primary (first) `IPConfig` of the primary (first) NIC is automatically added as the management NSIP address of the appliance. The remaining private IP addresses associated with `IPConfigs` must be added in the VPX instance as VIPs or SNIPs by using the `add ns ip` command, as determined by your requirements.

Here is the summary of the steps required for configuring multiple IP addresses for a NetScaler VPX virtual appliance in standalone mode:

1. Create Resource Group
2. Create Storage Account
3. Create Availability Set
4. Create Network service group
5. Create Virtual Network
6. Create Public IP Address
7. Assign IP Configuration
8. Create NIC
9. Create NetScaler VPX Instance

10. Check NIC Configurations
11. Check VPX-side Configurations

Script

Parameters

Following are sample parameters settings for the use case in this document. You can use different settings if you want.

`$locName="westcentralus"`

`$rgName="Azure-MultiIP"`

`$nicName1="VM1-NIC1"`

`$vNetName="Azure-MultiIP-vnet"`

`$vNetAddressRange="11.6.0.0/16"`

`$frontEndSubnetName="frontEndSubnet"`

`$frontEndSubnetRange="11.6.1.0/24"`

`$prmStorageAccountName="multiipstorage"`

`$avSetName="multiip-avSet"`

`$vmSize="Standard_DS4_V2"`(This parameter creates a VM with up to four NICs.)

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2 GB RAM.

`$publisher="Citrix"`

`$offer="netscalervpx110-6531"`(You can use different offers.)

`$sku="netscalerbyol"`(According to your offer, the SKU can be different.)

`$version="latest"`

`$pubIPName1="PIP1"`

`$pubIPName2="PIP2"`

`$domName1="multiipvpx1"`

`$domName2="multiipvpx2"`

`$vmNamePrefix="VPXMultiIP"`

`$osDiskSuffix="osmultiipalbdiskdb1"`

Network Security Group (NSG)-related information:

```
$nsgName="NSG-MultiIP"  
$rule1Name="Inbound-HTTP"  
$rule2Name="Inbound-HTTPS"  
$rule3Name="Inbound-SSH"  
$IpConfigName1="IPConfig1"  
$IPConfigName2="IPConfig-2"  
$IPConfigName3="IPConfig-3"
```

1. Create Resource Group

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. Create Storage Account

```
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName  
-ResourceGroupName $rgName -Type Standard_LRS -Location $locName
```

3. Create Availability Set

```
$avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName  
$rgName -Location $locName
```

4. Create Network Security Group

1. Add rules. You must add a rule to the network security group for any port that serves traffic.

```
$rule1=New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -  
Description "Allow HTTP"-Access Allow -Protocol Tcp -Direction  
Inbound -Priority 101 -SourceAddressPrefix Internet -SourcePortRange  
* -DestinationAddressPrefix * -DestinationPortRange 80  
$rule2=New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -  
Description "Allow HTTPS"-Access Allow -Protocol Tcp -Direction  
Inbound -Priority 110 -SourceAddressPrefix Internet -SourcePortRange  
* -DestinationAddressPrefix * -DestinationPortRange 443  
$rule3=New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name  
-Description "Allow SSH"-Access Allow -Protocol Tcp -Direction  
Inbound -Priority 120 -SourceAddressPrefix Internet -SourcePortRange  
* -DestinationAddressPrefix * -DestinationPortRange 22
```

2. Create network security group object.

```
$nsg=New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName  
-Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,  
$rule3
```

5. Create Virtual Network

1. Add subnets.

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name  
$frontEndSubnetName -AddressPrefix $frontEndSubnetRange
```

2. Add virtual network object.

```
$vnet=New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName  
$rgName -Location $locName -AddressPrefix $vNetAddressRange -  
Subnet $frontendSubnet
```

3. Retrieve subnets.

```
$subnetName="frontEndSubnet"  
$subnet1=$vnet.Subnets|?{ $_.Name -eq $subnetName }
```

6. Create Public IP Address

```
$pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName  
$rgName -DomainNameLabel $domName1 -Location $locName -AllocationMethod  
Static  
$pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName  
$rgName -DomainNameLabel $domName2 -Location $locName -AllocationMethod  
Static
```

Note

Check availability of domain names before using.

Allocation method for IP addresses can be dynamic or static.

7. Assign IP Configuration

In this use case, consider the following points before assigning IP addresses:

- IPConfig-1 belongs to subnet1 of VPX1.
- IPConfig-2 belongs to subnet 1 of VPX1.

- IPConfig-3 belongs to subnet 1 of VPX1.

Note

When you assign multiple IP configurations to a NIC, one configuration must be assigned as primary.

```

1 $IPAddress1="11.6.1.27"
2 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress1 -PublicIpAddress $pip1
    - Primary
3 $IPAddress2="11.6.1.28"
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress2 -PublicIpAddress $pip2
5 $IPAddress3="11.6.1.29"
6 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress3 -Primary

```

Use a valid IP address that meets your subnet requirements and check its availability.

8. Create NIC

```
$nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig1,$IpConfig2,
    $IPConfig3 -NetworkSecurityGroupId $nsg.Id
```

9. Create NetScaler VPX Instance

1. Initialize variables.

```
$suffixNumber = 1
$vmName = $vmNamePrefix + $suffixNumber
```

2. Create VM config object.

```
$vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avSet.Id
```

3. Set credentials, OS, and image.

```
$cred=Get-Credential -Message "Type the name and password for VPX
    login."
$vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
    ComputerName $vmName -Credential $cred
$vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
    $publisher -Offer $offer -Skus $sku -Version $version
```

4. Add NIC.

```
$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.  
Id -Primary
```

Note

In a multi-NIC VPX deployment, one NIC must be primary. So, “-Primary” must be appended while adding that NIC to the VPX instance.

5. Specify OS disk and create VM.

```
$osDiskName=$vmName + "-" + $osDiskSuffix1  
$osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString()+ "  
vhds/" + $osDiskName + ".vhd"  
$vmConfig=Set-AzureRMVMOsDisk -VM $vmConfig -Name $osDiskName -  
VhdUri $osVhdUri -CreateOption fromImage  
Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product  
$offer -Name $sku  
New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location  
$locName
```

10. Check NIC Configurations

After the VPX instance starts, you can check the IP addresses allocated to `IPConfigs` of the VPX NIC by using the following command.

```
$nic.IPConfig
```

11. Check VPX-side Configurations

When the NetScaler VPX instance starts, a private IP address associated with primary `IPconfig` of the primary NIC is added as the NSIP address. The remaining private IP addresses must be added as VIP or SNIP addresses, as determined by your requirements. Use the following command.

```
add nsip <Private IPAddress><netmask> -type VIP/SNIP
```

You’ve now configured multiple IP addresses for a NetScaler VPX instance in standalone mode.

Additional PowerShell scripts for Azure deployment

May 2, 2023

This section provides the PowerShell cmdlets with which you can perform the following configurations in Azure PowerShell:

- Provision a NetScaler VPX standalone instance
- Provision a NetScaler VPX pair in a high availability setup with an Azure external load balancer
- Provision a NetScaler VPX pair in a high availability setup with Azure internal load balancer

Also see the following topics for configurations that you can perform by using PowerShell commands:

- [Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands](#)
- [Configure GSLB on NetScaler VPX instances](#)
- [Configure GSLB on a NetScaler active-standby high-availability setup](#)
- [Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands](#)
- [Configure multiple Azure VIPs for a standalone VPX instance](#)

Provision a NetScaler VPX standalone instance

1. Create a resource group

The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

```
$rgName="<resource group name>"  
$locName="<location name, such as West US>"  
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

For example:

```
1 $rgName = "ARM-VPX"  
2 $locName = "West US"  
3 New-AzureRmResourceGroup -Name $rgName -Location $locName  
4 <!--NeedCopy-->
```

2. Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="<storage account name>"  
$saType="<storage account type>", specify one: Standard_LRS, Standard_GRS  
, Standard_RAGRS, or Premium_LRS
```

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName
$rgName -Type $saType -Location $locName
```

For example:

```
1 $saName="vpxstorage"
2 $saType="Standard\_LRS"
3 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName
  -Type $saType -Location $locName
4 <!--NeedCopy-->
```

3. Create an availability set

Availability set helps to keep your virtual machines available during downtime, such as during maintenance. A load balancer configured with an availability set ensures that your application is always available.

```
$avName="<availability set name>"
```

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
$rgName -Location $locName
```

4. Create a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$FrontendAddressPrefix="10.0.1.0/24"
$BackendAddressPrefix="10.0.2.0/24"
$vnetAddressPrefix="10.0.0.0/16"
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
backendSubnet -AddressPrefix $BackendAddressPrefix
New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName
$rgName -Location $locName -AddressPrefix $vnetAddressPrefix -
Subnet $frontendSubnet,$backendSubnet
```

For example:

```
1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  frontendSubnet -AddressPrefix $FrontendAddressPrefix
2
3 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  backendSubnet -AddressPrefix $BackendAddressPrefix
4
5 New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName
  -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet
  $frontendSubnet,$backendSubnet
6 <!--NeedCopy-->
```

5. Create a NIC

Create a NIC and associate the NIC with the NetScaler VPX instance. The front end Subnet created in the above procedure is indexed at 0 and the back end Subnet is indexed at 1. Now create NIC in one of the three following ways:

a) NIC with Public IP address

```
$nicName="<name of the NIC of the VM>"
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName
    $rgName -Location $locName -AllocationMethod Dynamic
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName
    $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex
].Id -PublicIpAddressId $pip.Id
```

b) NIC with Public IP and DNS label

```
$nicName="<name of the NIC of the VM>"
$domName="<domain name label>"
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName
    $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod
    Dynamic
```

Before assigning \$domName, check it is available or not by using command:

```
Test-AzureRmDnsAvailability -DomainQualifiedName $domName -
Location $locName
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName
    $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex
].Id -PublicIpAddressId $pip.Id
```

For example:

```
1 $nicName="frontendNIC"
2
3 $domName="vpxazure"
4
5 $pip = New-AzureRmPublicIpAddress -Name $nicName -
    ResourceGroupName $rgName -DomainNameLabel $domName -Location
    $locName -AllocationMethod Dynamic
6
7 $nic = New-AzureRmNetworkInterface -Name $nicName -
    ResourceGroupName $rgName -Location $locName -SubnetId $vnet.
    Subnets\[0\].Id -PublicIpAddressId $pip.Id
8 <!--NeedCopy-->
```

c) NIC with Dynamic Public Address and Static Private IP address

Make sure that the private (static) IP address you add to the VM must be the same range as that of the subnet specified.

```
$nicName="<name of the NIC of the VM>"
$staticIP="<available static IP address on the subnet>"
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName
    $rgName -Location $locName -AllocationMethod Dynamic
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName
    $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex
    ].Id -PublicIpAddressId $pip.Id -PrivateIpAddress $staticIP
```

6. Create a virtual object

```
$vmName="<VM name>"
$vmSize="<VM size string>"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
    $rgName
$vm=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId
    $avset.Id
```

7. Get the NetScaler VPX image

```
$pubName="<Image publisher name>"
$offerName="<Image offer name>"
$skuName="<Image SKU name>"
$cred=Get-Credential -Message "Type the name and password of the
local administrator account."
```

Provide your credentials that is used to log in into VPX

```
$vm=Set-AzureRmVMOperatingSystem -VM $vm -Linux -ComputerName
    $vmName -Credential $cred -Verbose
$vm=Set-AzureRmVMSourceImage -VM $vm -PublisherName $pubName -
    Offer $offerName -Skus $skuName -Version "latest"
$vm=Add-AzureRmVMNetworkInterface -VM $vm -Id $nic.Id
```

For example:

```
$pubName="citrix"
```

The following command is used for displaying all offers from Citrix:

```

1 Get-AzureRMVMImageOffer -Location $locName -Publisher $pubName |
  Select Offer
2
3 $offerName="netscalervpx110-6531"
4 <!--NeedCopy-->

```

The following command is used to know SKU offered by publisher for specific offer name:

```

Get-AzureRMVMImageSku -Location $locName -Publisher $pubName -
Offer $offerName | Select Skus

```

8. Create a virtual machine

```
$diskName="<name identifier for the disk in Azure storage, such as OSDisk>"
```

For example:

```

1 $diskName="dynamic"
2
3 $pubName="citrix"
4
5 $offerName="netscalervpx110-6531"
6
7 $skuName="netscalerbyol"
8
9 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -
  Name $saName
10
11 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds/"
  + $diskName + ".vhd"
12
13 $vm=Set-AzureRmVMOSDisk -VM $vm -Name $diskName -VhdUri $osDiskUri
  -CreateOption fromImage
14 <!--NeedCopy-->

```

When you create VM from Images present in marketplace, use the following command to specify the VM plan:

```

Set-AzureRmVMPlan -VM $vm -Publisher $pubName -Product $offerName
  -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM
  $vm

```

Provision a NetScaler VPX pair in a high availability setup with an Azure external load balancer

Log on to AzureRmAccount using your Azure user credentials.

1. Create a resource group

The location specified here is the default location for resources in that resource group. Make sure that all commands used to create a load balancer use the same resource group.

```
$rgName="<resource group name>"
```

```
$locName="<location name, such as West US>"
```

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

For example:

```
1 $rgName = "ARM-LB-NS"
2
3 $locName = "West US"
4
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
6 <!--NeedCopy-->
```

2. Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="<storage account name>"
```

```
$saType="<storage account type>", specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS
```

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```
1 $saName="vpxstorage"
2
3 $saType="Standard_LRS"
4
5 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
6 <!--NeedCopy-->
```

3. Create an availability set

A load balancer configured with an availability set ensures that your application is always available.

```
$avName="<availability set name>"
```

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

4. Create a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```

1 $vnetName = "LBVnet"
2
3 $FrontendAddressPrefix="10.0.1.0/24"
4
5 $BackendAddressPrefix="10.0.2.0/24"
6
7 $vnetAddressPrefix="10.0.0.0/16"
8
9 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
    frontendSubnet -AddressPrefix $FrontendAddressPrefix
10
11 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
    backendSubnet -AddressPrefix $BackendAddressPrefix
12
13 $vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
    $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -
    Subnet $frontendSubnet,$backendSubnet
14 <!--NeedCopy-->

```

Note: Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array VNet, subnetId must be \$vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId must be \$vnet.Subnets[1].Id, and so on.

5. Configure front end IP address and create back end address pool

Configure a front end IP address for the incoming load balancer network traffic and create a back end address pool to receive the load balanced traffic.

```

1 $pubName="PublicIp1"
2
3 $publicIP1 = New-AzureRmPublicIpAddress -Name $pubName -
    ResourceGroupName $rgName -Location $locName -AllocationMethod
    Static -DomainNameLabel nsvpx
4 <!--NeedCopy-->

```

Note: Check for the availability of the value for DomainNameLabel.

```

1 $FIPName = "ELBFIP"
2
3 $frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name
    $FIPName -PublicIpAddress $publicIP1
4
5 $BEPool = "LB-backend-Pool1"
6

```

```

7 $beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -
  Name $BEPool
8 <!--NeedCopy-->

```

6. Create a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```

1 $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name
  HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -
  ProbeCount 2
2 <!--NeedCopy-->

```

7. Create a load balancing rule

Create an LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance HTTP service.

```

1 $lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP-LB" -
  FrontendIpConfiguration $frontendIP1 -BackendAddressPool
  $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort
  80 -BackendPort 80
2 <!--NeedCopy-->

```

8. Create inbound NAT rules

Create NAT rules for services that you are not load balancing.

For example, when creating an SSH access to a NetScaler VPX instance.

Note: Protocol-FrontEndPort-BackendPort triplet must not be the same for two NAT rules.

```

1 $inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -
  Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol
  TCP -FrontendPort 22 -BackendPort 22
2
3 $inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -
  Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -
  FrontendPort 10022 -BackendPort 22
4 <!--NeedCopy-->

```

9. Create a load balancer entity

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```

1 $lbName="ELB"
2
3 $NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name
  $lbName -Location $locName -InboundNatRule $inboundNATRule1,
  $inboundNATRule2 -FrontendIpConfiguration $frontendIP1 -

```

```

        LoadBalancingRule $lbrule1 -BackendAddressPool $beAddressPool1
        -Probe $healthProbe
4 <!--NeedCopy-->

```

10. Create a NIC

Create two NICs and associate each NIC with each VPX instance

a) NIC1 with VPX1

For example:

```

1 $nicName="NIC1"
2
3 $lbName="ELB"
4
5 $bePoolIndex=0
6
7 \* Rule indexes starts from 0.
8
9 $natRuleIndex=0
10
11 $subnetIndex=0
12
13 \* Frontend subnet index
14
15 $lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName
    $rgName
16
17 $nic1=New-AzureRmNetworkInterface -Name $nicName -
    ResourceGroupName $rgName -Location $locName -Subnet $vnet.
    Subnets\[ $subnetIndex\] -LoadBalancerBackendAddressPool $lb.
    BackendAddressPools\[ $bePoolIndex\] -LoadBalancerInboundNatRule
    $lb.InboundNatRules\[ $natRuleIndex\]
18 <!--NeedCopy-->

```

b) NIC2 with VPX2

For example:

```

1 $nicName="NIC2"
2
3 $lbName="ELB"
4
5 $bePoolIndex=0
6
7 $natRuleIndex=1
8
9 \* Second Inbound NAT (SSH) rule we need to use
10
11 ` $subnetIndex=0
12
13 \* Frontend subnet index
14

```

```

15 $lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName
    $rgName
16
17 $nic2=New-AzureRmNetworkInterface -Name $nicName -
    ResourceGroupName $rgName -Location $locName -Subnet $vnet.
    Subnets\[ $subnetIndex\] -LoadBalancerBackendAddressPool $lb.
    BackendAddressPools\[ $bePoolIndex\] -LoadBalancerInboundNatRule
    $lb.InboundNatRules\[ $natRuleIndex\]
18 <!--NeedCopy-->

```

11. Create NetScaler VPX instances

Create two NetScaler VPX instances as part of the same resource group and availability set, and attach it to the external load balancer.

a) NetScaler VPX instance 1

For example:

```

1  $vmName="VPX1"
2
3  $vmSize="Standard_A3"
4
5  $pubName="citrix"
6
7  $offerName="netscalervpx110-6531"
8
9  $skuName="netscalerbyol"
10
11 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
    $rgName
12
13 $vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avset.Id
14
15 $cred=Get-Credential -Message "Type Credentials which will be used
    to login to VPX instance"
16
17 $vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName
    $vmName -Credential $cred -Verbose
18
19 $vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -
    Offer $offerName -Skus $skuName -Version "latest"
20
21 $vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
22
23 $diskName="dynamic"
24
25 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -
    Name $saName
26
27 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/
    " + $diskName + ".vhd"
28

```

```
29 $vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri
    $osDiskUri1 -CreateOption fromImage
30
31 Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName
    -Name $skuName
32
33 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM
    $vm1
34 <!--NeedCopy-->
```

b) NetScaler VPX instance 2

For example:

```
1 $vmName="VPX2"
2
3 $vmSize="Standard\_A3"
4
5 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
    $rgName
6
7 $vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avset.Id
8
9 $cred=Get-Credential -Message " Type Credentials which will be
    used to login to VPX instance "
10
11 $vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName
    $vmName -Credential $cred -Verbose
12
13 $vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -
    Offer $offerName -Skus $skuName -Version "latest"
14
15 $vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
16
17 $diskName="dynamic"
18
19 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -
    Name $saName
20
21 $osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/
    " + $diskName + ".vhd"
22
23 $vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri
    $osDiskUri1 -CreateOption fromImage
24
25 Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName
    -Name $skuName
26
27 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM
    $vm2
28 <!--NeedCopy-->
```

12. Configure the virtual machines

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.

```
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

Provision a NetScaler VPX pair in a high availability setup with Azure internal load balancer

Log on to AzureRmAccount using your Azure user credentials.

1. Create a resource group

The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

```
$rgName="\<resource group name\>"
```

```
$locName="\<location name, such as West US\>"
```

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

For example:

```
1 $rgName = "ARM-LB-NS"
2
3 $locName = "West US"
4
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
6 <!--NeedCopy-->
```

2. Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="\<storage account name>"
```

```
$saType="\<storage account type>", specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS
```

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```

1 $saName="vpxstorage"
2
3 $saType="Standard_LRS"
4
5 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName
  -Type $saType -Location $locName
6 <!--NeedCopy-->

```

3. Create an availability set

A load balancer configured with an availability set ensures that your application is always available.

```

$avName="<availability set name>"

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
  $rgName -Location $locName

```

4. Create a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```

1 $vnetName = "LBVnet"
2
3 $vnetAddressPrefix="10.0.0.0/16"
4
5 $FrontendAddressPrefix="10.0.1.0/24"
6
7 $BackendAddressPrefix="10.0.2.0/24"
8
9 $vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
  $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -
  Subnet $frontendSubnet,$backendSubnet`
10
11 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  frontendSubnet -AddressPrefix $FrontendAddressPrefix
12
13 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  backendSubnet -AddressPrefix $BackendAddressPrefix
14 <!--NeedCopy-->

```

Note: Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array VNet, subnetId must be \$vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId must be \$vnet.Subnets[1].Id, and so on.

5. Create a backend address pool

```
$beaddresspool= New-AzureRmLoadBalancerBackendAddressPoolConfig -
Name "LB-backend"
```

6. Create NAT rules

Create NAT rules for services that you are not load balancing.

```
1 $inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -
  Name "Inboundnatrule1" -FrontendIpConfiguration $frontendIP -
  Protocol TCP -FrontendPort 3441 -BackendPort 3389
2
3 $inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -
  Name "RDP2" -FrontendIpConfiguration $frontendIP -Protocol TCP
  -FrontendPort 3442 -BackendPort 3389
4 <!--NeedCopy-->
```

Use front end and back end ports as per your requirement.

7. Create a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```
1 $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name "
  HealthProbe" " -Protocol tcp -Port 9000 -IntervalInSeconds 5 -
  ProbeCount 2
2 <!--NeedCopy-->
```

8. Create a load balancing rule

Create an LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance HTTP service.

```
1 $lbrule = New-AzureRmLoadBalancerRuleConfig -Name "lbrule1" -
  FrontendIpConfiguration $frontendIP -BackendAddressPool
  $beAddressPool -Probe $healthProbe -Protocol Tcp -FrontendPort
  80 -BackendPort 80
2 <!--NeedCopy-->
```

Use front end and back end ports as per your requirement.

9. Create a load balancer entity

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```
1 $NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgname -Name
  "InternalLB" -Location $locName -FrontendIpConfiguration
  $frontendIP -InboundNatRule $inboundNATRule1,$inboundNatRule2 -
  LoadBalancingRule $lbrule -BackendAddressPool $beAddressPool -
  Probe $healthProbe
2 <!--NeedCopy-->
```

10. Create a NIC

Create two NICs and associate each NIC with each NetScaler VPX instance

```
1 $backendnic1= New-AzureRmNetworkInterface -ResourceGroupName
   $rgName -Name lb-nic1-be -Location $locName -PrivateIpAddress
   10.0.2.6 -Subnet $backendSubnet -LoadBalancerBackendAddressPool
   $nrplb.BackendAddressPools\[0\] -LoadBalancerInboundNatRule
   $nrplb.InboundNatRules\[0\]
2 <!--NeedCopy-->
```

This NIC is for NetScaler VPX 1. The Private IP must be in same subnet as that of subnet added.

```
1 $backendnic2= New-AzureRmNetworkInterface -ResourceGroupName
   $rgName -Name lb-nic2-be -Location $locName -PrivateIpAddress
   10.0.2.7 -Subnet $backendSubnet -LoadBalancerBackendAddressPool
   $nrplb.BackendAddressPools\[0\] -LoadBalancerInboundNatRule
   $nrplb.InboundNatRules\[1\].
2 <!--NeedCopy-->
```

This NIC is for NetScaler VPX 2. The parameter `Private IP Address` can have any private IP as per your requirement.

11. Create NetScaler VPX instances

Create two VPX instances part of the same resource group and availability set, and attach it to the internal load balancer.

a) NetScaler VPX instance 1

For example:

```
1 $vmName="VPX1"
2
3 $vmSize="Standard\_A3"
4
5 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
   $rgName
6
7 $vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
   AvailabilitySetId $avset.Id
8
9 $cred=Get-Credential -Message "Type Credentials which will be used
   to login to VPX instance"
10
11 $vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName
   $vmName -Credential $cred -Verbose
12
13 $vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -
   Offer $offerName -Skus $skuName -Version "latest"
14
15 $vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $backendnic1.Id
16
17 $diskName="dynamic"
```

```

18
19 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -
    Name $saName
20
21 $osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/"
    " + $diskName + ".vhd"
22
23 $vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri
    $osDiskUri1 -CreateOption fromImage
24
25 Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName
    -Name $skuName
26
27 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM
    $vm1
28 <!--NeedCopy-->

```

b) NetScaler VPX instance 2

For example:

```

1 $vmName="VPX2"
2
3 $vmSize="Standard\_A3"
4
5 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
    $rgName
6
7 $vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avset.Id
8
9 $cred=Get-Credential -Message " Type Credentials which will be
    used to login to VPX instance "
10
11 $vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName
    $vmName -Credential $cred -Verbose
12
13 $vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -
    Offer $offerName -Skus $skuName -Version "latest"
14
15 $vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $backendnic2.Id
16
17 $diskName="dynamic"
18
19 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -
    Name $saName
20
21 $osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/"
    " + $diskName + ".vhd"
22
23 $vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri
    $osDiskUri1 -CreateOption fromImage
24
25 Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName

```

```

26     -Name $skuName
27 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM
    $vm2
28 <!--NeedCopy-->
    
```

12. Configure the virtual machines

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.

```
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

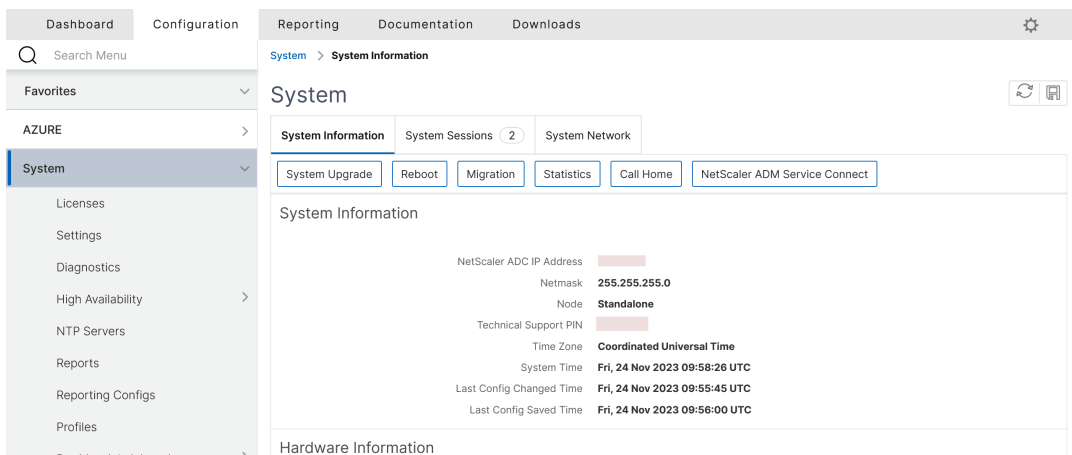

Create a support ticket for the VPX instance on Azure

December 6, 2023

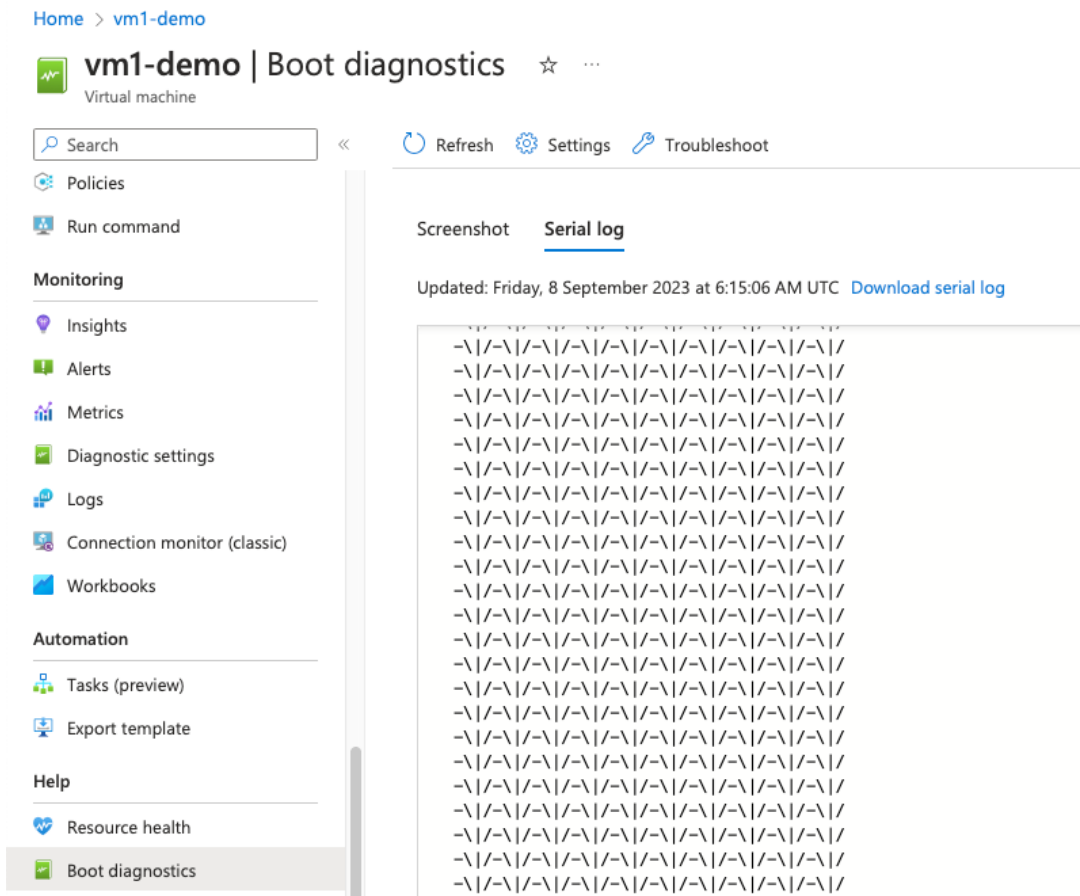

If you're experiencing issues with your NetScaler VPX instance on Azure, for troubleshooting, you can create a support ticket in the [NetScaler support portal](#).

To file a support ticket, make sure the following:

- Your network is connected.
- You have your Azure account number, the support PIN code of the NetScaler subscription-based offering that you have deployed on Azure, and the Azure serial log handy.
 - You can find the support PIN code on the **Systems page** in the VPX GUI.

- You can find the serial log in the Azure portal (**Boot diagnostics** section of your VM).

Note:
NetScaler supports subscription-based offerings on Azure (subscription license with hourly price).

Once you have all the information ready, call NetScaler support. You're asked to provide your name and email address.

Azure FAQs

May 2, 2023

- **Is the upgrade procedure of NetScaler VPX instance installed from Azure Marketplace different from the on-premises upgrade procedure?**

No. You can upgrade your NetScaler VPX instance in the Microsoft Azure cloud to NetScaler VPX release 11.1 or later, using standard NetScaler VPX upgrade procedures. You can upgrade ei-

ther using GUI or CLI procedures. For any new installations, use the NetScaler VPX image for Microsoft Azure cloud.

To download the NetScaler VPX upgrade builds, go to **NetScaler downloads** > [NetScaler Firmware](#).

- **How to correct MAC moves and interface mutes observed on NetScaler VPX instances hosted on Azure?**

In Azure Multi-NIC environment, by default, all data interfaces might show MAC moves and interface mutes. To avoid MAC moves and interface mutes on Azure environments, Citrix recommends you to create a VLAN per data interface (without tag) of the NetScaler VPX instance and bind the primary IP of the NIC in Azure.

For more information, see [CTX224626](#) article.

Deploy a NetScaler VPX instance on the Google Cloud Platform

May 9, 2024

You can deploy a NetScaler VPX instance on the Google Cloud Platform (GCP). A VPX instance in GCP enables you to take advantage of GCP cloud computing capabilities and use Citrix load balancing and traffic management features for your business needs. You can deploy VPX instances in GCP as stand-alone instances. Both single NIC and multi NIC configurations are supported.

Supported features

All Premium, Advanced, and Standard features are supported on the GCP based on the license/version type used.

Limitation

- IPv6 isn't supported.

Hardware requirements

VPX instance in GCP must have minimum of 2 vCPUs and 4 GB RAM.

Points to note

Consider the following GCP-specific points before you begin your deployment.

- After creating the instance, you can't add or remove any network interfaces.
- For a multi-NIC deployment, create separate VPC networks for each NIC. One NIC can be associated with only one network.
- For a single-NIC instance, the GCP console creates a network by default.
- Minimum 4 vCPUs are required for an instance with more than two network interfaces.
- If IP forwarding is required, you must enable IP forwarding while creating the instance and configuring the NIC.

Scenario: Deploy a multi-NIC, multi-IP standalone VPX instance

This scenario illustrates how to deploy a NetScaler VPX standalone instance in GCP. In this scenario, you create a standalone VPX instance with many NICs. The instance communicates with back-end servers (the server farm).

Create three NICs to serve the following purposes.

NIC	Purpose	Associated with VPC network
NIC 0	Serves management traffic (NetScaler IP)	Management network
NIC 1	Serves client-side traffic (VIP)	Client network
NIC 2	Communicates with back-end servers (SNIP)	Back-end server network

Set up the required communication routes between the following:

- VPX instance and the back-end servers.
- VPX instance and the external hosts on the public internet.

Summary of deployment steps

1. Create three VPC networks for three different NICs.
2. Create firewall rules for ports 22, 80, and 443.
3. Create an instance with three NICs.

Select the NetScaler VPX instance from GCP marketplace.

Note:

Create an instance in the same region where you've created the VPC networks.

Step 1. Create VPC networks.

Create three VPC networks that is associated with management NIC, client NIC, and server NIC. To create a VPC network, log on to **Google console > Networking > VPC network > Create VPC Network**. Complete the required fields, as shown in the screen capture, and click **Create**.

netscaler-vpx-platform-eng

← Create a VPC network

Name ?
vpxmgmt

Dynamic routing mode ?
 Regional
Cloud Routers will learn routes only in the region in which they were created

Global
Global routing lets you dynamically learn routes to and from all regions with a single VPN or interconnect and Cloud Router

Similarly, create VPC networks for client and server-side NICs.

Note:

All three VPC networks must be in the same region, which is asia-east1 in this scenario.

Step 2. Create firewall rules for ports 22, 80, and 443.

Create rules for SSH (port 22), HTTP (port 80), and HTTPS (port 443) for each VPC networks. For more information about firewall rules, see [Firewall Rules Overview](#).

netscaler-vpx-platform-eng

Step 3. Create the VPX instance.

1. Log on to the GCP console.
2. Navigate to the [GCP Marketplace](#).
3. Select a subscription based on your requirements.

4. Click **Launch** on the selected subscription.

5. Complete the deployment form and click **Deploy**.

Note: Use the VPC Networks created in **Step 1**.

6. The deployed instance appears under **Compute Engine > VM instances**.

Use the GCP SSH or the serial console to configure and manage the VPX instance.

Scenario: Deploy a single-NIC, standalone VPX instance

This scenario illustrates how to deploy a NetScaler VPX standalone instance with a single NIC in GCP. The alias IP addresses are used to achieve this deployment.

Create a single NIC (NIC0) to serve the following purposes:

- Handle management traffic (NetScaler IP) in the management network.
- Handle client-side traffic (VIP) in the client network.
- Communicate with back-end servers (SNIP) in the back-end server network.

Set up the required communication routes between the following:

- Instance and the back-end servers.
- Instance and the external hosts on the public internet.

Summary of deployment steps

1. Create a VPC network for NIC0.
2. Create firewall rules for ports 22, 80, and 443.
3. Create an instance with a single NIC.
4. Add Alias IP addresses to VPX.
5. Add VIP and SNIP on VPX.
6. Add a load balancing virtual server.
7. Add a service or service group on the instance.
8. Bind the service or service group to the load balancing virtual server on the instance.

Note:

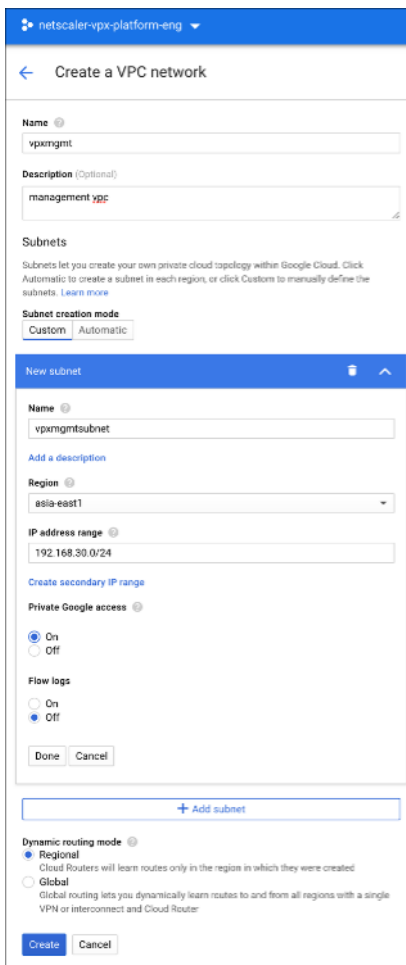

Create an instance in the same region where you've created the VPC networks.

Step 1. Create one VPC network.

Create one VPC network to associate with NIC0.

To create a VPC network, do these steps:

1. Log on to **GCP console > Networking > VPC network > Create VPC Network**
2. Complete the required fields, and click **Create**.

Step 2. Create firewall rules for ports 22, 80, and 443.

Create rules for SSH (port 22), HTTP (port 80), and HTTPS (port 443) for the VPC network. For more information about firewall rules, see [Firewall Rules Overview](#).

netscaler-vpx-platform-eng

Disable rule

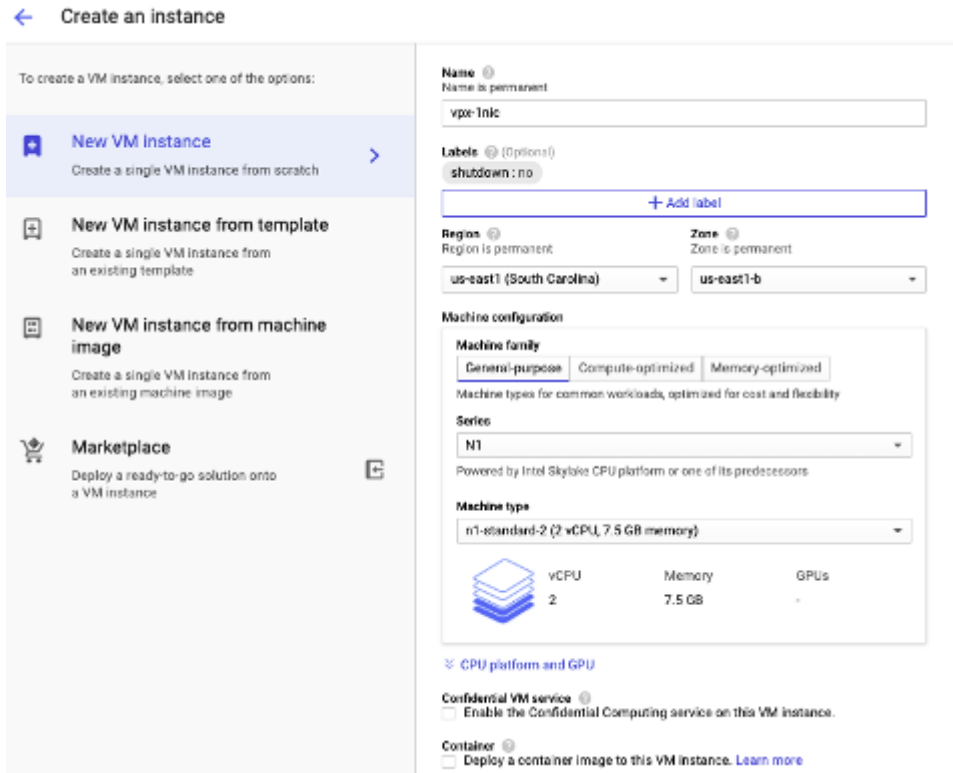

Step 3. Create an instance with single NIC.

To create an instance with single NIC, do these steps:

1. Log on to the **GCP console**.
2. Under **Compute**, hover over **Compute Engine**, and select **Images**.
3. Select the image, and click **Create Instance**.

4. Select an instance type with two vCPUs (minimum requirement for ADC).

5. Click the **Networking** tab from the **Management, security, disks, networking** window.
6. Under **Network interfaces**, click the **Edit** icon to edit the default NIC.
7. In the **Network interfaces** window, under **Network**, select the VPC network that you created.
8. You can create a static external IP address. Under the **External IP addresses**, click **Create IP address**.
9. In the **Reserve a static address** window, add a name and description and click **Reserve**.
10. Click **Create** to create the VPX instance.
The new instance appears under VM instances.

Step 4. Add alias IP addresses to the VPX instance.

Assign two alias IP addresses to the VPX instance to use as VIP and SNIP addresses.

Note:
Do not use the primary internal IP address of the VPX instance to configure the VIP or SNIP.

To create an alias IP address, perform these steps:

1. Navigate to the VM instance and click **Edit**.
2. In the **Network interface** window, edit the NIC0 interface.

3. In the **Alias IP range** field, enter the alias IP addresses.

4. Click **Done**, and then **Save**.

5. Verify the alias IP addresses in the **VM instance details** page.

Step 5. Add VIP and SNIP on the VPX instance.

On the VPX instance, add client alias IP address and server alias IP address.

1. On the NetScaler GUI, navigate to **System > Network > IPs > IPv4s**, and click **Add**.

2. To create a client alias IP (VIP) address:

- Enter the client-alias IP address and netmask configured for the VPC subnet in the VM instance.
- In the **IP Type** field, select **Virtual IP** from the drop-down menu.
- Click **Create**.

3. To create a server alias IP (SNIP) address:

- Enter the server-alias IP address and netmask configured for the VPC subnet in the VM instance.
- In the **IP Type** field, select **Subnet IP** from the drop-down menu.
- Click **Create**.

Step 6. Add load balancing virtual server.

1. On the NetScaler GUI, navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers**, and click **Add**.
2. Add the required values for Name, Protocol, IP Address Type (IP Address), IP Address (client alias IP), and Port.
3. Click **OK** to create the load balancing virtual server.

Dashboard Configuration Reporting Documentation Downloads

← Load Balancing Virtual Server

Basic Settings

Create a virtual server by specifying a name, an IP address, a port, and a protocol type. If an application is accessible from the Internet, the virtual server IP (VIP) address is a public IP address. If the application is accessible only from the local area network (LAN) or wide area network (WAN), the VIP is usually a private (RFC1918) IP address. You can configure multiple virtual servers to receive client requests, thereby increasing the availability of resources to process client requests.

Name*

Protocol*

IP Address Type*

IP Address*

Port*

More

OK Cancel

Step 7. Add a service or service group on the VPX instance.

1. From the NetScaler GUI, navigate to **Configuration > Traffic Management > Load Balancing > Services**, and click **Add**.
2. Add the required values for Service Name, IP Address, Protocol, and Port, and click **OK**.

Step 8. Bind the service/service group to the Load Balancing Virtual Server on the instance.

1. From the GUI, navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers**.
2. Select the load balancing virtual server configured in **Step 6**, and click **Edit**.
3. In the **Service and Service Groups** window, click **No Load Balancing Virtual Server Service Binding**.
4. Select the service configured in **Step 7**, and click **Bind**.

Points to note after you've deployed the VPX instance on GCP

- Log on to the VPX with user name `nsroot` and instance ID as password. At the prompt, change the password and save the configuration.
- For collecting a technical support bundle, run the command `shell /netscaler/showtech_cloud.pl` instead of the customary `show techsupport`.
- After deleting a NetScaler VM from GCP console, delete the associated NetScaler internal target instance also. To do so, go to gcloud CLI and type the following command:

```
1 gcloud compute -q target-instances delete <instance-name>--
   adcinternal --zone <zone>
2 <!--NeedCopy-->
```

Note:

`<instance-name>-adcinternal` is the name of the target instance that must be deleted.

NetScaler VPX licensing

A NetScaler VPX instance on GCP requires a license. The following licensing options are available for NetScaler VPX instances running on GCP.

- **Subscription-based licensing:** NetScaler VPX appliances are available as paid instances on the GCP marketplace. Subscription-based licensing is a pay-as-you-go option. Users are charged hourly. The following VPX models and license editions are available on the GCP marketplace.

Supported VPX model

NetScaler VPX Advanced - 200 Mbps

NetScaler VPX Premium - 1 Gbps

NetScaler VPX Premium - 5 Gbps

NetScaler VPX Express - 20 Mbps

NetScaler VPX - Customer Licensed

NetScaler VPX FIPS - Customer Licensed

- **Bring your own license (BYOL):** If you bring your own license (BYOL), see the VPX Licensing Guide at <http://support.citrix.com/article/CTX122426>. You have to:
 - Use the licensing portal within the Citrix website to generate a valid license.
 - Upload the license to the instance.
- **NetScaler VPX Check-In/Check-Out licensing:** For more information, see [NetScaler VPX Check-In/Check-Out Licensing](#).

VPX Express for on-premises and cloud deployments does not require a license file. For more information on NetScaler VPX Express see the “NetScaler VPX Express license” section in [NetScaler licensing overview](#).

GDM templates to deploy a NetScaler VPX instance

You can use a NetScaler VPX Google Deployment Manager (GDM) template to deploy a VPX instance on GCP. For details, see [NetScaler GDM Templates](#).

NetScaler marketplace images

You can use the images in GDM templates to bring up the NetScaler appliance.

The following table lists the images that are available on GCP marketplace.

Release	Image name	Image location

Deploy a VPX high-availability pair on Google Cloud Platform

May 2, 2023

You can configure two NetScaler VPX instances on Google Cloud Platform (GCP) as a high availability (HA) active-passive pair. When you configure one instance as the primary node and the other as the secondary node, the primary node accepts connections and manages servers. The secondary node monitors the primary. If for any reason, if the primary node is unable to accept connections, the secondary node takes over.

For more information on HA, see [High Availability](#).

The nodes must be in the same region; however, they can be either in the same zone or different zones. For more information, see [Regions and Zones](#).

Each VPX instance requires at least three IP subnets (Google VPC networks):

- A management subnet
- A client-facing subnet (VIP)
- A back-end facing subnet (SNIP, MIP, and so on)

Citrix recommends three network interfaces for a standard VPX instance.

You can deploy a VPX high-availability pair in the following methods:

- [Using external static IP address](#)
- [Using private IP address](#)
- [Using single nic VMs with private IP address](#)

GDM templates to deploy a VPX high-availability pair on GCP

You can use a NetScaler Google Deployment Manager (GDM) template to deploy a VPX high-availability pair on GCP. For details, see [NetScaler GDM Templates](#).

Forwarding rules support for VPX high-availability pair on GCP

You can deploy a VPX high-availability pair on the GCP using forwarding rules.

For more information on forwarding rules, see [Forwarding rules overview](#).

Prerequisites

- Forwarding rules must be in the same region as the VPX instances.
- Target instances must be in the same zone as the VPX instance.
- Number of target instances for both primary and secondary nodes must match.

Example:

You have a high-availability pair in the `us-east1` region with primary VPX in `us-east1-b` zone and secondary VPX in `us-east1-c` zone. A forwarding rule is configured for the primary VPX with the target instance in `us-east1-b` zone. Configure a target instance for secondary VPX in `us-east1-c` zone to update the forwarding rule on failover.

Limitations

Only forwarding rules that are configured with target instances at the back end are supported in VPX high-availability deployment.

Deploy a VPX high-availability pair with external static IP address on the Google Cloud Platform

May 2, 2023

You can deploy a VPX high-availability pair on GCP using an external static IP address. The client IP address of the primary node must be bound to an external static IP address. Upon failover, the external static IP address is moved to the secondary node for traffic to resume.

A static external IP address is an external IP address that is reserved for your project until you decide to release it. If you use an IP address to access a service, you can reserve that IP address so that only your project can use it. For more information, see [Reserving a Static External IP Address](#).

For more information on HA, see [High Availability](#).

Before you start

- Read the Limitation, Hardware requirements, Points to note mentioned in [Deploy a NetScaler VPX instance on Google Cloud Platform](#). This information applies to HA deployments also.
- Enable **Cloud Resource Manager API** for your GCP project.

- Allow full access to all Cloud APIs while creating the instances.

The screenshot shows the 'Identity and API access' configuration window. The 'Service account' is set to 'Compute Engine default service account'. Under 'Access scopes', the 'Allow full access to all Cloud APIs' option is selected with a blue radio button. Other options include 'Allow default access' and 'Set access for each API'.

- Ensure that the IAM role associated with your GCP service account has the following IAM permissions:

```

1  REQUIRED_INSTANCE_IAM_PERMS = [
2
3  "compute.addresses.use",
4  "compute.forwardingRules.list",
5  "compute.forwardingRules.setTarget",
6  "compute.instances.setMetadata",
7  "compute.instances.addAccessConfig",
8  "compute.instances.deleteAccessConfig",
9  "compute.instances.get",
10 "Compute.instances.list",
11 "compute.networks.useExternalIp",
12 "compute.subnetworks.useExternalIp",
13 "compute.targetInstances.list",
14 "compute.targetInstances.use",
15 "compute.targetInstances.create",
16 "compute.zones.list",
17 "compute.zoneOperations.get",
18 ]
19 <!--NeedCopy-->

```

- If you have configured alias IP addresses on an interface other than the management interface, ensure that your GCP service account has the following additional IAM permissions:

```

1  "compute.instances.updateNetworkInterface"
2  <!--NeedCopy-->

```

- If you have configured GCP forwarding rules on the primary node, read the limitations and requirements mentioned in [Forwarding rules support for VPX high-availability pair on GCP](#) to update them to new primary on failover.

How to deploy a VPX HA pair on Google Cloud Platform

Here's a summary of the HA deployment steps:

1. Create VPC networks in the same region. For example, Asia-east.

2. Create two VPX instances (primary and secondary nodes) on the same region. They can be in the same zone or different zones. For example Asia east-1a and Asia east-1b.
3. Configure HA settings on both instances by using the NetScaler GUI or ADC CLI commands.

Step 1. Create VPC networks

Create VPC networks based on your requirements. Citrix recommends you to create three VPC networks for associating with management NIC, client NIC, and server NIC.

To create a VPC network, perform these steps:

1. Log on the **Google console > Networking > VPC network > Create VPC Network**.
2. Complete the required fields, and click **Create**.

For more information, see the **Create VPC Networks** section in [Deploy a NetScaler VPX instance on Google Cloud Platform](#).

Step 2. Create two VPX instances

Create two VPX instances by following the steps given in [Scenario: deploy a multi-NIC, multi-IP stand-alone VPX instance](#).

Important

Assign a static external IP address to client IP address (VIP) of the primary node. You can use an existing reserved IP address or create a new one. To create a static external IP address, navigate to **Network interface > External IP**, click **Create IP address**.

After the failover, when the old primary becomes the new secondary, the static external IP address moves from the old primary and is attached to the new primary. For more information, see the Google cloud document [Reserving a Static External IP Address](#).

After you've configured the VPX instances, you can configure the VIP and SNIP addresses. For more information, see [Configuring NetScaler-owned IP addresses](#).

Step 3. Configure high availability

After you've created the instances on Google Cloud Platform, you can configure HA by using the NetScaler GUI for CLI.

Configure HA by using the GUI Step 1. Set up high availability in INC mode on both the instances.

On the **primary node**, perform the following steps:

1. Log on to the instance with user name `nsroot` and instance ID of the node from GCP console as the password.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the secondary node.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** check box.
5. Click **Create**.

On the **secondary node**, perform the following steps:

1. Log on to the instance with user name `nsroot` and instance ID of the node from GCP console as the password.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the primary node.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** check box.
5. Click **Create**.

Before you proceed further, ensure that the Synchronization state of the secondary node is shown as **SUCCESS** in the **Nodes** page.

System / High Availability / Nodes

Nodes 2

<input type="checkbox"/>	ID	IP ADDRESS	HOST NAME	MASTER STATE	NODE STATE	INC	SYNCHRONIZATION STATE	SYNCHRONIZATION FAILURE REASON
<input type="checkbox"/>	0	192.168.1.3		Primary	● UP	ENABLED	ENABLED	-NA-
<input type="checkbox"/>	1	192.168.1.66		Secondary	● UP	ENABLED	SUCCESS	-NA-

Total 2

25 Per Page Page 1 of 1

Note

Now, the secondary node has the same log-on credentials as the primary node.

Step 2. Add Virtual IP address and Subnet IP address on both the nodes.

On the **primary node**, perform the following steps:

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. Add a primary VIP address by following these steps:
 - a) Enter the internal IP address of the client-facing interface of the primary instance and net-mask configured for the client subnet in the VM instance.

- b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
 - c) Click **Create**.
3. Add a primary SNIP address by following these steps:
- a) Enter the internal IP address of the server-facing interface of the primary instance and netmask configured for the server subnet in the primary instance.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.
4. Add a secondary VIP address by following these steps:
- a) Enter the internal IP address of the client-facing interface of the secondary instance and netmask configured for the client subnet in the VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
 - c) Click **Create**.

Total 4

25 Per Page Page 1 of 1

On the **secondary node**, perform the following steps:

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. Add a secondary VIP address by following these steps:
 - a) Enter the internal IP address of the client-facing interface of the secondary instance and netmask configured for the client subnet in the VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
3. Add a secondary SNIP address by following these steps:
 - a) Enter the internal IP address of the server-facing interface of the secondary instance and netmask configured for the server subnet in the secondary instance.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.

The screenshot shows the 'IPs' configuration page in NetScaler. It has tabs for 'IPv4s' (3) and 'IPv6s' (1). Below the tabs are buttons for 'Add', 'Edit', 'Delete', 'Statistics', and 'Select Action'. A search bar is present with the text 'Click here to search or you can enter Key: Value format'. The main table lists IP configurations:

	IP ADDRESS	STATE	TYPE	MODE	ARP	ICMP	VIRTUAL SERVER	TRAFFIC DOMAIN
Secondary SNIP	192.168.3.76	ENABLED	Subnet IP	Active	ENABLED	ENABLED	-N/A-	0
Secondary VIP	192.168.2.54	ENABLED	Virtual IP	Passive	ENABLED	ENABLED	ENABLED	0
	192.168.1.66	ENABLED	NetScaler IP	Active	ENABLED	ENABLED	-N/A-	0

At the bottom, it shows 'Total 3', '25 Per Page', and 'Page 1 of 1'.

Step 3. Add IP set and bind IP set to the secondary VIP on both the instances.

On the **primary node**, perform the following steps:

1. Navigate to **System > Network > IP Sets > Add**.
2. Add an IP set name and click **Insert**.
3. From the **IPv4s** page, select the virtual IP (secondary VIP) and click **Insert**.
4. Click **Create** to create the IP set.

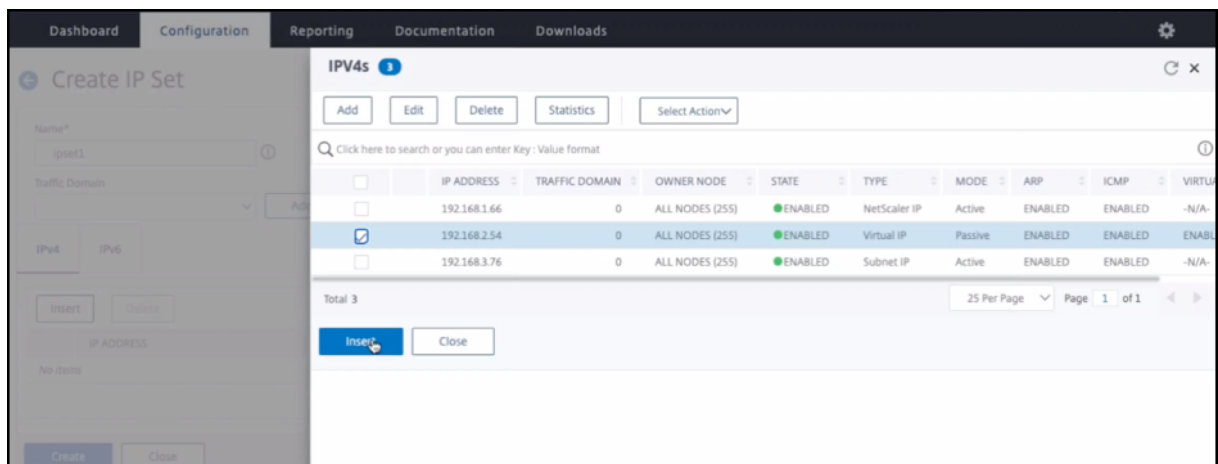

The screenshot shows the 'IPV4s' configuration page with a modal window titled 'Create IP Set' open. The modal has fields for 'Name*' (ipset1), 'Traffic Domain', and 'IP Address'. The 'IPV4s' table in the background is updated with four entries:

	IP ADDRESS	TRAFFIC DOMAIN	OWNER NODE	STATE	TYPE	MODE	ARP	ICMP	VIRTUA
	192.168.1.3	0	ALL NODES (255)	ENABLED	NetScaler IP	Active	ENABLED	ENABLED	-N/A-
	192.168.2.37	0	ALL NODES (255)	ENABLED	Virtual IP	Active	ENABLED	ENABLED	ENABLI
	192.168.3.7	0	ALL NODES (255)	ENABLED	Subnet IP	Active	ENABLED	ENABLED	-N/A-
	192.168.2.54	0	ALL NODES (255)	ENABLED	Virtual IP	Active	ENABLED	ENABLED	ENABLI

The modal window has 'Insert' and 'Create' buttons. The 'IPV4s' page shows 'Total 4', '25 Per Page', and 'Page 1 of 1'.

On the **secondary node**, perform the following steps:

1. Navigate to **System > Network > IP Sets > Add**.
2. Add an IP set name and click **Insert**.
3. From the **IPv4s** page, select the virtual IP (secondary VIP) and click **Insert**.
4. Click **Create** to create the IP set.

Note

IP set name must be same on both the instances.

Step 4. Add a load balancing virtual server on the primary instance.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers > Add.**
2. Add the required values for Name, Protocol, IP Address Type (IP Address), IP address (primary VIP), and Port.

3. Click **More**. Navigate to **IP Range IP Set Settings**, select **IPset** from the drop-down menu, and provide the IPset created in **Step 3**.
4. Click **OK** to create the load balancing virtual server.

Step 5. Add a service or service group on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Services > Add.**
2. Add the required values for Service Name, IP Address, Protocol and Port, and click **OK**.

Step 6. Bind the service or service group to the load balancing virtual server on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers**.
2. Select the load balancing virtual server configured in **Step 4**, and click **Edit**.
3. In the **Service and Service Groups** tab, click **No Load Balancing Virtual Server Service Binding**.
4. Select the service configured in the **Step 5**, and click **Bind**.

Save the configuration. After a forced failover, the secondary becomes the new primary. The external static IP of the old primary VIP moves to the new secondary VIP.

Configure high availability using CLI Step 1. Set up high availability in INC mode in both the instances.

On the primary node, type the following command.

```
1 add ha node 1 <sec_ip> -inc ENABLED
2 <!--NeedCopy-->
```

On the secondary node, type the following command.

```
1 add ha node 1 <prim_ip> -inc ENABLED
2 <!--NeedCopy-->
```

`sec_ip` refers to the internal IP address of the management NIC of the secondary node.

`prim_ip` refers to the internal IP address of the management NIC of the primary node.

Step 2. Add Virtual and Subnet IPs on both the nodes.

On the primary node, type the following command.

```
1 add ns ip <primary_vip> <subnet> -type VIP
2
3 add ns ip <secondary_vip> <subnet> -type VIP
4
5 add ns ip <primary_snip> <subnet> -type SNIP
6 <!--NeedCopy-->
```

`primary_vip` refers to the internal IP address of the client-facing interface of the primary instance.

`secondary_vip` refers to the internal IP address of the client-facing interface of the secondary instance.

`primary_snip` refers to the internal IP address of the server-facing interface of the primary instance.

On the secondary node, type the following command.

```
1 add ns ip <secondary_vip> <subnet> -type VIP
2
```

```
3 add ns ip <secondary_snip> <subnet> -type SNIP
4 <!--NeedCopy-->
```

`secondary_vip` refers to the internal IP address of the client-facing interface of the secondary instance.

`secondary_snip` refers to the internal IP address of the server-facing interface of the secondary instance.

Step 3. Add IP set and bind IP set to secondary VIP on both the instances.

On the primary node, type the following command:

```
1 add ipset <ipsetname>
2 bind ipset <ipsetname> <secondary VIP>
3 <!--NeedCopy-->
```

On the secondary node, type the following command:

```
1 add ipset <ipsetname>
2 bind ipset <ipsetname> <secondary VIP>
3 <!--NeedCopy-->
```

Note

IP set name must be same on both the instances.

Step 4. Add a virtual server on the primary instance.

Type the following command:

```
1 add <server_type> vserver <vserver_name> <protocol> <primary_vip> <port>
  > -ipset <ipset_name>
2 <!--NeedCopy-->
```

Step 5. Add a service or service group on the primary instance.

Type the following command:

```
1 add service <service_name> <service_ip_address> <protocol> <port>
2 <!--NeedCopy-->
```

Step 6. Bind the service/service group to the load balancing virtual server on the primary instance.

Type the following command:

```
1 bind <server_type> vserver <vserver_name> <service_name>
2 <!--NeedCopy-->
```

Note:

To save your configuration, type the command `save config`. Otherwise, the configurations

are lost after you restart the instances.

Step 7. Verify the configuration.

Ensure that the external IP address attached to the primary client NIC moves to the secondary on a failover.

1. Make a cURL request to the external IP address and make sure that it is reachable.
2. On the primary instance, perform failover:

From GUI, navigate to **Configuration > System > High Availability > Action > Force Failover**.

From CLI, type the following command:

```
1 force ha failover -f
2 <!--NeedCopy-->
```

On the GCP console, goto the Secondary instance. The external IP address must have moved to the client NIC of secondary after failover.

3. Issue a cURL request to the external IP and ensure it is reachable again.

Deploy a single NIC VPX high-availability pair with private IP address on Google Cloud Platform

May 2, 2023

You can deploy a single NIC VPX high-availability pair on GCP using private IP address. The client IP (VIP) address must be configured as alias IP address on the primary node. Upon failover, the Client IP address is moved to the secondary node, for the traffic to resume. The Subnet IP (SNIPs) addresses for each node must also be configured as an alias IP range.

For more information on high availability, see [High Availability](#).

Before you start

- Read the Limitation, Hardware requirements, Points to note mentioned in [Deploy a NetScaler VPX instance on Google Cloud Platform](#). This information applies to high availability deployments also.
- Enable **Cloud Resource Manager API** for your GCP project.

- Allow full access to all Cloud APIs while creating the instances.

- Ensure that your GCP service account has the following IAM permissions:

```
1  REQUIRED_INSTANCE_IAM_PERMS = [  
2  "compute.forwardingRules.list",  
3  "compute.forwardingRules.setTarget",  
4  "compute.instances.setMetadata",  
5  "compute.instances.get",  
6  "compute.instances.list",  
7  "compute.instances.updateNetworkInterface",  
8  "compute.targetInstances.list",  
9  "compute.targetInstances.use",  
10 "compute.targetInstances.create",  
11 "compute.zones.list",  
12 "compute.zoneOperations.get",  
13 ]  
14 <!--NeedCopy-->
```

- If your VMs do not have internet access, you must enable **Private Google Access** on the VPC subnet.

- If you have configured GCP forwarding rules on the primary node, read the limitations and requirements mentioned in [Forwarding rules support for VPX high-availability pair on GCP](#) to update them to new primary on failover.

How to deploy a VPX high availability pair on Google Cloud Platform

Here is a summary of the steps for deploying HA pair with single NIC:

1. Create one VPC network.
2. Create two VPX instances (primary and secondary nodes) in the same region. They can be in the same zone or different zones. For example Asia east-1a and Asia east-1b.
3. Configure HA settings on both instances by using the NetScaler GUI or ADC CLI commands.

Step 1. Create one VPC network

To create a VPC network, perform these steps:

1. Log on to the **Google console > Networking > VPC network > Create VPC Network**.

2. Complete the required fields, and click **Create**.

For more information, see the **Create VPC Networks** section in [Deploy a NetScaler VPX instance on Google Cloud Platform](#).

Step 2. Create two VPX instances

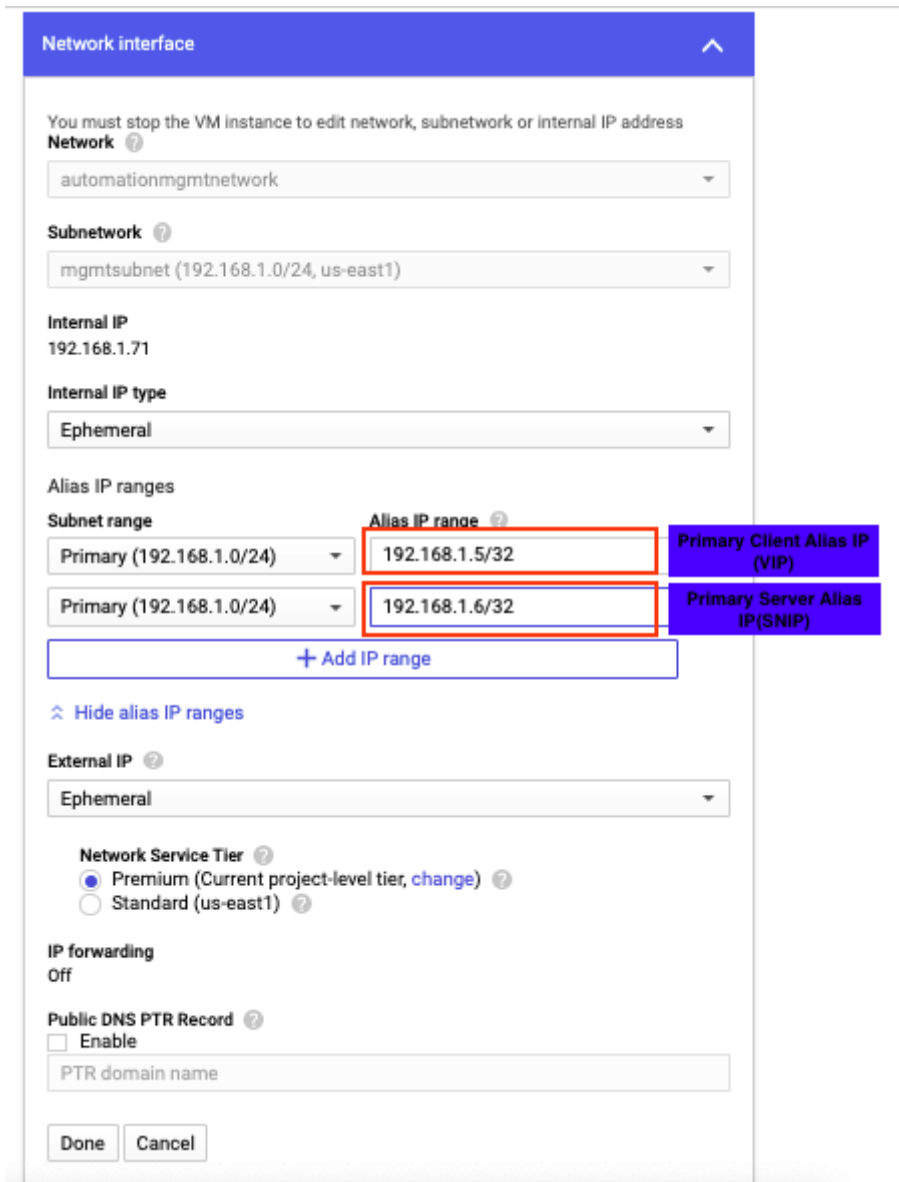

Create two VPX instances by following the step 1 to step 3 given in [Scenario: Deploy a single-NIC, stand-alone VPX instance](#).

Important:

Assign a client alias IP address only to the primary node and server alias IP addresses to primary and secondary nodes. Do not use the internal IP address of the VPX instance to configure the VIP or SNIP.

To create client and server alias IP addresses, perform these steps on the primary node:

1. Navigate to the VM instance and click **Edit**.
2. In the **Network Interface** window, edit the client (NIC0) interface.
3. In the **Alias IP range** field, enter the client alias IP address.
4. Click **Add IP Range** and enter the server alias IP address.

To create a server alias IP address, perform these steps on the secondary node:

1. Navigate to the VM instance and click **Edit**.
2. In the **Network Interface** window, edit the client (NIC0) interface.
3. In the **Alias IP range** field, enter the server alias IP address.

After the failover, when the old primary becomes the new secondary, the client alias IP address is moved from the old primary and is attached to the new primary.

After you have configured the VPX instances, you can configure the Virtual (VIP) and Subnet IP (SNIP) addresses. For more information, see [Configuring NetScaler-owned IP addresses](#).

Step 3. Configure high availability

After you've created the instances on Google Cloud Platform, you can configure high availability by using the NetScaler GUI or CLI.

Configure high availability by using the GUI

Step 1. Set up high availability in INC Enabled mode on both the nodes.

On the **primary node**, perform the following steps:

1. Log on to the instance with user name `nsroot` and instance ID of the node from GCP console as the password.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the secondary node.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** check box.
5. Click **Create**.

On the **secondary node**, perform the following steps:

1. Log on to the instance with user name `nsroot` and instance ID of the node from GCP console as the password.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the primary node.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** check box.
5. Click **Create**.

Before you proceed further, ensure that the Synchronization state of the secondary node is shown as **SUCCESS** in the **Nodes** page.

System > High Availability > Nodes

Note:

After the secondary node is synchronized with the primary node, the secondary node has the same log-on credentials as the primary node.

Step 2. Add Virtual IP address and Subnet IP address on both the nodes.

On the primary node, perform the following steps:

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. To create a client alias IP (VIP) address:
 - a) Enter the client alias IP address and netmask configured for the VPC subnet in the primary VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
 - c) Click **Create**.
3. To create a server alias IP (SNIP) address:
 - a) Enter the server alias IP address and netmask configured for the VPC subnet in the primary VM instance.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.

Step 3. Add a load balancing virtual server on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers > Add**.
2. Add the required values for Name, Protocol, IP Address Type (IP Address), IP Address (primary client alias IP address) and Port, and click **OK**.

↳ Load Balancing Virtual Server

Basic Settings

Create a virtual server by specifying a name, an IP address, a port, and a protocol type. If an application is accessible from the Internet, the virtual server IP (VIP) address is a public IP address. If the application is accessible only from the local area network (LAN) or wide area network (WAN), the VIP is usually a private (ICANN non-routable) IP address. You can configure multiple virtual servers to receive client requests, thereby increasing the availability of resources to process client requests.

Name*
 ⓘ

Protocol*

IP Address Type*

IP Address*
 ⓘ

Port*

▶ More

Step 4. Add a service or service group on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Services > Add**.
2. Add the required values for Service Name, IP Address, Protocol and Port, and click **OK**.

Step 5. Bind the service or service group to the load balancing virtual server on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers**.
2. Select the load balancing virtual server configured in **Step 3**, and click **Edit**.

3. In the **Service and Service Groups** tab, click **No Load Balancing Virtual Server Service Binding**.
4. Select the service configured in the **Step 4**, and click **Bind**.

Step 6. Save the configuration.

After a forced failover, the secondary becomes the new primary. The client alias IP (VIP) from the old primary moves to the new primary.

Configure high availability by using the CLI

Step 1. Set up high availability in **INC Enabled** mode in both the instances by using the NetScaler CLI.

On the primary node, type the following command.

```
1 add ha node 1 <sec_ip> -inc ENABLED
2 <!--NeedCopy-->
```

On the secondary node, type the following command.

```
1 add ha node 1 <prim_ip> -inc ENABLED
2 <!--NeedCopy-->
```

The `sec_ip` refers to the internal IP address of the management NIC of the secondary node.

The `prim_ip` refers to the internal IP address of the management NIC of the primary node.

Step 2. Add VIP and SNIP on both primary and secondary nodes.

Type the following commands on the primary node:

```
1 add ns ip <primary_client_alias_ip> <subnet> -type VIP
2
3 <!--NeedCopy-->
```

Note:

Enter the alias IP address and netmask configured for the client subnet in the VM instance.

```
1 add ns ip <primary_server_alias_ip> <subnet> -type SNIP
2 <!--NeedCopy-->
```

Type the following commands on the secondary node:

```
1 add ns ip <primary_client_alias_ip> <subnet> -type VIP
2 <!--NeedCopy-->
```

Note:

Enter the alias IP address and netmask configured for the client subnet in the VM instance.

```
1 add ns ip <secondary_server_alias_ip> <subnet> -type SNIP
2 <!--NeedCopy-->
```

Note:

Enter the alias IP address and netmask configured for the server subnet in the VM instance.

Step 3. Add a virtual server on the primary node.

Type the following command:

```
1 add <server_type> vserver <vserver_name> <protocol> <
  primary_client_alias_ip> <port>
2 <!--NeedCopy-->
```

Step 4. Add a service or service group on the primary node.

Type the following command:

```
1 add service <service_name> <service_ip_address> <protocol> <port>
2 <!--NeedCopy-->
```

Step 5. Bind the service or service group to the load balancing virtual server on the primary node.

Type the following command:

```
1 bind <server_type> vserver <vserver_name> <service_name>
2 <!--NeedCopy-->
```

Note:

To save your configuration, type the command `save config`. Otherwise, the configurations are lost after you restart the instances.

Deploy a VPX high-availability pair with private IP address on Google Cloud Platform

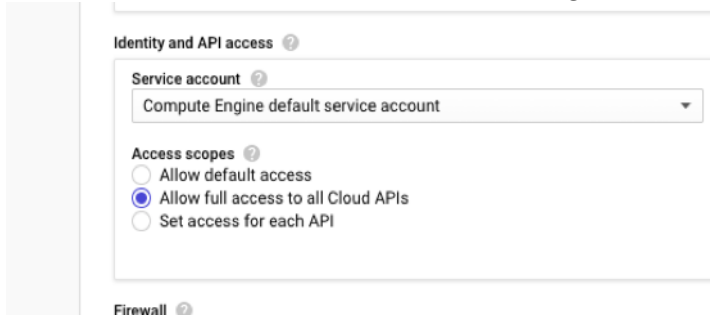

May 2, 2023

You can deploy a VPX high-availability pair on GCP using private IP address. The client IP (VIP) must be configured as alias IP address on the primary node. Upon failover, the Client IP address is moved to the secondary node, for the traffic to resume.

For more information on high availability, see [High Availability](#).

Before you start

- Read the Limitation, Hardware requirements, Points to note mentioned in [Deploy a NetScaler VPX instance on Google Cloud Platform](#). This information applies to high availability deployments also.
- Enable **Cloud Resource Manager API** for your GCP project.
- Allow full access to all Cloud APIs while creating the instances.

- Ensure that your GCP service account has the following IAM permissions:

```

1  REQUIRED_INSTANCE_IAM_PERMS = [
2  "compute.forwardingRules.list",
3  "compute.forwardingRules.setTarget",
4  "compute.instances.setMetadata",
5  "compute.instances.get",
6  "compute.instances.list",
7  "compute.instances.updateNetworkInterface",
8  "compute.targetInstances.list",
9  "compute.targetInstances.use",
10 "compute.targetInstances.create",
11 "compute.zones.list",
12 "compute.zoneOperations.get",
13 ]
14 <!--NeedCopy-->

```

- If you have configured external IP addresses on an interface other than the management interface, ensure that your GCP service account has the following additional IAM permissions:

```

1  REQUIRED_INSTANCE_IAM_PERMS = [
2  "compute.addresses.use"
3  "compute.instances.addAccessConfig",
4  "compute.instances.deleteAccessConfig",
5  "compute.networks.useExternalIp",
6  "compute.subnetworks.useExternalIp",
7  ]
8  <!--NeedCopy-->

```

- If your VMs do not have internet access, you must enable **Private Google Access** on the management subnet.

CANCEL **ADD**

- If you have configured GCP forwarding rules on the primary node, read the limitations and requirements mentioned in [Forwarding rules support for VPX high-availability pair on GCP](#) to update them to new primary on failover.

How to deploy a VPX high availability pair on Google Cloud Platform

Here is a summary of the high availability deployment steps:

1. Create VPC networks in the same region. For example, Asia-east.
2. Create two VPX instances (primary and secondary nodes) on the same region. They can be in the same zone or different zones. For example Asia east-1a and Asia east-1b.
3. Configure high availability settings on both instances by using the NetScaler GUI or ADC CLI commands.

Step 1. Create VPC networks

Create VPC networks based on your requirements. Citrix recommends you to create three VPC networks for associating with management NIC, client NIC, and server NIC.

To create a VPC network, perform these steps:

1. Log on the **Google console > Networking > VPC network > Create VPC Network**.
2. Complete the required fields, and click **Create**.

For more information, see the **Create VPC Networks** section in [Deploy a NetScaler VPX instance on Google Cloud Platform](#).

Step 2. Create two VPX instances

Create two VPX instances by following the steps given in [Scenario: deploy a multi-NIC, multi-IP stand-alone VPX instance](#).

Important:

Assign a client alias IP address to the primary node. Do not use the internal IP address of the VPX instance to configure the VIP.

To create a client alias IP address, perform these steps:

1. Navigate to the VM instance and click **Edit**.
2. In the **Network Interface** window, edit the client interface.
3. In the **Alias IP range** field, enter the client alias IP address.

nic2	automationservernetwork	serversubnet	192.168.3.8	—	None			View details

After the failover, when the old primary becomes the new secondary, the alias IP addresses move from the old primary and is attached to the new primary.

After you have configured the VPX instances, you can configure the Virtual (VIP) and Subnet IP (SNIP) addresses. For more information, see [Configuring NetScaler-owned IP addresses](#).

Step 3. Configure high availability

After you've created the instances on Google Cloud Platform, you can configure high availability by using the NetScaler GUI or CLI.

Configure high availability by using the GUI

Step 1. Set up high availability in INC Enabled mode on both the nodes.

On the **primary node**, perform the following steps:

1. Log on to the instance with user name `nsroot` and instance ID of the node from GCP console as the password.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the secondary node.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** check box.
5. Click **Create**.

On the **secondary node**, perform the following steps:

1. Log on to the instance with user name `nsroot` and instance ID of the node from GCP console as the password.
2. Navigate to **Configuration > System > High Availability > Nodes**, and click **Add**.
3. In the **Remote Node IP address** field, enter the private IP address of the management NIC of the primary node.
4. Select the **Turn on INC (Independent Network Configuration) mode on self node** check box.
5. Click **Create**.

Before you proceed further, ensure that the Synchronization state of the secondary node is shown as **SUCCESS** in the **Nodes** page.

<input type="checkbox"/>	ID	IP ADDRESS	HOST NAME	MASTER STATE	NODE STATE	INC	SYNCHRONIZATION STATE	SYNCHRONIZATION FAILURE RE
<input type="checkbox"/>	0	192.168.1.62		Primary	UP	ENABLED	ENABLED	-NA-
<input type="checkbox"/>	1	192.168.1.6		Secondary	UP	ENABLED	SUCCESS	-NA-

Note

After the secondary node is synchronized with the primary node, the secondary node has the same log-on credentials as the primary node.

Step 2. Add Virtual IP address and Subnet IP address on both the nodes.

On the primary node, perform the following steps:

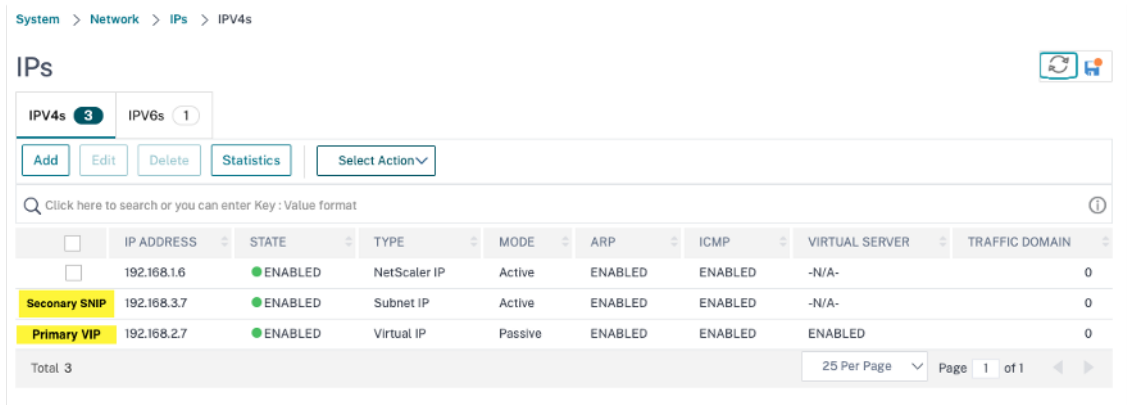

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. To create a client alias IP (VIP) address:

- a) Enter the Alias IP address and netmask configured for the client subnet in the VM instance.
 - b) In the **IP Type** field, select **Virtual IP** from the drop-down menu.
 - c) Click **Create**.
3. To create a server IP (SNIP) address:
- a) Enter the internal IP address of the server-facing interface of the primary instance and netmask configured for the server subnet.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.

On the secondary node, perform the following steps:

1. Navigate to **System > Network > IPs > IPv4s**, and click **Add**.
2. To create a client alias IP (VIP) address:
 - a) Enter the Alias IP address and netmask configured for the client subnet on the primary VM instance.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.
3. To create a server IP (SNIP) address:
 - a) Enter the internal IP address of the server-facing interface of the secondary instance and netmask configured for the server subnet.
 - b) In the **IP Type** field, select **Subnet IP** from the drop-down menu.
 - c) Click **Create**.

Step 3. Add a load balancing virtual server on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers > Add**.
2. Add the required values for Name, Protocol, IP Address Type (IP Address), IP Address (primary client alias IP address) and Port, and click **OK**.

+ Load Balancing Virtual Server

Basic Settings

Create a virtual server by specifying a name, an IP address, a port, and a protocol type. If an application is accessible from the Internet, the virtual server IP (VIP) address is a public IP address. If the application is accessible only from the local area network (LAN) or wide area network (WAN), the VIP is usually a private (ICANN non-routable) IP address. You can configure multiple virtual servers to receive client requests, thereby increasing the availability of resources to process client requests.

Name*

Protocol*

IP Address Type*

IP Address*

Port*

[More](#)

Step 4. Add a service or service group on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Services > Add**.
2. Add the required values for Service Name, IP Address, Protocol and Port, and click **OK**.

Step 5. Bind the service or service group to the load balancing virtual server on the primary node.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers**.
2. Select the load balancing virtual server configured in **Step 3**, and click **Edit**.
3. In the **Service and Service Groups** tab, click **No Load Balancing Virtual Server Service Binding**.
4. Select the service configured in the **Step 4**, and click **Bind**.

Step 5. Save the configuration.

After a forced failover, the secondary becomes the new primary. The client alias IP (VIP) and the server alias IP (SNIP) from the old primary moves to the new primary.

Configure high availability by using the CLI

Step 1. Set up high availability in **INC Enabled** mode in both the instances by using the NetScaler CLI.

On the primary node, type the following command.

```
1 add ha node 1 <sec_ip> -inc ENABLED
2 <!--NeedCopy-->
```

On the secondary node, type the following command.

```
1 add ha node 1 <prim_ip> -inc ENABLED
2 <!--NeedCopy-->
```

The `sec_ip` refers to the internal IP address of the management NIC of the secondary node.

The `prim_ip` refers to the internal IP address of the management NIC of the primary node.

Step 2. Add VIP and SNIP on both nodes.

Type the following commands on the primary node:

```
1 add ns ip <primary_client_alias_ip> <subnet> -type VIP
2
3 <!--NeedCopy-->
```

Note:

Enter the Alias IP address and netmask configured for the client subnet in the VM instance.

```
1 add ns ip <primary_snip> <subnet> -type SNIP
2 <!--NeedCopy-->
```

The `primary_snip` refers to the internal IP address of the server-facing interface of the primary instance.

Type the following commands on the secondary node:

```
1 add ns ip <primary_client_alias_ip> <subnet> -type VIP
2 <!--NeedCopy-->
```

Note

Enter the Alias IP address and netmask configured for the client subnet on the primary VM instance.

```
1 add ns ip <secondary_snip> <subnet> -type SNIP
2 <!--NeedCopy-->
```

The `secondary_snip` refers to the internal IP address of the server-facing interface of the secondary instance.

Note:

Enter the IP address and netmask configured for the server subnet in the VM instance.

Step 3. Add a virtual server on the primary node.

Type the following command:

```
1 add <server_type> vserver <vserver_name> <protocol> <
  primary_client_alias_ip> <port>
2 <!--NeedCopy-->
```

Step 4. Add a service or service group on the primary node.

Type the following command:

```
1 add service <service_name> <service_ip_address> <protocol> <port>
2 <!--NeedCopy-->
```

Step 5. Bind the service or service group to the load balancing virtual server on the primary node.

Type the following command:

```
1 bind <server_type> vserver <vserver_name> <service_name>
2 <!--NeedCopy-->
```

Note:

To save your configuration, type the command `save config`. Otherwise, the configurations are lost after you restart the instances.

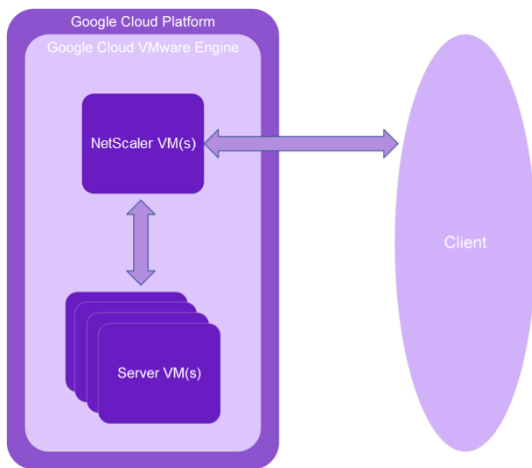

Install a NetScaler VPX instance on Google Cloud VMware Engine

October 26, 2023

Google Cloud VMware Engine (GCVE) provides you with private clouds that contain vSphere clusters, built from dedicated bare-metal Google Cloud Platform infrastructure. The minimum initial deployment is three hosts, but additional hosts can be added one at a time. All provisioned private clouds have vCenter Server, vSAN, vSphere, and NSX-T.

GCVE enables you to create cloud software-defined data centers (SDDC) on Google Cloud Platform with the desired number of ESX hosts. GCVE supports NetScaler VPX deployments. GCVE provides a user interface same as on-prem vCenter. It functions identical to the ESX-based NetScaler VPX deployments.

The following diagram shows the GCVE on the Google Cloud Platform that an administrator or a client can access over the internet. An administrator can create, manage, and configure workload or server VMs using GCVE. The admin can access the GCVE's web-based vCenter and NSX-T Manager using an OpenVPN connection. You can create the NetScaler VPX instances (standalone or HA pair) and server VMs within GCVE using vCenter, and manage the corresponding networking using NSX-T manager. The NetScaler VPX instance on GCVE works similar to the On-prem VMware cluster of hosts. GCVE can be managed using OpenVPN connection to the management infrastructure.

Prerequisites

Before you begin installing a virtual appliance, do the following:

- For more information on Google Cloud VMware Engine and its prerequisites, see [Google Cloud VMware Engine documentation](#).
- For more information on deploying Google Cloud VMware Engine, see [Deploy a Google Cloud VMware Engine private cloud](#).
- For more information on connecting to your private cloud using a point-to-site VPN gateway to access and manage Google Cloud VMware Engine, see [Access an Google Cloud VMware Engine private cloud](#).
- On VPN client machine, download the NetScaler VPX appliance setup files.
- Create appropriate NSX-T network segments on VMware SDDC to which the virtual machines connect. For more information, see [Add a network segment in Google Cloud VMware Engine](#).
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see [Licensing overview](#).

- Virtual machines (VMs) created or migrated to the GCVE private cloud must be attached to a network segment.

VMware cloud hardware requirements

The following table lists the virtual computing resources that the VMware SDDC must provide for each VPX nCore virtual appliance.

Table 1. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (vCPU)	2
Virtual network interfaces	In VMware SDDC, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded to version 7 or higher.
Disk space	20 GB

Note

This is in addition to any disk requirements for the hypervisor.

For production use of the VPX virtual appliance, the full memory allocation must be reserved.

OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. The following table describes the minimum system requirements for installing OVF tool.

Table 2. Minimum system requirements for OVF tool installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “OVF Tool User Guide” PDF file at http://kb.vmware.com/ .
CPU	750 MHz minimum, 1 GHz or faster recommended
RAM	1 GB Minimum, 2 GB recommended

Component	Requirement
NIC	100 Mbps or faster NIC

For information about installing OVF, search for the “OVF Tool User Guide” PDF file at <http://kb.vmware.com/>.

Downloading the NetScaler VPX setup files

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from the Citrix website. You need a Citrix account to log on. If you do not have a Citrix account, access the home page at <http://www.citrix.com>. Click the **New Users link**, and follow the instructions to create a new Citrix account.

Once logged on, navigate the following path from the Citrix home page:

Citrix.com > **Downloads > NetScaler > Virtual Appliances.**

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-13.0-79.64-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-13.0-79.64.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-13.0-79.64.mf)

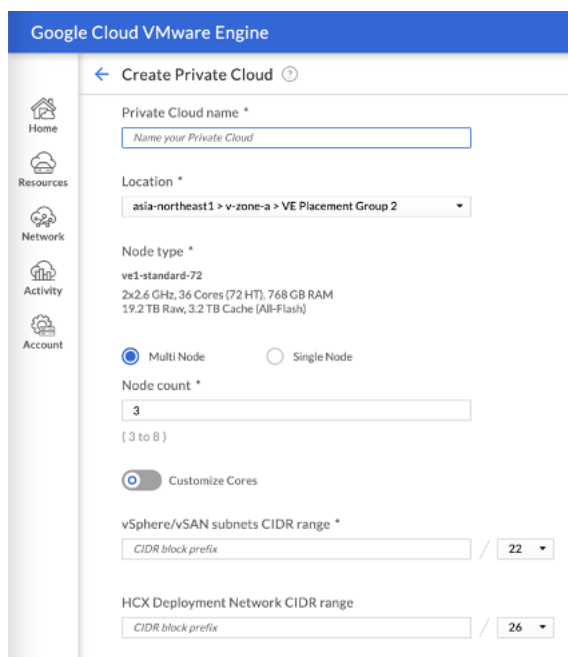

Deploy Google Cloud VMware Engine

1. Log in to your [GCVE portal](#), and navigate to **Home**.

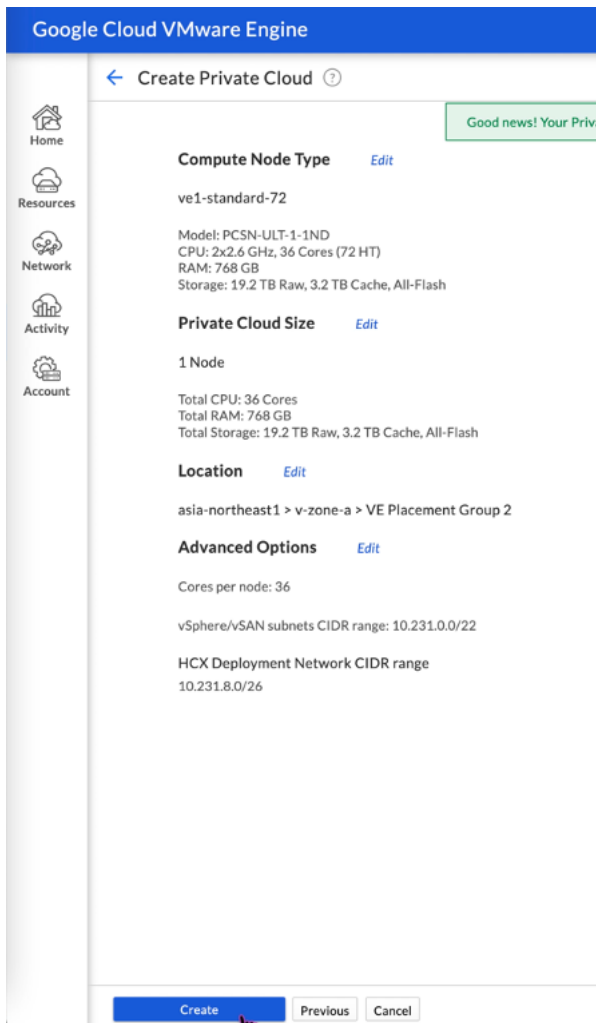

2. In the **New Private Cloud** page, enter the following details:

- Select a minimum of 3 ESXi hosts to create the default cluster of your private cloud.
- For the **vSphere/vSan subnet CIDR range** field, use /22 address space.
- For the **HCX Deployment Network CIDR range** field, use /26 address space.
- For the virtual network, make sure that the CIDR range doesn't overlap with any of your on-premises or other GCP subnets (virtual networks).

3. Click **Review and Create**.
4. Review the settings. If you need to change any settings, click **Previous**.

5. Click **Create**. Private Cloud provisioning process starts. It can take up to two hours for the Private Cloud to be provisioned.
6. Go to **Resources** to verify the private cloud that is created.

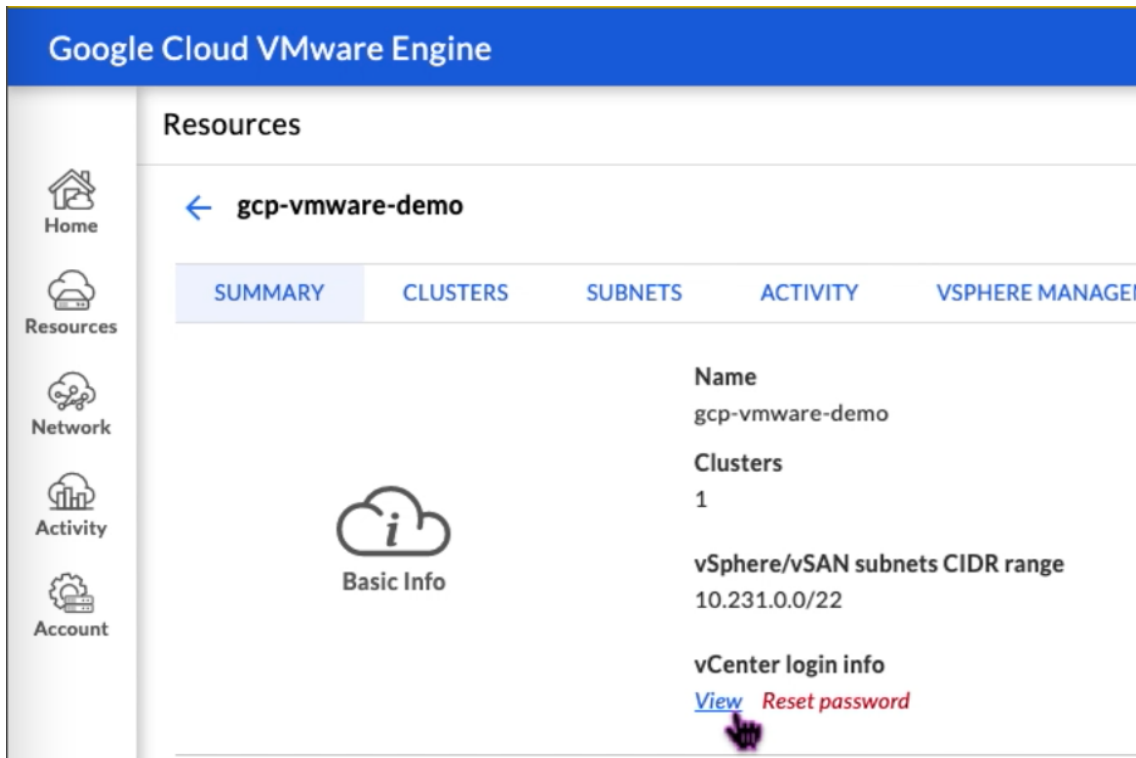

7. To access this resource, you must connect to GCVE using point-to-site VPN. For more information, see the following documentation:

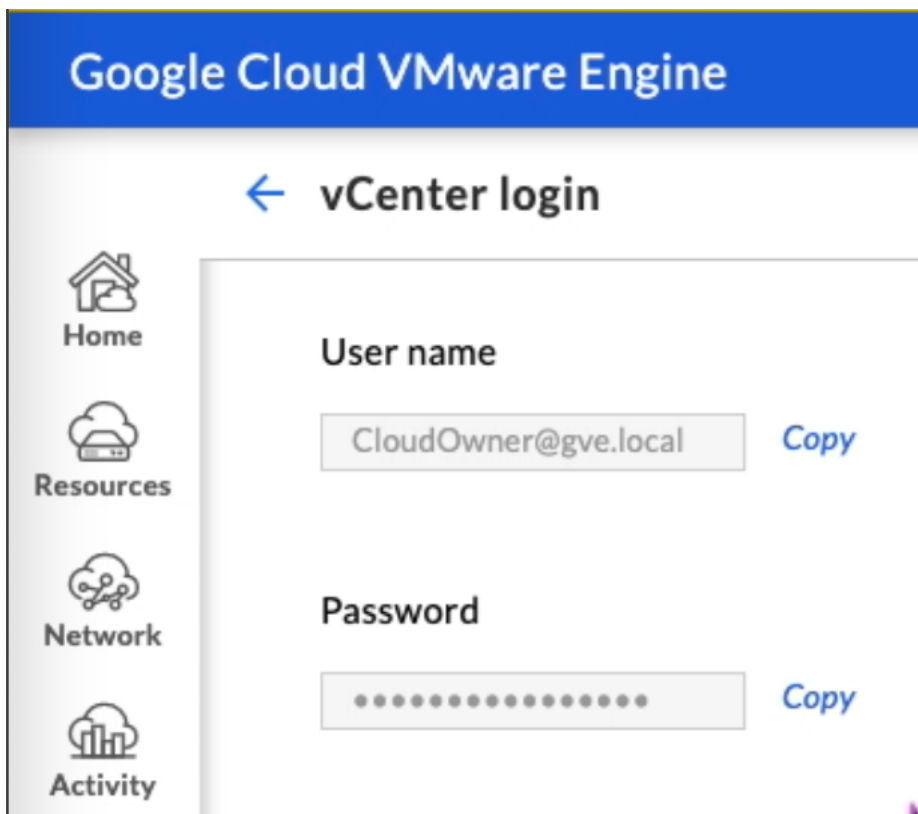

- [VPN gateways](#)
- [Connecting using VPN](#)

Access your Private Cloud vCenter portal

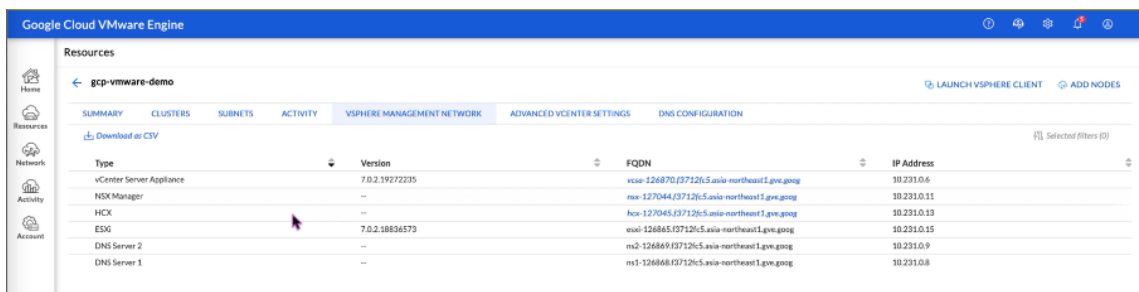

1. Navigate to your Google Cloud VMware Engine private cloud. In the **SUMMARY** tab, under **vCenter Login Info**, click **View**.

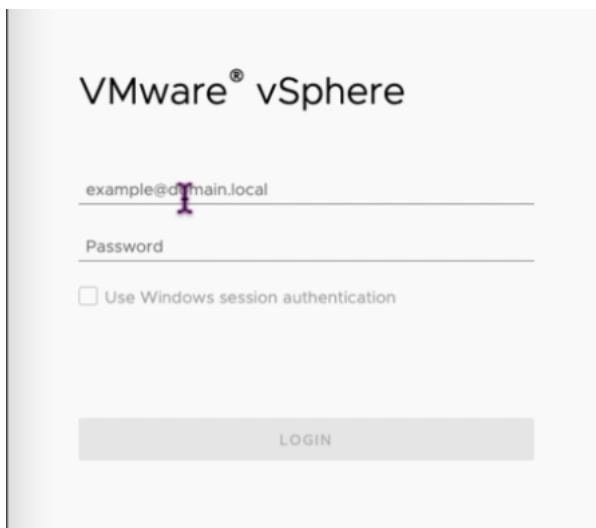

2. Make note of the vCenter credentials.

3. Launch the vSphere client by clicking **LAUNCH VSPHERE CLIENT** or navigate to **VSPHERE MANAGEMENT NETWORK** and click the **vCenter Server Appliance** FQDN.

4. Log in to VMware vSphere using vCenter credentials noted in Step 2 of this procedure.

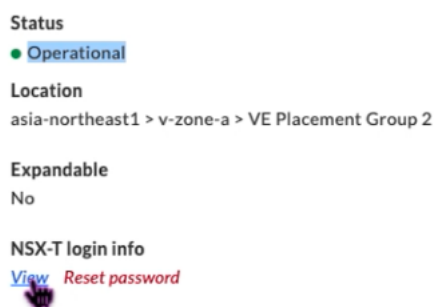

5. In vSphere client, you can verify the ESXi hosts that you created in GCVE portal.

Create an NSX-T segment in the GCVE NSX-T portal

You can create and configure an NSX-T segment from the NSX Manager in the Google Cloud VMware Engine console. These segments are connected to the default Tier-1 gateway, and the workloads on these segments get East-West and North-South connectivity. Once you create the segment, it displays in vCenter.

1. In your GCVE private cloud, under **Summary -> NSX-T login info**, select **View**.

2. Make note of the NSX-T credentials.

3. Launch the NSX Manager by navigating to **VSPHERE MANAGEMENT NETWORK** and click the **NSX Manager** FQDN.

Type	Version	FQDN	IP Address
vCenter Server Appliance	7.0.2.19272235	vcso-126870.f3712fc5.asia-northeast1.gve.goog	10.231.0.6
NSX Manager	--	nsx-127044.f3712fc5.asia-northeast1.gve.goog	10.231.0.11
HCX	--	hcx-127045.f3712fc5.asia-northeast1.gve.goog	10.231.0.13
ESXi	7.0.2.18836573	esxi-126865.f3712fc5.asia-northeast1.gve.goog	10.231.0.15
DNS Server 2	--	ns2-126869.f3712fc5.asia-northeast1.gve.goog	10.231.0.9
DNS Server 1	--	ns1-126868.f3712fc5.asia-northeast1.gve.goog	10.231.0.8

4. Log in to the NSX Manager using the credentials noted in Step 2 of this procedure.

VMware® NSX-T™

Username

Password

LOG IN

5. Set up DHCP service for the new segments or subnets.
6. Before you can create a subnet, set up a DHCP service.
7. In NSX-T, go to **Networking > DHCP**. The networking dashboard shows that the service creates one tier-0 and one tier-1 gateway.
8. To begin provisioning a DHCP server, click **Add DHCP Profile**.
9. In the DHCP name field, enter a name for the **Client-Management** profile.
10. Select **DHCP server** as the Profile type.
11. In the **Server IP address** column, provide a DHCP service IP address range.
12. Select your **Edge Cluster**.
13. Click **Save** to create the DHCP service.

14. Repeat Steps 6 to 13 for Server DHCP range.

15. Create two separate segments: one for Client and Management interfaces, and another for Server interfaces.
16. In NSX-T, go to **Networking > Segments**.
17. Click **Add Segment**.

18. In the **Segment Name** field, enter a name for your **Client Management** segment.
19. In the **Connected Gateway** list, select **Tier1** to connect to the tier-1 gateway.

In the **Transport Zone** list, select ****TZ-OVERLAY Overlay****.

- 20.
21. In the **Subnets** column, enter the subnet range. Specify the subnet range with .1 as the last octet. For example, 10.12.2.1/24.

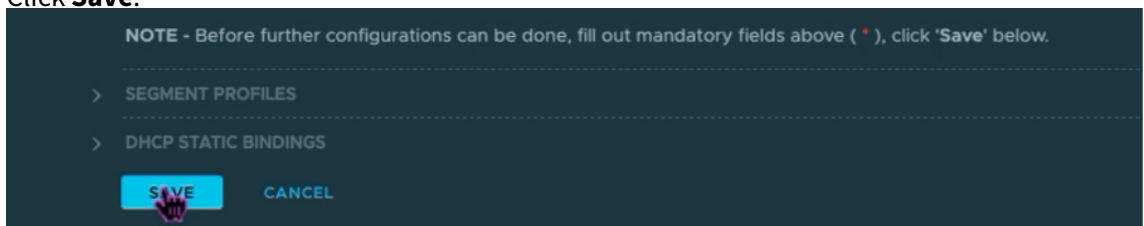

22. Click **Set DHCP Config**, and provide values for the **DHCP Ranges** field.

23. Click **Apply** to save your DHCP configuration.

24. Click **Save**.

25. Repeat Steps 17 to 24 for Server segment as well.
26. You can now select these network segments in vCenter when creating a VM.

For more information, see [Creating your first subnet](#).

Install a NetScaler VPX instance on VMware cloud

After you have installed and configured Private Cloud on GCVE, you can use the vCenter to install virtual appliances on the VMware Engine. The number of virtual appliances that you can install depends on the amount of resource available on the Private Cloud.

To install NetScaler VPX instances on Private Cloud, perform these steps on a desktop connected to private cloud point-to-site VPN:

1. Download the NetScaler VPX instance setup files for ESXi host from the NetScaler downloads site.
2. Open VMware vCenter in a browser connected to your private cloud point-to-site VPN.
3. In the **User Name** and **Password** fields, type the administrator credentials, and then click **Login**.
4. On the **File** menu, click **Deploy OVF Template**.
5. In the **Deploy OVF Template** dialog box, in **Deploy from file** field, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click **Next**.

Note:

By default, the NetScaler VPX instance uses E1000 network interfaces. To deploy ADC with the VMXNET3 interface, modify the OVF to use VMXNET3 interface instead of E1000. Availability of VMXNET3 interface is limited by GCP infrastructure and might not be available in Google Cloud VMware Engine.

6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the NSX-T Manager. Click **OK**.

```

11. To access the NetScaler appliance by using the SSH keys, type the following command in the CLI:

```

1 ssh nsroot@<management IP address>
2 <!--NeedCopy-->
    
```

Example:

```

1 ssh nsroot@10.230.1.10
2 <!--NeedCopy-->
    
```

12. You can verify the ADC configuration by using the `show ns ip` command.

Assign a Public IP address to a NetScaler VPX instance on VMware cloud

After you have installed and configured NetScaler VPX instance on GCVE, you must assign a public IP address to the Client interface. Before assigning public IP addresses to your VMs, make sure that Public IP service is enabled for your Google Cloud region.

To enable Public IP service for a new region, follow these steps:

1. On GCVE console, navigate to **Network > REGIONAL SETTINGS > Add Region**.

2. Select your region and enable **Internet Access** and **Public IP Service**.
3. Assign an Edge Services CIDR making sure that the CIDR range doesn't overlap with any of your on-premises or other GCP/GCVE subnets (virtual networks).

4. Public IP Service will be enabled for the selected region in a few minutes.

To assign public IP to the Client interface on the NetScaler VPX instance on GCVE, perform these steps on GCVE portal:

1. On GCVE console, navigate to **Network > PUBLIC IPS > Allocate**.

2. Enter a name for the public IP. Select your region, and select the private cloud where the IP will be used.
3. Provide the private IP for the interface to which you want the public IP to be mapped. This will be the **private IP** for your **Client** interface.
4. Click **Submit**.

Google Cloud VMware Engine

← Allocate Public IP ?

Name *

Location *

Private cloud *

Attached local address *

You need to open Firewall ports to enable traffic on this IP address through the Firewall Table feature.

5. Public IP is ready to use in a few minutes.
6. You must add Firewall rules to allow access to the public IP before you can use it. For more information, see [Firewall rules](#).

Add back-end GCP Autoscaling service

August 18, 2023

Efficient hosting of applications in a cloud requires easy and cost-effective management of resources, depending on the application demand. To meet the increasing demand, you have to scale network resources upward. When demand subsides, you need to scale down to avoid the unnecessary cost of underutilized resources. To minimize the cost of running the application, you have to constantly monitor traffic, memory and CPU use, and so on. However, monitoring traffic manually is cumbersome. For the application environment to scale up or down dynamically, you must automate the processes of monitoring traffic and of scaling resources up and down whenever necessary.

Integrated with the GCP Autoscaling service, the NetScaler VPX instance provides the following advantages:

- **Load balance and management:** Auto configures servers to scale up and scale down, depending on demand. The VPX instance auto detects managed instance groups in the back-end subnet and allows you to select the managed instance groups to balance the load. The virtual and subnet IP addresses are auto configured on the VPX instance.

- **High availability:** Detects managed instance groups that span multiple zones and load-balance servers.
- **Better network availability:** The VPX instance supports:
 - Back-end servers on same placement groups
 - Back-end servers on different zones

This diagram illustrates how the GCP Autoscaling service works in a NetScaler VPX instance acting as the load balancing virtual server.

Before you begin

Before you start using Autoscaling with your NetScaler VPX instance, you must complete the following tasks.

- Create a NetScaler VPX instance on GCP according to your requirement.
 - For more information about how to create a NetScaler VPX instance, see [Deploy a NetScaler VPX instance on the Google Cloud Platform](#).
 - For more information about how to deploy VPX instances in HA mode, see [Deploy a VPX high-availability pair on the Google Cloud Platform](#).
- Enable **Cloud Resource Manager API** for your GCP project.
- Allow full access to all Cloud APIs while creating the instances.

- Make sure that your GCP service account has the following IAM permissions:

```

1  REQUIRED_INSTANCE_IAM_PERMS = [
2  "compute.instances.get",
3  "compute.instanceGroupManagers.get",
4  "compute.instanceGroupManagers.list",
5  "compute.zones.list",
6  "logging.sinks.create",
7  "logging.sinks.delete",
8  "logging.sinks.get",
9  "logging.sinks.list",
10 "logging.sinks.update",
11 "pubsub.subscriptions.consume",
12 "pubsub.subscriptions.create",
13 "pubsub.subscriptions.delete",
14 "pubsub.subscriptions.get",
15 "pubsub.topics.attachSubscription",
16 "pubsub.topics.create",
17 "pubsub.topics.delete",
18 "pubsub.topics.get",
19 "pubsub.topics.getIamPolicy",
20 "pubsub.topics.setIamPolicy",
21 ]
22 <!--NeedCopy-->

```

- To set up Autoscaling, ensure the following are configured:
 - Instance template
 - Managed Instance group
 - Autoscaling policy

Add the GCP Autoscaling service to a NetScaler VPX instance

You can add the Autoscaling service to a VPX instance with a single click by using the GUI. Complete these steps to add the Autoscaling service to the VPX instance:

1. Log on to the VPX instance by using your credentials for `nsroot`.
2. When you log on to the NetScaler VPX instance for the first time, you see the default Cloud Profile page. Select the GCP managed instance group from the drop-down menu and click **Create** to

create a cloud profile.

← Create Cloud Profile

Name

Virtual Server IP Address*

Load Balancing Server Protocol

Load Balancing Server Port

Auto Scale Group*

Auto Scale Group Protocol

Auto Scale Group Port

Select this option to drain the connections gracefully. Else the connections will be dropped in the event of scale down.
 Graceful

- The **Virtual Server IP Address** field is auto-populated from all the IP addresses associated with the instances.
- The **Autoscale Group** is prepopulated from the managed instance group configured on your GCP account.
- When selecting the **Autoscale Group Protocol** and **Autoscale Group Port**, ensure that your servers listen on the configured protocol and ports. Bind the correct monitor in the service group. By default, the TCP monitor is used.
- Clear the **Graceful** checkbox because it is not supported.

Note:

For SSL Protocol type Autoscaling, after you create the Cloud Profile, the load balance virtual server or service group is down because of a missing certificate. You can bind the certificate to the virtual server or service group manually.

3. After the first time login if you want to create Cloud Profile, on the GUI go to **System > Google Cloud Platform > Cloud Profile** and click **Add**.

The **Create Cloud Profile** configuration page appears.

← Create Cloud Profile

Name

Virtual Server IP Address*

Load Balancing Server Protocol

Load Balancing Server Port

Auto Scale Group*

Auto Scale Group Protocol

Auto Scale Group Port

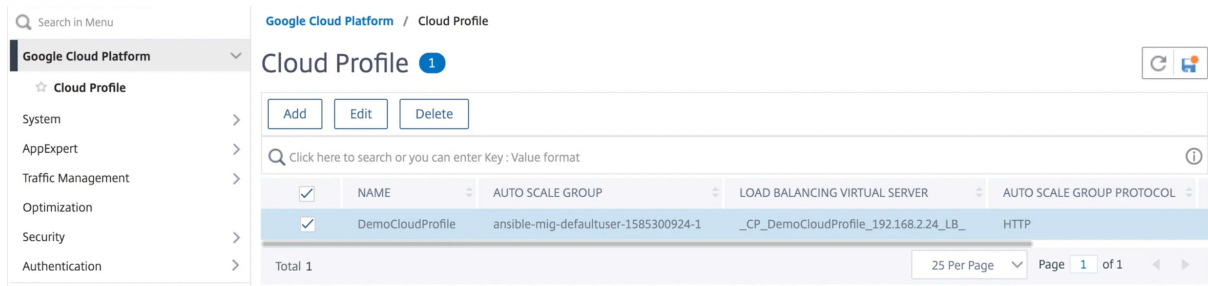

Select this option to drain the connections gracefully. Else the connections will be dropped in the event of scale down.

 Graceful

Cloud Profile creates a NetScaler load-balancing virtual server and a service group with members as the servers of the managed instance group. Your back-end servers must be reachable through the SNIP configured on the VPX instance.

Note:

From NetScaler release 13.1-42.x onwards, you can create different cloud profiles for different services (using different ports) with the same managed instance group in GCP. Thus, the NetScaler VPX instance supports multiple services with the same Autoscaling group in public cloud.

VIP scaling support for NetScaler VPX instance on GCP

May 2, 2023

A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. The number of public virtual IP (VIP) addresses needed for a deployment varies on a case-by-case basis.

The GCP architecture restricts each interface on the instance to be connected to a different VPC. A VPC on GCP is a collection of subnets, and each subnet can span across zones of a region. In addition, GCP imposes the following limitation:

- There is a 1:1 mapping of number of public IP addresses to number of NICs. Only one public IP address can be assigned to a NIC.
- A maximum of only 8 NICs can be attached on a higher capacity instance type.

For example, an n1-standard-2 instance can have only 2 NICs, and the Public VIPs that can be added is limited to 2. For more information, see [VPC resource quotas](#).

To achieve higher scales of public virtual IP addresses on a NetScaler VPX instance, you can configure the VIP addresses as part of the metadata of the instance. The NetScaler VPX instance internally uses forwarding rules provided by the GCP to achieve VIP scaling. The NetScaler VPX instance also provides high availability to the VIPs configured.

After you configure VIP addresses as part of the metadata, you can configure an LB virtual server using the same IP that is used to create the forwarding rules. Thus, we can use forwarding rules to mitigate the limitations we have w.r.t scale in using public VIP addresses on an NetScaler VPX instance on GCP.

For more information on forwarding rules, see [Forwarding rules overview](#).

For more information on HA, see [High Availability](#).

Points to note

- Google charges some additional cost for each virtual IP forwarding rule. The actual cost depends on the number of entries created. The associated cost can be found from the Google pricing documents.
- Forwarding rules are applicable only for public VIPs. You can use alias IP addresses when the deployment needs private IP addresses as VIPs.
- You can create forwarding rules only for the protocols, which need the LB virtual server. VIPs can be created, updated, or deleted on the fly. You can also add a new load balancing virtual server with the same VIP address but with a different protocol.

Before you start

- NetScaler VPX instance must be deployed on GCP.
- External IP address must be reserved. For more information, see [Reserving a static external IP address](#).
- Ensure that your GCP service account has the following IAM permissions:

```
1  REQUIRED_IAM_PERMS = [  
2  "compute.addresses.list",  
3  "compute.addresses.get",  
4  "compute.addresses.use",  
5  "compute.forwardingRules.create",  
6  "compute.forwardingRules.delete",  
7  "compute.forwardingRules.get",  
8  "compute.forwardingRules.list",  
9  "compute.instances.use",  
10 "compute.subnetworks.use",  
11 "compute.targetInstances.create",  
12 "compute.targetInstances.get",  
13 "compute.targetInstances.use",  
14 ]  
15  
16 <!--NeedCopy-->
```

- Enable **Cloud Resource Manager API** for your GCP project.
- If you use VIP scaling on a standalone VPX instance, ensure that your GCP service account has the following IAM permissions:

```
1  REQUIRED_IAM_PERMS = [  
2  "compute.addresses.list",  
3  "compute.addresses.get",  
4  "compute.addresses.use",  
5  "compute.forwardingRules.create",  
6  "compute.forwardingRules.delete",
```

```
7  "compute.forwardingRules.get",
8  "compute.forwardingRules.list",
9  "compute.instances.use",
10 "compute.subnetworks.use",
11 "compute.targetInstances.create",
12 "compute.targetInstances.list",
13 "compute.targetInstances.use",
14 ]
15 <!--NeedCopy-->
```

- If you use VIP scaling in a high availability mode, ensure that your GCP service account has the following IAM permissions:

```
1  REQUIRED_IAM_PERMS = [
2  "compute.addresses.get",
3  "compute.addresses.list",
4  "compute.addresses.use",
5  "compute.forwardingRules.create",
6  "compute.forwardingRules.delete",
7  "compute.forwardingRules.get",
8  "compute.forwardingRules.list",
9  "compute.forwardingRules.setTarget",
10 "compute.instances.use",
11 "compute.instances.get",
12 "compute.instances.list",
13 "compute.instances.setMetadata",
14 "compute.subnetworks.use",
15 "compute.targetInstances.create",
16 "compute.targetInstances.list",
17 "compute.targetInstances.use",
18 "compute.zones.list",
19 ]
20 <!--NeedCopy-->
```

Note:

In a high availability mode, if your service account does not have owner or editor roles, you must add the **Service Account User role** to your service account.

Configure external IP addresses for VIP scaling on NetScaler VPX instance

1. In the Google Cloud Console, navigate to the **VM Instances** page.
2. Create a new VM instance or use an existing instance.
3. Click the instance name. On the **VM instance details** page, click **Edit**.
4. Update the **Custom metadata** by entering the following:
 - Key = vips

- Value = Provide a value in the following JSON format:

```
{  
  "Name of external reserved IP": [list of protocols],  
}
```

GCP supports the following protocols:

- AH
- ESP
- ICMP
- SCT
- TCP
- UDP

For more information, see [Custom metadata](#).

Example for Custom metadata:

```
{  
  "external-ip1-name":["TCP", "UDP"],  
  "external-ip2-name":["ICMP", "AH"]  
}
```

In this example, the NetScaler VPX instance internally creates one forwarding rule for each IP, protocol pair. The metadata entries are mapped to the forwarding rules. This example helps you understand how many forwarding rules are created for a metadata entry.

Four forwarding rules are created as follows:

- a) external-ip1-name and TCP
- b) external-ip1-name and UDP
- c) external-ip2-name and ICMP
- d) external-ip2-name and AH

Note:

In HA mode, you must add custom metadata only on the primary instance. On failover, the custom metadata is synchronized to the new primary.

5. Click **Save**.

Setting up a load balancing virtual server with external IP address on a NetScaler VPX instance

Step 1. Add a load balancing virtual server.

1. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers > Add**.

<input type="checkbox"/>	NAME	STATE	EFFECTIVE STATE	IP A
<input type="checkbox"/>	gcplbdnsrserver	UP	UP	0.0.0
<input type="checkbox"/>	lbv2	UP	UP	10.3
<input type="checkbox"/>	v1	DOWN	DOWN	10.2
<input checked="" type="checkbox"/>	Demo-vServer	DOWN	DOWN	34.9

Total 4

2. Add the required values for Name, Protocol, IP Address Type (IP Address), IP Address (External IP address of the forwarding rule that is added as VIP on ADC) and Port, and click **OK**.

Load Balancing Virtual Server

Basic Settings

Create a virtual server by specifying a name, an IP address, a port, and a protocol type. If an app address is a public IP address. If the application is accessible only from the local area network (L (ICANN non-routable) IP address.
You can configure multiple virtual servers to receive client requests, thereby increasing the avail

Troubleshoot a VPX instance on GCP

May 2, 2023

Google Cloud Platform (GCP) provides console access to a NetScaler VPX instance. You can debug only if the network is connected. To view an instance's System Log, access the console and check **System Log files**.

NetScaler supports fee based NetScaler VPX instances (utility license with hourly fee) on GCP. To file a support case, find your GCP account number and support PIN code, and call NetScaler support. You are asked to provide your name and email address. To find the support PIN, log on to the VPX GUI and navigate to the **System** page.

Here is an example of a system page showing the support PIN.

Jumbo frames on NetScaler VPX instances

May 2, 2023

NetScaler VPX appliances support receiving and transmitting jumbo frames containing up to 9216 bytes of IP data. Jumbo frames can transfer large files more efficiently than it is possible with the standard IP MTU size of 1500 bytes.

A NetScaler appliance can use jumbo frames in the following deployment scenarios:

- Jumbo to Jumbo. The appliance receives data as jumbo frames and sends it as jumbo frames.
- Non-Jumbo to Jumbo. The appliance receives data as regular frames and sends it as jumbo frames.
- Jumbo to Non-Jumbo. The appliance receives data as jumbo frames and sends it as regular frames.

For more information, see [Configuring Jumbo Frames Support on a NetScaler Appliance](#).

Jumbo frames support is available on NetScaler VPX appliances running on the following virtualization platforms:

- VMware ESX
- Linux-KVM Platform
- Citrix XenServer
- Amazon Web Services (AWS)

Jumbo frames on VPX appliances work similar to jumbo frames on MPX appliances. For more information on Jumbo Frames and its use cases, see [Configuring Jumbo Frames on MPX appliances](#). The use cases of jumbo frames on MPX appliances also apply to VPX appliances.

Configure jumbo frames for a VPX instance running on VMware ESX

Perform the following tasks to configure jumbo frames on a NetScaler VPX appliance running on the VMware ESX server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501–9000. Use the CLI or GUI to set the MTU size. The NetScaler VPX appliances running on VMware ESX support receiving and transmitting jumbo frames containing up to only 9000 bytes of IP data.
2. Set the same MTU size on the corresponding physical interfaces of the VMware ESX server by using its management applications. For more information about setting the MTU size on the physical interfaces of VMware ESX, see <http://vmware.com/>.

Configure jumbo frames for a VPX instance running on Linux-KVM server

Perform the following tasks to configure jumbo frames on a NetScaler VPX appliance running on a Linux-KVM Server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501–9216. Use the NetScaler VPX CLI or GUI to set the MTU size.
2. Set the same MTU size on the corresponding physical interfaces of a Linux-KVM Server by using its management applications. For more information about setting the MTU size on the physical interfaces of Linux-KVM, see <http://www.linux-kvm.org/>.

Configure jumbo frames for a VPX instance running on Citrix XenServer

Perform the following tasks to configure jumbo frames on a NetScaler VPX appliance running on Citrix XenServer:

1. Connect to the XenServer using XenCenter.
2. Shut down all the VPX instances that use the Networks for which the MTU must be changed.
3. On the **Networking** tab, select the network - network 0/1/2.
4. Select **Properties** and edit MTU.

After configuring the jumbo frames on the XenServer, you can configure the jumbo frames on the ADC appliance. For more information, see [Configuring Jumbo Frames Support on a NetScaler Appliance](#).

Configure jumbo frames for a VPX instance running on AWS

Host-level configuration is not required for VPX on Azure. To configure Jumbo Frames on VPX, follow the steps given in [Configuring Jumbo Frames Support on a NetScaler Appliance](#).

Automate deployment and configurations of NetScaler

December 22, 2023

NetScaler provides multiple tools to automate your ADC deployments and configurations. This document provides a brief summary of various automation tools and references to various automation resources that you can use to manage ADC configurations.

The following illustration provides an overview of NetScaler automation in a hybrid multi cloud (HMC) environment.

Automate NetScaler using NetScaler Console

NetScaler Console acts as an automation control point to your distributed ADC infrastructure. The NetScaler Console provides a comprehensive set of automation capabilities from provisioning ADC appliances to upgrading it. The following are the key automation features of ADM:

- [Provisioning NetScaler VPX instances on AWS](#)
- [Provisioning NetScaler VPX instances on Azure](#)
- [StyleBooks](#)
- [Configuration jobs](#)
- [Configuration audit](#)
- [ADC upgrades](#)
- [SSL certificate management](#)
- [Integrations - GitHub, ServiceNow, Event notifications integrations](#)

NetScaler Console blogs and videos on automation

- [Application migrations using StyleBooks](#)
- [Integrate ADC configurations with CI/CD using ADM StyleBooks](#)
- [Simplifying public cloud NetScaler deployments through ADM](#)
- [10 ways NetScaler Console service supports easier NetScaler upgrades](#)

NetScaler Console also provides APIs for its various capabilities that integrate NetScaler Console and NetScaler as part of the overall IT automation. For more information, see [NetScaler Console Service APIs](#).

Automate NetScaler using Terraform

Terraform is a tool that takes infrastructure as code approach to provision and manage cloud, infrastructure, or service. NetScaler terraform resources are available in GitHub for use. Refer GitHub for detailed documentation and usage.

- [NetScaler Terraform modules to configure ADC for various use cases such as Load Balancing and GSLB](#)
- [Terraform cloud scripts to deploy ADC in AWS](#)
- [Terraform cloud scripts to deploy ADC in Azure](#)
- [Terraform cloud scripts to deploy ADC in GCP](#)
- [Blue-green deployment using NetScaler VPX and Azure pipelines](#)

Blogs and Videos on Terraform for ADC automation

- [Automate your NetScaler deployments with Terraform](#)
- [Provision and configure ADC in HA setup in AWS using Terraform](#)

Automate NetScaler using Consul-Terraform-Sync

NetScaler Consul-Terraform-Sync (CTS) module empowers application teams to automatically add or remove new instances of services to NetScaler. There is no need to raise manual tickets to IT admins or networking teams to make the necessary ADC configurations changes.

- [NetScaler Consul-Terraform-Sync Module for Network Infrastructure Automation](#)
- Citrix-HashiCorp joint webinar: [Dynamic Networking with Consul-Terraform-Sync for Terraform Enterprise and NetScaler](#)

Automate NetScaler using Ansible

Ansible is an open-source software provisioning, configuration management, and application-deployment tool enabling infrastructure as code. NetScaler Ansible modules and sample playbooks can be found in GitHub for use. Refer GitHub for detailed documentation and usage.

- [Ansible modules to configure ADC](#)
- [ADC Ansible modules documentation/reference guide](#)
- [Ansible modules for ADM](#)

Citrix is a certified Ansible Automation Partner. Users having Red Hat Ansible Automation Platform subscription can access NetScaler Collections from [Red Hat Automation Hub](#).

Terraform and Ansible automation blogs

- [Citrix named HashiCorp Integration Partner of the Year](#)
- [Citrix is now a Certified Red Hat Ansible Automation Platform Partner](#)
- [Terraform and Ansible Automation for app delivery and security](#)

Public cloud templates for ADC deployments

Public cloud templates simplify provisioning of your deployments in public clouds. Different NetScaler templates are available for various environments. For usage details, refer to respective GitHub repositories.

AWS CFTs:

- [CFTs to provision NetScaler VPX on AWS](#)

Azure Resource Manager (ARM) Templates:

- [ARM templates to provision NetScaler VPX on Azure](#)

Google Cloud Deployment Manager (GDM) Templates:

- [GDM templates to provision NetScaler VPX on Google](#)

Videos on Templates

- [Deploy NetScaler HA in AWS using CloudFormation Template](#)
- [Deploy NetScaler HA across Availability Zones using AWS QuickStart](#)
- [NetScaler HA deployment in GCP using GDM templates](#)

AWS Quick Starts

- [NetScaler Web App Firewall Quick Start](#)
- [AWS Quick Start for NetScaler VPX for Web Applications on AWS](#)

NITRO APIs

The NetScaler NITRO protocol allows you to programmatically configure and monitor the NetScaler appliance by using Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. For applications that must be developed in Java or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs).

- [NITRO API documentation](#)

FAQs

April 8, 2024

The following section helps you to categorize the FAQs based on Citrix Application Delivery Controller (ADC) VPX.

- Feature and functionality
- Encryption
- Pricing and packaging
- NetScaler VPX Express
- Hypervisor
- Capacity planning or sizing
- System requirements
- Other technical FAQs

Feature and functionality

What is NetScaler VPX?

NetScaler VPX is a virtual ADC appliance that can be hosted on a Hypervisor installed on industry standard servers.

Does NetScaler VPX include all the web application optimization functionality as ADC appliances?

Yes. NetScaler VPX includes all load balancing, traffic management, application acceleration, application security (including NetScaler Gateway and Citrix Application Firewall), and offload functionality. For a complete overview of the NetScaler feature and functionality, see [Application delivery your way](#).

Are there any limitations with Citrix Application Firewall when using it on NetScaler VPX?

Citrix Application Firewall on NetScaler VPX provides the same security protections as it does on NetScaler appliances. The performance or throughput of Citrix Application Firewall varies by platform.

Are there any differences between NetScaler Gateway on NetScaler VPX and NetScaler Gateway on NetScaler appliances?

Functionally, they are the same. NetScaler Gateway on NetScaler VPX supports all the NetScaler Gateway features available in NetScaler software release 14.1. However, because NetScaler appliances provide dedicated SSL acceleration hardware, it offers greater SSL VPN scalability than a NetScaler VPX instance.

Other than the obvious difference that NetScaler VPX can run on a hypervisor, how does it differ from NetScaler physical appliances?

There are two main areas where customers see differences in behavior. The first is NetScaler VPX cannot offer the same performance as many NetScaler appliances. The second is that while NetScaler appliances incorporate its own L2 networking functionality, NetScaler VPX relies upon the Hypervisor for its L2 networking services. Generally, it does not limit how the NetScaler VPX can be deployed. There can be certain L2 functionality that is configured on a physical NetScaler appliance must be configured on the underlying Hypervisor.

How does NetScaler VPX play a role in the Application Delivery market?

NetScaler VPX changes the game in the application delivery market in the following ways:

- By making a NetScaler appliance even more affordable, NetScaler VPX enables any IT organization to deploy a NetScaler appliance. It is not just for their most mission-critical web applications, but for all of their Web applications.
- NetScaler VPX allows customers to further converge networking and virtualization within their data centers. NetScaler VPX cannot only be used to optimize web applications hosted on virtualized servers. It also enables web application delivery itself to become a virtualized service that can be easily and rapidly deployed anywhere. IT organizations use the standard data center processes for tasks such as provisioning, automation, and charge-back for the web application delivery infrastructure.
- NetScaler VPX opens up new deployment architectures that are not practical if only physical appliances are used. NetScaler VPX and NetScaler MPX appliances can be used basis, tailored

to the individual needs of each respective application to handle processor-intensive actions such as compression and application firewall inspection. At the data center edge, NetScaler MPX appliances handle high-volume network-wide tasks such as initial traffic distribution, SSL encryption or decryption, denial of service (DoS) attack prevention, and global load balancing. Pairing high-performance NetScaler MPX appliances with easy-to-deploy NetScaler VPX virtual appliance brings unparalleled flexibility and customization capabilities to modern, large-scale, data center environments while also reducing overall data center costs.

How does NetScaler VPX fit into our Citrix delivery center strategy?

With the availability of NetScaler VPX, the entire Citrix delivery center offering is available as a virtualized offering. The entire Citrix delivery center benefits from the powerful management, provisioning, monitoring, and reporting capabilities available in Citrix XenCenter. This can be deployed rapidly into almost any environment, and managed centrally from anywhere. With one integrated, virtualized application delivery infrastructure, organizations can deliver desktops, client-server applications, and Web applications.

Encryption

Does NetScaler VPX support SSL offload?

Yes. However, NetScaler VPX does all SSL processing in software, so NetScaler VPX does not offer the same SSL performance as NetScaler appliances. NetScaler VPX can support up to 750 new SSL transactions per second.

Does third-party SSL cards installed on the server hosting NetScaler VPX accelerate SSL encryption or decryption?

No. Supporting third-party SSL cards cannot associate the NetScaler VPX to specific hardware implementations. It greatly diminishes an organizations ability to flexibly host NetScaler VPX anywhere within the data center. NetScaler MPX appliances must be used when more SSL throughput than NetScaler VPX provides is required.

Does NetScaler VPX support the same encryption ciphers as physical NetScaler appliances?

VPX supports all encryption ciphers as physical NetScaler appliances, except the ECDSA.

What is the SSL transactions throughput of NetScaler VPX?

See [NetScaler VPX data sheet](#) for information on SSL transactions throughput.

Pricing and packaging

How is NetScaler VPX packaged?

NetScaler VPX selection is similar to the selection of NetScaler appliances. First, the customer selects the NetScaler edition based on its functionality requirements. Then, the customer selects the specific NetScaler VPX bandwidth tier based on their throughput requirements. NetScaler VPX is available in Standard, Advanced, and Premium Editions. NetScaler VPX offers from 10 Mbps (VPX 10) to 100 Gbps (VPX 100G). More details can be found in the NetScaler VPX data sheet.

Is NetScaler VPX priced the same for all Hypervisors?

Yes.

Are the same NetScaler SKUs used for VPX on all Hypervisors?

Yes.

Can a NetScaler VPX license be moved from one Hypervisor to another (For example from VMware to Hyper-V)?

Yes. NetScaler VPX licenses are independent of the underlying Hypervisor. If you decide to move the NetScaler VPX virtual machine from one Hypervisor to another, you do not have to get a new license. However, you might need to rehost the existing NetScaler VPX license.

Can NetScaler VPX instances be upgraded?

Yes. Both the throughput limits and NetScaler family edition can be upgraded. Upgrade SKUs for both types of upgrade are available.

If I want to deploy NetScaler VPX in a high availability pair, how many licenses do I need?

As with NetScaler physical appliances, a NetScaler high availability configuration requires two active instances. Therefore, the customer must purchase two licenses.

NetScaler VPX Express and 90-day free trial

Does NetScaler VPX Express include all NetScaler standard functionality? Does it include NetScaler Gateway and load balancing for Citrix Virtual Apps (formerly XenApp) Web Interface and XML broker?

Yes. NetScaler VPX Express includes full NetScaler Standard functionality. Starting from NetScaler release 12.0–56.20, Citrix modified the VPX express behavior.

Does NetScaler VPX Express include all NetScaler standard functionality? Does it include NetScaler Gateway and load balancing for Citrix Virtual Apps Web Interface and XML broker?

Starting from NetScaler release 12.0–56.20, VPX Express offers the NetScaler Standard Edition feature set, except Gateway functionality. Earlier to the 12.0–56.20 release, VPX expresses includes all features in the standard edition.

Does NetScaler VPX Express require a license?

With the new NetScaler VPX Express release (12.0–56.20 and onwards), VPX Express is free and requires no license files to install and comes with no commitment. If you have a VPX Express license already, then the prior VPX Express behavior is preserved. If the VPX Express *license file* is removed and the 12.0–56.20 and onwards release is used, the new VPX express behavior takes effect.

Does the NetScaler VPX Express license expire?

With the new VPX express, no. There is no license and no expiry date. If you have a VPX express license already, the license expires one year after download.

Does NetScaler VPX Express include the five free NetScaler Gateway concurrent licenses?

Yes, if you own a VPX express license.

Is there a limit to how many NetScaler VPX Expresses a customer can download?

Five.

Does NetScaler VPX Express support the same encryption ciphers as NetScaler MPX appliances?

For general availability, all the same strong encryption ciphers supported on NetScaler appliances are available on NetScaler VPX and NetScaler VPX Express. It is subjected to the same import or export regulations.

Can I file technical support cases for NetScaler VPX Express?

No. A retail NetScaler VPX license such as, VPX-10, VPX-200, VPX-1000, VPX- 3000 is required to file technical support cases. However, NetScaler VPX Express users are free to use both the NetScaler VPX Knowledge Center, and request help from the community using the Z discussion forums.

Can NetScaler VPX Express be upgraded to a retail version?

Yes. Simply purchase the retail NetScaler VPX license that you need, and then apply the corresponding license to the NetScaler VPX Express instance.

Hypervisor

What VMware versions do NetScaler VPX support?

NetScaler VPX supports both VMware ESX and ESXi for versions 3.5 or later. For more information, see [Support matrix and usage guidelines](#)

For VMware, how many virtual network interfaces can you allocate to a VPX?

You can allocate up to 10 virtual network interfaces to a NetScaler VPX.

From vSphere, how can we access the NetScaler VPX command line?

The VMware vSphere client provides built-in access to the NetScaler VPX command line through a console tab. Also, you can use any SSH or Telnet client to access the command line. You can use the NSIP address of the NetScaler VPX in the SSH or Telnet client.

How can you access the NetScaler VPX GUI?

To access the NetScaler VPX GUI, type the NSIP of the NetScaler VPX, for example, <http://NSIP address> in the address field of any browser.

Can two NetScaler VPX instances installed on the same VMware ESX be configured in a high availability setup?

Yes, but it is not recommended. A hardware failure would affect both NetScaler VPX instances.

Can two NetScaler VPX instances running on two different VMware ESX systems be configured in a high availability setup?

Yes. It is recommended in a high availability setup.

For the VMware, are interface related events supported on NetScaler VPX?

No. Interface-related events are not supported.

For the VMware, are tagged VLANs supported on NetScaler VPX?

Yes. NetScaler tagged VLANs are supported on NetScaler VPX from release 11.0 and higher. For more information, see the [NetScaler documentation](#).

For VMware, are link aggregation and LACP supported on NetScaler VPX?

No. Link Aggregation and LACP are not supported for NetScaler VPX. Link aggregation must be configured at the VMware level.

How do we access NetScaler VPX documentation?

The documentation is available from the NetScaler VPX GUI. After logging in, select the **Documentation** tab.

Capacity planning or sizing

What performance can I expect with NetScaler VPX?

NetScaler VPX offers good performance. See [NetScaler VPX data sheet](#) for a specific performance level achievable using NetScaler VPX.

Given that server CPU power varies, how can we estimate the maximum performance of a NetScaler instance?

Using a faster CPU can result in higher performance (up to the maximum allowed by the license), while using a slower CPU can certainly limit the performance.

Are NetScaler VPX bandwidth or throughput limits for inbound only traffic, or both inbound and outbound traffic?

NetScaler VPX bandwidth limits are enforced for traffic inbound to the NetScaler only, regardless of whether the request traffic or response traffic. It indicates that a NetScaler VPX-1000 (for example) can process both 1 Gbps of inbound traffic and 1 Gbps of outbound traffic simultaneously. Inbound and outbound traffic is not the same as request and response traffic. To the NetScaler, both traffic coming from endpoints (request traffic) and traffic coming from origin servers (response traffic) is “inbound” (that is, coming into the NetScaler).

Can multiple instances of NetScaler VPX be run on the same server?

Yes. However, ensure that the physical server has enough CPU and I/O capacity to support the total workload running on the host, or NetScaler VPX performance can be impacted.

If more than one instance of NetScaler VPX is running on a physical server, what is the minimum hardware requirement per NetScaler VPX instance?

Each NetScaler VPX instance must be allocated 2 GB of physical RAM, 20 GB of hard disk space, and 2 vCPUs. For critical deployments, we do not recommend 2 GB RAM for VPX because the system operates in a memory-constrained environment. This might lead to scale, performance, or stability related issues. The recommended is 4 GB RAM or 8 GB RAM.

Note:

The NetScaler VPX is a latency-sensitive, high-performance virtual appliance. To deliver its expected performance, the appliance requires vCPU reservation, memory reservation, vCPU pinning on the host. Also, hyper threading must be disabled on the host. If the host does not meet these requirements, issues such as high-availability failover, CPU spike within the VPX instance, sluggishness in accessing the VPX CLI, pit boss daemon crash, packet drops, and low throughput occur.

Make sure that every VPX instance meets the predefined conditions.

Can I host NetScaler VPX and other applications on the same server?

Yes. For example, NetScaler VPX, Citrix Virtual Apps Web Interface and Citrix Virtual Apps XML Broker can all be virtualized and can run on the same server. For best performance, ensure that the physical host has enough CPU and I/O capacity to support all the running workloads.

Will adding CPU cores to a single NetScaler VPX instance increase the performance of that instance?

Depending on the license, a NetScaler VPX instance can use up to 4 vCPU today. Adding an extra CPU to a NetScaler VPX instance that can use more CPUs increases the performance.

Why NetScaler VPX looks like consuming more than 90% of the CPU even though it is idle?

It is normal behavior and NetScaler appliances exhibit the same behavior. To see the true extent of NetScaler VPX CPU utilization, use the `stat CPU` command in the NetScaler CLI, or view NetScaler VPX CPU utilization from the NetScaler GUI. The NetScaler packet processing engine is always “looking for work,” even when there is no work to be done. Therefore, it does everything to take control of the CPU and not release it. On a server installed with NetScaler VPX and nothing else, results in looking like (from the Hypervisor perspective) that NetScaler VPX is consuming the entire CPU. Looking at the CPU utilization from “inside NetScaler” (by using the CLI or the GUI) provides a picture of NetScaler VPX CPU capacity being used.

System requirements**What are the minimum hardware requirements for NetScaler VPX?**

The following table explains the minimum hardware requirements for NetScaler VPX.

Type	Requirements
Processor	Dual core server with Intel Xeon or AMD EPYC.
Memory	Minimum 2 GB. However, 4 GB is recommended.
Disk	Minimum 20 GB hard drive.
Hypervisor	Citrix Hypervisor 5.6 or later, VMware ESX/ESXi 3.5 or later, or Windows Server 2008 R2 with Hyper-V

Type	Requirements
Network Connectivity	100 Mbps minimum, but 1 Gbps is recommended.
NIC	A NIC compatible with the Hypervisor you are using.

Note:

For critical deployments, 4 GB memory is preferred for NetScaler VPX. With 2 GB memory, NetScaler VPX operates in a memory-constrained environment. This might lead to scale, performance, or stability related issues.

For more information on system requirements, see [NetScaler VPX data sheet](#).

Note:

From NetScaler 13.1 release onwards, the NetScaler VPX instance on VMware ESXi hypervisor supports AMD EPYC processors.

What is the Intel VT-x?

These features, sometimes referred to as “hardware assist” or “virtualization assist”, trap sensitive or privileged CPU instructions run by the guest OS out to the Hypervisor. This simplifies hosting guest OSs (BSD for a NetScaler VPX) on the Hypervisor.

How common are VT-x?

Virtually, all servers shipped within the last two years might support VT-x. Many servers ship with virtualization assist disabled in the BIOS. Before assuming you cannot run NetScaler VPX, check if you need to change this setting on the server.

Is there a hardware compatibility list (HCL) for NetScaler VPX?

As long as the server supports Intel VT-x, NetScaler VPX must run on any server compatible with the underlying Hypervisor. See the Hypervisor HCL for a comprehensive list of supported platforms.

What version of NetScaler OS is NetScaler VPX based on?

NetScaler VPX is based on NetScaler 9.1 or later releases.

Since NetScaler VPX runs on BSD, can it be run natively on a server with BSD Unix installed?

No. NetScaler VPX requires the Hypervisor to run. Detailed Hypervisor supports can be found in [NetScaler VPX data sheet](#).

Other technical FAQs

Does link aggregation on a physical server with multiple NIC's work?

LACP is not supported. For the Citrix Hypervisor, Static link aggregation is supported and has limits of four channels and seven virtual interfaces. For VMware, static aggregation is not supported within NetScaler VPX, but can be configured at the VMware level.

Is MAC based forwarding (MBF) supported on VPX? Is there any change from the NetScaler appliance implementation?

MBF is supported and it behaves the same way as with the NetScaler appliance. The Hypervisor basically switches all the packets received from NetScaler VPX to the outside and conversely.

How is the NetScaler VPX upgrade process carried out?

Upgrades are performed the same way as for NetScaler appliances: download a kernel file and use install ns or the upgrade utility in the GUI.

How are flash and disk space allocated? Can we change it?

/flash = 965M

/var = 14G

A minimum of 2 GB memory must be allocated to each NetScaler VPX instance. The NetScaler VPX disk image was sized at 20 GB for serviceability purposes such as, room for taking and storing up to 4 GB core dumps, and log and trace files. While it would be possible to generate a smaller disk image, there are no plans to do this currently. /flash and /var are both in the same disk image. They're kept as separate file systems for compatibility purposes.

For detailed memory allocation recommendation, refer to [NetScaler VPX data sheet](#).

Can we add a new hard drive to increase space on NetScaler VPX instance?

Yes. From NetScaler release 13.1 build 21.x onwards, you have the option to increase disk space on the NetScaler VPX instance by adding a second disk. When you attach the second disk, the “/var/crash”

directory is automatically mounted on to this disk. The second disk is used for storing core files and logging. Existing directories that are used to store core files and log files continue to work as earlier.

Note:

Take external backup on downgrade of the NetScaler appliance to avoid loss of data.

For information on how to attach a new hard disk drive (HDD) to a NetScaler VPX instance on a cloud, see the following:

- [Azure documentation](#)

Note:

To attach a secondary disk on VPX instances deployed on Azure, ensure that the Azure VM sizes have a local temporary disk. For more information, see [Azure VM sizes with no local temporary disk](#).

- [AWS documentation](#)
- [GCP documentation](#)

Warning:

After you add a new HDD to VPX, some of the scripts that work on files, which are moved to the new HDD might fail under the following conditions:

If you use the “link” shell command to create hard links to the files, which were moved to a new HDD.

Replace all such commands with “ln -s” to use a symbolic link. Also, modify the failing scripts accordingly.

Can I increase the primary disk size on VPX?

Starting from NetScaler release 14.1 build 21.x, admins can dynamically increase the primary disk size on NetScaler VPX from 20 GB up to 1 TB at once. And the subsequent time, you can again increase up to 1 TB. To increase the disk space, extend the primary disk size to a minimum of 1 GB in the respective cloud or hypervisor UI.

Note:

You can only increase the size of the disks. Once the new size is allocated, you cannot decrease it later. Therefore, increase the disk size only if it is essential.

How do I manually increase the primary disk size on NetScaler VPX?

Follow these steps to manually increase the VPX primary disk size from a hypervisor or cloud:

1. Shutdown the VM.
2. Extend the default disk size of 20 GB to a higher value. For example, 20 GB to 30 GB or 40 GB. For Azure, extend the default disk size of 32 GB to 64 GB.
3. Power on the VM and enter the boot prompt.
4. Log into single user mode using the “boot -s” command.
5. Verify the disk space. You can check the newly allocated disk space using “gpart show” command.
6. Note the partition name. For example, the VM partition is da0.
7. Resize the disk partition using the “gpart resize” command.

Example:

Let's resize the da0 MBR partition to include 10 GB free space by running the following command.

```
gpart resize -i 1 da0
```

8. Merge the free space to the last partition.

Example:

```
gpart resize -i 5 da0s1
```

9. Extend the filesystem to include newly allocated free space using the “growfs” command.

Example:

```
growfs /dev/ada0s1e
```

10. Reboot the VM and verify the increased disk space using the “df -h” command on shell prompt.

What can we expect to regard the NetScaler VPX build numbering and interoperability with other builds?

NetScaler VPX has similar build numbering as the 9.1. Cl (classic) and 9.1. Nc (nCore) releases, for instance 9.1_97.3.vpx, 9.1_97.3.nc, and 9.1_97.3.cl.

Can the NetScaler VPX be a part of a high availability setup with a NetScaler appliance?

Not a supported configuration.

Are all the interfaces visible in NetScaler VPX directly related to the number of interfaces on the Hypervisor?

No. You can add up to seven interfaces (10 for VMware) through the NetScaler VPX configuration utility with only one physical NIC on the Hypervisor.

Can Citrix Hypervisor XenMotion or VMware vMotion or Hyper-V live migration be used to move active instances of NetScaler VPX?

NetScaler VPX does not support Hyper-V live migration. vMotion is supported starting from the NetScaler release 13.0. Live Migration (formerly XenMotion) is supported starting from the NetScaler release 14.1 build 17.38.

Licensing overview

December 26, 2023

NetScaler offers a wide range of product editions and licensing models for MPX and VPX appliances, to meet your organization's needs.

For proper operation of a NetScaler appliance, it must have one of the NetScaler family edition licenses. The ADC product line has three family editions:

- Standard Edition

Note

The standard edition has reached End-of-Sale (EOS) and is only available for renewal.

- Advanced Edition
- Premium Edition

For more information, see the data sheet. The data sheet is available on www.netscaler.com.

Select a NetScaler edition. Then select an MPX or a VPX license offering based on the following criteria:

- Perpetual and subscription (yearly and hourly subscription)
- vCPU and bandwidth
- on-premises and cloud

NetScaler VPX Express license

VPX Express for on-premises and cloud deployments does not require a license file, and it offers the following features:

- 20 Mbps bandwidth
- Web Logging, Load Balancing, Content Switching, Cache Redirection, SSL Offloading, Content Filtering, Rewrite, IPv6 protocol translation, Responder, AppFlow, Clustering, and CallHome
- Maximum 250 SSL sessions
- 20 Mbps SSL throughput

After you are satisfied, you can purchase a license using one of the following options:

- A standalone NetScaler VPX license.
- NetScaler Pooled Capacity license for VPX instances. For more information, see [NetScaler Pooled Capacity](#).

NetScaler fixed bandwidth (throughput) license

Fixed bandwidth perpetual licenses are EOS and you must now use fixed bandwidth subscription licenses. Fixed bandwidth subscription allows you to run a fixed throughput deployment in any form factor (MPX/SDX/VPX/BLX). After deploying your NetScaler, you must fetch your license files from the license server and download a license manually to each device (on-premises or cloud).

Notes:

- Only advanced and premium editions are supported.
- Edition and bandwidth upgrades are not supported.
- Migration to pooled capacity license is not supported.

NetScaler Flexed license

NetScaler Flexed licensing is the new licensing framework aimed at simplifying the license management process. Your Flexed license includes software instance licenses (VPX/CPX/BLX, SDX, and MPX) and bandwidth capacity licenses. You must apply the Flexed licenses on the NetScaler Console service or NetScaler Console on-prem. You can then allocate them across all NetScaler form factors deployed in cloud or on-prem.

For more information about Flexed licenses on NetScaler Console, see [Flexed license](#).

For more information about Flexed licenses on NetScaler Console service, see [Flexed license](#).

NetScaler Pooled license

Use NetScaler Console to create a licensing framework that comprises a common bandwidth and an instance pool. For more information, see [NetScaler Pooled Capacity](#).

Note:

NetScaler Console can host both Pooled and Self Managed Pool licenses. To use the required license, configure the license server on NetScaler and check out the capacity from the appropriate pool. The ADC CLI and GUI configuration steps for the Pooled and Self Managed Pool license are the same.

NetScaler Self Managed Pool license

From NetScaler release 13.1 build 30.x onwards, NetScaler instances support the Self Managed Pool license. With this license, you can simplify and automate license file uploads to a license server. Use NetScaler Console to create a licensing framework that comprises a common bandwidth or vCPU and instance pool.

To use the Self Managed Pool license, configure the license server to the `SelfManagedPool` license mode on NetScaler and check out the required capacity. Use the `show ns license` command after rebooting the NetScaler appliance to find out the license that is configured.

Important

If your system is configured with Pooled Capacity license but want to migrate to Self Managed Pool license without impacting the traffic flow, ensure that the target server has the required Self Managed Pool license.

You can migrate only between the following compatible licenses:

- Pooled Capacity to Self Managed Pool, and conversely.
- vCPU to Self Managed vCPU, and conversely.

To migrate the license, run the following command:

```
add ns licenseserver (<licenseServerIP> | <serverName>)-forceUpdateIP  
-licensemode [CICO | Pooled | SelfManagedPool | VCPU | SelfManagedvCPU  
]
```

Example:

```
add licenseserver 192.0.2.246 -forceUpdateIP -licensemode selfManagedvCPU
```

Configure Self Managed Pool license using the CLI

To add the license server config to the NetScaler appliance, run the following command:

```
1 add ns licenseserver (<licenseServerIP> | <serverName>) [-port <
    positive_integer>] -licensemode [CICO | Pooled | SelfManagedPool |
    VCPU | SelfManagedvCPU]
2 <!--NeedCopy-->
```

Example:

```
1 add ns licenseserver 192.0.2.246 -port 27000 -licensemode
    SelfManagedPool
2 <!--NeedCopy-->
```

Note:

The `show ns licenseserverpool` command displays only licenses based on the specified license mode. Hence, the licenses are fetched faster. To get an inventory of all the licenses, run the `show ns licenseserverpool -getallLicenses` command. If the license mode is not specified, the Pooled Capacity licenses are displayed by default.

To modify the system capacity, run the following command:

```
1 set ns capacity ((-bandwidth <positive_integer> -unit ( Gbps | Mbps ))
    | -platform <platform>) [-Edition <Edition>]
2 <!--NeedCopy-->
```

Example:

```
1 set ns capacity -bandwidth 3 -unit gbps -edition enterprise
2 <!--NeedCopy-->
```

Note:

Capacity is checked out from the license pool of the license server.

To reboot the NetScaler appliance, run the following command:

```
1 reboot [-warm]
2 <!--NeedCopy-->
```

To display the state of all the licensed features and configured license mode, run the following command:

```
1 show ns license
2 <!--NeedCopy-->
```

Sample output of `show ns licenseserverpool` command:

```
> add licenseserver [redacted] -licensemode SelfManagedPool
Done
> sh licenseserverpool
Instance Total           : 200
Instance Available      : 199
Standard Bandwidth Total : 10.00 Gbps
Standard Bandwidth Available : 10.00 Gbps
Enterprise Bandwidth Total : 10.00 Gbps
Enterprise Bandwidth Available : 7.00 Gbps
Platinum Bandwidth Total : 0 Mbps
Platinum Bandwidth Available : 0 Mbps
```

Sample output of show ns licenseserverpool -getallLicenses command:

```
> sh licenseserverpool -getallLicenses
Instance Total           : 40
Instance Available      : 33
Standard Bandwidth Total : 210.00 Gbps
Standard Bandwidth Available : 210.00 Gbps
Enterprise Bandwidth Total : 50.00 Gbps
Enterprise Bandwidth Available : 50.00 Gbps
Platinum Bandwidth Total : 210.00 Gbps
Platinum Bandwidth Available : 205.00 Gbps
VPX8000P Total         : 1
VPX8000P Available     : 1
Standard CPU Total      : 100
Standard CPU Available  : 100
Enterprise CPU Total    : 100
Enterprise CPU Available : 100
Platinum CPU Total     : 25
Platinum CPU Available  : 20
```

Sample output of show license command:

```
> show license
License status:
  Web Logging: YES
  Surge Protection: YES
  Load Balancing: YES
  Content Switching: YES
  Cache Redirection: YES
  Compression Control: YES
  Delta Compression: NO
  SSL Offloading: YES
  Global Server Load Balancing: YES
  GSLB Proximity: YES
  Dynamic Routing: YES
  Content Filtering: YES
  Content Accelerator: NO
  Integrated Caching: NO
  SSL VPN: YES (Maximum users = 1000) (Maximum ICA users = Unlimited)
  AAA: YES
  OSPF Routing: YES
  RIP Routing: YES
  BGP Routing: YES
  Rewrite: YES
  IPv6 protocol translation: YES
  Application Firewall: NO
  Responder: YES
  NetScaler Push: YES
  AppFlow: YES
  CloudBridge: NO
  ISIS Routing: YES
  Clustering: YES
  CallHome: YES
  AppQoS: YES
  AppFlow for ICA: YES
  Front End Optimization: YES
  Large Scale NAT: YES
  RDP Proxy: YES
  Reputation: NO
  URL Filtering: NO
  Video Optimization: NO
  Forward Proxy: NO
  SSL Interception: NO
  Remote Content Inspection: YES
  Adaptive TTP: NO
  Connection Quality Analytics: NO
  Bot Management: NO
  API Gateway: NO
  Model Number ID: 3000
  License Type: Enterprise License
  Licensing mode: Self Managed Pool
Done
```

Configure Self Managed Pool license using the GUI

Complete the following steps to configure the Self Managed Pool license:

1. Navigate to **System > Licenses > ADC License > Manage Licenses > Add New License**.
2. In the **Licenses** page, select the **Use remote licensing** radio button, and choose your license mode from **Remote Licensing Mode**.
3. Enter the server IP address and the license port details.
4. Provide the NetScaler Console access credentials.
5. Click **Continue**.

- [VPX-GCP license](#)

Allocate and apply a license

October 30, 2023

In the NetScaler MPX and VPX ADC GUI, you can use your hardware serial number (HSN) or your license access code to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information, see [Manage Licenses](#).

Citrix Licensing guide

The Citrix Licensing guide also covers information about installing licenses in a NetScaler appliance and installing licenses in other NetScaler products. For more information, see the [NetScaler Licensing Guide](#).

Prerequisites

Note

Buy separate licenses for each appliance in a high availability pair. Ensure that the same types of licenses are installed on both the appliances. For example, if you buy a premium license for one appliance, you must purchase another premium license for the other appliance.

To use the hardware serial number or license access code to allocate your licenses:

- You must be able to access public domains through the appliance. For example, the appliance must be able to access www.citrix.com. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain:
 - Use a proxy server or set up a DNS server.
 - Configure a NetScaler IP (NSIP) address or a subnet IP (SNIP) address on your NetScaler appliance.
- Your license must be linked to your hardware, or you must have a valid license access code. Citrix sends your license access code by email when you purchase a license.

Allocate a license by using the GUI

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license access code.

You can partially allocate licenses as required for your deployment. For example, if your license file contains 10 licenses, but your current requirement is for only six licenses, you can allocate six licenses now, and allocate more licenses later. You can't allocate more than the total number of licenses present in your license file.

To allocate your license

1. In a web browser, type the IP address of the NetScaler appliance (for example, <http://192.168.100.1>).
2. In User Name and Password, type the administrator credentials.

3. On the **Configuration** tab, navigate to **System > Licenses**.
4. In the details pane, click **Manage Licenses**, click **Add New License**, and then select one of the following options:

- **Use Serial Number:** The software internally fetches the serial number of your appliance and uses this number to display your licenses.
- **Use license access code:** Citrix emails the license access code for the license that you purchased. Enter the license access code in the text box.

If you do not want to configure internet connectivity on the NetScaler appliance, you can use a proxy server. Select **Connect through Proxy Server** and specify the IP address and port of your proxy server.

5. Click **Get Licenses**. Depending on the option that you selected, one of the following dialog boxes appears.

- The following dialog box appears if you selected Hardware Serial Number.

Serial No: HW-47EGM28S8V				
<input type="checkbox"/>	Name	Total count	Allocate	Id
<input type="checkbox"/>	▶ Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
<input type="checkbox"/>	▶ Citrix Access Gateway Platform License	1	0	key002
<input type="checkbox"/>	▶ Citrix Access Gateway Universal License	10	0	key003
<input type="checkbox"/>	▶ Citrix EasyCall	10	0	key004
<input type="checkbox"/>	▶ Citrix EasyCall Unlimited License	10	0	key005
<input type="checkbox"/>	▶ Citrix Branch Repeater VPX 45 Mbps	1	0	key006
<input type="checkbox"/>	▶ Citrix Repeater Plug-in	10	0	key007

- The following dialog box appears if you selected License Access Code.

License Activation code: HW-47EGM28S8V

<input type="checkbox"/>	Name	Total count	Allocate	Id
<input type="checkbox"/>	▶ Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
<input type="checkbox"/>	▶ Citrix Access Gateway Platform License	1	0	key002
<input type="checkbox"/>	▶ Citrix Access Gateway Universal License	10	0	key003
<input type="checkbox"/>	▶ Citrix EasyCall	10	0	key004
<input type="checkbox"/>	▶ Citrix EasyCall Unlimited License	10	0	key005
<input type="checkbox"/>	▶ Citrix Branch Repeater VPX 45 Mbps	1	0	key006
<input type="checkbox"/>	▶ Citrix Repeater Plug-in	10	0	key007

6. Select the license file that you want to use to allocate your licenses.
7. In the **Allocate** column, enter the number of licenses to be allocated. Then click **Get**.
 - If you selected **Hardware Serial Number**, enter the number of licenses, as shown in the following screenshot.

Serial No: HW-47EGM28S8V

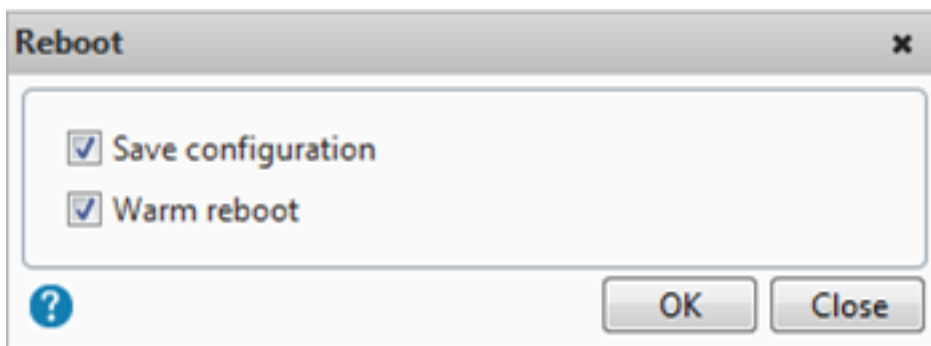

<input type="checkbox"/>	Name	Total count	Allocate	Id
<input type="checkbox"/>	▶ Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
<input type="checkbox"/>	▶ Citrix Access Gateway Platform License	1	0	key002
<input checked="" type="checkbox"/>	▶ Citrix Access Gateway Universal License	10	6	key003
<input type="checkbox"/>	▶ Citrix EasyCall	10	0	key004
<input type="checkbox"/>	▶ Citrix EasyCall Unlimited License	10	0	key005
<input type="checkbox"/>	▶ Citrix Branch Repeater VPX 45 Mbps	1	0	key006
<input type="checkbox"/>	▶ Citrix Repeater Plug-in	10	0	key007

Get Cancel

- If you selected **license access code**, enter the number of licenses, as shown in the following screenshot.

8. Click restart for the license to take effect.
9. In the restart dialog box, click **OK** to proceed with the changes, or click **Close** to cancel the changes.

Install a license

If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

To install a license file by using the GUI

1. In a web browser, type the IP address of the NetScaler appliance (for example, <http://192.168.100.1>).

2. In User Name and Password, type the administrator credentials.
3. On the **Configuration** tab, navigate to System Licenses.
4. In the details pane, click **Manage Licenses**.
5. Click **Add New License**, then select **Upload license files from a local computer**.
6. Click **Browse**. Navigate to the location of the license files, select the license file, and then click **Open**.
7. Click restart to apply the license.
8. In the restart dialog box, click **OK** to proceed with the changes, or click **Close** to cancel the changes.

To install the licenses by using the CLI

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the `nsconfig` directory, if it does not exist, and copy one or more new license files to this directory.

Example

```
1 login: nsroot
2 Password: nsroot
3 Last login: Mon Aug 4 03:37:27 2008 from 10.102.29.9
4 Done
5 > shell
6 Last login: Mon Aug 4 03:51:42 from 10.103.25.64
7 root@ns# mkdir /nsconfig/license
8 root@ns# cd /nsconfig/license
9 <!--NeedCopy-->
```

Copy one or more new license files to this directory.

Note

The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the `reboot -w` command to warm restart the system, or run the `restart` command to restart the system normally.

Verify licensed features

Before using a feature, ensure that your license supports the feature.

To verify the licensed features by using the CLI

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.

2. Log on to the ADC appliance by using the administrator credentials.
3. At the command prompt, enter the `sh ns license` command to display the features supported by the license.

Example

```
1 sh ns license
2     License status:
3             Web Logging: YES
4             Surge Protection: YES
5             .....
6             Responder: YES
7 Done
8 <!--NeedCopy-->
```

To verify the licensed features by using the GUI

1. In a web browser, type the IP address of the ADC appliance, such as <http://192.168.100.1>.
2. In User Name and Password, type the administrator credentials.
3. Provide the User name and Password and click **Login**.
4. In the navigation pane, expand **System**, and then click **Licenses**. You see a green check mark next to the licensed features.

Enable or disable a feature

When you use the NetScaler appliance for the first time, you must enable a feature before you can use its functionality. If you configure a feature before it's enabled, a warning message appears. The configuration is saved but it applies only after the feature is enabled.

To enable a feature by using the CLI

At the command prompt, type the following commands to enable a feature and verify the configuration:

```
1 - enable feature <FeatureName>
2
3 - show feature
4 <!--NeedCopy-->
```

```
1 **Example**
```

```

1  enable feature lb cs
2  done
3  >show feature
4
5          Feature                               Acronym           Status
6  -----
7  1)  Web Logging                               WL                 OFF
8  2)  Surge Protection                          SP                 ON
9  3)  Load Balancing                           LB                 ON
10 4)  Content Switching                         CS                 ON
11 5)  Cache Redirection                         CR                 ON
12 .
13 .
14 .
15 24) NetScaler Push                           push              OFF
16 Done
17 <!--NeedCopy-->

```

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key isn't available for a particular feature, the following error message appears for that feature:

ERROR: features not licensed

Note:

To enable an optional feature, you must have a feature-specific license. For example, you've purchased and installed the NetScaler Advanced Edition license. However, to enable the Integrated Caching feature, you must purchase and install the AppCache license.

To disable a feature by using the CLI

At the command prompt, type the following commands to disable a feature and verify the configuration:

```

1 -  disable feature \<FeatureName\>
2
3 -  show feature
4 <!--NeedCopy-->

```

```

1  **Example**

```

The following example shows how to disable load balancing (LB).

```

1  > disable feature lb
2  Done
3  > show feature
4
5          Feature                               Acronym           Status

```

```

6          -----
7      1)   Web Logging           WL           OFF
8      2)   Surge Protection      SP           ON
9      3)   Load Balancing       LB           OFF
10     4)   Content Switching     CS           ON
11     .
12     .
13     .
14     24)  NetScaler Push       push      OFF
15     Done
16     >
17 <!--NeedCopy-->

```

Configure NetScaler license expiry alerts

By default, a GUI alert appears when the ADC license expiry date is less than or equal to 30 days.

You can configure the NetScaler appliance to perform the following alert operations from a specified number of days before a NetScaler license is due to expire:

- Display a license expiry alert banner on the NetScaler GUI.
- Send SNMP traps containing the license expiry information at regular intervals to the configured trap listeners if the “NS_LICENSE_EXPIRY”SNMP alarm is enabled.

Upon license expiry, the NetScaler appliance automatically restarts to revoke the license. If a NetScaler appliance uses Citrix service provider (CSP) licenses, the appliance does not restart automatically to revoke the license. However, if the user restarts the appliance, it restarts as unlicensed.

To specify a number of days for NetScaler license expiry alerts by using the CLI:

At the command prompt, type:

- **set licenseparameters [-licenseexpiryalerttime]**
- **sh licenseparameters**

Example:

```

1 > set licenseparameters -licenseexpiryalerttime 200
2 Done
3
4 > sh licenseparameters
5 ...
6     Licenseexpiryalerttime: 200
7 <!--NeedCopy-->

```

To specify a number of days for NetScaler license expiry alerts by using the NetScaler GUI:

1. Navigate to **Configuration > System > Licenses > Manage Licenses**.

2. In **Notification Settings**, click the edit button to specify a number of days for NetScaler license expiry alerts.

Check license expiry information

You can check NetScaler license expiry information through the GUI or CLI.

To check NetScaler license expiry information through GUI:

Go to **Configuration > System > Licenses**.

A GUI alert appears when the ADC license expiry date is less than or equal to the specified number of days for the NetScaler license expiry alert.

To check the license expiry information through CLI:

Type the command “show ns license”.

```
1 > sh license
2   License status:
3
4   Web Logging: YES
5   Surge Protection: YES
6
7   Web Logging: YES
8   Surge Protection: YES
9
10  ...
11
12 Days to expiry: 196
13
14 Done
15 >
16 <!--NeedCopy-->
```

Validate license files without rebooting the NetScaler appliance

With this feature, you can test licenses and see all the features available in the given license without applying them on the NetScaler appliance. This option allows you to test new licenses without rebooting the NetScaler appliance.

You can use this feature by both GUI and CLI.

Validate license files by using the GUI

1. Go to **System -> Licences**.
2. In the **ADC Test License** tab, click **Manage Test Licenses**.
3. Click **Upload**, and upload one or more license files. If multiple license files are uploaded, the union of all license files is calculated.
4. After the license file upload is complete, click **ADC Test License** again to display the licensed features of the uploaded license.

Section 1 shows license information and Section 2 shows all features that the license includes.

License

5. Verify the information displayed and click **Apply** to use the license. Reboot (warm) the NetScaler appliance for the license to take effect. Immediate reboot isn't mandatory, and the current license is applicable until the next reboot.

Validate license files by using the CLI

1. Copy the test license file to the ADC appliance at path: `/nsconfig/testlicense`.

Example:

```
1 scp CNS_15082_SERVER_PLT_Retail.lic nsroot@<ns_ip>:/nsconfig/
  testlicense/
2 <!--NeedCopy-->
```

2. Verify whether the license file is copied to the correct location.

Example:

```
1 ls /nsconfig/testlicense/ CNS_15082_SERVER_PLT_Retail.lic
2 <!--NeedCopy-->
```

3. Run the `show ns testlicense` command to see the license information.

```
1 > sh ns testlicense
2   License status:
3           Web Logging: YES
4           Surge Protection: YES
5           Load Balancing: YES
6           Content Switching: YES
7           Cache Redirection: YES
8           Compression Control: YES
9           Delta Compression: NO
10          SSL Offloading: YES
11   Global Server Load Balancing: YES
12          .....
13          API Gateway: YES
14          Model Number ID: 15082
15          License Type: Platinum License
16          Licensing mode: Local
17          Days to expiration: 54
18 <!--NeedCopy-->
```

4. Verify the information displayed, and run the `apply ns testlicense` command to apply the license. Reboot (warm) the NetScaler appliance for the license to take effect.

```
1 > apply ns testlicense
2
3 Warning: The configuration changes will not take effect until the
  system is rebooted
4 Done
5 > reboot -w
```

```
6 Are you sure you want to restart NetScaler (Y/N)? [N]:Y
7 Done
8 <!--NeedCopy-->
```

Upgrade a license

Edition and bandwidth upgrades aren't supported. To move between editions in a pooled subscription, you must purchase a new pooled subscription with the new edition and upload those licenses to NetScaler Console.

Bandwidth upgrade does not apply to pooled licenses because each instance can check-in/check-out the necessary bandwidth based on the requirement as long as the underlying hardware or software supports it.

Note:

You can use NetScaler Console to create a licensing framework that comprises a common bandwidth and instance pool. For complete information, see [NetScaler pooled capacity](#).

Data governance

February 22, 2024

What is Console Advisory Connect?

Console Advisory Connect is a feature to enable seamless onboarding of NetScaler MPX, SDX, and VPX instances, and NetScaler Gateway appliances onto NetScaler Console service. This feature lets the NetScaler instance or NetScaler Gateway appliance automatically, securely connect with NetScaler Console service, and send system, usage, and telemetry data to it. Based on this data, you get insights and recommendations for your NetScaler infrastructure on NetScaler Console service.

By using the Console Advisory Connect feature and onboarding your NetScaler instances or NetScaler Gateway appliances to NetScaler Console service. You can also manage all your NetScaler and NetScaler Gateway assets whether on-premises or in the cloud. Also, you benefit from access to a

rich set of visibility features that help in quick identification of performance issues, high resource usage, critical errors, and so on. NetScaler Console service provides a wide range of capabilities for your NetScaler instances and applications. For more information on NetScaler Console service, see [NetScaler Application Delivery Management Service](#)

Important

- NetScaler Gateway appliance also supports the Console Advisory Connect feature. For better ease, the NetScaler Gateway appliance isn't called explicitly in the consecutive sections.

What is NetScaler Console service?

NetScaler Console service is a cloud-based solution that helps you manage, monitor, orchestrate, automate, and troubleshoot your NetScaler instances. It also provides you analytical insights and curated machine learning based recommendations about NetScaler instances and about application health, performance, and security. For more information, see [NetScaler Console service Overview](#)

How the Console Advisory Connect is enabled?

Console Advisory Connect is enabled by default, after you install or upgrade NetScaler or Gateway to release 13.0 build 61.xx and above.

What data is captured using Console Advisory Connect?

The following details are captured using Console Advisory Connect:

- **NetScaler details**
 - Serial ID
 - Encoded Serial ID
 - Host ID
 - UUID
 - Management IP address
 - Host name
 - Version
 - Build type
 - Build
 - License type
 - Hypervisor
 - Deployment type(standalone/HA)
 - Platform type

- Platform description
- System ID
- Modes enabled on ADC
- Features enabled on ADC

- **License Information**

- Features licensed on NetScaler
- License number

- **Key usage metrics**

- System date time
- CPU usage percentage
- Management CPU percentage
- Throughput
- SSL new sessions
- SSL encryption throughput
- SSL decryption throughput
- System Uptime

- **Configuration**

- ns.conf file

Note

Before the Console Advisory Connect sends the `ns.conf` file from NetScaler appliance to the NetScaler Console service, it anonymizes the encrypted or hashed passwords. The Console Advisory Connect checks for `-encrypted` or `-passcrypt` parameters and replaces the associated encrypted or hashed value with `XXXX`. The Console Advisory Connect then encodes and compresses the `ns.conf` file, and sends it to the NetScaler Console service endpoint.

- **Critical error details**

- Hard disk failures
- SSL card failures
- Power Supply Unit (PSU) failures
- Flash drive failure
- Warm reboot
- Sustained memory usage above 90% or a memory leak
- Sustained rate limit drops

- **Usage of NITRO automation tools**

- Usage of automation tools such as Ansible, Terraform, or NITRO SDKs.

- **Diagnostics details**

Note:

The ADM diagnostic tool uses the following diagnostic details. For more information, see the [Diagnostic tool](#) topic in NetScaler Console.

- ADC CLI status
- ADC DNS status
- network connection status to ADM endpoint “adm.cloud.com”
- network connection status to ADM endpoint “agent.adm.cloud.com”
- network connection status to ADM trust service “trust.citrixnetworkapi.net”
- network connection status to ADM download site “download.citrixnetworkapi.net”

How the data is used?

By collecting the data, NetScaler can provide you with timely and in-depth insights about your NetScaler installations, which include the following:

- **Key metrics.** Details of key metrics about CPU, memory, throughput, SSL throughput, and high-light anomalous behavior on NetScaler instances.
- **Critical errors.** Any critical errors that might have occurred on your NetScaler instances.
- **Deployment advisory.** Identify NetScaler instances that are deployed in standalone mode but have high throughput and are vulnerable to a single point of failure.
- **Diagnostic tool.** When you onboard an ADC instance onto NetScaler Console, you might experience a few issues that prevent the ADC instance from successfully onboarding. To troubleshoot the issues, you can either manually use the diagnostic tool or see the diagnostic information in the ADM GUI. For more information, see [Diagnostic tool](#).

How long the collected data is kept?

Any data collected is kept for no longer than 13 months.

If you decide to terminate the use of the service by disabling the Console Advisory Connect feature from the NetScaler, any previously collected data is deleted after a period of 30 days.

Where the data is stored and how secure is it?

All data collected by Console Advisory Connect is stored in one of the three regions—United States, European Union, and Australia and New Zealand (ANZ). For more information, see [Geographical Considerations](#).

The data is stored securely with strict tenant isolation at the database layer.

How to disable Console Advisory Connect?

If you want to disable data collection through Console Advisory Connect, see [How to enable and disable Console Advisory Connect](#).

Introduction to Console Advisory Connect for NetScaler appliances

February 22, 2024

NetScaler Console service is a cloud-based solution that helps you manage, monitor, orchestrate, automate, and troubleshoot your NetScaler instances. It also provides analytical insights and curated machine learning based recommendations for your applications health, performance, and security. For more information, see [NetScaler Application Delivery Management Service](#).

Console Advisory Connect is a feature to enable seamless onboarding of NetScaler instances onto NetScaler Console service. This feature helps NetScaler instances and NetScaler Console service to function as a holistic solution, which offers customers multi fold benefits.

Console Advisory Connect feature lets the NetScaler instance automatically connect with the NetScaler Console service and send system, usage, and telemetry data to it. Based on this data, the NetScaler Console service gives you some insights and recommendations on your NetScaler and Gateway infrastructure like the following:

- Security advisory insight highlighting your vulnerable ADC appliances.
- Upgrade advisory insight highlighting ADC appliances that have reached or about to reach end of maintenance and end of life.
- Quick identification of performance issues, high resource usage, and critical errors.

To harness the power of NetScaler Console service, you can choose to onboard your NetScaler instances to NetScaler Console service. The onboarding process uses Console Advisory Connect, and makes the experience smooth and faster for you.

Points to note

- Console Advisory Connect is now available on NetScaler MPX, SDX, and VPX instances and NetScaler Gateway appliances.
- The initiative in NetScaler Console service that uses this Console Advisory Connect feature is Console Advisory Connect based low-touch onboarding. For more information, see [Low-touch onboarding of NetScaler instances using Console Advisory Connect](#).

- If Console Advisory Connect is enabled on an ADC instance, certain diagnostic details are automatically sent to ADM service.

For more information, see [Data governance](#).

Important

Console Advisory Connect fails to collect the probe data and cannot help in on-boarding the ADC appliance to ADM service if the following conditions are met:

- `NSinternal` user account is disabled.
- SSH public key is not set up.

To overcome the preceding scenario, Citrix recommends you follow any one of the following:

- Enable `internaluser` user account by using the `set ns param -internaluserlogin ENABLED`.
- Configure the public key authentication. For more information, see [Access a NetScaler appliance by using SSH keys and no password](#).

How does Console Advisory Connect support with NetScaler Console service?

Here is a high-level workflow of how the Console Advisory Connect feature on NetScaler interacts with NetScaler Console service.

1. Console Advisory Connect feature on NetScaler appliance auto connects with NetScaler Console service using a periodic probe request.
2. This request has system, usage and telemetry data, using which the NetScaler Console service gives you some insights and recommendations on your NetScaler infrastructure. Like; quick identification of performance issues, high resource usage, and critical errors.
3. You can view the insights and recommendations and decide to onboard your ADC instances to the NetScaler Console service to start managing your NetScaler instances.
4. When you decide to onboard, the Console Advisory Connect feature helps complete the on-boarding seamlessly.

What versions of NetScaler is Console Advisory Connect supported on?

Console Advisory Connect is supported on all NetScaler platforms and all appliance models (MPX, VPX, and SDX). Starting from NetScaler release 13.0 build 61.xx, Console Advisory Connect is enabled by default for NetScaler appliances.

How to enable Console Advisory Connect?

If you are an existing NetScaler customer, and upgrade to NetScaler release 13.0 build 61.xx, Console Advisory Connect is enabled by default as part of the upgrade process.

If you are a new NetScaler customer, installing NetScaler release 13.0 build 61.xx, Console Advisory Connect is enabled by default as part of the install process.

Note

Unlike the new NetScaler appliances, existing NetScaler appliances find the route through Citrix Insight Service (CIS) or Call Home.

How to enable and disable Console Advisory Connect?

You can enable and disable Console Advisory Connect from CLI, GUI, or NITRO API methods.

Using CLI

To enable the Console Advisory Connect by using the CLI

At the command prompt, type:

```
1 set adm parameter - admserviceconnect ENABLED
```

To disable the Console Advisory Connect by using the CLI

At the command prompt, type:

```
1 set adm parameter - admserviceconnect DISABLED
```

Important

If your NetScaler is on release 13.0 build 61.xx, the parameter name to enable or disable Console Advisory Connect is “autoconnect.” For example, to enable service connect, use the `set adm parameter - autoconnect ENABLED` command.

Using the GUI

To disable the Console Advisory Connect by using the NetScaler GUI

1. In a web browser, type the IP address of the NetScaler appliance (for example, <http://192.0.2.10>).
2. In **User Name** and **Password**, enter the administrator credentials.

3. Navigate to **System > Settings > Configure ADM Parameters**.
4. On the **Configure ADM Parameters** page, clear the **Enable Console Advisory Connect** dialog box, and click **OK**.

Using the NITRO API

You can disable Console Advisory Connect by using the **NITRO** command.

- In NetScaler release 13.0 build 61.xx, you can enable or disable the Console Advisory Connect by using the following command:

```
- curl -X PUT -H "Content-Type:application/json" http://192.0.2.10/nitro/v1/config/admparameter> -d '{ "admparameter":{ "autoconnect": "enabled" } }' -u nsroot:Test@1
```

- From NetScaler release 13.0 build 64.xx, the “autoconnect” parameter name is renamed to **admserviceconnect**. You can disable the Console Advisory Connect by using the following command:

```
- curl -X PUT -H "Content-Type:application/json" http://192.0.2.10/nitro/v1/config/admparameter -d '{ "admparameter":{ "admserviceconnect": "disabled" } }' -u nsroot:Test@1
```

Diagnostic tool

When you onboard an ADC instance onto NetScaler Console, you might experience a few issues that prevent the ADC instance from successfully onboarding. To troubleshoot the issues, you can either manually use the diagnostic tool or see the diagnostic information in the ADM GUI.

- For more information about the details captured using Console Advisory Connect, see [Data governance](#).
- For more information about the diagnostic tool, see [Diagnostic tool](#).

NetScaler Console built-in agent behavior

From NetScaler release 13.0 build 61.xx and higher, the NetScaler Console built-in agent available on NetScaler instances communicates with ADM service. It communicates without the need for manual initialization on the respective ADC instance. After communication with ADM service is established, the built-in agent stays evergreen by auto-upgrading itself to the latest software version regularly.

Previously, you had to initialize the built-in agent on the ADC instances, using `mastools` commands, to establish communication with ADM service and for regular auto-upgrades.

For more information, see [Configure the ADC built-in agent to manage instances](#).

For more information on Console Advisory Connect, see the following topics:

- Data governance: [Data governance](#).
- NetScaler Console service: [NetScaler Application Delivery Management Service](#).

Upgrade and downgrade a NetScaler appliance

August 7, 2023

NetScaler 14.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Read the release notes document before you upgrade your software.

This section provides information about **upgrading and downgrading a NetScaler appliance** (MPX and VPX) firmware **by using the NetScaler GUI or CLI**.

You can also **use NetScaler Console to upgrade a NetScaler appliance**. For more information, see:

- [10 ways NetScaler Console service supports easier NetScaler upgrades](#)
- [Use NetScaler Console service to upgrade NetScaler instances](#)
- [Use NetScaler Console software to upgrade NetScaler instances](#)

For information about **upgrading a NetScaler SDX appliance**, see [Single Bundle Upgrade](#).

Before you begin

December 6, 2023

Before you start the upgrade or downgrade process, make sure you check the following:

- Evaluate your organization's support agreement. Document appliance serial number, support agreement, and contact details for support from Citrix technical support or the Citrix Authorized Partner.
- Time allocated for upgrading NetScaler appliances. Follow your organization's change control procedure. Allocate twice as much time to perform the upgrades. Allocate enough time to upgrade each of the NetScaler appliance.
- The NetScaler licensing system enforces Customer Success Services (CSS) membership license validation for NetScaler VPX appliances. Before you upgrade a NetScaler VPX appliance, ensure that the current CSS membership of the appliance is valid and has not expired.

Ensure that the current CSS membership expiration date is equal or newer than the CSS eligibility date of the NetScaler product version to be upgraded.

If the CSS membership expiration date is earlier than the CSS eligibility date, then the existing license does not work on the upgraded version of the NetScaler VPX appliance. This functionality can prevent unauthorized usage of the licenses. You must renew the CSS membership before you can upgrade the NetScaler VPX appliance.

For a list of NetScaler VPX releases and their CSS eligibility dates, see [NetScaler product Customer Success Services Eligibility Dates](#).

For more information about CSS, see [Customer Success Services](#).

- Citrix recommends the upgrade of one major release at a time. For example, if the NetScaler appliance is on release 13.0, and you want to upgrade to release 14.1, first upgrade the appliance to release 13.1, and then to release 14.1.
- The licensing framework and types of licenses. A software edition upgrade might require new licenses, such as:
 - upgrading from the standard edition to the advanced edition, or
 - the standard edition to the Premium edition, or
 - the advanced edition to the Premium edition.

Existing NetScaler licenses continue to work when you upgrade to version 14.1. For more information, see [Licensing](#)

- Check for [New and deprecated commands, parameters, and SNMP OIDs](#).
- Check for [NetScaler MPX Hardware and Software Compatibility Matrix](#).
- If the NetScaler Gateway logon page is customized, then make sure that the UI theme is set to default.
- If you are upgrading LOM, review the [LOM Firmware Upgrade page](#).

- Download the NetScaler firmware from the [NetScaler Downloads](#). For the detailed steps to download the NetScaler firmware, see the [Download a NetScaler release package](#).
- Back up files. Perform a backup of the configuration file, customization file, certificates, monitor scripts, license files, and so on either manually or refer to the following documentation for backup using NetScaler CLI or GUI - [Backup and restore](#).
 - Refer to the following list for other common customized files for backup.
 - * `/nsconfig/monitors/*.pl`
 - * `/nsconfig/rc.netscaler`
 - Back up and delete the customization folder. The folder is usually in the path `/var/customizations`. An example of customization is a logon page with a logo. After you have copied the customizations folder, you have to delete it from the NetScaler appliance, before you upgrade the appliance. Upgrading with customization in place might cause some issues.

Important:

We recommend that you review the backup procedures first and have an action plan in case the update does not complete on NetScaler.

- Verify that there is adequate space in the `/var` and `/flash` directory for the NetScaler appliance before performing an upgrade. The `/var` directory requires 7 GB of free space (1 GB for the upgrade bundle, 2 GB for extraction, and 4 GB for the upgrade process)
The `/flash` directory requires anywhere between 140 MB to 160 MB space to copy the new kernel. Therefore, ensure that there is at least 250 MB free space available.
For more information on clearing out the disk space in `/var` see, [How to free space on /var directory for logging issues with a NetScaler appliance](#).
For more information on clearing out the disk spaces in `/flash` see, <https://support.citrix.com/article/CTX133587>.
- Verify that there are no invalid configurations before performing an upgrade using the preconfiguration check tool. This tool is also run by default during the upgrade process and as part of the `installns` script. To avoid upgrade failures due to invalid configuration, it is recommended to run the preconfiguration check tool before upgrade. For more information, see [Preconfiguration check tool](#).

If there are configurations related to classic policies, see [Upgrade considerations for configurations with classic policies](#) and [Classic Policy Deprecation FAQs](#).

If there are any invalid configurations, use the `nspepi` tool for converting the invalid configurations to valid configurations. For information about the `nspepi` tool, see [Converting policy expressions using NSPEPI tool](#).

Note:

If you select option Y in the `installns` script for upgrading the build, the preconfiguration check is not performed.

- Validate the integrity of the NetScaler appliance. If you have a NetScaler hardware appliance, Citrix highly recommends running `fsck` for running a disk check and validating the integrity of the NetScaler hard drive. In the event of an error, reset the hard disk drive and repeating the disk check command. If the error message reappears, contact NetScaler support to further investigate the issue.
 - Validate the disk integrity of the hard drive using a `fsck` command. For more information, see [CTX122845](#).
 - Validate the integrity of NetScaler using the diagnostic bundle files and upload the logs to Citrix Insight Service for analysis. For more information, see [How to collect a technical support bundle](#).
- Check the NetScaler VPX [Support matrix and usage guidelines](#).
- Check the [FAQ](#) section.
- Verify the upgrading procedures with a test environment.

For more information about prerequisites for upgrading or downgrading the NetScaler appliance, see these support articles:

- CTX220371: [Must Read Articles Before and After Upgrading NetScaler](#)

Upgrade considerations for configurations with classic policies

December 14, 2023

Classic policies are deprecated from NetScaler release 12.0 build 56.20. Starting with release 13.1, classic policy support is removed from some of the features. To know the complete list of features or commands that aren't supported from release 13.1 release, see **Table 2** in [Notice of Status Change Announcement for NetScaler Classic Policy Based Features and Functionalities](#).

As a prerequisite for upgrading to release 13.1 or later, we recommend you to convert the classic policies to advanced policies for the features that are supported by the NSPEPI tool. To know the features that are supported by the NSPEPI tool, see [Commands or features handled by the nspepi conversion tool](#). If you do not convert to advanced policies before the upgrade, then the upgrade fails due to invalid configuration.

Important:

Before you upgrade to release 13.1 or later, we recommend you to run the preconfiguration check tool. This tool ensures that your configuration does not contain commands related to the deprecated or removed features. If there are any commands related to the deprecated or removed features, the tool throws an error and the configuration might be lost. We recommend you to download the latest version of the preconfiguration check tool from the public GitHub link - <https://github.com/citrix/ADC-scripts/tree/master/nspepi>.

For more information, see the [Preconfiguration check tool before upgrade](#).

If there are any errors as part of the preconfiguration check, we recommend you to use the `nspepi` tool to convert the invalid configurations to valid configurations. Download the latest version of the `nspepi` tool from the public GitHub link - <https://github.com/citrix/ADC-scripts/tree/master/nspepi>. For more information on converting policy expressions using the `nspepi` tool, see [Converting policy expressions using NSPEPI tool](#).

If you miss converting the classic policies before the upgrade, you can choose to convert to advanced policies during the upgrade. As part of the upgrade, you can choose one of the options described in the following table while running the `./installns` command.

Option	Description
No option	If there are any errors as part of the preconfiguration check, the installation stops. You must convert classic policies to advanced policies to proceed with the upgrade process.
-M	NSPEPI tool is run as part of the installation and converts classic policies to advanced policies.
-Y	This option isn't recommended. In this option, the preconfiguration check is skipped and therefore any valid configuration might get lost.

To convert classic policies to advanced policies during the upgrade, select the `-M` option. The `-M` option triggers the NSPEPI tool and updates the existing `ns.conf` file with the modified configuration. The old configuration is present at `/nsconfig/ns.conf_old` for future reference.

```
1 ./installns -M`
2 <!--NeedCopy-->
```

If you find any error during the advanced policy conversion, contact NetScaler support.

The `nspepi` tool does not handle the conversion for a few commands or features. See [Commands or features not handled by the nspepi conversion tool](#) for the complete list.

Perform the following steps for each different configuration that you need to convert:

1. Run the `nspepi` tool on Citrix ADC release 12.1 or 13.0 to convert the `ns.conf` file. The NSPEPI tool generates two files with prefixes `new_` and `warn_`. The file with the `new_` prefix contains the converted configuration and the file with the `warn_` prefix contains the warnings and errors.
2. Check the file with the `warn_` prefix and fix errors (if any).
3. Test the converted configuration. Apply the converted configuration using one of the following options:
 - a) Run the `clear config -f basic` command and then source the converted configuration by running the `source /nsconfig/new_ns.conf` command.
 - b) Remove the classic commands manually (by unbinding and removing policies) and then source the converted configuration by running the `source /nsconfig/new_ns.conf` command.

Note:

You might see “Resource already exists” errors for the configurations that aren’t cleared using the `clear config -f basic` command. You can ignore these errors.

4. Save the configuration.

After successfully converting invalid configurations to valid configurations, verify if there are any other prerequisites and then proceed to upgrade. For more information, see [Upgrade and downgrade a NetScaler appliance](#).

Upgrade considerations for customized configuration files in the `/etc` directory

May 2, 2023

The following configuration files are supported to be modified in the `/etc` directory:

- `inetd.conf`
- `syslog.conf`
- `newsyslog.conf`
- `ntp.conf`
- `crontab`
- `host.conf`
- `hosts`
- `ttys`

- `sshd_config`
- `httpd.conf`
- `monitrc`
- `rc.conf`
- `ssh_config`
- `localtime`
- `issue`
- `issue.net`
- `ldap.conf`
- `motd`

Note:

New files might be added to the above list depending on the NetScaler build running on the appliance. You can display an updated list of files by running the following shell command in the NetScaler command line interface:

```
grep NSETC= /etc/rc
```

If you have modified any of the configuration files in the `/etc` directory and copied it to the `/nsconfig` directory, to maintain persistency, the NetScaler appliance creates a symlink in `/etc` pointing to the file in `/nsconfig`.

For example: `/etc/httpd.conf -> /nsconfig /httpd.conf`

A release package might contain its own version of the configuration files in the `/etc` directory. These configuration files include important updates that are required for the NetScaler appliance to properly function. Upgrading a NetScaler appliance to a release replaces the configuration files in the `/etc` directory with the configuration files containing the release updates.

Consider an example of a customized configuration file, `example.conf`, which is present in the `/etc` directory. The `example.conf` file is copied to the `/nsconfig` directory to maintain persistency. The NetScaler appliance creates a symlink in `/etc` pointing to the file in `/nsconfig`: `/etc/example.conf -> /nsconfig /example.conf`

Also, a release package includes its own version of `example.conf`, which contains important updates. The following behavior is observed when you upgrade the NetScaler appliance to the release:

Because the symlink `/etc/example.conf` is already present, the NetScaler appliance does not place the release package copy of the `example.conf` in the `/etc` directory during the upgrade process.

As the release package copy of `example.conf` contains important updates, the absence of it in the `/etc` directory can cause the NetScaler appliance to fail or to not properly function.

Steps to preserve upgrade changes and customization

To ensure that both release updates and your customizations are not lost, perform the following steps:

- Pre-upgrade steps:
 - [Back up customized file before upgrade](#)
 - [Remove persistency of customized file before upgrade](#)
- Post-upgrade steps:
 - [Apply customizations to upgraded file and add persistency after upgrade](#)

Important:

Do NOT directly replace your customized file in the `/etc` folder. Directly replacing a `/etc` file with the back-up customized file removes any release updates added to the file during the upgrade process.

Back up customized file before upgrade

Take a backup of the customized files present in the `/nsconfig` directory before upgrading the appliance.

Create a `/var/nsconfig_backup` directory and move the customized files to this directory. That is, move any files that you modified in the `/etc` directory and copied to `/nsconfig` by running the following command at the shell prompt:

```
1 mv /nsconfig/<filename> /var/nsconfig_backup/  
2 <!--NeedCopy-->
```

Example:

```
1 mv /nsconfig/httpd.conf /var/nsconfig_backup/  
2 <!--NeedCopy-->
```

Remove persistency of customized file before upgrade

Delete the `/etc` symlinks that are pointing to the `/nsconfig` files before upgrading the appliance.

1. Check the existing symlinks in the `/etc` directory by running the following command at the shell prompt:

```
1 ls -la /etc  
2 <!--NeedCopy-->
```

2. Delete a `/etc` symlink pointing to a `/nsconfig` file by running the following command at the shell prompt:

```
1 unlink /etc/<filename>
2 <!--NeedCopy-->
```

Example:

```
1 unlink /etc/httpd.conf
2 <!--NeedCopy-->
```

3. Verify that the symlink is removed by running the following command at the shell prompt:

```
1 cat /etc/<filename>
2 <!--NeedCopy-->
```

Example:

```
1 cat /etc/httpd.conf
2 <!--NeedCopy-->
```

This command does not display any content if the symlink is removed.

Apply customizations to upgraded file and add persistency after upgrade

If you have taken a backup of any modified `/nsconfig` config file to the `/var/nsconfig_backup`, do the following after upgrading the appliance:

1. Compare the file present in the `/var/nsconfig_backup` and the `/etc` directories. Manually add the appropriate changes to the `/etc` file already containing the release updates.

Important:

Directly replacing the `/etc` file with the `/var/nsconfig_backup` file removes any release updates added to the file during the upgrade process. This removal of updates can cause the related NetScaler functionalities to fail or to not work properly.

2. To maintain persistency, copy the updated file present in the `/etc` directory to the `/nsconfig` directory by running the following command at the shell prompt:

```
1 cp /etc/<filename> /nsconfig/
2 <!--NeedCopy-->
```

Example:

```
1 cp /etc/httpd.conf /nsconfig/
2 <!--NeedCopy-->
```

3. Repeat the above two steps for each customized file present in the `/var/nsconfig_backup` directory.
4. Restart the appliance to put the changes into effect.

Upgrade considerations - SNMP configuration

May 2, 2023

The timeout parameter for an SNMP alarm is an internal option that has no impact on the alarm configuration.

Timeout parameter might appear in the SNMP alarm configurations in the running configuration (sh running) and the saved configuration (ns.conf) even if you have not made any changes to these SNMP alarm configurations.

On upgrading to a release build with the fix for the timeout setting issue, the SNMP configurations are erroneously reset to default values.

The following SNMP alarms (if configured) are impacted during an upgrade:

- APPFW-BUFFER-OVERFLOW
- APPFW-COOKIE
- APPFW-CSRF-TAG
- APPFW-DENY-URL
- APPFW-FIELD-CONSISTENCY
- APPFW-FIELD-FORMAT
- APPFW-POLICY-HIT
- APPFW-REFERER-HEADER
- APPFW-SAFE-COMMERCE
- APPFW-SAFE-OBJECT
- APPFW-SQL
- APPFW-START-URL
- APPFW-VIOLATIONS-TYPE
- APPFW-XML-ATTACHMENT
- APPFW-XML-DOS
- APPFW-XML-SCHEMA-COMPILE
- APPFW-XML-SOAP-FAULT
- APPFW-XML-SQL
- APPFW-XML-VALIDATION
- APPFW-XML-WSI

- APPFW-XML-XSS
- APPFW-XSS
- CLUSTER-BACKPLANE-HB-MISSING
- CLUSTER-NODE-HEALTH
- CLUSTER-NODE-QUORUM
- CLUSTER-VERSION-MISMATCH
- COMPACT-FLASH-ERRORS
- CONFIG-CHANGE
- CONFIG-SAVE
- HA-BAD-SECONDARY-STATE
- HA-NO-HEARTBEATS
- HA-SYNC-FAILURE
- HA-VERSION-MISMATCH
- HARD-DISK-DRIVE-ERRORS
- HA-STATE-CHANGE
- HA-STICKY-PRIMARY
- PORT-ALLOC-FAILED
- SYNFLOOD

These SNMP alarms configurations are impacted when you upgrade the NetScaler to the following release builds:

- Release 11.1 build 61.2 or later
- Release 12.0 build 61.0 or later
- Release 12.1 build 30.1 or later
- Release 13.0 build 51.4 or later

Example

Let's consider an example of CLUSTER-NODE-HEALTH SNMP alarm.

```
1 CLUSTER-NODE-HEALTH SNMP alarm is set up by using the NetScaler command
   line:
2
3 > set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -
   severity Major
4
5 > save config
6 <!--NeedCopy-->
```

This SNMP alarm configuration appears in the saved configuration file (`ns.conf`) as:

```
1 set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -severity
   Major -timeout 86400
```

```
2
3 <!--NeedCopy-->
```

During an upgrade to any of the release builds mentioned above, the following error appears in ns.log file:

```
1 May 23 09:14:46 <local0.err> ns nsconfigd: __init_config_filter(): (
  null) line 0: No such argument [-timeout]>> set snmp alarm CLUSTER-
  NODE-HEALTH -time 111 -state DISABLED -severity Major -timeout
  86400.
2 <!--NeedCopy-->
```

After the upgrade, the SNMP alarm configurations are reset to the default values.

Workaround

Use one of the following workarounds:

- Before the upgrade, remove the timeout setting from the SNMP configurations in the saved configuration file (ns.conf).
- After the upgrade, reconfigure the SNMP alarms without the timeout parameter.

Download a NetScaler release package

May 2, 2023

Complete the following steps to download a NetScaler release package:

1. Open [NetScaler Downloads](#) page in a Web browser.
2. On the NetScaler Downloads page, expand the **NetScaler release** that you want to update to.
3. Expand one of the appropriate categories, and click the NetScaler build link. For example, for downloading a version of NetScaler firmware, expand **Firmware**, and click the NetScaler build that you want to download.
4. On the selected NetScaler build page, expand the **Build** section, click **Download File** to download the NetScaler build package.

Note:

The checksum is provided to ensure that you match the downloaded build package with the actual package which is hosted on the website. Checksum is an important check to ensure that you have the correct bits.

Upgrade a NetScaler standalone appliance

October 4, 2023

Before upgrading the system software, make sure that you read the [Before you begin](#) section and complete the prerequisites such as backing up the necessary files and downloading the NetScaler firmware.

Upgrade a NetScaler standalone appliance by using the GUI

Follow these steps to upgrade a standalone NetScaler to release 14.1 by using the GUI.

1. In a web browser, type the IP address of the NetScaler, for example `http://10.102.29.50`.
2. In User Name and Password, type the administrator credentials (nsroot/nsroot) and then click **Log On**.
3. Navigate to **System** and click **System Upgrade**.
4. From the **Choose File** menu choose the appropriate option: **Local** or **Appliance**. If you want to use the Appliance option, the firmware needs to be uploaded to the NetScaler first. You can use any file transfer method such as WinSCP to upload the NetScaler firmware to the appliance.
5. Select the correct file and click **Upgrade**.
6. Follow the instructions to upgrade the software.
7. When prompted, select **Reboot**.

After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrade a NetScaler standalone appliance by using the CLI

Follow these steps to upgrade a standalone NetScaler to release 14.1 by using the CLI:

In the following procedure, <release> and <releasenum> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

1. Use an SSH client, such as PuTTY, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials. Save the running configuration. At the prompt, type:

```
save config
```

3. Switch to the shell prompt by running the following command:

```
shell
```

4. Create a copy of the ns.conf file. At the shell prompt, type:

- `cd /nsconfig`
- `cp ns.conf ns.conf.NS<currentreleasenum><currentbuildnum>`

You should backup the configuration file to another computer.

5. IMPORTANT:

It is important that both the upgrade changes and your customizations are applied to an upgraded NetScaler appliance. So, if you have customized configuration files in the `/etc` directory, perform the **pre-upgrade steps** in [Upgrade considerations for customized configuration files](#)

6. Create a location for the installation package. At the shell prompt type:

- `cd /var/nsinstall`
- `cd <releasenum>`

Note:

If the desired release number directory is not present, create one using the following command:

```
mkdir <releasenum>
```

Example:

```
mkdir 14.1
```

- `mkdir build_<targetbuildnum>`
- `cd build_<targetbuildnum>`

7. Copy the already downloaded NetScaler firmware to the build directory that you have created in the above step, by using any file transferring method such as WinSCP. See the [Before You Begin](#) section for more information about downloading the NetScaler firmware.

8. Extract the contents of the installation package. Example:

```
tar -xvzf build-14.1-37.2_nc_64.tgz
```

9. Run the installns script to install the new version of the system software.

```
./installns
```

10. When prompted, restart the NetScaler.

11. **IMPORTANT:**

It is important that both the upgrade changes and your customizations are applied to an upgraded NetScaler appliance. So, if you have customized configuration files in the `/etc` directory, perform the **post-upgrade steps** in [Upgrade considerations for customized configuration files](#)

Below is an example of NetScaler firmware upgrade.

```

How to upgrade a standalone NetScaler appliance by using the CLI

This is an embedded video. [Click the link to watch the video](#)

Upgrade a NetScaler standalone appliance by using NITRO API

To use NITRO API to upgrade or downgrade a NetScaler, see [Automate NetScaler Upgrade and Downgrade with a Single API](#).

Verify entities status on the NetScaler appliance after upgrading

After the NetScaler appliance is upgraded, verify the status of the following entities:

- Virtual servers are in UP state
- Monitors are in UP state
- GSLB sites synchronise without any issues
- All certificates are present on the appliance
- All the licenses are present on the appliance

Check and install NetScaler 14.1 software update

Update the NetScaler software when an update is available, for better performance. A NetScaler update can include feature improvements, performance fixes, or enhancements. Make sure you read the release notes to see what fixes and enhancements are available in the update. To check and install a software update, do the following.

1. In the NetScaler home page, click **Check for Update** from the **nsroot** menu at the top right corner.
2. In the **Latest System Software Updates Available** page, check the available software update that you can install.
3. Click **Download** to download the installation package from the [NetScaler download](#) website.
4. After you have downloaded the software package, install the update through either CLI or GUI procedure.

Note

The **Check for Update** link is accessible only if you log into the GUI through HTTP protocol and not through HTTPS protocol.

Related resources

The following resources provide related information about upgrading or downgrading a NetScaler appliance:

- Video tutorial - [How to upgrade your NetScaler using CLI](#)

Downgrade a NetScaler standalone appliance

February 1, 2024

You can downgrade to any earlier release on a standalone NetScaler by using the CLI or GUI.

Note:

Loss in configuration might occur when downgrading. Compare the configurations before and after the downgrade, and then manually reenter any missing entries.

Downgrade a NetScaler appliance by using the CLI

Follow the steps given below to downgrade a NetScaler standalone appliance running release 14.1 to an earlier release.

In this procedure, `<release>` and `<releasenum>` represent the release version you are downgrading to, and `<targetbuildnumber>` represents the build number that you are downgrading to.

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

```
save config
```

3. Create a copy of the ns.conf file. At the shell prompt, type:

```
a) cd /nsconfig
```

```
b) cp ns.conf ns.conf.NS<currentbuildnumber>
```

You should backup a copy of the configuration file on another computer.

4. Copy the <releasenum> configuration file (ns.conf.NS<releasenum>) to ns.conf. At the shell prompt, type:

```
1 cp ns.conf.NS<releasenum> ns.conf
2 <!--NeedCopy-->
```

Note:

ns.conf.NS<releasenum> is the backup configuration file that is automatically created when the system software is upgraded from release version <releasenum> to the current release version.

There may be some loss in configuration when downgrading. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

Important:

If routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file contains the configuration. At the shell prompt, type:

```
1 cd /nsconfig
2 cp ZebOS.conf ZebOS.conf.NS
3 cp ZebOS.conf.NS<targetreleasenum> ZebOS.conf
4 <!--NeedCopy-->
```

6. Change directory to /var/nsinstall/<releasenum>nsinstall, or create one if it does not exist.
7. Change directory to build_<targetbuildnum>, or create one if it does not exist.
8. Download or copy the installation package (build-<release>-<targetbuildnum>.tgz) to this directory and extract the contents of the installation package.
9. Run the installns script to install the new version of the system software. The script updates the /etc directory.

Notes:

- **NetScaler version 14-1 build 12.35 or earlier:** You might see a prompt to load the configuration file if the configuration file for the build you are downgrading to does not exist. You can select a different configuration file from the list and downgrade the system software.
- **NetScaler version 14-1 build 17.x or later:** The downgrade fails if the configuration file for the build you are downgrading to does not exist. You must use the ./installns -a command to select the configuration file and then downgrade the

system software manually.

If the free space available on the flash drive is insufficient to install the new build, the NetScaler aborts the installation. Manually clean up the flash drive and restart the installation.

Example:

```
1 login: nsroot
2
3 Password: nsroot
4
5 Last login: Mon Apr 24 02:06:52 2017 from 10.102.29.9
6
7 Done
8
9 > save config
10
11 > shell
12
13 root@NSnnn# cp ns.conf.NS10.5 ns.conf
14
15 root@NSnnn# cd /var/nsinstall
16
17 root@NSnnn# mkdir 10.5nsinstall
18
19 root@NSnnn# cd 10.5nsinstall

Downgrade a NetScaler appliance by using the GUI

You can use the upgrade wizard of the GUI to downgrade a NetScaler appliance running release 14.1 to an earlier release.

Notes:

You cannot downgrade a NetScaler appliance running release 14.1 directly to release 10.5 or earlier by using the GUI. Citrix recommends using the CLI for downgrading.

Visit the [Product Matrix](#) site for more information on the NetScaler release lifecycle.

It is a best practice to downgrade to one major release at a time.

For example, if the NetScaler appliance is on release 14.1, and you want to downgrade to release 13.0, you must downgrade the appliance to release 13.1 first, and then to release 13.0.

Follow the steps given below to downgrade a NetScaler appliance running release 14.1 to an earlier release by using GUI.

1. In a web browser, type the IP address of the NetScaler, for example `http://10.102.29.50`.
2. In User Name and Password, type the administrator credentials and then click **Log On**.
3. Navigate to **System** and click **System Upgrade**.
4. From the **Choose File** menu choose the appropriate option: **Local** or **Appliance**. If you want to use the Appliance option, the firmware must be uploaded to the NetScaler first. You can use any file transfer method such as WinSCP to upload the NetScaler firmware to the appliance.
5. Select the correct file and click **Upgrade**.
6. Follow the instructions to downgrade the software.
7. When prompted, select **Reboot**.

After the downgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrade a high availability pair

November 8, 2023

One of the requirements of NetScaler in a high availability setup is to install the same NetScaler software version (Release) on both the primary and secondary nodes. Therefore, ensure that the software is upgraded on both nodes.

You can follow the same procedure as upgrading a standalone instance to upgrade both the nodes in a high availability pair, although other considerations apply to upgrading a high availability pair.

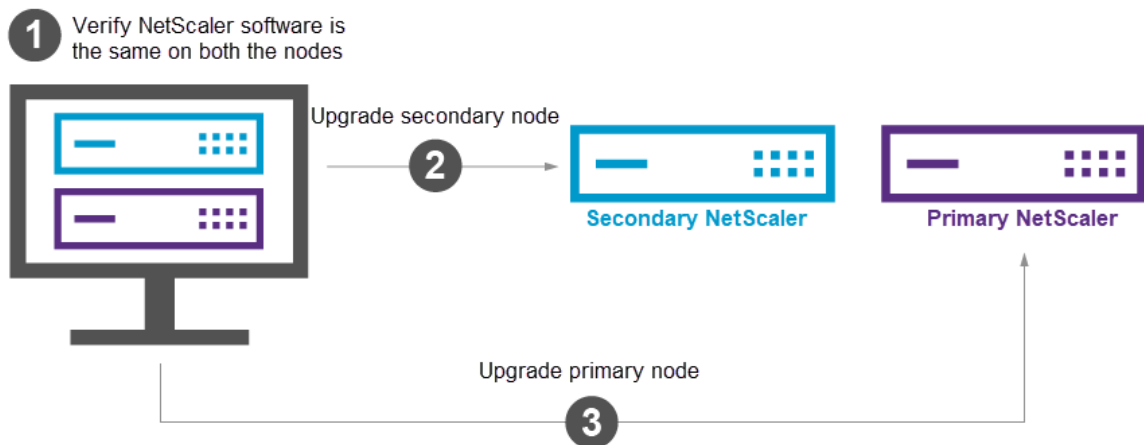

Before you start a NetScaler firmware upgrade on an HA pair, read the prerequisites mentioned in the [Before you begin](#) section. Also, you need to consider a few HA-specific points.

Points to note

IMPORTANT:

It's important that both the upgrade changes and your customizations are applied to an upgraded NetScaler. Therefore, if you have customized configuration files in the `/etc` directory, see [Upgrade considerations for customized configuration files](#) before you continue with the upgrade.

- Upgrade the secondary node first and then the primary node. You can upgrade NetScaler using the CLI or GUI.

- If both the nodes in an HA setup are running different NetScaler software versions, the following functionalities are disabled:
 - HA config synchronization
 - HA command propagation
 - HA synchronization of state service information
 - Connection mirroring (connection failover) of sessions
 - HA synchronization of persistence sessions information

Notes:

The functionality behavior changes as follows when both the nodes are running different builds (for example 8.x and 4.x) of the same NetScaler software release (for example 14.1):

- These functionalities are disabled if both the builds have different internal HA versions.
- These functionalities work fine if both the builds have the same internal HA versions.

Refer to the [New internal HA version in NetScaler builds](#) section to check if the internal HA version has changed in a NetScaler build.

- Synchronization of the files in the `All` mode of the `sync HA files` command works successfully if the two nodes in an HA configuration are running different NetScaler software versions, or the two nodes are running different builds of the same version. For more information, see [synchronizing Configuration Files in High Availability Setup](#).

New internal HA version in NetScaler builds

The following table lists the NetScaler builds in which the internal HA version has changed:

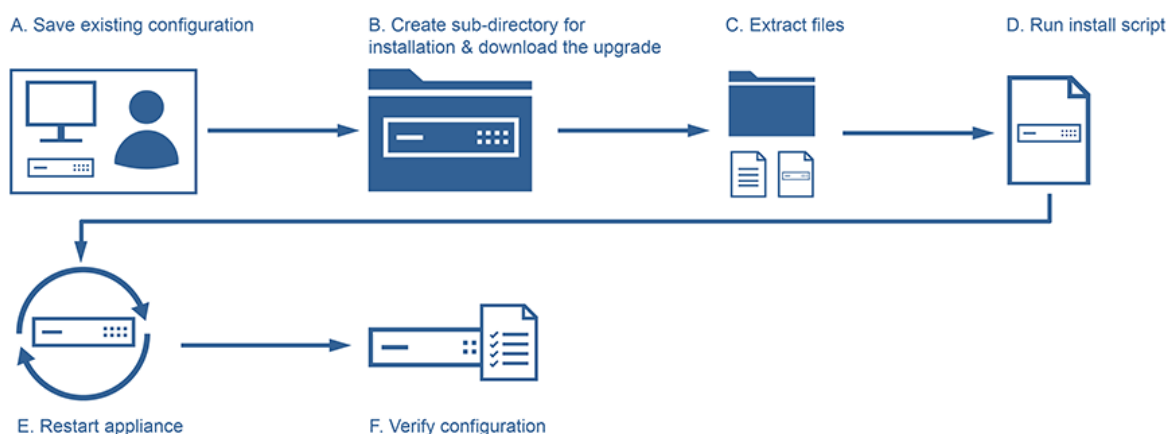

Release 14.1	Release 13.1	Release 13.0	Release 12.1
Build 12.30	Build 50.23	Build 92.21	Build 65.35
Build 8.50	Build 49.15	Build 90.12	Build 62.27
Build 4.42	Build 48.47	Build 87.9	Build 61.19
	Build 45.64	Build 86.17	Build 60.19
	Build 37.38	Build 85.19	Build 59.16
	Build 33.54	Build 84.11	Build 58.15
	Build 30.52	Build 82.45	Build 57.18
	Build 27.59	Build 79.64	Build 56.22
	Build 24.38	Build 76.31	Build 55.24
	Build 21.50	Build 71.44	Build 50.31
	Build 17.42	Build 67.43	Build 49.37
	Build 12.51	Build 64.35	
	Build 9.60	Build 61.48	
	Build 4.44	Build 58.32	
		Build 52.24	
		Build 41.28	

Upgrade a high availability pair by using the CLI

The upgrade process includes the following steps:

1. Upgrade software on the secondary node
2. Upgrade software on the primary node

The following illustration shows the procedure to upgrade software on the node:

Upgrade software on the secondary node

1. Upgrade the secondary node as described in [Upgrade a NetScaler standalone appliance using the CLI](#).
2. Log in to the NetScaler CLI using the `nsroot` credentials.
3. Run the following command to display the state of NetScaler.

```
1 show ha node
2 <!--NeedCopy-->
```

The command output must show that the node is a secondary node and synchronization is disabled.

4. Run the following command to perform a force failover and takeover as primary node:

```
1 force failover
2 <!--NeedCopy-->
```

5. Verify that the node is now a primary node.

Here's a sample configuration in the new primary node.

```
1 login: nsroot
2 Password: nsroot
3 Last login: Monday Apr 17 08:37:26 2017 from 10.102.29.9
4 Done
5 show ha node
6      2 nodes:
7 1)   Node ID:      0
8      IP:          10.0.4.2
9      Node State: UP
10     Master State: Primary
11     ...
12     Sync State: AUTO DISABLED
```

```
13      Propagation: AUTO DISABLED
14      ...
15 Done
16 <!--NeedCopy-->
```

Upgrade software on the primary node

Note:

After completing the “Upgrade software on the secondary node” procedure, the original primary node is now a secondary node.

1. Upgrade the secondary node as described in [Upgrade a NetScaler standalone appliance using the CLI](#).
2. Log in to the NetScaler CLI using the `nsroot` credentials.
3. Run the following command to display the state of the NetScaler.

```
1 show ha node
2 <!--NeedCopy-->
```

The command output must show that the node is a secondary node and the status of the node as UP.

4. Run the following command to perform a force failover to ensure that the node is a primary node:

```
1 force failover
2 <!--NeedCopy-->
```

5. Verify that the node is a primary node.

Here’s an example configuration of the new primary node and the new secondary node.

```
1 show ha node
2   Node ID:      0
3   IP:          10.0.4.11
4   Node State:  UP
5   Master State: Primary
6   ...
7   ...
8   INC State:  DISABLED
9   Sync State: ENABLED
10  Propagation: ENABLED
11  Enabled Interfaces : 1/1
12  Disabled Interfaces : None
13  HA MON ON Interfaces : 1/1
14  ...
15  ...
16  Local node information
```

```
17   Critical Interfaces: 1/1
18   Done
19
20   Show ha node
21     Node ID:      0
22     IP:    10.0.4.2
23     Node State: UP
24     Master State: Secondary
25     ..
26     ..
27     INC State: DISABLED
28     Sync State: SUCCESS
29     Propagation: ENABLED
30     Enabled Interfaces : 1/1
31     Disabled Interfaces : None
32     HA MON ON Interfaces : 1/1
33     . .
34     . .
35     Local node information:
36     Critical Interfaces: 1/1
37   Done
38   <!--NeedCopy-->
```

Upgrade a high availability pair by using the GUI

Follow these steps to upgrade a NetScaler pair in a high availability setup, by using the ADC GUI. Consider an example of a high availability setup of NetScaler instances NETSCALER-A (primary) and NETSCALER-B (secondary).

1. **Upgrade the secondary node.** Log in to the secondary node GUI using administrator credentials, and upgrade the node as described in [Upgrade a NetScaler standalone appliance by using the GUI](#).
2. **Force failover.** Perform a force failover on the secondary node using the GUI as described in [Forcing a node to fail over](#).

After failover operation, the secondary node takes over as primary and the primary node becomes the new secondary node. After the failover operation in the example HA setup:

- NETSCALER-B becomes the new primary
 - NETSCALER-A becomes the new secondary
3. **Upgrade the original primary node (new secondary node).** Log in to the new secondary node GUI (NETSCALER-A) and upgrade the node as described in [Upgrade a NetScaler standalone appliance by using the GUI](#).
 4. **Force failover.** Perform a force failover on the new secondary node (NETSCALER-A) using the GUI as described in [Forcing a node to fail over](#).

After this second failover operation, the state of both the nodes return to the same state as before starting the HA upgrade operation. After the failover operation in the example HA setup:

- NETSCALER-A becomes primary
- NETSCALER-B becomes secondary

5. **Verify the upgrade process.** Log in to the GUI of both the nodes. Navigate to **System > High Availability**, on the details page, verify the HA state of both the nodes. Also, verify the upgraded version details displayed on the top pane of the GUI.

How to upgrade a high availability setup by using the GUI

This is an embedded video. [Click the link to watch the video](#)

In Service Software Upgrade support for high availability for performing zero downtime upgrade

January 17, 2024

During a regular upgrade process in a high availability (HA) setup, at some point, both nodes run different software builds. These two builds can have the same or different internal HA version numbers.

If both the builds have different HA version numbers, connection failover (even if it is enabled) for existing data connections is not supported. In other words, all existing data connections are lost, which leads to downtime.

To address this issue, In Service Software Upgrade (ISSU) can be used for HA set-ups. ISSU introduces a migration functionality, which replaces the force failover operation step in the upgrade process. The migration functionality takes care of honoring the existing connections and includes the force failover operation.

After a migration operation is performed, the new primary node always receives traffic (request and response) related to the existing connections but steers them to the old primary node. The old primary node processes the data traffic and then sends them directly to the destination.

How the enhanced ISSU works

The regular upgrade process in an HA setup consists of the following steps:

1. **Upgrade the secondary node.** This step includes software upgrade of the secondary node and restart of the node.

2. **Force Failover.** Running the force failover makes the upgraded secondary node to primary, and the primary node to secondary.
3. **Upgrade the new secondary node.** This step includes software upgrade of the new secondary node and restart of the node.

During the time frame between step 1 and step 3, both nodes run different software builds. These two builds can have the same or different internal HA versions.

If both the builds have different HA version numbers, connection failover (even if it is enabled) for existing data connections is not supported. In other words, all existing data connections are lost, which leads to downtime.

The ISSU upgrade process in an HA setup consists of the following steps:

1. **Upgrade the secondary node.** This step includes software upgrade of the secondary node and restart of the node.
2. **ISSU migration operation.** The step includes the force failover operation and takes care of the existing connections. After you perform the migration operation, the new primary node always receives traffic (request and response) related to the existing connections but steers them to the old primary node through the configured SYNC VLAN (if configured) in the GRE tunnel. The old primary node processes the data traffic and then sends them directly to the destination. The ISSU migration operation is completed when all the existing connections are closed.
3. **Upgrade the new secondary node.** This step includes software upgrade of the new secondary node and restart of the node.

Before you begin

Before you start performing the ISSU process in an HA setup, go through the following pre-requisites, limitations, and points to note:

- Ensure that the capacity of the interface, where the MAC address of the peer NSIP address is resolved, is equal to or greater than the capacity of the client or server interface. For example, consider the following scenarios:
 - The MAC address of the peer NSIP address is resolved on the interface 1/x, and the data interface is 10/x. In this scenario, you must not perform ISSU because the capacity of the interface on which the MAC address is resolved is less than that of the data interface.
 - The MAC address of the peer NSIP address is resolved on the interface 10/x, and the data interface is 10/x. In this scenario, you can perform ISSU because the capacity of the interface on which the MAC address is resolved is the same as the data interface.

- Ensure the `SYNC VLAN` is configured on both the nodes of the HA setup. For more information, see [Restricting high availability synchronization traffic to a VLAN](#).

Note:

SYNC VLAN configuration is supported only in L2 HA. It is not supported for HA-INC mode.

- ISSU is not supported on the Microsoft Azure cloud because Microsoft Azure does not support GRE tunneling.
- HA config propagation and synchronization do not work during ISSU.
- ISSU is not supported for IPv6 HA setup.
- ISSU is not supported with admin partitions.
- ISSU is not supported for the following sessions:
 - Jumbo frames
 - IPv6 sessions
 - Large scale NAT (LSN)
- In an HA setup in INC mode, ISSU migration operation migrates only the client side connections. The migration of server-side connections is not required because both the HA nodes have independent SNIP configurations.
- For SYNC VLAN configuration, it is recommended to increase the SYNC VLAN MTU by at least 42 bytes.

Configuration steps

ISSU includes a migration feature, which replaces the force failover operation in the regular upgrade process of an HA setup. The migration functionality takes care of honoring the existing connections and includes the force failover operation.

During the ISSU process of an HA setup, you run the migration operation just after you upgraded the secondary node. You can perform the migration operation from either of the two nodes.

CLI Procedure

To perform the HA migration operation by using the CLI:

At the command prompt type:

```
1 start ns migration
2 <!--NeedCopy-->
```

GUI Procedure

To perform the HA migration operation by using the GUI:

Navigate to **System > System Information > Migration tab**. Click **Start Migration**.

Display ISSU statistics

You can view the ISSU statistics for monitoring the current ISSU process in an HA setup. The ISSU statistics displays the following information:

- Current status of ISSU migration operation
- Start time of the ISSU migration operation
- End time of the ISSU migration operation
- Start time of the ISSU rollback operation
- Total number of connections that are processed as part of ISSU migration operation
- Number of remaining connections that are being processed as part of ISSU migration operation

You can view the ISSU statistics on either of the HA nodes by using the CLI or GUI.

CLI Procedure

To display the ISSU statistics by using the CLI:

At the command prompt type:

```
1 show ns migration
2 <!--NeedCopy-->
```

GUI Procedure

To display the ISSU statistics by using the GUI:

Navigate to **System > System Information > Migration tab**. Click **Click to show migration details**.

Display ISSU statistics - the list of existing connections that the old primary node is processing

You can display the list of existing connections that the old primary node is serving as part of the ISSU migration operation by using the `dumpsession(Dump Session)` option of the `show migration` operation.

The show migration operation with the `dumpsession` option must be run only on the new primary node during the ISSU operation.

CLI Procedure

To display the list of existing connections that the old primary node is processing by using the CLI:

At the command prompt type:

```
1 show ns migration -dumpsession YES
2 <!--NeedCopy-->
```

```
1 > sh migration -dumpsession yes
2
3 Index      remote-IP-port      local-IP-port      idle-time(x 10
4           ms)
5 1          192.0.2.10         22          192.0.2.1         15998         703
6 2          198.51.100.20     7375         98.51.100.2       22            687
7 3          203.0.113.30     5506         203.0.113.3       22            687
8
9
10 <!--NeedCopy-->
```

GUI Procedure

To display the list of existing connections that the old primary node is processing by using the GUI:

Navigate to **System > System Information > Migration tab**. Click **Click to show migration connections**.

Rollback of the ISSU process

HA setups now support rollback of the In Service Software Upgrade (ISSU) process. The ISSU rollback feature is helpful if you observe that the HA setup during the ISSU migration operation is not stable, or is not performing at an optimum level as expected.

The ISSU rollback is applicable when the ISSU migration operation is in progress. The ISSU rollback does not work if the ISSU migration operation is already completed. In other words, you must run the ISSU rollback operation when the ISSU migration operation is in progress.

The ISSU rollback functions differently based on the state of the ISSU migration operation when the ISSU rollback operation is triggered:

- **Force failover has not yet happened during the ISSU migration operation.** The ISSU rollback stops the ISSU migration operation, and removes any internal data related to the ISSU migration stored in both the nodes. The current primary node remains as the primary node and continues to process data traffic related to existing and new connections.

- **Force failover has happened during ISSU migration operation.** If the HA failover has happened during the ISSU migration operation, then the new primary node (say it is N1) processes traffic related to the new connections. The old primary node (new secondary node, say it is N2) processes traffic related to the old connections (existing connections before the ISSU migration operation).

The ISSU rollback stops the ISSU migration operation and triggers a force failover. The new primary node (N2) now starts processing traffic related to the new connections. The new primary node (N2) also continues to process traffic related to old connections (existing connections established before the ISSU migration operation). In other words, the existing connections established before the ISSU migration operation are not lost.

The new secondary node (N1) removes all the existing connections (new connections created during the ISSU migration operation) and does not process any traffic. In other words, any existing connections that were established after the force failover of the ISSU migration operation are lost forever.

Configuration steps

You can use the NetScaler CLI or GUI to perform the ISSU rollback operation.

CLI Procedure

To perform the ISSU rollback operation by using the CLI:

At the command prompt type:

```
1 stop ns migration
2 <!--NeedCopy-->
```

GUI Procedure

To perform the ISSU rollback operation by using the GUI:

Navigate to **System > System Information > Migration tab**. Click **Stop Migration**.

SNMP traps for In Service Software Upgrade process

The In Service Software Upgrade (ISSU) process for an HA setup supports the following SNMP trap messages at the start and end of the ISSU migration operation.

SNMP Trap	Description
migrationStarted	This SNMP trap is generated and sent to the configured SNMP trap listeners when the ISSU migration operation starts.
migrationComplete	This SNMP trap is generated and sent to the configured SNMP trap listeners when the ISSU migration operation completes.

The primary node (before the start of the ISSU process) always generates these two SNMP traps and sends them to the configured SNMP trap listeners.

There are no SNMP alarms associated with the ISSU SNMP traps. In other words, these traps are generated irrespective of any SNMP alarm. You only have to configure the trap SNMP listeners.

For more information on configuring SNMP trap listeners, see [SNMP traps on NetScaler](#).

Downgrade a high availability pair

May 2, 2023

You can downgrade to any release on a high availability pair by using the command line interface. The GUI does not support the downgrade process.

To downgrade the system software on a NetScaler pair in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see [Downgrade a NetScaler standalone appliance](#).

Important

Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually re-enter any missing entries.

Troubleshooting issues related to the installation, upgrade, and downgrade processes

May 2, 2023

If the appliance does not work as expected after you complete the installation, upgrade, or downgrade process, the first thing to do is to check for the most common causes of the problem.

Resources for troubleshooting

For best results, use the following resources to troubleshoot an issue related to installing, upgrading, or downgrading a NetScaler:

- The configuration files from the appliance. In case of a High Availability pair, the configuration files from both appliances.
- The following files from the appliance(s):
 - The relevant newslog files.
 - The ns.log file.
 - The messages file.
- A network topology diagram.

Issues and resolutions

Following are the most common installation, upgrade, and downgrade issues, and tips for resolving them:

1. Issue

Upgrading a NetScaler MPX appliance fails due to hardware and software incompatibility.

Resolution

See the [NetScaler MPX hardware-software compatibility matrix](#) and check whether the software release is supported on the NetScaler MPX hardware.

2. Issue

Upgrading a NetScaler VPX appliance fails due to NetScaler VPX appliance and hypervisor incompatibility.

Resolution

See the [NetScaler VPX appliance and hypervisor compatibility matrix](#) and check whether the NetScaler VPX appliance model is supported on the hypervisor.

3. Issue

Upgrading a NetScaler appliance fails due to hardware errors.

Resolution

Validate the integrity of the NetScaler appliance. If you have a NetScaler hardware appliance, Citrix recommends running `fsck` for running a disk check and validating the integrity of the NetScaler hard drive.

For more information, see [How to Verify the File System Integrity of a NetScaler appliance](#).

4. **Issue**

Upgrading a NetScaler appliance by using the GUI stalls.

Resolution

Refresh the browser to check whether the upgrade is progressing or not.

5. **Issue**

Upgrading a NetScaler appliance fails due to low Space in /var Directory

Resolution

Free up space on the /var directory. For more information, see
Refer to [How to free space on /var directory](#).

6. **Issue**

The NetScaler is not accessible after the software downgrade

Cause

During the software downgrade process, if the configuration file of the existing release and build does not match the configuration file of the earlier release and build, the appliance cannot load the configuration, and the default IP address is assigned to the appliance.

Resolution

- Verify that the appliance is accessible from the console.
- Verify the NSIP address and the routes on the appliance.
 - If the IP address has changed to the default 192.168.100.1 IP address, change the IP address as required.
 - Verify that the appliance is accessible.

7. **Issue**

During an upgrade, if I run the command for synchronizing, the following message appears:

Command failed on the secondary node but succeeded on the primary node.

Resolution

Do not run any dependent commands (set /unset /bind /unbind) when High Availability (HA) synchronization is in progress.

8. **Issue**

During an upgrade process, traffic does not pass through the new primary node when you run the force failover command.

Resolution

- Check for problems with the network topology and the switch configurations.
- Run the `set L2param -garpreply ENABLED` command to enable the GARP reply.
- Try using virtual MAC if not already used.
- Run the `sendarp -a` command from the primary node.

9. Issue

After upgrading or downgrading a NetScaler appliance, connecting to the appliance fails through SSH.

Resolution

Perform the following operations in the NetScaler appliance:

- Remove old or insecure host keys at `/nsconfig/ssh/ssh_host_*`.
- Review the custom SSHD configuration at `/nsconfig/sshd_config` and check if it is still relevant and compatible. Rename or remove the custom SSHD configuration accordingly.
- Cold reboot the NetScaler appliance

10. Issue

In an HA pair, after you run the `force HA failover` command the devices keep rebooting. The secondary device does not come up after an upgrade.

Resolution

Check to see if the `/var` directory is full. If so, remove the old installation files. Run the `df -h` command to show the available disk space.

11. Issue

After upgrading an HA pair, one of the nodes is listed as state UNKNOWN.

Resolution

- Check to see if both nodes are running the same build. If the builds are not same and HA nodes have a version mismatch, some of the fields are shown as UNKNOWN when you run the `show ha node` command.
- Check to see if the secondary appliance is reachable.

12. Issue

After you upgrade the NetScaler, the interface shows most of the load balancing virtual servers and services are DOWN.

Resolution

Verify that the SNIP address is active on the secondary appliance. Also, type the `show service` command to see if the service is running.

13. Issue

After performing an upgrade, all virtual servers are down on the secondary appliance.

Resolution

Enable the HA state and HA synchronization by running the following commands:

- set node hastate enable
- set node hasync enable

Disabling HA is not recommended.

14. Issue

After performing a downgrade, the NetScaler does not boot up properly.

Resolution

Check to see if the correct license has been installed.

15. Issue

In an HA pair, some features do not get synchronized after an upgrade is performed.

Resolution

Run the sync ha file misc command to synchronize the configurations files from the primary node to secondary node.

16. Issue

During reboot, the following error message appears:

One or more commands in ns.conf failedWhat should I do?

Resolution

Make sure that no command in the ns.conf file exceeds the 255 byte limit. In commands that create policies that are too long for the 255-byte limit, you can use pattern sets to shorten the policies.

Example:

```
1 add cs policy p11 -rule 'HTTP.REQ.URL.ENDSWITH_ANY("
   ctx_file_extensions")'
2 Done
3 <!--NeedCopy-->
```

ctx_file_extensions is a default patset that covers a large number of extensions. In addition to the default pattern sets, you can create user-defined pattern sets. Add a patset by running the following command:

```
1 add patset <name>
2 <!--NeedCopy-->
```

Note: Patsets are supported only in release 9.3 or later.

17. Issue

When upgrading a NetScaler VPX appliance, I am told to free up space in /var. What files do I remove?

Resolution

Remove the old installation files from /var/tmp/ directory. Also remove unwanted files from /flash.

18. Issue

There is no connectivity to the graphical user interface (GUI) when you run the force HA failover command on the secondary appliance.

Resolution

Log on to the secondary appliance using the command line interface and enable the access to GUI by running the set ns ip <IP> -gui enabled command.

19. Issue

After performing an upgrade, and when I click on any link on the GUI that has to load a java applet (Upgrade Wizard or license Wizard), the following error message appears: **GUI version does not match with the kernel version. Please close this instance, clear java plug-in cache and reopen.**

Resolution

- Log on to the NetScaler using the GUI.
- Navigate to NetScaler Gateway > Global Settings.
- Click Change Global Settings under Settings.
- In the details pane, under Client Experience, select Default from the UI theme list.
- Click OK.

20. Issue

If upgrading a NetScaler appliance failed because of any reason, how to restore the appliance using the backed-up files?

Resolution

If the upgrade is unsuccessful then restore the appliance to the previous version of the NetScaler appliance using the backed-up files. For more information, see [Backup and restore a NetScaler appliance](#).

For more information on backup and restore of a NetScaler cluster setup, see [Backup and restore of a cluster setup](#).

21. **Issue**

If licenses are missing after a failed upgrade of a NetScaler appliance, how to resolve the issue?

Resolution

If any license goes missing or if you want to reallocate the licenses, refer to the following topic [Licensing overview](#).

Note

These troubleshooting steps also apply to issues with configuration loss when downgrading the software across multiple releases.

For any other issue, see the release notes, Knowledge Center articles, and FAQs.

FAQs

May 2, 2023

For answers to the questions that you might have about upgrading the NetScaler firmware, see the [Installing, Upgrading, and Downgrading FAQs](#).

Solutions for Telecom Service Providers

May 2, 2023

Information and Communication Technology (ICT) is about bringing the Internet user closer to the apps and data. The latest datacenter technologies have enabled the user, apps and data to be located anywhere. A user can access apps and data from the office or from home, or from a location such as an airport. The apps and data can be located either on the enterprise's premises, in a public or private cloud, or on a hybrid host. The result has been on only increased productivity, but also reduced costs of ownership and maintenance.

Service providers offer the core infrastructure needed for carrying the user's apps and data over the network. Because the core infrastructure serves millions of subscribers and a wide variety of apps and data, requirements for scale and protocol support are very high. The core infrastructure handles two major types of traffic: data plane and control plane. Each of these planes has its own scale and protocol-support requirements.

The data plane is the part of the core infrastructure that carries user apps and data from end to end, that is, between end-user equipment and the application server. The number of users accessing apps and data is in the thousands of millions, so throughput and IP-addressing requirements are very high. Every user in the network must be uniquely identifiable. Only then can the service provider control the traffic, monitor network usage, deliver user-specific services, and log information correctly. Many of the today's client devices and application servers support IPv6 natively. The core infrastructure must not only support a mix of IPv4 and IPv6 clients and servers, but also provide the technologies for cross-communication between IPv4 and IPv6. Finally, a service provider is measured by the quality of service (directly related to end-user experience) and the availability of service without disruptions. The data plane should be resilient enough to provide both quality and availability at the same time.

The control-plane infrastructure manages user traffic and maintains the business and network operations services. The most important of the many protocols that run in this plane are Diameter, Radius, and SMPP. Diameter is a base protocol over which several other function-specific protocols have been developed. For example:

- Gx interface between the Policy and Charging Enforcement Function (PCEF) and the Policy and Charging Rules Function (PCRF)
- Gy interface between the Online Charging System (OCS) and the Cisco Packet Data Network Gateway (PGW)/Policy and Charging Enforcement Function (PCEF)

The volume of control plane traffic is in direct proportion to user activity. To manage the control plane traffic, service providers use several ADC functionalities, such as load balancing and content switching. They need fine-grain control of control plane traffic, which equals data-plane traffic in complexity.

Service providers must meet demanding service-level agreements (SLAs), and are scrutinized thoroughly by regulators for compliance. Adhering to requirements while managing the data and control plane traffic requires a service provider to keep its infrastructure nimble, within budget, easily upgradable, and flexible. As the most powerful and advanced ADCs in the market today, NetScaler products are a natural fit for the service-provider environment.

Large Scale NAT

August 11, 2023

Note:

Large Scale NAT (LSN) feature is deprecated from NetScaler 14.1 release onwards.

Deprecated features are not removed immediately. The NetScaler appliance continues to support the deprecated feature until it is removed in a future release.

The Internet's phenomenal growth has resulted in a shortage of public IPv4 addresses. Large Scale NAT (LSN/CGNAT) provides a solution to this issue, maximizing the use of available public IPv4 addresses by sharing a few public IPv4 addresses among a large pool of Internet users.

LSN translates private IPv4 addresses into public IPv4 addresses. It includes network address and port translation methods to aggregate many private IP addresses into fewer public IPv4 addresses. LSN is designed to handle NAT on a large scale. The NetScaler LSN feature is very useful for Internet Service Providers (ISPs) and carriers providing millions of translations to support a large number of users (subscribers) and at very high throughput.

LSN Architecture

The LSN architecture of an ISP using NetScaler products consists of subscribers (Internet users) in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP's core network. Subscribers are connected to the ISP through the ISP's access network. Usually, subscribers for commercial use of the Internet are directly connected to the ISP's access network. Serving those subscribers requires only one level of NAT (NAT44).

Noncommercial subscribers, however, are typically behind customer-premises equipment (CPE), such as routers and modems, that also implements NAT. These two levels of NAT create the NAT444 model. Deploying a NetScaler appliance in an ISP's core network for LSN functionality is transparent to the subscribers and requires no configuration changes to subscribers or the CPEs.

The NetScaler appliance receives all subscriber packets destined to the Internet. The appliance is configured with a pool of pre-defined NAT IP addresses to use for LSN. The NetScaler appliance uses its LSN feature to translate the source IP address (private) and port of the packet to the NAT IP address (public) and NAT port, and then sends the packet to its destination on the Internet. The appliance maintains a record of all active sessions that use the LSN feature. These sessions are called LSN sessions. The NetScaler appliance also maintains the mappings between subscriber IP address and port, and NAT IP address and port, for each session. These mappings are called LSN mappings. From LSN sessions and LSN mappings, the NetScaler appliance recognizes a response packet (received from the Internet) belonging to a particular session. The appliance translates the destination IP address and port of the response packet from NAT IP address:port to the subscriber IP address:port, and sends the translated packet to the subscriber.

LSN Features Supported on NetScaler appliance

The following describes some of the LSN features supported on NetScaler appliance:

NAT Resource Allocation

The NetScaler appliance allocates NAT IP addresses and ports, from its pre-defined NAT resource pool, to subscribers to translate their packets for transmission to external hosts (Internet). The NetScaler

appliance supports the following types of NAT IP address and port allocation for subscribers:

- **Deterministic.** The NetScaler appliance allocates a NAT IP address and a block of ports to each subscriber. The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

- **Dynamic.** The NetScaler appliance allocates a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. When port block allocation is enabled in the configuration, the appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The NetScaler appliance then allocates this NAT IP address and one of the ports from the allocated block to each subsequent connection from this subscriber. If the entire block of ports is being used, the appliance allocates a new random port block to the subscriber when it initiates a new connection. One of the port in the new port block is allocated for the new connection.

IP Pooling

The following NAT resource allocation options are available for subsequent sessions of a subscriber who was allocated a random NAT IP address and port for an existing session.

- **Paired.** The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When no more ports are available for that address, the appliance drops any new connections from the subscriber. This option is needed for proper functioning of certain applications that require creation of multiple sessions on the same source IP address (for example in peer-to-peer applications that use RTP or RTCP protocol).
- **Random.** The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

Reusing LSN Mappings

The NetScaler appliance can reuse an existing LSN map for new connections originating from the same subscriber IP address and port. The NetScaler LSN feature supports the following types of LSN mapping reuse:

1. **Endpoint Independent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port. This type of LSN map reuse is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
3. **Address port dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

LSN Filtering

The NetScaler appliance can filter packets from external hosts based on the active LSN sessions and LSN mappings. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). The NetScaler LSN feature supports the following types of filtering:

1. **Endpoint Independent.** The NetScaler appliance filters out only those packets that are not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x), regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external host to the subscriber. This type of filtering is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
3. **Address port dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external IP address and port.

Quotas

The NetScaler appliance can limit the number of NAT ports and sessions for each subscriber to ensure fair distribution of resources among subscribers. The NetScaler appliance can also limit the number

of session for a subscriber group to ensure fair distribution of resources among different subscriber groups.

- **Port quota.** The NetScaler appliance can limit the LSN NAT ports to be used at a time by each subscriber for a specified protocol. For example, you could limit each subscriber to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports of the specified protocol to that subscriber.
- **Subscriber Session Limit.** The number of concurrent session for a subscriber can be more than its port quota. The NetScaler appliance can limit the LSN sessions allowed for each subscriber for a specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions of the specified protocol.
- **Group Session Limit.** The NetScaler appliance can limit the total number of LSN sessions allowed for a subscriber group for a specified protocol. When the total number of LSN sessions reaches the limit for a group for a specified protocol, the NetScaler appliance does not allow any subscriber of the group to open additional sessions of the specified protocol. For example, You limit a group to a maximum of 10000 UDP sessions. When the total number of UDP sessions for this group reaches 10000, the NetScaler appliance does not allow any subscriber of the group to open additional UDP sessions.

Application Layer Gateways

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Hairpin Support

The NetScaler appliance supports communication between subscribers or internal hosts using NAT IP addresses. This type of communication between two subscribers using NAT IP addresses is called hairpin flow. Hairpin flow is enabled by default, and you cannot disable it.

Points to Consider before Configuring LSN

May 2, 2023

Consider the following points before configuring LSN on a NetScaler appliance:

- Make sure that you understand the different components of Large Scale NAT, described in RFCs 6888, 5382, 5508, and 4787.
- Endpoint independent mapping (EIM) and endpoint independent filtering (EIF) are disabled by default. These options must be enabled for proper functioning of VoIP and peer-to-peer (P2P) applications.
- **Logging LSN:** Following are the consideration points for logging LSN information:
 - Citrix recommends logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large numbers of LSN log entries (in order of millions).
 - Citrix recommends using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.
 - The following limitations apply to SYSLOG over TCP:
 - * The Syslog over TCP solution does not provide authentication, integrity check, and privacy.
 - * The NetScaler appliance relies on the TCP protocol to provide confirmation of SYSLOG message delivery to external log servers.
- **High Availability:** Following are the consideration points for high availability of NetScaler appliances for LSN:
 - Citrix recommends configuring the LSN feature in a high availability deployment of two NetScaler appliances for uninterrupted and seamless operation of all LSN sessions.
 - In a high availability deployment, Citrix recommends:
 - * Setting the SYNC VLAN parameter for dedicating a VLAN for all HA related communication.
 - * Synchronizing the symmetric RSS key of the primary node to the secondary node for stateful synchronization of a large number of LSN mappings and sessions.
 - * Binding the subnet of LSN IP addresses to a VLAN to avoid flooding of GARP broadcasts on all VLANs after a failover.
 - In a high availability deployment of NetScaler appliances, ALG-related sessions are not mirrored to the secondary appliance.
- **Application Layer Gateways (ALGs):** Following are the consideration points related for ALGs on a NetScaler appliance:

- The following are not supported for SIP ALG:
 - * Multicast IP addresses
 - * Encrypted SDP
 - * SIP messages over TLS
 - * FQDN translation in SIP messages
 - * Authentication of SIP messages
 - * Traffic domains, admin partitions, and NetScaler clusters.
 - * SIP messages with multipart bodies.
- The following are not supported for RTSP ALG:
 - * Multicast RTSP sessions
 - * RTSP session over UDP
 - * NetScaler traffic domains, admin partitions, and NetScaler clusters
- The NetScaler appliance does not support ALG for the IPSec protocol.
- If you disable the LSN feature when some LSN sessions exist on the NetScaler appliance, these sessions continue to exist for the duration of the configured timeout interval.
- LSN takes precedence over RNAT. If a packet from a specified LSN subscriber also matches a RNAT rule, the packet is translated according to the LSN configuration.
- Forwarding of packets related only to the LSN sessions is based on the NetScaler appliance's routing table.
- Unlike with subnet IP addresses, selection of an LSN NAT IP address for a subscriber's connection is not based on the routing entry for the destination IP address.
- For inbound packets, static LSN mappings take precedence over dynamic LSN mappings.
- For outbound packets, LSN application profiles take precedence over static mapping.
- When a large number of LSN sessions (> 1 million) exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all of them. In the command line interface or the configuration utility, use the selection parameters for showing LSN session operation.
- To reduce the amount of active memory allocated to the LSN feature, you must warm restart the NetScaler appliance after changing the configured-memory setting. Without a warm restart, you can only increase the amount of active memory.

Configuration Steps for LSN

May 2, 2023

Configuring LSN on a NetScaler appliance consists of the following tasks:

1. **Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

2. **Create an LSN client entity and bind subscribers to it.** An LSN client entity is a set of subscribers on whose traffic you want the NetScaler appliance to perform LSN. The client entity includes IPv4 addresses and extended ACL rules for identifying subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.
3. **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The pool is assigned parameters, such as port block allocation and NAT type (Deterministic or Dynamic). An LSN pool bound to an LSN group applies to all subscribers of an LSN client entity bound to the same group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.
4. **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage, that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
5. **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.
6. **Create an LSN Group and bind LSN pools, (optional) LSN transport profiles, and (optional)**

LSN application profiles to the LSN group. An LSN group is an entity consisting of an LSN client, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

The following table lists the maximum numbers of different LSN entities and bindings that can be created on a NetScaler appliance. These limits are also subject to memory available on the NetScaler appliance.

LSN entities and bindings	Limit
LSN clients	1024
LSN pools	128
LSN groups	1024
Subscriber networks that can be bound to an LSN client	64
Extended ACLs that can be bound to an LSN client	1024
NAT IP addresses in a Pool	4096
LSN pools that can be bound to an LSN group	8
LSN groups that can use the same LSN pool	16
LSN transport profiles that can be bound to an LSN group	3 (one each for TCP, UDP, and ICMP protocols)
LSN groups that can use same LSN transport profile	8
LSN application profiles that can be bound to an LSN group	64
LSN groups that can use same LSN application profile	8
Port ranges that can be bound to an LSN application profile	8

Configuration Using the Command Line Interface

To create an LSN client by using the command line interface

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
4 <!--NeedCopy-->
```

To bind a network address or an ACL rule to an LSN client by using the command line interface

At the command prompt, type:

```
1 bind lsn client <clientname> ((-network <ip_addr> [-netmask <netmask>]
   [-td<positive_integer>]) | -aclname <string>)
2
3 show lsn client
4 <!--NeedCopy-->
```

To create an LSN pool by using the command line interface

At the command prompt, type:

```
1 add lsn pool <poolname> [-nattype ( DYNAMIC | DETERMINISTIC )] [-
   portblockallocation ( ENABLED | DISABLED )] [-portrealloctimeout <
   secs>] [-maxPortReallocTmq <positive_integer>]
2
3 show lsn pool
4 <!--NeedCopy-->
```

To bind an IP address range to an LSN pool by using the command line interface

At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
4 <!--NeedCopy-->
```

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```
1 add lsn transportprofile <transportfilename> <transportprotocol> [-  
  sessiontimeout <secs>] [-firststtimeout <secs>] [-portquota <  
  positive_integer>] [-sessionquota <positive_integer>] [-  
  portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (   
  ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]  
2  
3 show lsn transportprofile  
4 <!--NeedCopy-->
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
1 add lsn appsprofile <appsfilename> <transportprotocol> [-ippooling (   
  PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-  
  tcproxy ( ENABLED | DISABLED )] [-td <positive_integer>]  
2  
3 show lsn appsprofile  
4 <!--NeedCopy-->
```

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
1 bind lsn appsprofile <appsfilename> <lsnport>  
2  
3 show lsn appsprofile  
4 <!--NeedCopy-->
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC |   
  DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging (   
  ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-  
  sessionSync ( ENABLED | DISABLED )] [-snmptraplimit <positive_integer  
>] [-ftp ( ENABLED | DISABLED )]  
2  
3 show lsn group  
4 <!--NeedCopy-->
```

To bind LSN profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> (-poolname <string> | -transportprofilename
   <string> | -appsprofilename <string>)
2
3 show lsn group
4 <!--NeedCopy-->
```

Configuration Using the Configuration Utility

To configure an LSN client and bind an IPv4 network address or an ACL rule by using the configuration utility

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv4 network address or an ACL rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility

Navigate to **System > Large Scale NAT > Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN transport profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport** tab, and then add a transport profile.

To configure an LSN application profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application** tab, and then add an application profile.

To configure an LSN group and bind an LSN client, pools, transport profiles, and application profiles by using the configuration utility

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, pools, transport profiles, and application profiles to the group.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn client
 - clientname
Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.),

space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

This is a mandatory argument. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn client

- clientname

Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

This is a mandatory argument. Maximum Length: 127

- network

IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the NetScaler appliance to perform Large Scale NAT.

- netmask

Subnet mask for the IPv4 address specified in the Network parameter.

Default value: 255.255.255.255

- td

ID of the traffic domain on which this subscriber or the subscriber network (as specified by the network parameter) belongs.

If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain.

Default value: 0

Minimum value: 0

Maximum value: 4094

- aclname

Name(s) of any configured extended ACL(s) whose action is ALLOW. The condition specified in the extended ACL rule identifies the traffic from an LSN subscriber for which the NetScaler appliance is to perform large scale NAT. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn pool

- poolname

Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1').

This is a mandatory argument. Maximum Length: 127

- nattype

Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group):

Available options function as follows:

- * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
 - * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscribers connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the

allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

– portblockallocation

Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the NetScaler appliance allocates a NAT port from the subscribers allocated NAT port block to create the LSN session.

You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the NetScaler appliance allocates a new random port block for the subscriber.

For Deterministic NAT, this parameter is enabled by default, and you cannot disable it.

Possible values: ENABLED, DISABLED

Default value: DISABLED

– portrealloctimeout

The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:

- * Deterministic NAT
- * Address-Dependent filtering and Address-Port-Dependent filtering
- * Dynamic NAT with port block allocation

In these cases, ports are immediately reallocated.

Default value: 0

Maximum value: 600

– maxPortReallocTmq

Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address.

When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session.

Default value: 65536

Maximum value: 65536

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn pool

- poolname

Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1').

This is a mandatory argument. Maximum Length: 127

- lsnip

IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN.

After the pool is created, these IPv4 addresses are added to the NetScaler appliance as NetScaler owned IP address of type LSN. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the NetScaler appliance as any NetScaler owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn transportprofile

- transportprofilename

Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the CLI: If the

name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn transport profile1” or ‘lsn transport profile1’).

This is a mandatory argument. Maximum Length: 127

– transportprotocol

Protocol for which to set the LSN transport profile parameters.

This is a mandatory argument.

Possible values: TCP, UDP, ICMP

– sessiontimeout

Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the NetScaler appliance removes the session.

This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints.

Default value: 120

Minimum value: 60

– finrsttimeout

Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints.

If a TCP LSN session is idle (after the NetScaler appliance receives a FIN or RST message) for a time that exceeds this value, the NetScaler appliance removes the session.

Since the LSN feature of the NetScaler appliance does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection.

Default value: 30

– portquota

Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports for that subscriber.

Default value: 0

Minimum value: 0

Maximum value: 65535

- sessionquota

Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions.

Default value: 0

Minimum value: 0

Maximum value: 65535

- portpreserveparity

Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the NetScaler appliance allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- portpreserverange

If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the NetScaler appliance can allocate port 100 as the NAT port for this connection.

This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports.

When all the well-known ports of all the available NAT IP addresses are used in different subscribers connections (LSN sessions), and a subscriber initiates a connection from a well-known port, the NetScaler appliance drops this connection.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- syncheck

Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the NetScaler appliance.

If you disable this parameter, the NetScaler appliance accepts any non-SYN packets and creates a new LSN session entry for this connection.

Following are some reasons for the NetScaler appliance to receive such packets:

- * LSN session for a connection existed but the NetScaler appliance removed this session because the LSN session was idle for a time that exceeded the configured session timeout.
- * Such packets can be a part of a DoS attack.

Possible values: ENABLED, DISABLED

Default value: ENABLED

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn appsprofile

- appsprofilename

Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1').

This is a mandatory argument. Maximum Length: 127

- transportprotocol

Name of the protocol for which the parameters of this LSN application profile applies.

This is a mandatory argument.

Possible values: TCP, UDP, ICMP

- ippooling

NAT IP address allocation options for sessions associated with the same subscriber.

Available options function as follows:

- * **Paired**—The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the NetScaler appliance drops any new connection from the subscriber.
- * **Random**—The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

This parameter is applicable to dynamic NAT allocation only.

Possible values: PAIRED, RANDOM

Default value: RANDOM

- mapping

Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port.

Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

- * **ENDPOINT-INDEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.
- * **ADDRESS-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
- * **ADDRESS-PORT-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- filtering

Type of filter to apply to packets originating from external hosts.

Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

- * **ENDPOINT INDEPENDENT**—Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber.
- * **ADDRESS DEPENDENT**—Filters out packets not destined to subscriber IP address and port X:x. In addition, the appliance filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
- * **ADDRESS PORT DEPENDENT** (the default)—Filters out packets not destined to subscriber IP address and port (X:x). In addition, the NetScaler appliance filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent

packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

– tcpproxy

Enable TCP proxy, which enables the NetScaler appliance to optimize the TCP traffic by using Layer 4 features.

Possible values: ENABLED, DISABLED

Default value: DISABLED

– td

ID of the traffic domain through which the NetScaler appliance sends the outbound traffic after performing LSN.

If you do not specify an ID, the appliance sends the outbound traffic through the default traffic domain, which has an ID of 0.

Default value: 65535

Maximum value: 65535

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn appprofile

- appprofilename

Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn application profile1” or ‘lsn application profile1’).

This is a mandatory argument. Maximum Length: 127

- lsnport

Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn group
 - groupname

Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).

This is a mandatory argument. Maximum Length: 127
 - clientname

Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group. You cannot remove this association or replace with another LSN client entity once the LSN group is created.

This is a mandatory argument. Maximum Length: 127
 - nattype

Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers:

Available options function as follows:

 - * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
 - * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the

allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

– portblocksize

Size of the NAT port block to be allocated for each subscriber.

To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always enabled, and you cannot disable it.

In Dynamic NAT, the NetScaler appliance allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

– logging

Log mapping entries and sessions created or deleted for this LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities.

A log message for an LSN mapping entry consists of the following information:

- * NSIP address of the NetScaler appliance
- * Time stamp
- * Entry type (MAPPING or SESSION)
- * Whether the LSN mapping entry is created or deleted
- * Subscriber's IP address, port, and traffic domain ID
- * NAT IP address and port
- * Protocol name
- * Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for Endpoint-Independent mapping

- Only Destination IP address (and not port) is logged for Address-Dependent mapping
- Destination IP address and port are logged for Address-Port-Dependent mapping

Possible values: ENABLED, DISABLED

Default value: DISABLED

– sessionLogging

Log sessions created or deleted for the LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

A log message for an LSN session consists of the following information:

- * NSIP address of the NetScaler appliance
- * Time stamp
- * Entry type (MAPPING or SESSION)
- * Whether the LSN session is created or removed
- * Subscriber's IP address, port, and traffic domain ID
- * NAT IP address and port
- * Protocol name
- * Destination IP address, port, and traffic domain ID

Possible values: ENABLED, DISABLED

Default value: DISABLED

– sessionSync

In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary).

For this setting to work, you must enable the global session synchronization parameter.

Possible values: ENABLED, DISABLED

Default value: ENABLED

– snmptraplimit

Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute.

Default value: 100

Minimum value: 0

Maximum value: 10000

- ftp

Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually communicated in the packets payload. When acting as an ALG, the appliance changes the packets payload to ensure that the protocol continues to work over LSN.

Note: The NetScaler appliance also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn group

- groupname

Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1').

This is a mandatory argument. Maximum Length: 127

- poolname

Name of the LSN pool to bind to the specified LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. For Dynamic NAT, pools bound to an LSN group can be bound to multiple LSN groups. Maximum Length: 127

- transportprofilename

Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.

By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol. Maximum Length: 127

- appsprofilename

Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. Maximum Length: 127

Sample LSN Configurations

September 21, 2020

The following are examples of configuring LSN through command line interface.

Create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and default settings:

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
18
19 Done
20
```

```
21 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
22
23 Done
24 <!--NeedCopy-->
```

Create an LSN configuration with an extended ACL for identifying LSN subscribers:

```
1 add ns acl LSN-ACL-2 ALLOW -srcIP 192.0.2.10-192.0.2.20
2
3 Done
4
5 apply acls
6
7 Done
8
9 add lsn client LSN-CLIENT-2
10
11 Done
12
13 bind lsn client LSN-CLIENT-2 -aclname LSN-ACL-2
14
15 Done
16
17 add lsn pool LSN-POOL-2
18
19 Done
20
21 bind lsn pool LSN-POOL-2 203.0.113.5-203.0.113.10
22
23 Done
24
25 add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2
26
27 Done
28
29 bind lsn group LSN-GROUP-2 -poolname LSN-POOL-2
30
31 Done
32 <!--NeedCopy-->
```

Create an LSN configuration with endpoint-independent mapping for HTTP protocol (port 80) and address-port dependent mapping for SSH protocol (port 22). Also, restrict each subscriber to use a maximum of 1000 NAT ports for TCP protocol and 100 NAT ports for UDP protocol. Restrict each subscriber to have a maximum of 2000 concurrent sessions for TCP protocol. Restrict the group to have a maximum of 30000 concurrent sessions for TCP protocol:

```
1 add lsn client LSN-CLIENT-3
2
3 Done
4
5 bind lsn client LSN-CLIENT-3 -network 192.0.3.0 -netmask 255.255.255.0
6
```

```
7 Done
8
9 add lsn pool LSN-POOL-3
10
11 Done
12
13 bind lsn pool LSN-POOL-3 203.0.113.11
14
15 Done
16
17 add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-3
18
19 Done
20
21 bind lsn group LSN-GROUP-3 -poolname LSN-POOL-3
22
23 Done
24
25 add lsn appsprofile LSN-APPS-HTTPPROFILE-3 TCP -mapping ENDPOINT-
    INDEPENDENT
26
27 Done
28
29 bind lsn appsprofile LSN-APPS-HTTPPROFILE-3 80
30
31 Done
32
33 bind lsn group LSN-GROUP-3 -applicationfilename LSN-APPS-HTTPPROFILE
    -3
34
35 Done
36
37 add lsn appsprofile LSN-APPS-SSHPROFILE-3 TCP -mapping ADDRESS-PORT-
    DEPENDENT
38
39 Done
40
41 bind lsn appsprofile LSN-APPS-SSHPROFILE-3 22
42
43 Done
44
45 bind lsn group LSN-GROUP-3 -applicationfilename LSN-APPS-SSHPROFILE
    -3
46
47 Done
48
49 add lsn transportprofile LSN-TRANS-PROFILE-TCP-3 TCP -portquota 1000 -
    sessionquota 2000 -groupSessionLimit 30000
50
51 Done
52
53 bind lsn group LSN-GROUP-3 -transportfilename LSN-TRANS-PROFILE-TCP
    -3
```

```
54
55 Done
56
57 add lsn transportprofile LSN-TRANS-PROFILE-UDP-3 UDP -portquota 100
58
59 Done
60
61 bind lsn group LSN-GROUP-3 -transportprofilename LSN-TRANS-PROFILE-UDP
    -3
62
63 Done
64 <!--NeedCopy-->
```

Create an LSN configuration for a large set of subscribers:

```
1 add lsn client LSN-CLIENT-4
2
3 Done
4
5 bind lsn client LSN-CLIENT-4 -network 192.0.4.0 -netmask 255.255.255.0
6
7 Done
8
9 bind lsn client LSN-CLIENT-4 -network 192.0.5.0 -netmask 255.255.255.0
10
11 Done
12
13 bind lsn client LSN-CLIENT-4 -network 192.0.6.0 -netmask 255.255.255.0
14
15 Done
16
17 bind lsn client LSN-CLIENT-4 -network 192.0.7.0 -netmask 255.255.255.0
18
19 Done
20
21 bind lsn client LSN-CLIENT-4 -network 192.0.8.0 -netmask 255.255.255.0
22
23 Done
24
25 add lsn pool LSN-POOL-4
26
27 Done
28
29 bind lsn pool LSN-POOL-4 203.0.113.30-203.0.113.40
30
31 Done
32
33 bind lsn pool LSN-POOL-4 203.0.113.45-203.0.113.50
34
35 Done
36
37 bind lsn pool LSN-POOL-4 203.0.113.55-203.0.113.60
38
```

```
39 Done
40
41 add lsn group LSN-GROUP-4 -clientname LSN-CLIENT-4
42
43 Done
44
45 bind lsn group LSN-GROUP-4 -poolname LSN-POOL-4
46
47 Done
48
49 add lsn appspfile LSN-APPS-WELLKNOWNPROFILE-4 TCP -mapping ENDPOINT-
    INDEPENDENT
50
51 Done
52
53 bind lsn appspfile LSN-APPS-WELLKNOWN-PORTS-PROFILE-4 1- 1023
54
55 Done
56
57 bind lsn group LSN-GROUP-4 -applicationfilename LSN-APPS-WELLKNOWN-
    PORTS-PROFILE-4
58
59 Done
60 <!--NeedCopy-->
```

Create an LSN configuration with sharing of NAT resources among multiple LSN groups. In this example, LSN pool LSN-POOL-5 is shared with LSN groups LSN-GROUP-5 and LSN-GROUP-6:

```
1 add lsn client LSN-CLIENT-5
2
3 Done
4
5 bind lsn client LSN-CLIENT-5 -network 192.0.15.0 -netmask 255.255.255.0
6
7 Done

41 bind lsn group LSN-GROUP-8 -applicationprofile LSN-APPS-HTTP-
  PROFILE-8
42
```

```
43 Done
44 <!--NeedCopy-->
```

Create an LSN configuration that restricts the outbound traffic of a specific protocol (TCP), sending it through a particular traffic domain (td 5). With endpoint-independent filtering, receive inbound traffic related to this protocol (TCP) on any traffic domain:

```
1 add lsn client LSN-CLIENT-9
2
3 Done
4
5 bind lsn client LSN-CLIENT-9 -network 192.0.9.0 -netmask 255.255.255.0
  -td 1
6
7 Done
8
9 add lsn pool LSN-POOL-9
10
11 Done
12
13 bind lsn pool LSN-POOL-9 203.0.113.90
14
15 Done
16
17 add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
18
19 Done
20
21 bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
22
23 Done
24
25 add lsn appsprofile LSN-APPS-PROFILE-9 TCP -filtering ENDPOINT-
  INDEPENDENT -td 5
26
27 Done
28
29 bind lsn group LSN-GROUP-9 -appprofile LSN-APPS-PROFILE-9
30
31 Done
32 <!--NeedCopy-->
```

Create an LSN configuration that restricts outbound HTTP (port 80) traffic, sending it through a particular traffic domain (td 10). With address-dependent filtering, receive inbound traffic related to this protocol (HTTP) on the specified traffic domain (td 10):

```
1 add lsn client LSN-CLIENT-10
2
3 Done
4
5 bind lsn client LSN-CLIENT-10 -network 192.0.10.0 -netmask
  255.255.255.0 -td 1
```

```
6
7 Done
8
9 add lsn pool LSN-POOL-10
10
11 Done
12
13 bind lsn pool LSN-POOL-10 203.0.113.100
14
15 Done
16
17 add lsn group LSN-GROUP-10 -clientname LSN-CLIENT-10
18
19 Done
20
21 bind lsn group LSN-GROUP-10 -poolname LSN-POOL-10
22
23 Done
24
25 add lsn appsprofile LSN-APPS-PROFILE-10 TCP -mapping ENDPOINT -
    INDEPENDENT -filtering ADDRESS-DEPENDENT -td 10
26
27 Done
28
29 bind lsn appsprofile LSN-APPS-PROFILE-10 80
30

Configuring Static LSN Maps

May 2, 2023

The NetScaler appliance supports manual creation of a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. Static LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP:Port maps to the subscriber IP address:Port. For example, Web servers located in the internal network.

To create a static LSN mapping by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td
   <positive_integer>] [<natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd
   <positive_integer>]]
2 - show lsn static
3 <!--NeedCopy-->
```

To create a static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new static mapping.

Parameter Descriptions (of commands listed in the CLI procedure)

add lsn static name

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn static1" or 'lsn static1'). This is a mandatory argument. Maximum Length: 127

transportprotocol

Protocol for the LSN mapping entry. This is a mandatory argument. Possible values: TCP, UDP, ICMP

subscrIP

IPv4 address of an LSN subscriber for the LSN mapping entry. This is a mandatory argument.

subscrPort

Port of the LSN subscriber for the LSN mapping entry. This is a mandatory argument. Maximum value: 65535

td

ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0, Minimum value: 0, Maximum value: 4094

natIP

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

natPort

NAT port for this LSN mapping entry.

destIP

Destination IP address for the LSN mapping entry.

dsttd

ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0, Minimum value: 0, Maximum value: 4094

Wildcard Port Static Maps

A static mapping entry is usually a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. A one-to-one static LSN mapping entry exposes only one port of the subscriber to the Internet.

Some situations might require exposing all ports (64K) of a subscriber to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64K one-to-one static mapping entries, one mapping entry for each port. Creating 64K entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

Another simple method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber to the Internet. For a subscriber's inbound or outbound connections matching a wildcard static mapping entry, the subscriber's port does not change after the NAT operation.

When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber's port by connecting to the NAT port that has the same number as the subscriber's port.

Configuring the NetScaler appliance to Provide Access to All Ports of an IPv4 Subscriber

To configure the NetScaler appliance to provide access to all ports of an IPv4 subscriber, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <
    positive_integer>] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
4 <!--NeedCopy-->
```

Sample Configuration

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 192.0.2.10 are made accessible through NAT IP 203.0.113.33.

Sample configuration:

```
1 add lsn static NAT44-WILDCARD-STATIC-1 ALL 192.0.2.10 * 203.0.113.33 *
2
3 Done
4 <!--NeedCopy-->
```

Configuring Application Layer Gateways

May 2, 2023

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

May 2, 2023

You can enable or disable ALG for the FTP protocol for an LSN configuration by enabling or disabling the FTP option of the LSN group of the LSN configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an LSN configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Sample LSN Configuration for FTP ALG:

In the following sample LSN configuration, FTP ALG is enabled for subscribers that have IP address in the range 192.0.2.30-192.0.2.100.

```
1 add ns acl LSN-ACL-1 ALLOW -srcIP 192.0.2.30-192.0.2.100
2
3 Done
4
5 apply acls
6
7 Done
8
9 add lsn client LSN-CLIENT-1
10
11 Done
12
13 bind lsn client LSN-CLIENT-1 -aclname LSN-ACL
14
15 Done
16
```

```
17 add lsn pool LSN-POOL-1
18
19 Done
20
21 bind lsn pool LSN-POOL-1 203.0.113.10
22
23 Done
24
25 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -FTP ENABLED
26
27 Done
28
29 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
30
31 Done
32 <!--NeedCopy-->
```

Sample LSN Configuration for TFTP ALG:

In the following sample LSN configuration, endpoint-independent mapping and endpoint-independent filtering are enabled for TFTP protocol (UDP port 69). The NetScaler appliance automatically enables TFTP ALG for this LSN configuration.

```
1 add lsn client LSN-CLIENT-2
2
3 Done
4
5 bind lsn client LSN-CLIENT-2 -network 198.51.100.0 -netmask
   255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-2
10
11 Done
12
13 bind lsn pool LSN-POOL-2 203.0.113.10-203.0.113.11
14
15 Done
16
17 add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2
18
19 Done
20
21 bind lsn group LSN-GROUP-2 -poolname pool1 LSN-POOL-2
22
23 Done
24
25 add lsn appsprofile LSNAPPSPROFILE-TFTP-2 UDP -mapping ENDPOINT-
   INDEPENDENT - filtering ENDPOINT-INDEPENDENT
26
27 Done
28
```

```
29 bind lsn appsprofile LSNAPPSPROFILE-TFTP-2 69
30
31 Done
32
33 bind lsn group LSN-GROUP-1 -applicationfilename LSNAPPSPROFILE-TFTP
   -2
34
35 Done
36 <!--NeedCopy-->
```

Application Layer Gateway for PPTP Protocol

May 2, 2023

The NetScaler appliance supports Application Layer Gateways (ALGs) for the Point-to-Point Tunneling Protocol (PPTP).

PPTP is a network protocol that enables secure transfer of data from a remote client to an enterprise server by creating a tunnel across TCP/IP-based data networks. PPTP encapsulates PPP packets into IP packets for transmission over the Internet. PPTP establishes a tunnel for each communicating PPTP network server (PNS)-PPTP Access Concentrator (PAC) pair. After the tunnel is set up, enhanced generic routing encapsulation (GRE) is used to exchange PPP packets. A call ID in the GRE header indicates the session to which a particular PPP packet belongs.

The NetScaler appliance recognizes PPTP packets that arrive on the default TCP port, 1723. The appliance parses PPTP control packets, translates the call ID, and assigns a NAT IP address. For two-way data communication between the client and server, the NetScaler appliance creates an LSN session entry based on the server call ID, and an LSN session based on the client call ID. The appliance then parses the GRE data packets and translates call IDs on the basis of the two LSN session entries.

For PPTP protocol, the NetScaler appliance also includes timeout setting for any idle PPTP LSN sessions. If a PPTP LSN session is idle for a time that exceeds the timeout setting, the NetScaler appliance removes the session.

Limitations:

The following are the limitations of PPTP ALG on a NetScaler appliance:

- PPTP ALG is not supported for hairpin LSN flow.
- PPTP ALG is not supported to work with any RNAT configuration.
- PPTP ALG is not supported in NetScaler clusters.

Configuring PPTP ALG

Configuring PPTP ALG on the NetScaler appliance consist of the following tasks:

- Create an LSN configuration and enable PPTP ALG on it. In an LSN configuration, the LSN group includes the PPTP ALG setting. For instructions on creating an LSN configuration, see [Configuration Steps for LSN](#).
- (Optional) Set the global timeout for idle PPTP LSN sessions.

To enable PPTP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-pptp ( ENABLED |  
    DISABLED )]  
2  
3 show lsn group  
4 <!--NeedCopy-->
```

To set the global timeout for idle PPTP LSN sessions by using the CLI

At the command prompt, type:

```
1 set appAlgParam -pptpGreIdleTimeout <positive_integer>  
2  
3 show appAlgParam  
4 <!--NeedCopy-->
```

Example:

In the following sample LSN configuration, PPTP ALG is enabled for subscribers in the 192.0.2.0/24 network.

Also idle PPTP LSN session timeout is set to 200 secs.

```
1 add lsn client LSN-CLIENT-1  
2  
3 Done  
4  
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0  
6  
7 Done  
8  
9 add lsn pool LSN-POOL-1  
10  
11 Done  
12  
13 bind lsn pool LSN-POOL-1 203.0.113.3
```

```
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -pptp ENABLED
18
19 Done
20
21 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
22
23 Done
24
25 set appAlgParam -pptpGreIdleTimeout 200
26
27 Done
28 <!--NeedCopy-->
```

Application Layer Gateway for SIP Protocol

May 2, 2023

Using Large Scale NAT (LSN) with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media.

SIP ALG adheres to the following RFCs:

- RFC 3261
- RFC 3581
- RFC 4566
- RFC 4475

Note

SIP ALG is supported in a NetScaler standalone appliance, in a NetScaler high availability setup, as well as in a NetScaler cluster setup.

How SIP ALG Works

How IP address translation is performed depends on the type and direction of the message. A message can be any of the following:

- Inbound request

- Outbound response
- Outbound request
- Inbound response

For an outgoing message, the private IP address and port number of the SIP client are replaced with the NetScaler owned public IP address and port number, called the *LSN pool IP address and port number*, specified during LSN configuration. For an incoming message, the LSN pool IP address and the port number are replaced with the private address of the client. If the message contains any public IP addresses, the NetScaler SIP ALG retains them. Also, a pinhole is created on the:

- LSN pool IP address and port on behalf of the private client, so that the messages that arrive at this IP address and port from the public network are treated as SIP messages.
- Public IP address and port on behalf of the public clients, so that the messages that arrive at this IP address and port from the private network are treated as SIP messages.

When a SIP message is sent out across the network, the SIP Application Layer Gateway (ALG) collects information from the message and translates the IP addresses in the following headers into LSN pool IP addresses:

- Via
- Contact
- Route
- Record-Route

In the following sample SIP request message, LSN replaces the IP addresses in the header fields to hide them from the outside network.

```
1 INVITE adam@10.102.185.156 SIP/2.0 Via: SIP/2.0/UDP 192.170.1.161:62914
  From: eve@10.120.210.3 To: adam@10.102.185.156 Call-ID: a12abcde@10
  .120.210.3 Contact: adam@10.102.185.156 Route: <sip:netscreen@10
  .150.20.3:5060> Record-Route: <sip:netscreen@10.150.20.3:5060>
2 <!--NeedCopy-->
```

When a message containing SDP information arrives, the SIP ALG collects information from the message and translates the IP addresses in the following fields into LSN pool IP addresses and port numbers:

- c= (connection information)

This field can appear at the session or media level. It appears in the following format:

c=<network-type><address-type><connection-address>

If the destination IP address is a unicast IP address, the SIP ALG creates pinholes by using the IP address and port numbers specified in the m= field.

- m= (media announcement)

This field appears at the media level and contains the description of the media. It appears in the following format:

`m=<media><port><transport><fmt list>`

- `a=` (information about the media field)

This field can appear at the session or media level, in the following format:

`a=<attribute>`

`a=<attribute>:<value>`

The following excerpt from a sample SDP section shows the fields that are translated for resource allocation.

`o=user 2344234 55234434 IN IP4 10.150.20.3`

`c=IN IP4 10.150.20.3`

`m=audio 43249 RTP/AVP 0`

The following table shows how SIP payload is translated.

Inbound Request (from public to private)	To	None	
			From
			Call-ID
			Via
			Request-URI
			Contact
		Record-Route	
			Route
Outbound Response (from private to public)	To	None	
			From
			Call-ID
			Via
			Request-URI
			Contact

		Record-Route	
			Route
Outbound Request (from private to public)	To	None	
			From
			Call-ID
			Via
			Request-URI
			Contact
		Record-Route	
			Route
Inbound Response (from public to private)	To	None	
			From
			Call-ID
			Via
			Request-URI
			Contact
		Record-Route	
			Route

Limitations of SIP ALG

A SIP ALG has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
 - Multicast IP addresses
 - Encrypted SDP
 - SIP TLS
 - FQDN translation
 - SIP layer authentication

- TD/partitioning
- Multipart body
- SIP messages over IPv6 network
- Line folding

Tested SIP Clients and Proxy Servers

The following SIP clients and proxy server have been tested with SIP ALG:

- **SIP Clients:** X-Lite, Zoiper, Ekiga, Avaya
- **Proxy Server:** openSIPS

LSN SIP Scenario: SIP Proxy Outside the Private Network (Public Network)

SIP Client Registration

For a typical SIP call, SIP client must register with the SIP registrar by composing a REGISTER request and sending it to the SIP registrar. The NetScaler appliance's SIP ALG intercepts the request, replaces the IP address and port number in the request with the LSN pool IP address and port number provided in the LSN configuration, and forwards the request to the SIP registrar. The SIP ALG then opens a pinhole in the NetScaler configuration to allow further SIP communication between the SIP client and the SIP registrar. The SIP registrar sends a 200 OK response to the SIP client over the LSN pool IP address and port number. The NetScaler appliance captures this response in the pinhole, and the SIP ALG replaces the SIP header, putting the original Contact, Via, Route, and Record-Route SIP fields back into the message. The SIP ALG then forwards the message to the SIP client. The following figure shows how SIP ALG uses LSN in a SIP call registration

flow.

Outgoing Calls

A SIP call is initiated with a SIP INVITE message sent from the internal to the external network. The SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, replacing them with the LSN pool IP address and port number. LSN stores these mappings for subsequent SIP messages in the SIP call. The SIP ALG then opens separate pinholes in the NetScaler configuration to allow SIP and media through the NetScaler appliance on the dynamically assigned ports specified in the SDP and SIP headers. When a 200 OK message arrives at the NetScaler, it is captured by one of the created pinholes. The SIP ALG replaces the SIP header, restoring the original Contact, Via, Route, and Record-Route SIP fields, and then forwards the message to the internal SIP

Incoming Calls

A SIP incoming call is initiated with a SIP INVITE message from the external client to the internal network. The SIP registrar forwards the INVITE message to the SIP client in the internal network, using the pinhole that was created when the Internal SIP client registered with the SIP registrar.

The SIP ALG performs NAT on the LSN IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the IP address and port number of the internal SIP client, and forwards the request to the SIP client. When the 200 OK response message sent by the internal SIP client arrives at the NetScaler appliance, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the LSN pool IP address and port number, forwards the response message to the SIP registrar, and then opens a pinhole in the outbound direction for further SIP communi-

tion.

Call Termination

The BYE message terminates a call. When the device receives a BYE message, it translates the header fields in the message just as it does for any other message. But because a BYE message must be acknowledged by the receiver with a 200 OK, the ALG delays call teardown for 15 seconds to allow time for transmission of the 200 OK.

Call Between Clients in the Same Network

When both client A and client B in the same network initiate a call, the SIP messages are routed through the SIP proxy in the outside network. The SIP ALG processes the INVITE from client A as a normal outgoing call. Since client B is in the same network, the SIP proxy sends the INVITE back to the NetScaler appliance. The SIP ALG examines the INVITE message, determines that it contains the NAT IP address of client A, and replaces that address with the private IP address of client A before sending the message to client B. Once the call is established between the clients, the NetScaler is not involved in the media transmission between the clients.

More LSN SIP Scenarios: SIP Proxy Inside the Private Network

If you want to host the SIP Proxy server inside the private network, Citrix recommends that you do one of the following:

- Configure a static LSN Mapping for the private SIP proxy. For more information, see [Configuring Static LSN Maps](#). Make sure that the NAT port is the same as the port configured in the SIP ALG profile.
- Configure the SIP Proxy server inside a demilitarized zone (DMZ).

Figure 1. SIP Call Registration

Figure 2. SIP Incoming Call Flow

Figures 1 and 2 show the following scenarios:

- Scenario 1—SIP client in the private network registers with the SIP proxy server in the same network. ALG operations are not performed, because the SIP client and SIP proxy server are in the same network.
- Scenario 2—SIP client in the public network registers with the SIP proxy server in the private network. The REGISTER message from the public SIP client is sent to the NetScaler appliance by using the static LSN mapping configured on the appliance, and the appliance creates a pinhole

for further SIP operations.

- Scenario 3—SIP Incoming call flow. A SIP incoming call is initiated with a SIP INVITE message from the external to the internal network. The NetScaler appliance receives the INVITE message from SIP client C2, which is in the external network, through the static LSN maps configured on the NetScaler appliance.

The appliance creates a pinhole and forwards the INVITE message to the SIP proxy. The SIP proxy then forwards the INVITE message to SIP client C1 in the internal network. SIP client C1 then sends 180 and 200 OK messages to the SIP proxy, which in turn forwards the message to SIP client C2 through the NetScaler appliance.

When the 200 OK response message sent by internal SIP client C1 arrives at the NetScaler, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, and in the SDP fields, replacing them with the LSN pool IP address and port number. The SIP ALG then forwards the response message to SIP client C2 and opens a pinhole in the outbound direction for further SIP communication.

Support for Audit Logs

You can log ALG information as part of LSN logging by enabling ALG in the LSN audit logging configuration. For more information on LSN logging, see [Logging and Monitoring LSN](#). A log message for an ALG entry in the LSN log consists of the following information:

- Time stamp
- Type of SIP message (for example, SIP request)
- Source IP address and port of the SIP client
- Destination IP address and port of the SIP proxy
- NAT IP address and port
- SIP method
- Sequence number
- Whether or not the SIP client is registered
- Caller's user name and domain
- Receiver's user name and domain

Sample audit log:

Request:

```
1 07/19/2013:09:49:19 GMT Informational 0-PPE-0 : default ALG

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuration Steps for LSN](#). While configuring LSN, make sure that you:

- Set the following parameters while adding the LSN application profile:
 - IP Pooling = PAIRED
 - Address and Port Mapping = ENDPOINT-INDEPENDENT
 - Filtering = ENDPOINT-INDEPENDENT

Important: For the SIP ALG to work, a full cone NAT configuration is mandatory.

Example:

```

1 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-
  INDEPENDENT -filtering ENDPOINT-INDEPENDENT
2 <!--NeedCopy-->

```

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range.

Example:

```

1 add lsn sipalprofile sipalprofile_tcp -sipsrcportrange 1-65535 -
  sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole
  ENABLED -sipTransportProtocol TCP
2 <!--NeedCopy-->

```

- Set SIP ALG = ENABLED, while creating the LSN group.

Example:

```
1 add lsn group g1 -clientname c1 -sipalg ENABLED
2 <!--NeedCopy-->
```

- Bind the SIP ALG profile to the LSN group.

Sample SIP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, SIP ALG specific setting, and configure SIP ALG:

```
1 add lsn pool p1
2
3 Done
4
5 bind lsn pool p1 10.102.185.190
6
7 Done
8
9 add lsn client c1
10
11 Done
12
13 bind lsn client c1 -network 192.170.1.0 -netmask 255.255.255.0
14
15 Done
16
17 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
18
19 Done
20
21 add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
22
23 Done
24
25 bind lsn appsprofile app_tcp 1-65535
26
27 Done
28
29 bind lsn appsprofile app_udp 1-65535
30
31 Done
32
33 add lsn sipalgprofile sipalgprofile_tcp -sipdstportrange 5060 -
    openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -
    sipTransportProtocol TCP
34
35 Done
36
37 add lsn sipalgprofile sipalgprofile_udp -sipdstportrange 5060 -
    openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -
```

```
    sipTransportProtocol UDP
38
39 Done
40
41 add lsn group g1 -clientname c1 -sipalg ENABLED
42
43 Done
44
45 bind lsn group g1 -poolname p1
46
47 Done
48
49 bind lsn group g1 -appsprofilename app_tcp
50
51 Done
52
53 bind lsn group g1 -appsprofilename app_udp
54
55 Done
56
57 bind lsn group g1 -sipalgprofilename sipalgprofile_tcp
58
59 Done
60
61 bind lsn group g1 -sipalgprofilename sipalgprofile_udp
62
63 Done
64 <!--NeedCopy-->
```

Application Layer Gateway for RTSP Protocol

July 16, 2023

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called an LSN pool

IP address.

- Inbound response—LSN pool IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Note

RTSP ALG is supported in a NetScaler standalone appliance, in a NetScaler high availability setup, as well as in a NetScaler cluster setup.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- TD/admin partitioning
- RSTP Authentication
- HTTP tunneling

RTSP and LSN scenario

Typically, a RTSP SETUP request specifies how a single media stream must be transported. The request contains the media stream URL and a transport specifier. This specifier typically includes one local port for receiving RTP data (audio or video), and another for receiving RTCP data (meta information). The server reply usually confirms the chosen parameters and fills in the missing parts, such as the server's chosen ports. Each media stream must be configured by using the SETUP command before an aggregate play request can be sent.

In a typical RTSP communication, the media client in the public network sends a SETUP request to the media server in the private network. RSTP ALG intercepts the request and, in the media stream, replaces the public IP address and port number with the LSN pool IP address and LSN port number.

The media server in the private network uses the LSN pool IP address and LSN port number to send a 200 OK response to the media client in the public network. The NetScaler RTSP ALG intercepts the response and replaces the LSN pool IP address and LSN port number with the public IP address and port number of the media client.

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuration Steps for LSN](#). While configuring LSN, make sure that you:

- Set the **NAT Type** as DETERMINISTIC or DYNAMIC while adding the LSN pool.
- Set the following parameters while adding the LSN application profile:
 - IP Pooling = PAIRED
 - Address and Port Mapping = ENDPOINT-INDEPENDENT
 - Filtering = ENDPOINT-INDEPENDENT
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

Sample RTSP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and RTSP ALG settings:

```
1 enable ns feature WL SP LB CS LSN
2
3 Done
4
5 add lsn pool pool1 -nattype DETERMINISTIC
6
7 Done
8
9 bind lsn pool pool1 10.102.218.246
10
11 Done
12
13 add lsn client client1
14
15 Done
16
17 bind lsn client client1 -network 200.200.200.11 -netmask 255.255.255.0
18
19 Done
20
21 add lsn appsprofile app1 TCP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
22
23 Done
24
25 add lsn appsprofile app2 UDP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
26
27 Done
28
29 bind lsn appsprofile app1 1-65535
30
31 Done
32
33 bind lsn appsprofile app2 1-65535
34
35 Done
36
```

```
37 add lsn rtspalgprofile rtspalgprofiledefault -rtspIdleTimeout 1000 -
    rtspportrange 554
38
39 Done
40
41 add lsn group group1 -clientname client1 -nattype DETERMINISTIC -
    portblocksize 512 -rtspalg ENABLED
42
43 Done
44
45 bind lsn group group1 -poolname pool1
46
47 Done
48
49 bind lsn group group1 -appsprofilename app1
50
51 Done
52
53 bind lsn group group1 -appsprofilename app2
54
55 Done
56
57 bind lsn group group1 -rtspalgprofilename rtspalgprofiledefault
58
59 Done
60 <!--NeedCopy-->
```

Application Layer Gateway for IPSec Protocol

May 2, 2023

If communication between two network devices (for example, client and server) uses the IPSec protocol, IKE traffic (which is over UDP) uses port fields, but Encapsulating Security Payload (ESP) traffic does not. If a NAT device on the path assigns the same NAT IP address (but different ports) to two or more clients at the same destination, the NAT device is unable to distinguish and properly route the return ESP traffic does not contain port information. Therefore, IPSec ESP traffic fails at the NAT device.

NAT-Traversal (NAT-T) capable IPSec endpoints detect the presence of an intermediate NAT device during IKE phase 1 and switch to UDP port 4500 for all subsequent IKE and ESP traffic (encapsulating ESP in UDP). Without NAT-T support on the peer IPSec endpoints, IPSec protected ESP traffic is transmitted without any UDP encapsulation. Therefore, IPSec ESP traffic fails at the NAT device.

The NetScaler appliance supports IPSec application layer gateway (ALG) functionality for large scale NAT configurations. The IPSec ALG processes IPSec ESP traffic and maintains session information so that the traffic does not fail when the IPSec endpoints do not support NAT-T (UDP encapsulation of ESP

traffic).

How IPsec ALG Works

An IPsec ALG monitors IKE traffic between a client and the server, and permits only one IKE phase 2 message exchange between the client and the server at any given time.

Once the two-way ESP packets are received for a particular flow, the IPsec ALG creates a NAT session for this particular flow so that subsequent ESP traffic can flow smoothly. The ESP traffic is identified by Security Parameters Indexes (SPIs), which are unique for a flow and for each direction. An IPsec ALG uses ESP SPIs in place of source and destination ports for performing large scale NAT.

If a gate receives no traffic, it times out. After both gates time out, another IKE phase 2 exchange is permitted.

IPsec ALG Timeouts

IPsec ALG on a NetScaler appliance has three timeout parameters:

- **ESP Gate Timeout.** Maximum time that the NetScaler appliance blocks an IPsec ALG gate for a particular client on a specific NAT IP address for a given server if no two-way ESP traffic is exchanged between the client and the server.
- **IKE Session Timeout.** Maximum time that the NetScaler appliance keeps the IKE session information before removing it if there is no IKE traffic for that session.
- **ESP Session Timeout.** Maximum time that NetScaler appliance keeps the ESP session information before removing it if there is no ESP traffic for that session.

Points to Consider before Configuring IPsec ALG

Before you start configuring IPsec ALG, consider the following points:

- You must understand the different components of IPsec protocol.
- IPsec ALG is not supported for DS-Lite and Large scale NAT64 configurations.
- IPsec ALG is not supported for hairpin LSN flow.
- IPsec ALG does not work with RNAT configurations.
- IPsec ALG is not supported in NetScaler clusters.

Configuration Steps

Configuring IPsec ALG for large scale NAT44 on a NetScaler appliance consists of the following tasks:

- **Create an LSN application profile and bind it to the LSN configuration.** Set the following parameters while configuring an application profile:
 - Protocol=UDP
 - IP Pooling = PAIRED
 - Port=500

Bind the application profile to the LSN group of an LSN configuration. For instructions on creating an LSN configuration, see [Configuration Steps for LSN](#).

- **Create an IPsec ALG profile.** An IPsec profile includes various IPsec timeouts, such as IKE session timeout, ESP session timeout, and ESP gate timeout. You bind an IPsec ALG profile to an LSN group. An IPsec ALG profile has the following default settings:
 - IKE session timeout = 60 minutes
 - ESP session timeout = 60 minutes
 - ESP gate timeout = 30 seconds
- **Bind the IPsec ALG profile to the LSN configuration.** IPsec ALG is enabled for an LSN configuration when you bind an IPsec ALG profile to the LSN configuration. Bind the IPsec ALG profile to the LSN configuration by setting the IPsec ALG profile parameter to the name of the created profile in the LSN group. An IPsec ALG profile can be bound to multiple LSN groups, but an LSN group can have only one IPsec ALG profile.

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
1 add lsn appsprofile <appsprofilename> UDP -ippooling PAIRED
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

To bind destination port to the LSN application profile by using the command line interface

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

To bind an LSN application profile to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> -appsprofilename <string>
2
3 show lsn group
4 <!--NeedCopy-->
```

To create an IPsec ALG profile by using the CLI

At the command prompt, type:

```
1 add ipsecalg profile <name> [-ikeSessionTimeout <positive_integer>] [-
  espSessionTimeout <positive_integer>] [-espGateTimeout <
  positive_integer>] [-connfailover ( ENABLED | DISABLED)
2
3 show ipsecalg profile <name>
4 <!--NeedCopy-->
```

To bind an IPsec ALG profile to an LSN configuration by using the CLI

At the command prompt, type:

```
1 bind lsn group <groupname> -poolname <string> - ipsecAlgProfile <string
  >
2
3 show lsn group <name>
4 <!--NeedCopy-->
```

To create an LSN application profile and bind it to an LSN configuration by using the GUI

Navigate to **System > Large Scale NAT > Profiles**, click **Application** tab, add an LSN application profile and bind it to an LSN group.

To create an IPsec ALG profile by using the GUI** Navigate to **System > Large Scale NAT > Profiles**, click **IPSEC ALG** tab, and then add an IPsec ALG profile.

To bind an IPsec ALG profile to an LSN configuration by using the GUI**

1. Navigate to **System > Large Scale NAT > LSN Group**, open the LSN group.
2. In **Advanced Settings**, click **+ IPSEC ALG Profile** to bind the created IPsec ALG profile to the LSN group.

Sample Configuration

In the following sample large scale NAT44 configuration, IPsec ALG is enabled for subscribers in the 192.0.2.0/24 network. IPsec ALG profile IPSECALGPROFILE-1 with various IPsec timeout settings is created and is bound to LSN group LSN Group -1.

Sample configuration:

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.9
14
15 Done
16
17 add lsn appsprofile LSN-APPSPROFILE-1 UDP -ippooling PAIRED
18
19 Done
20
21 bind lsn appsprofile LSN-APPSPROFILE-1 500
22
23 Done
24
25 add ipsecalg profile IPSECALGPROFILE-1 -ikeSessionTimeout 45 -
    espSessionTimeout 40 - espGateTimeout 20 -connfailover ENABLED
26
27 Done
28
29 bind lsn group LSN-GROUP-1 -appsprofilename LSN-APPSPROFILE-1
30
31 Done
32
33 bind lsn group LSN-GROUP-1 -poolname LSN-POOL-1
34
35 Done
36
37 bind lsn group LSN-GROUP-1 - ipsecAlgProfile IPSECALGPROFILE-1
38
39 Done
40 <!--NeedCopy-->
```

Logging and Monitoring LSN

May 2, 2023

You can log LSN information to diagnose, troubleshoot problems, and to meet legal requirements. You can monitor the performance of the LSN feature by using LSN statistical counters and displaying current LSN sessions.

Logging LSN

Logging LSN information is one of the important functions required by the ISPs to meet legal requirements and for identifying the source of traffic at any given time.

A NetScaler appliance logs LSN mapping entries and the LSN sessions created or deleted for each LSN group. You can control logging of LSN information for an LSN group by using the logging and session logging parameters of the LSN group. These are group level parameters and are disabled by default. The NetScaler appliance logs LSN sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

Logging	Session Logging	Logging Behavior
Enabled	Enabled	Logs LSN mapping entries as well as LSN sessions.
Enabled	Disabled	Logs LSN mapping entries but not LSN sessions.
Disabled	Enabled	Logs neither mapping entries nor LSN sessions.

A log message for an LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (MAPPING)
- Whether the LSN mapping entry was created or deleted
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name

- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for Endpoint-Independent mapping.
 - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
 - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for an LSN session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (SESSION)
- Whether the LSN session is created or removed
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG action entities.

For logging LSN information, Citrix recommends:

- Logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large amounts of LSN log entries (in order of millions).
- Using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.

Note:

- The SYSLOG generated on NetScaler appliance are dynamically sent to the external log servers.
- When using SYSLOG over TCP, if the TCP connection is down or the SYSLOG server is busy, then the NetScaler appliances stores the logs in buffer and send the data once the connection is active.

For more information about configuring logging, see [Audit Logging](#).

Configuring LSN logging consists of the following tasks:

- **Configuring the NetScaler appliance for logging.** This task involves creating and setting various entities and parameters of the NetScaler appliance:
 - **Create a SYSLOG or NSLOG audit logging configuration.** Creating an audit logging configuration involves the following tasks:
 - * Create a NSLOG or SYSLOG audit action and enable the LSN parameter. Audit actions specify the IP addresses of log servers.
 - * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy. Audit actions specify the IP addresses of log servers. Optionally, you can set the transport method for log messages that are sent to the external log servers. By default UDP is selected, you can set the transport method as TCP for a reliable transport mechanism. Bind the audit policy to system global.
 - * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy.
 - * Bind the audit policy to system global.

Note: For an existing audit logging configuration, just enable the LSN parameter for logging LSN information in the server specified by the audit action.
 - **Enable logging and session logging parameters.** Enable logging and session logging parameters either as you add LSN groups or after you have created the groups. The NetScaler appliance generates log messages related to these LSN groups and sends them to the server of those audit actions that have the LSN parameter enabled.
- **Configuring log servers.** This task involves installing SYSLOG or NSLOG packages on the desired servers. This task also involves specifying the NSIP address of the NetScaler appliance in the configuration file of SYSLOG or NSLOG. Specifying the NSIP address enables the server to identify the log information sent by the NetScaler appliance for storing them in a log file.

For more information about configuring logging, see [Audit Logging](#).

SYSLOG Configuration Using the Command Line Interface

To create a SYSLOG server action for LSN logging by using the command line interface At the command prompt, type:

```
1 add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel
  <logLevel>... [-transport (TCP)] [-lsn ( ENABLED | DISABLED )]
2 <!--NeedCopy-->
```

To create a SYSLOG server policy for LSN logging by using the command line interface At the command prompt, type:

```
1 add audit syslogPolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

To bind a SYSLOG server policy to system global for LSN logging by using the command line interface At the command prompt, type:

```
1 bind system global [<policyName> [-priority <positive_integer>]]
2 <!--NeedCopy-->
```

SYSLOG Configuration Using the Configuration Utility

To configure a SYSLOG server action for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Syslog** and, on the Servers tab, add a new auditing server or edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.
3. (Optional) To enable SYSLOG over TCP, select the **TCP Logging** option.

To configure a SYSLOG server policy for LSN logging by using the configuration utility Navigate to **Systems > Auditing > Syslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

To bind a SYSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Syslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

NSLOG Configuration Using the Command Line Interface

To create a NSLOG server action for LSN logging by using the command line interface At the command prompt, type:

```
1 add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel
  <logLevel> ... [-lsn ( ENABLED | DISABLED )]
2 <!--NeedCopy-->
```

To create a NSLOG server policy for LSN logging by using the command line interface At the command prompt, type:

```
1 add audit nslogPolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

To bind a NSLOG server policy to system global for LSN logging by using the command line interface At the command prompt, type:

```
1 bind system global [<policyName>]
2 <!--NeedCopy-->
```

NSLOG Configuration Using the Configuration Utility

To configure a NSLOG server action for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Nslog** and, on the **Servers** tab, add a new auditing server or, edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.

To configure a NSLOG server policy for LSN logging by using the configuration utility Navigate to **Systems > Auditing > Nslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

To bind a NSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Nslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

Example The following configuration specifies two SYSLOG and two NSLOG servers for storing log entries including LSN logs. LSN Logging is configured for LSN groups LSN-GROUP-2 and LSN-GROUP-3.

The NetScaler appliance generates log messages related to LSN mappings and LSN sessions of these LSN groups, and sends them to the specified log servers.

```
1 add audit syslogAction SYS-ACTION-1 198.51.101.10 -logLevel ALL -lsn
   ENABLED
2 Done
3 add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
4 Done

Minimal Logging

Deterministic LSN configurations and Dynamic LSN configurations with port block significantly reduces the LSN log volume. For these two types of configuration, the NetScaler appliance allocates a NAT IP address and a block of ports to a subscriber. The NetScaler appliance generates a log message for a port block at the time of allocation to a subscriber. The NetScaler appliance also generates a log message when a NAT IP address and port block is freed. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. The appliance also neither logs any mapping entry created for a session nor when the mapping entry gets removed.

The minimal logging feature for deterministic LSN configurations and dynamic LSN configurations with port block is enabled by default and there is no provision to disable it. In other words, the NetScaler appliance automatically do minimal logging for deterministic LSN configurations and dynamic LSN configurations with port block. There is no option available for disabling this feature. The appliance sends the log messages to all the configured log servers.

A log message for each port block consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type as DETERMINISTIC or PORTBLOCK

- Whether a port block is allocated or is freed
- Subscriber's IP address and the assigned NAT IP address and port block
- Protocol name

Minimal Logging for Deterministic LSN Configuration

Consider an example of a simple deterministic LSN configuration for four subscribers having the IP address 192.0.17.1, 192.0.17.2, 192.0.17.3, and 192.0.17.4.

In this LSN configuration, the port block size is set to 32768 and LSN NAT IP address pool has IP addresses in the range 203.0.113.19-203.0.113.23.

```

1 add lsn client LSN-CLIENT-7
2 Done
3 bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask
  255.255.255.253
4 Done
5 add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
6 Done
7 bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
8 Done
9 add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype
  DETERMINISTIC -portblocksize 32768
10 Done
11 bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
12 Done
13 <!--NeedCopy-->

```

The NetScaler appliance sequentially preallocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-33791) on the beginning NAT IP address (203.0.113.19) to the beginning subscriber IP address (192.0.17.1). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The appliance logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers. The appliance generates the following log messages for the LSN configuration.

```

1 1) 03/23/2015:00:30:56 GMT Informational 0-PPE-0 : default LSN
  LSN_DETERMINISTIC 79201453 0 : Dtrstc ALLOC Client 12.0.0.241,

Minimal Logging for Dynamic LSN Configuration with Port Block

Consider an example of a simple dynamic LSN configuration with port block for any subscriber in the network 192.0.2.0/24. In this LSN configuration, the port block size is set to 1024 and LSN NAT IP address pool has IP addresses in the range 203.0.113.3-203.0.113.4.

```

1 set lsn parameter -memLimit 4000
2 Done
3 add lsn client LSN-CLIENT-1
4 Done
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6 Done
7 add lsn pool LSN-POOL-1
8 Done
9 bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
10 Done
11 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
12 Done
13 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
14 Done
15 <!--NeedCopy-->

```

The NetScaler appliance allocates a random NAT IP address and a block of ports, from the LSN NAT IP pool and on the basis of the set port block size, for a subscriber when it initiates a session for the first time. The NetScaler logs the NAT IP address and block of ports allocated to this subscriber. The appliance does not log any LSN session created or deleted for this subscriber. If all the ports are allocated (for different subscriber's sessions) from the subscriber's allocated port block, the appliance

allocates a new random NAT IP address and port block for the subscriber for additional sessions. The NetScaler logs every NAT IP address and port block allocated to a subscriber.

The appliance generates the following log message when the subscriber, having the IP address 192.0.2.1, initiates a session. The log message shows that the appliance has allocated NAT IP address 203.0.113.3 and port block 1024-2047 to the subscriber.

```
1 03/23/2015:00:07:12 GMT Informational 0-PPE-3 : default LSN
  LSN_PORTBLOCK 106725793 0 : Portblock ALLOC Client 12.0.2.72,
  NatInfo 203.0.113.3:1024 to 2047, Proto:TCP
2 <!--NeedCopy-->
```

Once there are no more sessions left that is using the allocated NAT IP address and one of the ports in the allocated port block, the allocated NAT IP address and block of ports is freed from the subscriber. The NetScaler logs that the NAT IP address and the block of ports is freed from the subscriber. The appliance generates the following log messages for the subscriber, having the IP address 192.0.2.1, when no more sessions are left that is using the allocated NAT IP address (203.0.113.3) and a port from the allocated port block (1024-2047). The log message shows that the NAT IP address and port block are freed from the subscriber.

```
1 03/23/2015:00:11:09 GMT Informational 0-PPE-3 : default LSN
  LSN_PORTBLOCK 106814342 0 : Portblock FREE Client 12.0.3.122,
  NatInfo 203.0.113.3: 1024 to 2047, Proto:TC
2 <!--NeedCopy-->
```

Load Balancing SYSLOG Servers

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
1 add service <name>(<IP> | <serverName>) <serviceType (SYSLOGTCP |
  SYSLOGUDP)> <port>
2 <!--NeedCopy-->
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

```
1 add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod
  <AUDITLOGHASH>]
2 <!--NeedCopy-->
```

Bing the service to the load balancing virtual server.

```
1 Bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
1 add syslogaction <name> <serverIP> [-lbVserverName <string>] [-logLevel
  <logLevel>]
2 <!--NeedCopy-->
```

Add a SYSLOG policy by specifying the rule and action.

```
1 add syslogpolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
1 bind system global <policyName>
2 <!--NeedCopy-->
```

Load balancing of SYSLOG servers using the configuration utility

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

3. Bing the service to the load balancing virtual server to the service.

Bing the service to the load balancing virtual server.

Navigate to Traffic Management > Virtual Servers, select a virtual server and then selectAUDIT-LOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYS-LOGUDP as service type.

Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.

5. Add a SYSLOG policy by specifying the rule and action.

Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
1 add service service1 192.0.2.10 SYSLOGUDP 514
2 Done
3
4 add service service2 192.0.2.11 SYSLOGUDP 514
5 Done
6
7 add service service3 192.0.2.11 SYSLOGUDP 514
8 Done
9
10 add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
11 Done
12
13 bind lb vserver lbvserver1 service1
14 Done
15
16 bind lb vserver lbvserver1 service2
17 Done
18
19 bind lb vserver lbvserver1 service3
20 Done
21
22 add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
23 Done
24
25 add syslogpolicy syspol1 ns_true sysaction1
26 Done
27
28 bind system global syspol1
29 Done
30 <!--NeedCopy-->
```

Logging HTTP Header Information

The NetScaler appliance can now log request header information of an HTTP connection that is using the LSN functionality of the NetScaler. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to.
- HTTP Method specified in the HTTP request.
- HTTP version used in the HTTP request.
- IP address of the subscriber that sent the HTTP request.

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular websites among a set of subscribers.

An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging. The HTTP header log profile is then bound to an LSN group. The NetScaler appliance then logs HTTP header attributes, which are enabled in the bound HTTP header log profile for logging, of any HTTP requests related to the LSN group. The appliance then sends the log messages to the configured log servers.

An HTTP header log profile can be bound to multiple LSN groups but an LSN group can have only one HTTP header log profile.

To create an HTTP header log profile by using the the command line interface

At the command prompt, type:

```
1 add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED |  
    DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (   
    ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]  
2  
3 show lsn httphdrlogprofile  
4 <!--NeedCopy-->
```

To bind an HTTP header log profile to an LSN group by using the the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> -httphdrlogprofilename <string>  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

Example

In the following example of an LSN configuration, HTTP header log profile HTTP-Header-LOG-1 is bound to LSN group LSN-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging so that all these attributes are logged for any HTTP requests from subscribers (in the network 192.0.2.0/24) related to the LSN group.

```
1 add lsn httphdrlogprofile HTTP-HEADER-LOG-1
2 Done
3
4 set lsn parameter -memLimit 4000
5 Done
6
7 add lsn client LSN-CLIENT-1
8 Done
9
10 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
11 Done
12
13 add lsn pool LSN-POOL-1
14 Done
15
16 bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
17 Done
18
19 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
20 Done
21
22 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
23 Done
24
25 bind lsn group LSN-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1
26 Done
27 <!--NeedCopy-->
```

The NetScaler generates the following HTTP header log message when one of the subscriber belonging to the LSN configuration example sends an HTTP request.

The log message tells us that a client having the IP address 192.0.2.33 sends an HTTP request to URL example.com using HTTP method GET and HTTP version 1.1.

```
1 03/19/2015:16:24:04 GMT Informational 0-PPE-1 : default LSN Message 59
   0 : "LSN Client IP:TD 10.102.37.118:0 URL: example.com Host:
     192.0.2.33 Version: HTTP1.1 Method: GET"
2 <!--NeedCopy-->
```

Logging MSISDN Information

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber's operator.

You can configure a NetScaler appliance to include MSISDNs in LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs helps the administrator in faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.3:45195.

Log Entry Type	Sample Log Entry
LSN session creation	Oct 14 15:37:30 10.102.37.77 10/14/2015:10:08:14 GMT 0-PPE-6 : default LSN LSN_SESSION 25012 0 : SESSION CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP
LSN mapping creation	Oct 14 15:37:30 10.102.37.77 10/14/2015:10:08:14 GMT 0-PPE-6 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP
LSN session deletion	Oct 14 15:40:30 10.102.37.77 10/14/2015:10:11:14 GMT 0-PPE-6 : default LSN LSN_SESSION 25012 0 : SESSION CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP

Log Entry Type	Sample Log Entry
LSN mapping	Oct 14 15:40:30 10.102.37.77 10/14/2015:10:11:14 GMT 0-PPE-6 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP

Perform the following tasks for including MSISDN information in LSN logs

- **Create an LSN log profile.** An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration. Enable the log subscriber ID parameter when creating the LSN log profile.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. For instructions on configuring Large Scale NAT, see [Configuration Steps for LSN](#).

To create an LSN log profile by using the CLI At the command prompt, type:

```
1 add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED |
   DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

Sample Configuration:

In this example of LSN configuration, the LSN log profile has the log subscriber ID parameter enabled. The profile is bound to LSN group LSN-GROUP-9. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in the network 192.0.2.0/24).

```
1 add lsn logprofile LOG-PROFILE-MSISDN-9 -logSubscriberID ENABLED
2
```

```
3 Done
4 add lsn client LSN-CLIENT-9
5
6 Done
7 bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
8
9 Done
10 add lsn pool LSN-POOL-9
11
12 Done
13 bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
14
15 Done
16 add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
17
18 Done
19 bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
20
21 Done
22 bind lsn group LSN-GROUP-9 -logfilename LOG-PROFILE-MSISDN-9
23
24 Done
25 <!--NeedCopy-->
```

Displaying Current LSN Sessions

You can display the current LSN sessions for detecting any unwanted or inefficient LSN sessions on the NetScaler appliance. You can display all or some LSN sessions on the basis of selection parameters.

Note: When more than a million LSN sessions exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all by using the selection parameters.

Configuration Using the Command Line Interface

To display all LSN sessions by using the command line interface At the command prompt, type:

```
1 show lsn session
2 <!--NeedCopy-->
```

To display selective LSN sessions by using the command line interface At the command prompt, type:

```
1 show lsn session [-clientname <string>] [-network <ip_addr> [-netmask <
  netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <
  port>]]
2 <!--NeedCopy-->
```

Example To display all LSN sessions existing on a NetScaler

```
> show lsn session
      SubscrIP          SubscrPort    SubscrTD          DstIP          DstPort DstTD    NatIP NatPort Proto  Dir
1.    192.0.2.10        15136      0          198.51.100.9      80      0    203.0.113.6    6234    TCP  OUT

Done
```

Configuration Using the Configuration Utility

To display all or selected LSN sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the NAT44 tab.
2. For displaying LSN sessions on the basis of selection parameters, click Search.

Parameter Descriptions (of commands listed in the CLI procedure)

- show lsn session
 - clientname
Name of the LSN Client entity. Maximum Length: 127

- network
IP address or network address of subscriber(s).
- netmask
Subnet mask for the IP address specified by the network parameter.
Default value: 255.255.255.255
- td
Traffic domain ID of the LSN client entity.
Default value: 0
Minimum value: 0
Maximum value: 4094
- natIP
Mapped NAT IP address used in LSN sessions.

Displaying LSN Statistics

You can display statistics related to the LSN feature for evaluating the performance of the LSN feature or to troubleshoot problems. You can display a summary of statistics of the LSN feature or of a particular LSN group. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

To display all LSN statistics by using the command line interface

At the command prompt, type:

```
1 stat lsn
2 <!--NeedCopy-->
```

To display statistics for a specified LSN group by using the command line interface

At the command prompt, type:

```
1 stat lsn group [<groupname>]
2 <!--NeedCopy-->
```

Example

```

1 > stat lsn
2
3 Large Scale NAT statistics
4
5 LSN TCP Received Packets          Rate(/s)
   40                               Total
6 LSN TCP Received Bytes           0
   3026
7 LSN TCP Transmitted Packets      0
   40
8 LSN TCP Transmitted Bytes        0
   3026

44			
45	Done		
46	<!--NeedCopy-->		

Parameter Descriptions (of commands listed in the CLI procedure)

- stat lsn group
 - groupname
Name of the LSN Group. Maximum Length: 127
 - detail
Specifies detailed output (including more statistics). The output can be quite voluminous. Without this argument, the output will show only a summary.
 - fullValues
Specifies that numbers and strings should be displayed in their full form. Without this option, long strings are shortened and large numbers are abbreviated.
 - ntimes
The number of times, in intervals of seven seconds, the statistics should be displayed.
Default value: 1

- logFile
The name of the log file to be used as input.
- clearstats
Clear the statistics / counters
Possible values: basic, full

Compact Logging

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

The following examples of NAT44 mapping creation log entries show the advantage of compact logging.

Default logging format	02/02/2016:01:13:01 GMT Informational 0-PPE-2 : default LSN LSN_ADDRPORT_MAPPING 85 0 : A&PDM CREATED Clie- tIP:Port:TD1.1.1.1:6500:0,NatIP:NatPort8.8.8.8:47902, DestinationIP:Port:TD2.2.2.2:80:0, Protocol: TCP
Compact logging format	02/02/2016:01:14:57 GMT Info 0-PE2:default LSN 87 0:A&PDMC C-1.1.1.1:6500:0 N-8.8.8.9:51066 D- 2.2.2.2:80:0 T

Configuration Steps

Perform the following tasks for logging LSN information in compact format:

- **Create an LSN log profile.** An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

To create an LSN log profile by using the CLI

At the command prompt, type:

```
1 add lsn logprofile <logfilename> -logCompact (ENABLED|DISABLED)
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogfilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

Sample configuration:

```
1 add lsn logprofile LOG-PROFILE-COMPACT-9 -logCompact ENABLED
2
3 Done
4 add lsn client LSN-CLIENT-9
5 Done
6 bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
7 Done
8 add lsn pool LSN-POOL-9
9 Done
10 bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
11 Done
12 add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
13 Done
14 bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
15 Done
16 bind lsn group LSN-GROUP-9 -logProfileName LOG-PROFILE-COMPACT-9
17 Done
18 <!--NeedCopy-->
```

IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following large scale NAT44 related events:

- Creation or deletion of an LSN session.

- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

Points to Consider before you Configure IPFIX logging

Before you start configuring IPsec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature topic.

Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

To enable LSN logging in the AppFlow configuration by using the CLI At the command prompt, type:

```
1 set appflow param -lsnLogging ( ENABLED | DISABLED )
2
3 show appflow param
4 <!--NeedCopy-->
```

To create an LSN log profile by using the CLIAt the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

To create an LSN log profile by using the GUI Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

TCP SYN Idle Timeout

May 2, 2023

SYN idle timeout is the timeout for establishing TCP connections that use LSN on the NetScaler appliance. If a TCP session is not established within the configured timeout period, the NetScaler removes the session. SYN idle timeout is useful in providing protection against SYN flood attacks. In an LSN configuration, the LSN group entity includes the SYN idle timeout setting.

Example:

In the following sample LSN configuration, SYN idle timeout is set to 30 secs for TCP connections related to subscribers from the 192.0.2.0/24 network.

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
```

```
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -synidletimeout 30
18
19 Done
20
21 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
22
23 Done
24 <!--NeedCopy-->
```

Overriding LSN configuration with Load Balancing Configuration

May 2, 2023

An LSN configuration takes precedence over any load balancing configuration by default. For overriding the large scale networking (LSN) configuration with the load balancing configuration for traffic matching both configurations, create a net profile with Override LSN parameter enabled and bind this profile to the virtual server of the load balancing configuration. USNIP or USIP settings of the load balancing configuration are applied to the traffic, instead of applying the LSN IP address of the LSN configuration.

This option is useful in an LSN deployment that includes NetScaler appliances and value added services, such as firewall and optimization devices. In this type of deployment, the ingress traffic on the NetScaler appliance is required to pass through these value-added services before an LSN configuration on the appliance is applied to the traffic. For the NetScaler appliance to send the ingress traffic to a value added service, a load balancing configuration is created and override LSN is enabled on the appliance. The load balancing configuration includes value added services, represented as load balancing services, bound to a virtual server of type ANY. The virtual server is configured with listen policies for identifying the traffic to be sent to the value added service.

To enable override lsn in a net profile by using the CLI

To enable override lsn while adding a net profile, at the command prompt, type

```
1 add netProfile <name> -overrideLsn ( ENABLED | DISABLED )
2
3 show netprofile <name>
4 <!--NeedCopy-->
```

To enable override lsn while adding a net profile, at the command prompt, type

```
1 set netProfile <name> -overrideLsn ( ENABLED | DISABLED )
2
3 show netprofile <name>
4 <!--NeedCopy-->
```

To enable override lsn in a net profile by using GUI

1. Navigate to **System > Network > Net Profiles**.
2. Set the **Override LSN** parameter while adding or modifying net profiles.

In the following sample configuration, net profile NETPROFILE-OVERRIDELSN-1 has override LSN option enabled and is bound to load balancing virtual server LBVS-1.

Sample configuration:

```
1 add netprofile NETPROFILE-OVERRIDELSN-1 -overrideLsn ENABLED
2
3 Done
4
5 set lb vserver LBVS-1 -netprofile NETPROFILE-OVERRIDELSN-1
6
7 Done
8 <!--NeedCopy-->
```

Clearing LSN Sessions

May 2, 2023

You can remove any unwanted or inefficient LSN sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected LSN sessions from the NetScaler appliance.

To clear all LSN sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session
2
3 show lsn session
4 <!--NeedCopy-->
```

To clear selective LSN sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session [-clientname <string>] [-network <ip_addr> [-netmask  
   <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <  
   port>]]  
2  
3 show lsn session  
4 <!--NeedCopy-->
```

Example

Clear all LSN sessions existing on a NetScaler

```
1 flush lsn session  
2  
3 Done  
4 <!--NeedCopy-->
```

Clear all LSN sessions related to LSN client entity LSN-CLIENT-1

```
1 flush lsn session -clientname LSN-CLIENT-1  
2  
3 Done  
4 <!--NeedCopy-->
```

Clear all LSN sessions related to a subscriber network (192.0.2.0) of LSN client entity LSN-CLIENT-2 belonging to traffic domain 100

```
1 flush lsn session -clientname LSN-CLIENT-2 - network 192.0.2.0 -  
   netmask 255.255.255.0 - td 100  
2  
3 Done  
4 <!--NeedCopy-->
```

To clear all LSN sessions by using the configuration utility

Navigate to System > Large Scale NAT > Sessions, and click Flush Sessions.

Parameter Descriptions (of commands listed in the CLI procedure)

- flush lsn session
 - clientname
Name of the LSN Client entity. Maximum Length: 127

- network
IP address or network address of subscriber(s).
- netmask
Subnet mask for the IP address specified by the network parameter.
Default value: 255.255.255.255
- td
Traffic domain ID of the LSN client entity.
Default value: 0
Minimum value: 0
Maximum value: 4094
- natIP
Mapped NAT IP address used in LSN sessions.
- natPort
Mapped NAT port used in the LSN sessions.

Load Balancing SYSLOG Servers

May 2, 2023

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
1 add service <name>(<IP> | <serverName>) <serviceType (SYSLOGTCP |  
   SYSLOGUDP)> <port>  
2 <!--NeedCopy-->
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

```
1 add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod  
  <AUDITLOGHASH>]  
2 <!--NeedCopy-->
```

Bind the service to the load balancing virtual server.

```
1 bind lb vserver <name> <serviceName>  
2 <!--NeedCopy-->
```

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
1 add syslogaction <name> <serverIP> [-lbVserverName <string>] [-logLevel  
  <logLevel>]  
2 <!--NeedCopy-->
```

Add a SYSLOG policy by specifying the rule and action.

```
1 add syslogpolicy <name> <rule> <action>  
2 <!--NeedCopy-->
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
1 bind system global <policyName>  
2 <!--NeedCopy-->
```

Load balancing of SYSLOG servers using the configuration utility

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

3. Bing the service to the load balancing virtual server to the service.

Bing the service to the load balancing virtual server.

Navigate to Traffic Management > Virtual Servers, select a virtual server and then selectAUDITLOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.

5. Add a SYSLOG policy by specifying the rule and action.

Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
1 add service service1 192.0.2.10 SYSLOGUDP 514
2
3 add service service2 192.0.2.11 SYSLOGUDP 514
4
5 add service service3 192.0.2.11 SYSLOGUDP 514
6
7 add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
8
9 bind lb vserver lbvserver1 service1
10
11 bind lb vserver lbvserver1 service2
12
13 bind lb vserver lbvserver1 service3
14
15 add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
16
17 add syslogpolicy syspol1 ns_true sysaction1
18
19 bind system global syspol1
20 <!--NeedCopy-->
```

Limitations:

The NetScaler appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

Port Control Protocol

May 2, 2023

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
 - Mapping: Enabled
 - Peer: Enabled
 - Minimum map life: 120 seconds
 - Maximum max life: 86400 seconds
 - Announce count: 10
 - Third Party: Disabled

- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

Note

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
  ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
  announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
  DISABLED )]
2
3 show pcp profile <name>
4 <!--NeedCopy-->
```

To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
  string>]
2
3 show pcp server <name>
4 <!--NeedCopy-->
```

Sample Configuration for NAT44

In the following sample configuration, PCP server PCP-SERVER-9, with default PCP settings, is bound to LSN group LSN-GROUP-9. PCP-SERVER-9 serves PCP requests from subscribers in network 192.0.2.0/24.

Sample configuration:

```
1 add pcp server PCP-SERVER-9 192.0.3.9
2
3 Done
```

```
4
5 add lsn client LSN-CLIENT-9
6
7 Done
8
9 bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
10
11 Done
12
13 add lsn pool LSN-POOL-9
14
15 Done
16
17 bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
18
19 Done
20
21 add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
22
23 Done
24
25 bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
26
27 Done
28
29 bind lsn group LSN-GROUP-9 -pcpServer PCP-SERVER-9
30
31 Done
32 <!--NeedCopy-->
```

LSN44 in a cluster setup

May 2, 2023

Large scale NAT44 configurations are supported on a NetScaler cluster setup.

A NetScaler cluster is a group of NetScaler appliances that are configured and managed as a single system. A NetScaler cluster provides scalability and availability. Each NetScaler appliance in a cluster setup acts as an independent LSN entity and is managed as a single system.

The LSN configuration in a cluster setup is same as in a standalone appliance except a specific pool of LSN IP addresses are owned by only one node at a time. In other words, an LSN IP pool entity is configured as a spotted entity in a particular node. All the nodes of a cluster setup can have a specific LSN IP pool entity. To make sure that the packets related to an LSN session are received on the same cluster node that performed the NAT operation, policy based backplane (PBS) steering is configured. PBS steers the received related packets of an LSN session to the same cluster node.

Sample configuration:

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 -ownerNode 1 203.0.113.3
14
15 Done
16
17 bind lsn pool LSN-POOL-1 -ownerNode 2 203.0.113.3
18
19 Done
20
21 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
22
23 Done
24
25 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
26
27 Done
28
29 add ns acl b1 ALLOW -srcIP = 192.0.2.0-192.0.2.255 -type DFD -dfdhash
    SIP
30
31
32 Done
33
34 apply ns acls -type DFD
35
36 Done
37 <!--NeedCopy-->
```

Dual-Stack Lite

August 11, 2023

Note:

Dual-Stack Lite feature is deprecated from NetScaler 14.1 release onwards.

Deprecated features are not removed immediately. The NetScaler appliance continues to sup-

port the deprecated feature until it is removed in a future release.

Because of the shortage of IPv4 addresses, and the advantages of IPv6 over IPv4, many ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses only IPv4, and many subscribers do not support IPv6.

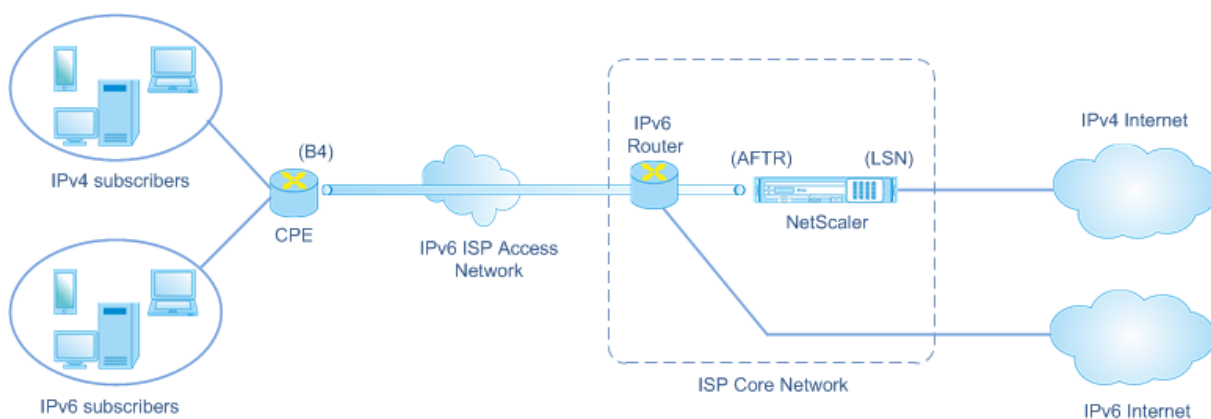

Dual Stack Lite (DS-Lite) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the Internet. DS-Lite uses IPv4-in-IPv6 tunneling to send a subscriber's IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber's IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN related processing. The response packets traverse through the same path to the subscriber.

The NetScaler appliance implements the AFTR component of a DS-Lite deployment and is compliant with RFC 6333.

Architecture

The Dual-Stack Lite architecture for an ISP consists of the following components:

- **Basic Bridging Broadband (B4).** Basic Bridging broadband, or B4, is a device or component that resides in the subscriber premises. Typically, B4 is a component in the CPE devices in the subscriber premises. IPv4 subscribers are connected to the IPv6-only ISP access network through the CPE device containing the B4 component. The main function of the B4 is to initiate an IPv6 tunnel between B4 and an address family transition router (AFTR) in order to send or receive subscriber IPv4 request or response packets over the tunnel. B4 includes an IPv6 address known as the B4 tunnel endpoint address. B4 uses this address to source IPv6 packets to AFTR and receive packets from AFTR.
- **Address family transition router (AFTR).** AFTR is a device or component residing in the ISP's core network. AFTR terminates the IPv6 tunnel from the B4 device. In other words, the IPv6 tunnel is formed between B4 in the subscriber premise and AFTR in ISP core network. AFTR decapsulates IPv6 packets received from B4 to recover the subscribers' original IPv4 packets. AFTR sends the IPv4 packets to the LSN device or component. LSN routes the IPv4 packets to their destination after performing NAT address and port translation (NAT 44) and other LSN related processing. AFTR includes an IPv6 address known as the AFTR tunnel endpoint address. AFTR uses this address to source IPv6 packets to B4 and receive IPv6 packets from B4. The NetScaler appliance implements the AFTR component.
- **Softwire.** The IPv6 tunnel created between B4 and AFTR is called a softwire.

The DS-Lite architecture of an ISP using a NetScaler appliance consists of subscribers in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP's core network. IPv4 subscribers are connected to a CPE device that includes the DS-Lite B4 functionality. The CPE device is connected to the ISP core network through ISP's IPv6-only access network. The NetScaler appliance contains the DS-Lite AFTR and LSN functionality.

IPv4 subscribers connected to the CPE device are assigned private IPv4 addresses either manually or through DHCP server running on the CPE device. On the CPE device, the AFTR tunnel endpoint address is specified manually or through DHCPv6. Configuration of CPE devices is vendor specific and therefore outside the scope of this documentation.

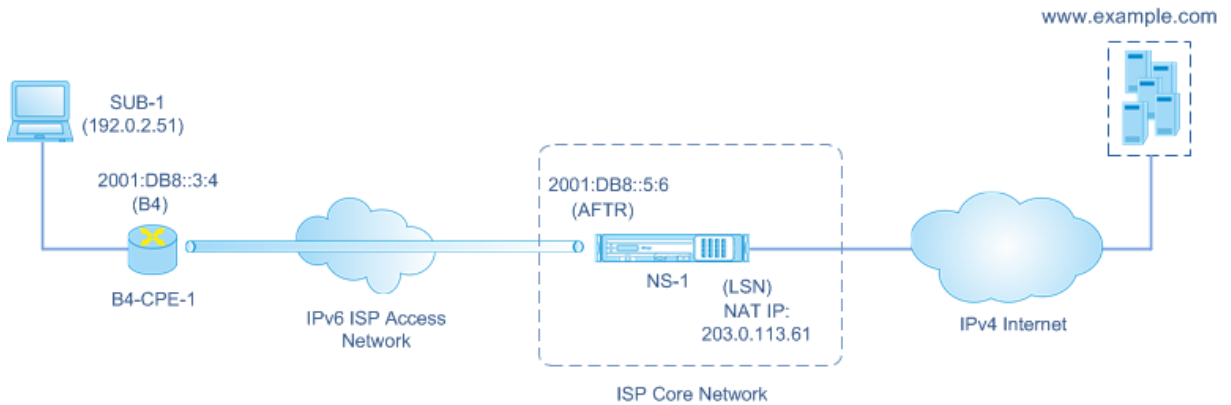

Upon receiving a request packet that is from an IPv4 subscriber and destined to a location on the Internet, the B4 component of the CPE device encapsulates the IPv4 packet in an IPv6 packet and sends it to the NetScaler appliance in the ISP core network. The NetScaler appliance's AFTR functionality decapsulates the IPv6 packet to recover the subscriber's original IPv4 packet. The LSN functionality of the NetScaler appliance translates the source IP address and port of the IPv4 packet to a NAT IP address and NAT port selected from the configured NAT pool, and then sends the packet to its destination on the Internet.

The appliance maintains a record of all active sessions that use the AFTR and LSN functionalities. These sessions are called DS-Lite sessions. The NetScaler appliance also maintains the mappings between B4 IPv6 address, subscriber IPv4 address and port, and NAT IPv4 address and port, for each DS-Lite session. These mappings are called DS-Lite LSN mappings. From DS-Lite session entries and DS-Lite LSN mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular DS-Lite session.

When the NetScaler appliance receives a response packet belonging to a particular DS-Lite session, the appliance's LSN functionality translates the destination IP address and port of the response packet from NAT IP address and port to the subscriber IP address and port, the AFTR functionality encapsulates the resulting packet in an IPv6 packet and sends it to the CPE device. The B4 functionality of the CPE device decapsulates the IPv6 packet to recover the IPv4 response packet, and then sends the IPv4 packet to the subscriber.

Example

Consider an example of a DS-Lite deployment consisting of NetScaler NS-1 in an ISP’s core network, CPE device B4-CPE-1 in a subscriber premise, and a single IPv4 subscriber SUB-1. B4-CPE-1 supports the B4 functionality of DS-Lite feature.

The following table lists the settings used in this example.

Entity	Name	Details
IPv4 address of subscriber SUB-1		192.0.2.51
IPv6 address of softwire endpoint on the B4 device (B4-CPE-1)		2001:DB8::3:4
IPv6 address of the softwire endpoint on the AFTR device (NS-1)		2001:DB8::5:6

Settings on NetScaler appliance NS-1:

Entity	Name	Details
LSN client	LSN-DSLITE-CLIENT-1	Network6 (Identifying traffic from B4 devices) = 2001:DB8::3:0/100
LSN pool	LSN-DSLITE-POOL-1	LSN IPs (NAT IP) = 203.0.113.61 - 203.0.113.70
IPv6 Profile	LSN-DSLITE-PROFILE-1	Type = DS-LITE; IPv6 address (AFTR IPv6 address) = One of the NetScaler owned IPv6 address of type SNIP6 = 2001:DB8::5:6

Entity	Name	Details
LSN group	LSN-DSLITE-GROUP-1	LSN client = LSN-DSLITE-CLIENT-1; LSN pool = LSN-DSLITE-POOL-1; IPv6 profile = LSN-DSLITE-PROFILE-1

Following is the traffic flow in this example:

1. IPv4 subscriber SUB-1 sends a request to (<http://www.example.com/>). The IPv4 packet has:
 - Source IP address = 192.0.2.51
 - Source port = 2552
 - Destination IP address = 198.51.100.250
 - Destination port = 80
2. Upon receiving the IPv4 request packet, B4-CPE-1 encapsulates it in the payload of an IPv6 packet and then sends the IPv6 packet to NS-1. The IPv6 packet has:
 - Source IP address = 2001:DB8::3:4
 - Destination IP address = 2001:DB8::5:6
3. When NS-1 receives the IPv6 packet, the AFTR module decapsulates the packet by removing the IPv6 headers. The resulting packet is SUB-1's original IPv4 request packet.
4. The LSN module of NS-1 translates the source IP address and port of the packet to a NAT IP address and NAT port selected from the configured NAT pool. The translated IPv4 packet has:
 - Source IP address = 203.0.113.61
 - Source port = 3002
 - Destination IP address = 198.51.100.250
 - Destination port = 80
5. The LSN module also creates an LSN mapping and session entry for this DS Lite session. The mapping includes the following information:
 - Source IP address of the IPv6 packet (B4-CPE-1's IPv6 address) = 2001:DB8::3:4
 - Source IP address of the IPv4 packet (SUB-1's IPv4 address) = 192.0.2.51
 - Source port of the IPv4 packet = 2552
 - NAT IP address = 203.0.113.61
 - NAT port = 3002

6. NS-1 sends the resulting IPv4 packet to its destination on the Internet.
7. The server for `www.example.com` processes the request packet and sends a response packet. The IPv4 response packet has:
 - Source IP address = 198.51.100.250
 - Source port = 80
 - Destination IP address = 203.0.113.61
 - Destination port = 3002
8. Upon receiving the IPv4 packet, NS-1 examines the LSN mapping and session entries and finds that the IPv4 response packet belongs to a DS Lite session. The LSN module of NS-1 translates the destination IP address and port. The IPv4 packet now has:
 - Source IP address = 198.51.100.250
 - Source port = 80
 - Destination IP address = 192.0.2.51
 - Destination port = 2552
9. The AFTR module of NS-1 encapsulates the IPv4 packet in an IPv6 packet and then sends the IPv6 packet to B4-CPE-1. The IPv6 packet has:
 - Source IP address = 2001:DB8::5:6
 - Destination IP address = 2001:DB8::3:4
10. Upon receiving the packet, B4-CPE-1 decapsulates the IPv6 packet by removing the IPv6 headers, and then sends the resulting IPv4 packet to CL-1.

Points to Consider before Configuring DS-Lite

May 2, 2023

Consider the following points before configuring DS-Lite on a NetScaler appliance:

1. You must understand the different components of DS-Lite, described in RFC 6333.
2. A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address AFTR component on a NetScaler appliance. For more information on NetScaler LSN feature, see [Large Scale NAT](#).

3. For a DS-Lite configuration, the NetScaler appliance supports LSN for IPv4 packets that belong to one of the following protocols only. The NetScaler appliance drops IPv4 packets belonging to other protocols:
 - TCP
 - UDP
 - ICMP

4. The NetScaler appliance supports the following ALGs DS-Lite:
 - ICMP
 - FTP
 - TFTP
 - Session Initiation Protocol (SIP)
 - Real Time Streaming Protocol (RTSP)

Configuring DS-Lite

May 2, 2023

A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. For more information on the NetScaler LSN feature, see [Large Scale NAT](#). A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address (of type SNIP6) of the DS-Lite AFTR component on a NetScaler appliance.

Configuring DS-Lite on a NetScaler appliance consists of the following tasks:

- **Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
- **Create an LSN client entity for identifying traffic from B4 CPE devices.** The LSN client entity refers to a set of DS-Lite B4 devices. The client entity includes IPv6 addresses or IPv6 network address or ACL6 rules for identifying the traffic from these B4 devices. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.
- **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.

- **Create an LSN IPv6 profile.** An LSN IPv6 profile defines the IPv6 address of the DS-Lite AFTR component on the NetScaler appliance. The IPv6 address must be one of the NetScaler owned IPv6 address of type SNIP6.
- **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
- **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.
- **Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

Configuration by Using the Command Line

To create an LSN client by using the command line interface:

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
4 <!--NeedCopy-->
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface:

At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
  string>)
2
3 show lsn client
4 <!--NeedCopy-->
```

To create an LSN pool by using the command line interface:

At the command prompt, type:

```
1 add lsn pool <poolname> [-nattype ( DYNAMIC )] [-portblockallocation (
  ENABLED | DISABLED )] [-portreallocatetimeout <secs>] [-
  maxPortReallocTmq <positive_integer>]
2
3 show lsn pool
4 <!--NeedCopy-->
```

To bind an IP address range to an LSN pool by using the command line interface:

At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
4 <!--NeedCopy-->
```

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface:

At the command prompt, type:

```
1 add lsn ip6profile <name> - type DS-Lite - network6 < ipv6_addr|*s >
2
3 show lsn ip6profile
4 <!--NeedCopy-->
```

To create an LSN transport profile by using the command line interface:

At the command prompt, type:

```

1 add lsn transportprofile <transportprofilename> <transportprotocol> [-
  sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
  positive_integer>] [-sessionquota <positive_integer>] [-
  portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
  ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
2
3 show lsn transportprofile
4 <!--NeedCopy-->

```

To create an LSN application profile by using the command line interface:

At the command prompt, type:

```

1 add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
  PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
  tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]
2
3 show lsn appsprofile
4 <!--NeedCopy-->

```

To bind an application protocol port range to an LSN application profile by using the command line interface:

At the command prompt, type:

```

1 bind lsn appsprofile <appsprofilename> <lsnport>
2
3 show lsn appsprofile
4 <!--NeedCopy-->

```

To create an LSN group by using the command line interface:

At the command prompt, type:

```

1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC )]
  [-portblocksize <positive_integer>] [-logging (ENABLED | DISABLED )]
  [-sessionLogging ( ENABLED | DISABLED )][-sessionSync ( ENABLED |
  DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED |
  DISABLED )] [-pptp ( ENABLED |DISABLED )] [-sipalg ( ENABLED |
  DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2
3 show lsn group
4 <!--NeedCopy-->

```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface:

At the command prompt, type:

```

1 bind lsn group <groupname> (-poolname <string> | -transportprofilename
  <string> | -httphdrlogprofilename <string> | -appsprofilename <
  string> | -sipalgprofilename <string> | rtspalgprofilename <string>)

```

```
2
3 show lsn group

Configuration by Using the Configuration Utility

To configure an LSN client and bind an IPv6 network address or an ACL6 rule by using the configuration utility:

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv6 network address or an ACL6 rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility:

Navigate to **System > Large Scale NAT > Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN IPv6 profile by using the configuration utility:

Navigate to **System > Large Scale NAT > Profiles**, click the **IPv6** tab, and assign an IPv6 address for DS-Lite AFTR.

To configure an LSN transport profile by using the configuration utility:

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport**, and then add a transport profile.

To configure an LSN application profile by using the configuration utility:

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application**, and then add an application profile.

To configure an LSN group and bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles by using the configuration utility:

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles to the group.

```
1 > add lsn client LSN-DSLITE-CLIENT-1
2 Done
3 > bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
4 Done
5 > add lsn pool LSN-DSLITE-POOL-1
6 Done
7 > bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
8 Done
9 > add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
10 Done
```

```
11 > add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1
12 Done
13 > add lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
14 Done
```

Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for Endpoint-Independent mapping.
 - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
 - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name

- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for Endpoint-Independent mapping.
 - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
 - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

LSN Log Entry Type	Sample Log Entry
DS-Lite session creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:38 GMT 0-PPE-1 : default LSN LSN_SESSION 37647607 0 : SESSION CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol:TCP
DS-Lite session deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:22 GMT 0-PPE-1 : default LSN LSN_SESSION 37647617 0 : SESSION DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol: TCP
DS-Lite LSN mapping creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:39 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647610 0 : EIM CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP
DS-Lite LSN mapping deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:25 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647618 0 : EIM DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP

Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

Configuration by Using the Command Line Interface

To display all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
1 show lsn session - nattytype DS-Lite
2 <!--NeedCopy-->
```

To display selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
1 show lsn session - nattytype DS-Lite [-clientname <string>] [-network <
  ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
  ip_addr> [-natPort <port>]]
2 <!--NeedCopy-->
```

Example:

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
1 show lsn session - nattytype DS-Lite
2   B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP
   NatPort Proto Dir
3
4 1.  2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61
   3002 TCP OUT
5
6 2.  2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61
   52862 TCP OUT
7
8 3.  2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61
   48116 ICMP OUT
9
10 4.  2001: DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69
   48305 TCP OUT
11
12 Done
13 <!--NeedCopy-->
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. **Navigate to System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

To clear all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
flush lsn session -nattype DS-Lite
show lsn session -nattype DS-Lite
```

To clear selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
1 flush lsn session -nattype DS-Lite [-clientname <string>] [-network <
   ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
   ip_addr> [-natPort <port>]]
2
3 show lsn session -nattype DS-Lite
4 <!--NeedCopy-->
```

To clear all or selected DS-Lite sessions by using the configuration utility:

1. Navigate to **System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. Click **Flush Sessions**.

Configuring DS-Lite Static Maps

May 2, 2023

The NetScaler appliance supports manual creation of DS-Lite LSN mappings, which contain the mapping between the following information:

- Subscriber's IP address and port, and IPv6 address of B4 device or component
- NAT IP address and port

Static DS-Lite LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP address and port map to the subscriber IP address and port through the specified B4 device (for example, web servers located in the internal network).

Note: This feature is supported in release 11.0 build 64.x and later.

To create a DS-Lite static LSN mapping by using the command line

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td
   <positive_integer>] [-network6 <B4_ADDR>] [<natIP> [<natPort>]] [-
   destIP<ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
4 <!--NeedCopy-->
```

Parameter Descriptions

add lsn static

- name

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “ds-lite lsn static1” or ‘ds-lite lsn static1’). This is a mandatory argument. Maximum Length: 127

- transportprotocol

Protocol for the DS-Lite LSN mapping entry.

- subscrIP

IPv4 address of a subscriber for the DS-Lite LSN mapping entry.

- subscrPort

Port of the subscriber for the DS-Lite LSN mapping entry.

- Network6

IPv6 address of the B4 device or component.

- td

ID of the traffic domain to which the B4 device belongs. The IPv6 address of the B4 device is specified in the network6 paramter. If you do not specify an ID, the B4 device is assumed to be a part of the default traffic domain.

- natIP

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

- natPort

NAT port for this DS-Lite LSN mapping entry.

- destIP

Destination IP address for the DS-Lite LSN mapping entry.

- dsttd

ID of the traffic domain through which the destination IP address for this DS-Lite LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0.

To create a DS-Lite static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new DS-Lite static LSN mapping.

Configuring Deterministic NAT Allocation for DS-Lite

May 2, 2023

Deterministic NAT allocation for DS-Lite LSN deployments is a type of NAT resource allocation in which the NetScaler appliance pre-allocates, from the LSN NAT IP pool and on the basis of the specified port block size, an LSN NAT IP address and a block of ports to each subscriber (subscriber behind B4 device).

Note: This feature is supported in release 11.0 build 64.x and later.

The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified by just its mapped NAT IP address and port block. For this reason, the NetScaler appliance does not log the creation or deletion of an LSN session.

A DS-Lite subscriber can have only one deterministic port block. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

Example: Deterministic DS-Lite

In this example, a deterministic DS-Lite configuration includes four subscribers with IP addresses 192.0.17.5, 192.0.17.6, 192.0.17.7, and 192.0.17.8. These ipv4 subscribers are behind a B4 device having the IPv6 address 2001:DB8::3:4. In this configuration, the port block size is set to 20480 and LSN NAT IP address pool has IP addresses in the range 203.0.113.41-203.0.113.42.

The NetScaler appliance sequentially pre-allocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-21503) on the beginning NAT IP address (203.0.113.41) to the beginning subscriber IP address (192.0.17.5). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The NetScaler logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers.

The following table lists the NAT IP address and blocks of ports allocated to each subscriber in this example:

Subscriber IP address	Allocated NAT IP address	Allocated Block of Ports	IPv6 address of B4
192.0.17.5	203.0.113.41	1024 - 21503	2001:DB8::3:4
192.0.17.6	203.0.113.41	21504 - 41983	2001:DB8::3:4
192.0.17.7	203.0.113.41	41984 - 62463	2001:DB8::3:4
192.0.17.8	203.0.113.42	1024 - 21503	2001:DB8::3:4

Configuration Steps

You need to configure deterministic NAT as part of the DS-Lite configuration. For instructions on configuring DS-Lite, see [Configuring DS-Lite](#).

While configuring DS-Lite, make sure that you:

- Set the NAT Type parameter to Deterministic when adding the LSN pool and the LSN group.
- Set the desired port block size parameter when adding the LSN group, unless you can accept the default value.

Points to Consider before Configuring Deterministic DS-Lite

Consider the following points before configuring deterministic DS-Lite:

- The complete IP address of each subscriber must be specified in a separate `add lsn client` command, by setting the `Network` and `Netmask` parameters. (Set `Netmask` to `255.255.255.255`.) Also the IPv4 address of the B4 device specified in `Network6` parameter must be complete (/128 prefix). In other words, `Network` and `Network6` parameter do not accept addresses other than /32 bit mask and /128 prefix, respectively.
- The NetScaler appliance drops connections from subscribers that are not specified in any deterministic DS-Lite configuration but are behind B4 devices specified in a deterministic DS-lite configuration.
- The NetScaler appliance recognizes subscribers having the same IPv4 address as different subscribers if they are behind different B4 devices. A combination of subscriber IPv4 address and B4 device defines a unique subscriber in the LSN client entity of a DS-Lite configuration.

Sample Deterministic DS-Lite Configuration:

The following configuration uses the settings listed in section Example: Deterministic DS-Lite.

```
1 add lsn client LSN-DSLITE-CLIENT-10
2
3 Done
4 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.5 -netmask
   255.255.255.255 -network6 2001:DB8::3:4/128
5
6 Done
7 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.6 -netmask
   255.255.255.255 -network6 2001:DB8::3:4/128
8
9 Done
10 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.7 -netmask
   255.255.255.255 -network6 2001:DB8::3:4/128
11
12 Done
13 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.8 -netmask
   255.255.255.255 -network6 2001:DB8::3:4/128
14
15 Done
16 add lsn pool LSN-DSLITE-POOL-10 -nattype DETERMINISTIC
17
18 Done
19 bind lsn pool LSN-DSLITE-POOL-10 203.0.113.41-203.0.113.42
20
21 Done
22 add lsn ip6profile LSN-DSLITE-PROFILE-10 -type DS-Lite -network6 2001:
   DB8::5:6
23
24 Done
```

```
25 add lsn group LSN-DSLITE-GROUP-10 -clientname LSN-DSLITE-CLIENT-10 -
    nattype DETERMINISTIC -portblocksize 20480 -ip6profile LSN-DSLITE-
    PROFILE-10
26
27 Done
28 bind lsn group LSN-DSLITE-GROUP-10 -poolname LSN-DSLITE-POOL-10
29
30 Done
31 <!--NeedCopy-->
```

Configuring Application Layer Gateways for DS-Lite

May 2, 2023

For some application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway (ALG) for a protocol parses the packet payload and does necessary changes to ensure that the protocol continues to work over DS-Lite.

The NetScaler appliance supports ALG for the following protocols for DS-Lite:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for a DS-Lite configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for a DS-Lite configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

May 2, 2023

Using DS-Lite with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for DS-Lite is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Note

SIP ALG is supported in a NetScaler standalone appliance, in a NetScaler high availability setup, as well as in a NetScaler cluster setup.

Limitations of SIP ALG

SIP ALG for DS-Lite has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
 - Multicast IP addresses
 - Encrypted SDP
 - SIP TLS
 - FQDN translation
 - SIP layer authentication
 - Admin partitions
 - Multipart body
 - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuring DS-Lite](#). While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
 - IP Pooling = PAIRED
 - Address and Port Mapping = ENDPOINT-INDEPENDENT
 - Filtering = ENDPOINT-INDEPENDENT

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group
- Enable SIP ALG in the LSN group

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string>[-sipalg ( ENABLED |
  DISABLED )]
2
3 show lsn group<groupname>
4 <!--NeedCopy-->
```

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn sipalgprofile<sipalgprofilename>[-dataSessionIdleTimeout<
  positive_integer>][-sipSessionTimeout<positive_integer>][-
  registrationTimeout<positive_integer>][-sipsrcportrange<port[-port
  ]>][-sipedstportrange<port[-port]>][-openRegisterPinhole ( ENABLED |
  DISABLED )][-openContactPinhole ( ENABLED | DISABLED )][-
  openViaPinhole ( ENABLED | DISABLED )][-openRecordRoutePinhole (
  ENABLED | DISABLED )][-sipTransportProtocol ( TCP | UDP )[-
  openRoutePinhole ( ENABLED | DISABLED )][-rport ( ENABLED | DISABLED
  )]
2
3 show lsn sipalgprofile<sipalgprofilename>
4 <!--NeedCopy-->
```

Sample Configuration

The following sample DS-Lite configuration, SIP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::3:0/96.

```
1 add lsn client LSN-DSLITE-CLIENT-1
2 Done
3 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/96
4 Done
5 add lsn pool LSN-DSLITE-POOL-1
6 Done
7 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
8 Done
9 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
  DB8::5:6
```

```
10 Done
11 add lsn appsprofile LSN-DSLITE-APPS-PROFILE-1 TCP -ippooling PAIRED -
    mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn sipalprofile SIPALGPROFILE-1 -sipdstportrange 5060 -
    sipTransportProtocol TCP
14 Done
15 add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1 -sipalg ENABLED
16 Done
17 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
18 Done
19 bind lsn group LSN-DSLITE-GROUP-1 -appsprofilename LSN-DSLITE-APPS-
    PROFILE-1
20 Done
21 bind lsn group LSN-DSLITE-GROUP-1 -sipalprofilename SIPALGPROFILE-1
22 Done
23 <!--NeedCopy-->
```

Application Layer Gateway for RTSP Protocol

May 2, 2023

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Note

RTSP ALG is supported in a NetScaler standalone appliance, in a NetScaler high availability setup,

as well as in a NetScaler cluster setup.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- RTSP Authentication
- HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuring DS-Lite](#). While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
 - IP Pooling = PAIRED
 - Address and Port Mapping = ENDPOINT-INDEPENDENT
 - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED |  
    DISABLED )]  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <  
    positive_integer>] -rtspportrange <port[-port]> [-  
    rtspTransportProtocol (TCP|UDP)]
```

```
2
3 show lsn rtspalgprofile <rtspalgprofilename>
4 <!--NeedCopy-->
```

Sample RTSP ALG Configuration

The following sample DS-Lite configuration, RTSP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::4:0/96.

Sample RTSP ALG Configuration:

```
1 add lsn client LSN-DSLITE-CLIENT-5
2 Done
3 bind lsn client LSN-DSLITE-CLIENT-5 -network6 2001:DB8::4:0/96
4 Done
5 add lsn pool LSN-DSLITE-POOL-5
6 Done
7 bind lsn pool LSN-DSLITE-POOL-5 203.0.113.61 - 203.0.113.70
8 Done
9 add lsn ip6profile LSN-DSLITE-PROFILE-5 -type DS-Lite -network6 2001:
  DB8::5:6
10 Done
11 add lsn appsprofile LSN-DSLITE-APPS-PROFILE-5 TCP -ippooling PAIRED -
  mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn rtspalgprofile RTSPALGPROFILE-5 -rtspIdleTimeout 1000 -
  rtspportrange 554
14 Done
15 add lsn group LSN-DSLITE-GROUP-5 -clientname LSN-DSLITE-CLIENT-5 -
  portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-5 -rtspalg ENABLED
16 Done
17 bind lsn group LSN-DSLITE-GROUP-5 -poolname LSN-DSLITE-POOL-5
18 Done
19 bind lsn group LSN-DSLITE-GROUP-5 -appsprofilename LSN-DSLITE-APPS-
  PROFILE-5
20 Done
21 bind lsn group LSN-DSLITE-GROUP-5 -rtspalgprofilename RTSPALGPROFILE-5
22 Done
23 <!--NeedCopy-->
```

Logging and Monitoring DS-Lite

May 2, 2023

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information.

For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for Endpoint-Independent mapping.
 - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
 - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for Endpoint-Independent mapping.
 - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
 - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

LSN Log Entry Type	Sample Log Entry
--------------------	------------------

DS-Lite session creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:38 GMT 0-PPE-1 : default LSN LSN_SESSION 37647607 0 : SESSION CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol:TCP
DS-Lite session deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:22 GMT 0-PPE-1 : default LSN LSN_SESSION 37647617 0 : SESSION DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol: TCP
DS-Lite LSN mapping creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:39 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647610 0 : EIM CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP
DS-Lite LSN mapping deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:25 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647618 0 : EIM DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP

Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

To display all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session - nattytype DS-Lite
2 <!--NeedCopy-->
```

To display selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session - nattytype DS-Lite [-clientname <string>] [-network <
  ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
  ip_addr> [-natPort <port>]]
2 <!--NeedCopy-->
```

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session -nattytype DS-Lite
```

```
1 B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP
  NatPort Proto Dir
2
3 1. 2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61
  3002 TCP OUT
4
5 2. 2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61
  52862 TCP OUT
6
7 3. 2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61
  48116 ICMP OUT
8
9 4. 2001: DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69
  48305 TCP OUT
10 Done
11 <!--NeedCopy-->
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. **Navigate to System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for

these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

To clear all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session -nattype DS-Lite
2
3 show lsn session -nattype DS-Lite
4 <!--NeedCopy-->
```

To clear selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session -nattype DS-Lite [-clientname <string>] [-network <
    ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
    ip_addr> [-natPort <port>]]
2
3 show lsn session -nattype DS-Lite
4 <!--NeedCopy-->
```

To clear all or selected DS-Lite sessions by using the configuration utility

1. Navigate to **System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. Click **Flush Sessions**.

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the DS-Lite functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv4 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- **Create an HTTP header log profile.** An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- **Bind the HTTP header to an LSN group of a DS-Lite LSN configuration.** Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

To create an HTTP header log profile by using the command line interface At the command prompt, type:

```
1 add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED |  
    DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (   
    ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]  
2  
3 show lsn httphdrlogprofile  
4 <!--NeedCopy-->
```

To bind an HTTP header log profile to an LSN group by using the command line interface At the command prompt, type:

```
1 bind lsn group <groupname> -httphdrlogprofilename <string>  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

Sample Configuration

In the following DS-Lite LSN configuration, HTTP header log profile HTTP-Header-LOG-1 is bound to LSN group LSN-DSLITE-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging, so that all these attributes are logged for any HTTP requests from B4 devices (in the network 2001:DB8:5001::/96).

Sample Configuration:

```
1 add lsn httphdrlogprofile HTTP-HEADER-LOG-1  
2  
3 Done
```

```
4
5 add lsn client LSN-DSLITE-CLIENT-1
6
7 Done
8
9 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
10
11 Done
12
13 add lsn pool LSN-DSLITE-POOL-1
14
15 Done
16
17 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
18
19 Done
20
21 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
22
23 Done
24
25 add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1
26
27 Done
28
29 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
30
31 Done
32
33 bind lsn group LSN-DSLITE-GROUP-1 -httpdrlogprofilename HTTP-HEADER-
    LOG-1
34
35 Done
36 <!--NeedCopy-->
```

IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following DS_Lite related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

Points to Consider before you Configure IPFIX logging

Before you start configuring IPsec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see [Configuring the AppFlow feature](#).

Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

To enable LSN logging in the AppFlow configuration by using the CLI At the command prompt, type:

```
1 set appflow param -lsnLogging (ENABLED | DISABLED )
2
3 show appflow param
4 <!--NeedCopy-->
```

To create an LSN log profile by using the CLIAt the command prompt, type At the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

To create an LSN log profile by using the GUI Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

Port Control Protocol for DS-Lite

May 2, 2023

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the

default PCP profile settings for that server. A default PCP profile has the following parameter settings:

- Mapping: Enabled
 - Peer: Enabled
 - Minimum map life: 120 seconds
 - Maximum max life: 86400 seconds
 - Announce count: 10
 - Third Party: Disabled
- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
 - Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.
Note: A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]
2
3 show pcp profile <name>
4 <!--NeedCopy-->
```

To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
    string>]
2
3 show pcp server <name>
4 <!--NeedCopy-->
```

Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3:0/100.

Sample configuration:

```
1 add pcp profile PCP-DSLITE-PROFILE-1 -minMapLife 300
2 Done
3 add pcp server PCP-DSLITE-SERVER-1 192.0.3.10 -pcpProfile PCP-DSLITE-
  PROFILE-1
4 Done
5 add lsn client LSN-DSLITE-CLIENT-1
6 Done
7 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
8 Done
9 add lsn pool LSN-DSLITE-POOL-1
10 Done
11 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
  DB8::5:6
14 Done
15 add lsn group LSN-DSLITE-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -
  ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-DSLITE-GROUP-1 -poolname PCP-NAT64-SERVER-1
20 Done
21 <!--NeedCopy-->
```

Large Scale NAT64

August 11, 2023

Note:

Large Scale NAT64 (LSN64) feature is deprecated from NetScaler 14.1 release onwards.

Deprecated features are not removed immediately. The NetScaler appliance continues to support the deprecated feature until it is removed in a future release.

Because of the imminent exhaustion of IPv4 addresses, ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses IPv4. Large scale NAT64 is an IPv6 transition solution for ISPs with IPv6

infrastructure to connect their IPv6-only subscribers to the IPv4 Internet. DNS64 is a solution for enabling discovery of IPv4-only domains by IPv6-only clients. DNS64 is used with large scale NAT64 to enable seamless communication between IPv6-only clients and IPv4-only servers.

A NetScaler appliance implements large scale NAT64 and DNS64 and is compliant with RFCs 6145, 6146, 6147, 6052, 3022, 2373, 2765, and 2464.

Architecture

The NAT64 architecture of an ISP using a NetScaler appliance consists of IPv6 subscribers accessing the IPv4 Internet through a NetScaler appliance deployed in the ISP's core network. IPv6 subscribers are connected to the ISP core network through the ISP's IPv6-only access network.

The large scale NAT64 functionality of a NetScaler appliance enables communication between IPv6 clients and IPv4 servers through IPv6-to-IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. NetScaler DNS64 functionality represents IPv4-only domains to IPv6-subscribers by synthesizing DNS AAAA records for IPv4-only domains and sending them to the subscribers.

Large scale NAT64 has two main components: NAT64 prefix and NAT IPv4 pool. DNS64 has one main component, DNS64 prefix, which has the same value as NAT64 prefix.

Upon receiving an AAAA request from an IPv6-only subscriber for a domain name that is hosted on an IPv4-only web server on the Internet, the NetScaler DNS64 functionality synthesizes an AAAA record for the domain name and sends it to the subscriber. The AAAA record is synthesized by concatenating the DNS64 prefix (which is set to the NAT64 prefix) and the actual IPv4 address of the domain name.

The subscriber now has an IPv6 destination address that corresponds to the desired domain name. The subscriber sends the request to the synthesized IPv6 address. Upon receiving the IPv6 request, the large scale NetScaler NAT64 functionality translates the IPv6 request packet to an IPv4 request packet. Large scale NAT64 sets the IPv4 request's destination address to the IPv4 address, which is

extracted from the IPv6 request's destination address by stripping the NAT64 prefix from the IPv6 address. The destination port is retained from the IPv6 request. Large Scale NAT64 also sets the source IP address:source port of the IPv4 packet to the NAT IP address:NAT port selected from the configured NAT pool.

The appliance maintains a record of all active sessions that use the large scale NAT64 functionality. These sessions are called large scale NAT64 sessions. The appliance also maintains the mappings between subscriber IPv6 address and port, and NAT IPv4 address and port, for each large scale NAT64 session. These mappings are called large scale NAT64 mappings. From large scale NAT64 session entries and large scale NAT64 mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular NAT64 session.

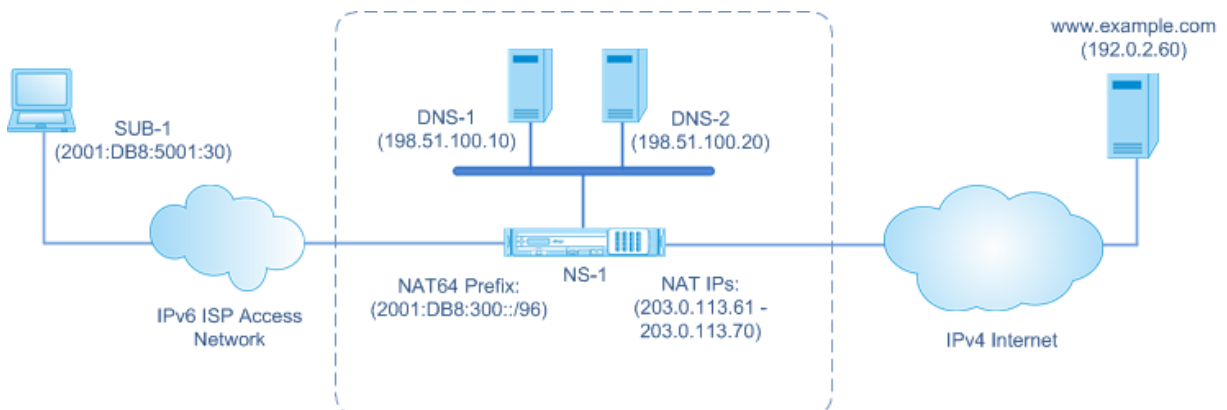

When the appliance receives an IPv4 response packet belonging to a particular NAT64 session, it uses the information stored in the NAT64 session to translate the IPv4 packet into an IPv6 packet, and then sends the IPv6 response packet to the subscriber.

Example: Traffic Flow of NAT64 and DNS64 Deployment

Consider an example of a large scale NAT64 and DNS64 deployment consisting of NetScaler appliance NS-1 and two local DNS servers, DNS-1 and DNS-2, in an ISP's core network, and IPv6 subscriber SUB-1. SUB-1 is connected to NS-1 through the ISP's IPv6 access network. NS-1 includes large scale NAT64 and DNS64 configurations for enabling the communication between IPv6 subscriber SUB-1 and IPv4 hosts (internal and external).

Large scale NAT64 configuration includes a NAT64 prefix (2001:DB8:300::/96) and NAT IPv4 pool for translation of IPv6 requests to IPv4 requests and IPv4 responses to IPv6 responses.

DNS64 configuration includes a DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) and a DNS64 prefix (2001:DB8:300::/96). LBVS-DNS64-1 represents local DNS server DNS-1 and DNS-2 to ISP's subscribers. The DNS64 prefix, which has the same value as the NAT64 prefix, is used for synthesizing DNS AAAA records from DNS A records received from DNS servers DNS-1 and DNS-2. NS-1 responds with a synthesized AAAA record to SUB-1 for a DNS request to resolve an IPv4 host.

DNS64 Traffic Flow

Traffic flows between IPv6 subscriber SUB-1 and site www.example.com, which resides on an IPv4-only web server on the Internet, as follows:

1. IPv6 subscriber SUB-1 sends a DNS AAAA request for www.example.com to its designated DNS server (2001:DB8:9999::99).
2. DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) on NetScaler appliance NS1 receives the AAAA request. LBVS-DNS64-1's load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
3. DNS-1 returns an empty record or an error message, because there is no AAAA record available for www.example.com.
4. Because the DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS1 sends a DNS A request to DNS-1 for the IPv4 address of www.example.com.
5. DNS-1 responds with the A record of 192.0.2.60 for www.example.com.
6. DNS64 module on NS1 synthesizes an AAAA record for www.example.com by concatenating the DNS64 Prefix (2001:DB8:300::/96) associated with LBVS-DNS64-1, and IPv4 address (192.0.2.60) for www.example.com = 2001:DB8:300::192.0.2.60
7. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

NAT64 Traffic Flow

1. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
 - Source IP address = 2001:DB8:5001:30
 - Source port = 2552
 - Destination IP address = 2001:DB8:300::192.0.2.60
 - Destination port = 80
2. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
 - Source IP address = 2001:DB8:5001:30
 - Source port = 2552
 - Destination IP address = 2001:DB8:300::192.0.2.60
 - Destination port = 80

3. When NS-1 receives the IPv6 packet, the large scale NAT64 module creates a translated IPv4 request packet with:
 - Source IP address = One of the IPv4 addresses available in the configured NAT pool (203.0.113.61)
 - Source port = One of ports available with the allocated NAT IPv4 address (3002)
 - Destination IP address = IPv4 address extracted from the IPv6 request's destination address by stripping the NAT64 prefix (2001:DB8:300::/96) from the IPv6 address (192.0.2.60)
 - Destination port = IPv6 request's destination port (80)
4. The large scale NAT64 module also creates mapping and session entries for this large scale NAT64 flow. The session and mapping entries include the following information:
 - Source IP address of the IPv6 packet = 2001:DB8:5001:30
 - Source port of the IPv6 packet = 2552
 - NAT IP address = 203.0.113.61
 - NAT port = 3002
 - NS-1 sends the resulting IPv4 packet to its destination on the Internet.
5. Upon receiving the request packet, the server for www.example.com processes the packet and sends a response packet to NS-1. The IPv4 response packet has:
 - Source IP address = 192.0.2.60
 - Source port = 80
 - Destination IP address = 203.0.113.61
 - Destination port = 3002
6. Upon receiving the IPv4 response packet, NS-1 examines the large scale NAT64 mapping and session entries and finds that the IPv4 response packet belongs to a large scale NAT64 session. The large scale NAT64 module creates a translated IPv6 response packet:
 - Source IP address = 2001:DB8:300::192.0.2.60
 - Source port = 80
 - Destination IP address = 2001:DB8:5001:30
 - Destination port = 2552
7. NS-1 sends the translated IPv6 response to client SUB-1.

Large Scale NAT64 features Supported on NetScaler appliances

Large scale NAT64 on a NetScaler appliance supports the standard LSN feature set. For more information on these LSN features, see [LSN Architecture](#).

Following are some of the large scale NAT64 features supported on NetScaler appliances:

- ALGs. Support of application Layer Gateway (ALG) for SIP, RTSP, FTP, ICMP, and TFTP protocols.
- Deterministic/Fixed NAT. Support for pre-allocation of blocks of ports to subscribers to minimize logging.
- Mapping. Support of Endpoint-independent mapping (EIM), Address-dependent mapping (ADM), and Address-Port dependent mapping (APDM).
- Filtering. Support of Endpoint-Independent Filtering (EIF), Address-Dependent Filtering (ADF), and Address-Port-Dependent Filtering (APDF).
- Quotas. Configurable limits on number of ports, sessions per subscriber, and sessions per LSN group.
- Static Mapping. Support for manually defining a large scale NAT64 mapping.
- Hairpin Flow. Support for communication between subscribers or internal hosts using NAT IP addresses.
- 464XLAT connections. Support for communication between IPv4-only applications on IPv6 subscriber hosts and IPv4 hosts on the Internet through IPv6 network.
- Variable length NAT64 and DNS64 prefixes. The NetScaler appliance supports defining NAT64 and DNS64 prefixes of lengths of 32, 40, 48, 56, 64, and 96.
- Multiple NAT64 and DNS64 prefix. The NetScaler appliance supports multiple NAT64 and DNS64 prefixes.
- LSN Clients. Support for specifying or identifying subscribers for large scale NAT64 by using IPv6 prefixes and extended ACL6 rules.
- Logging. Support for logging NAT64 sessions for law enforcement. In addition, the following are also supported for logging.
 - **Reliable SYSLOG.** Support for sending SYSLOG messages over TCP to external log servers for a more reliable transport mechanism.
 - **Load balancing of log servers.** Support for load balancing of external log servers for preventing storage of redundant log messages.
 - **Minimal Logging.** Deterministic LSN configurations or Dynamic LSN configurations with port block significantly reduce the large scale NAT64 log volume.
 - **Logging MSISDN information.** Support for including subscribers' MSISDN information in large scale NAT64 logs to identify and track subscriber activity over the Internet.

Points to Consider for Configuring Large Scale NAT64

May 2, 2023

Before you start configuring large scale NAT64 and DNS64, consider these points:

1. Make sure you understand the different components of large scale NAT64, described in RFCs.

2. The NetScaler appliance supports only the following ALGs for large Scale NAT64:
 - FTP
 - TFTP
 - ICMP
 - SIP
 - RTSP
3. In a high availability setup of two NetScaler appliances, large NAT64 session synchronization (connection mirroring) is not supported.

Configuring DNS64

May 2, 2023

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

- Add DNS services. DNS services are logical representations of DNS servers for which the NetScaler appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see [Load Balancing](#).
- Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy. A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude-rule and mapped-rule settings.
- Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it. The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see [Load Balancing](#).

Note

The command line interface has separate commands for these two tasks, but the GUI combines them in a single dialog box.

- Enable caching of DNS records. Enable the global parameter for the NetScaler appliance to cache DNS records, which are obtained through DNS proxy operations. For more information on enabling caching of DNS records, see [Enabling Caching of DNS Records](#).

To create a service of type DNS by using the command line interface

At the command prompt, type:

```
1 add service <name> <IP> <serviceType> <port> ...
2 <!--NeedCopy-->
```

To create a DNS64 action by using the command line interface

At the command prompt, type:

```
1 add dns action64 <actionName> -Prefix <ipv6_addr|*> [-mappedRule <
  expression>] [-excludeRule <expression>]
2 <!--NeedCopy-->
```

To create a DNS64 policy by using the command line interface

At the command prompt, type:

```
1 add dns policy64 <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

To create a DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
1 add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED
  ) [-bypassAAAA ( YES | NO)] ...
2 <!--NeedCopy-->
```

To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
1 bind lb vserver <name> <serviceName> ...
2
3 bind lb vserver <name> -policyName <string> -priority <positive_integer>
  > ...
4 <!--NeedCopy-->
```

Sample configuration:

```
1 add service SVC-DNS-1 203.0.113.50 DNS 53
2 Done
3 add service SVC-DNS-2 203.0.113.60 DNS 53
4 Done
5 add dns Action64 DNS64-Action-1 -Prefix 2001:DB8:300::/96
6 Done
7 add dns Policy64 DNS64-Policy-1 -rule "CLIENT.IPv6.SRC.IN_SUBNET(2001:
  DB8:5001::/64)" -action DNS64-Action-1
8 Done
9 add lb vserver LBVS-DNS64-1 DNS 2001:DB8:9999::99 53 -dns64 ENABLED
10 Done
11 bind lb vserver LBVS-DNS64-1 SVC-DNS-1
12 Done
13 bind lb vserver LBVS-DNS64-1 SVC-DNS-2
14 Done
15 bind lb vserver LBVS-DNS64-1 -policyname DNS64-Policy-1 -priority 2
16 Done
17 <!--NeedCopy-->
```

Configuring Large Scaler NAT64

May 2, 2023

A large scale NAT64 configuration on a NetScaler appliance uses the LSN commands sets. In a large scale NAT64 configuration, the LSN client entity specifies the IPv6 address or IPv6 network address, or ACL6 rules, for identifying IPv6 subscribers. A NAT64 configuration also includes an IPv6 profile, which specifies a NAT64 prefix.

Configuring NAT64 on a NetScaler appliance consists of the following tasks:

- Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
- Create an LSN client entity for identifying traffic from IPv6 subscribers. The LSN client entity refers to a set of IPv6 subscribers. The client entity includes IPv6 addresses or IPv6 network prefixes, or ACL6 rules, for identifying the traffic from these subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The GUI combines these two operations on a single screen.
- Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform large scale NAT64. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The GUI combines these two operations on a single screen.

- Create an LSN IP6 profile. An LSN IP6 profile defines the NAT64 prefix for a large scale NAT64 configuration.
- (Optional) Create an LSN Transport Profile for a specified protocol. An LSN transport profile defines various timeouts and limits, such as maximum large scale NAT64 sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
- (Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it. An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The GUI combines these two operations on a single screen.
- Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group. An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The GUI combines these two operations in a single screen.

Configuration Using the Command Line

You can create different configurations using the command line interface. Follow the steps given below.

To create an LSN client by using the command line interface

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
4 <!--NeedCopy-->
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface

At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
  string>)
2
3 show lsn client
4 <!--NeedCopy-->
```

To create an LAN pool by using the command line interface

At the command prompt, type:

```
1 add lsn pool <poolname>
2
3 show lsn pool <poolname>
4 <!--NeedCopy-->
```

To bind NAT IP addresses to an LSN pool by using the command line interface

At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
4 <!--NeedCopy-->
```

Note

For removing NAT IP (LSN IP addresses) addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface

At the command prompt, type:

```
1 add lsn ip6profile <name> -type NAT64 -natprefix <ipv6_addr|*>
2
3 show lsn ip6profile
4 <!--NeedCopy-->
```

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```
1 add lsn transportprofile <transportprofilename> <transportprotocol> [-
  sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
  positive_integer>] [-sessionquota <positive_integer>] [-
  portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
  ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
2
3 show lsn transportprofile
4 <!--NeedCopy-->
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
1 add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
  PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
  tcpproxy ( ENABLED | DISABLED )]
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>
2
```

```

3 show lsn appsprofile
4 <!--NeedCopy-->

```

To create an LSN group by using the command line interface

At the command prompt, type:

```

1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC |
  DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging(
  ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][
  sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer
  >] [-ftp ( ENABLED | DISABLED )] [-sipalg ( ENABLED | DISABLED )] [
  rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2
3 show lsn group
4 <!--NeedCopy-->

```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```

1 bind lsn group <groupname> (-poolname <string> | -transportprofilename
  <string> | -httphdrlogprofilename <string> | -appsprofilename <
  string> | -sipalgprofilename <string> | rtspalgprofilename <string>)
2
3 show lsn group
4 <!--NeedCopy-->

```

Sample Large Scale NAT64 Configurations

Here are some sample configurations of large scale NAT64:

Simple large scale NAT64 configuration with default settings:

```

1 add lsn client LSN-NAT64-CLIENT-1
2
3 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
4
5 add lsn pool LSN-NAT64-POOL-1
6
7 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
8
9 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
  :300::/96
10

```

```

11 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
    ip6profile LSN-NAT64-PROFILE-1
12
13 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
14
15 <!--NeedCopy-->

```

Simple large scale NAT64 configuration with an extended ACL6 rule for identifying subscribers:

```

1 add ns acl6 LSN-NAT64-ACL-2 ALLOW - srcIPv6 = 2001:DB8:5002::20 - 2001:
    DB8:5002::200
2
3 apply acl6s
4
5 add lsn client LSN-NAT64-CLIENT-2
6
7 bind lsn client LSN-NAT64-CLIENT-2 - acl6name LSN-NAT64-ACL-2
8
9 add lsn pool LSN-NAT64-POOL-2
10
11 bind lsn pool LSN-NAT64-POOL-2 203.0.113.5-203.0.113.10
12
13 add lsn ip6profile LSN-NAT64-PROFILE-2 -type NAT64 -natprefix 2001:DB8
    :302::/96
14
15 add lsn group LSN-NAT64-GROUP-2 -clientname LSN-NAT64-CLIENT-2 -
    ip6profile LSN-NAT64-PROFILE-2
16
17 bind lsn group LSN-NAT64-GROUP-2 -poolname LSN-NAT64-POOL-2
18
19 <!--NeedCopy-->

```

Large scale NAT64 configuration with deterministic NAT resource allocation:

```

1 add lsn client LSN-NAT64-CLIENT-7
2
3 bind lsn client LSN-NAT64-CLIENT-7 -network6 2001:DB8:1002::7/128
4
5 add lsn pool LSN-NAT64-POOL-7 -nattype DETERMINISTIC
6
7 bind lsn pool LSN-NAT64-POOL-7 203.0.113.24-203.0.113.27
8
9 add lsn ip6profile LSN-NAT64-PROFILE-7 -type NAT64 -natprefix 2001:DB8
    :307::/96
10
11 add lsn group LSN-NAT64-GROUP-7 -clientname LSN-NAT64-CLIENT-7 -
    ip6profile LSN-NAT64-PROFILE-7 -nattype DETERMINISTIC -portblocksize
    256
12
13 bind lsn group LSN-NAT64-GROUP-7 -poolname LSN-POOL-7
14
15 <!--NeedCopy-->

```

Configuring Application Layer Gateways for Large Scale NAT64

May 2, 2023

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over large scale NAT64.

The NetScaler appliance supports ALG for the following protocols for large scale NAT64:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for an large scale NAT64 configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an large scale NAT64 configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

May 2, 2023

Using Large Scale NAT64 with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol

(SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for large scale NAT64 is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Note

SIP ALG is supported in a NetScaler standalone appliance, in a NetScaler high availability setup, as well as in a NetScaler cluster setup.

Limitations of SIP ALG

SIP ALG for large scale NAT64 has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
 - Multicast IP addresses
 - Encrypted SDP
 - SIP TLS
 - FQDN translation
 - SIP layer authentication
 - Traffic Domains
 - Admin partitions
 - Multipart body
 - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Large Scale NAT64. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
 - IP Pooling = PAIRED
 - Address and Port Mapping = ENDPOINT-INDEPENDENT
 - Filtering = ENDPOINT-INDEPENDENT
- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group.
- Enable SIP ALG in the LSN group.

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```

1 add lsn group <groupname> -clientname <string> [-sipalg ( ENABLED |
  DISABLED )]
2
3 show lsn group <groupname>
4 <!--NeedCopy-->

```

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```

1 add lsn sipalgprofile <sipalgprofilename>[-dataSessionIdleTimeout <
  positive_integer>][-sipSessionTimeout <positive_integer>] [-
  registrationTimeout <positive_integer>] [-sipsrcportrange <port[-
  port]>] [-sipdstportrange <port[-port]>] [-openRegisterPinhole (
  ENABLED | DISABLED )] [-openContactPinhole ( ENABLED | DISABLED )]
  [-openViaPinhole ( ENABLED | DISABLED )] [-openRecordRoutePinhole (
  ENABLED | DISABLED )]-sipTransportProtocol ( TCP | UDP ) [-
  openRoutePinhole ( ENABLED | DISABLED )] [-rport ( ENABLED |
  DISABLED )]
2
3 show lsn sipalgprofile <sipalgprofilename>
4 <!--NeedCopy-->

```

Sample Configuration

The following sample large scale NAT64 configuration, SIP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1003::/96.

```

1 add lsn client LSN-NAT64-CLIENT-9
2
3 Done
4 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
5
6 Done
7 add lsn pool LSN-NAT64-POOL-9
8
9 Done
10 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
11
12 Done
13 add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8
  :309::/96
14
15 Done
16 add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -
  mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
17
18 Done

```

```
19 add lsn sipalgprofile SIPALGPROFILE-9 -sipdstportrange 5060 -
    sipTransportProtocol TCP
20
21 Done
22 add lsn group LSN-NAT64-GROUP-9 -clientnameLSN-NAT64-CLIENT-9 -
    ip6profile LSN-NAT64-PROFILE-7 -sipalg ENABLED
23
24 Done
25 bind lsn group LSN-NAT64-GROUP-9 -poolnameLSN-NAT64-POOL-9
26 Done
27 bind lsn group LSN-NAT64-GROUP-9 -appsprofilename LSN-NAT64-APPS-
    PROFILE-9
28 Done
29 bind lsn group LSN-NAT64-GROUP-9 -sipalgprofilename SIPALGPROFILE-9
30 Done
31 <!--NeedCopy-->
```

Application Layer Gateway for RTSP Protocol

May 2, 2023

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Note

RTSP ALG is supported in a NetScaler standalone appliance, in a NetScaler high availability setup, as well as in a NetScaler cluster setup.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- RTSP Authentication
- HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring Large Scale NAT64. While configuring, make sure that you:

- Set the following parameters while adding an LSN application profile:
 - IP Pooling = PAIRED
 - Address and Port Mapping = ENDPOINT-INDEPENDENT
 - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED |  
    DISABLED )]  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <  
    positive_integer>] -rtspportrange <port[-port]> [-  
    rtspTransportProtocol (TCP|UDP)]  
2  
3 show lsn rtspalgprofile <rtspalgprofilename>  
4 <!--NeedCopy-->
```

Sample RTSP ALG Configuration

The following sample large scale NAT64 configuration, RTSP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1002::/96.

```
1 add lsn client LSN-NAT64-CLIENT-9
2 Done
3 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
4 Done
5 add lsn pool LSN-NAT64-POOL-9
6 Done
7 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
8 Done
9 add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8
:309::/96
10 Done
11 add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -

Configuring Static Large Scale NAT64 Maps

May 2, 2023

The NetScaler appliance supports manual creation of NAT64 mappings, which contain the mapping between the following information:

- Subscriber's IP address and port
- NAT IP address and port

Static Large Scale NAT64 mappings are useful in cases where you want to ensure that the IPv4 connections initiated to a NAT IP address:port are IPv6 translated and mapped to the subscriber IP address:port (for example, web servers located in the internal network).

To create a Large Scale NAT64 mapping by using the command line

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [<
    natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
4 <!--NeedCopy-->
```

Wildcard Port Static Large Scale NAT64 Maps

A static large scale NAT64 mapping entry is usually a one-to-one mapping between a subscriber IPv6 address:port and a NAT IPv4 address:port. A one-to-one static large scale NAT64 mapping entry exposes only one port of the subscriber IP address to the Internet.

Some situations might require exposing all ports (64K - limited to the maximum number of ports of a NAT IPv4 address) of a subscriber IP address to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64 thousand one-to-one static mapping entries, one mapping entry for each port. Creating those entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

A simpler method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber IP address for all protocols to the Internet.

For a subscriber's inbound or outbound connections matching a wildcard static mapping entry, the subscriber's port does not change after the NAT operation. When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber's port by connecting to the NAT port that has the same number as the subscriber's port.

To configure the NetScaler appliance to provide access to all ports of a subscriber IPv6 address, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <
    positive_integer>] [-destIP <ip_addr>
2
3 show lsn static
4 <!--NeedCopy-->
```

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 2001:DB8:5001::3 are made accessible through NAT IP 203.0.11.33.

```
1 add lsn static NAT64-WILDCARD-STATIC-1 ALL 2001:DB8:5001::3 *
    203.0.11.33 *
2 Done
3 <!--NeedCopy-->
```

Logging and Monitoring Large Scale NAT64

May 2, 2023

You can log large scale NAT64 information to diagnose and troubleshoot problems, and to meet legal requirements. You can monitor the performance of the large scale NAT64 deployment by using statistical counters and displaying the related current sessions.

Logging Large Scale NAT64

Logging large scale NAT64 information is required for ISPs to meet legal requirements and identify the source of traffic at any given time.

A log message for a large scale NAT64 mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.
- Entry type (MAPPING).
- Whether the mapping entry was created or deleted.
- Subscriber's IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.

- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
 - Destination IP address and port are not logged for endpoint-independent mapping.
 - Only the destination IP address is logged for address-dependent mapping. The port is not logged.
 - Destination IP address and port are logged for address-port-dependent mapping.

A log message for a large scale NAT64 session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table displays sample large scale NAT64 log entries of each type stored on the configured log servers. The log entries show that a subscriber whose IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

Log Entry Type	Sample Log Entry
Session Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_SESSION 5532 0 : SESSION CREATED Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_ADDR_MAPPING 5533 0 : ADM CREATED Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:TD 23.0.0.1:80, Protocol: TCP

Log Entry Type	Sample Log Entry
Session Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION DELETED Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM DELETED Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

Configuration Steps

You can configure logging of large scale NAT64 information for a large scale NAT64 configuration by setting the LSN groups's logging and session logging parameters. These are group level parameters and are disabled by default. The NetScaler appliance logs large scale NAT64 sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

Logging	Session Logging	Logging Behavior
Enabled	Enabled	Logs LSN mapping entries as well as LSN sessions
Enabled	Disabled	Logs LSN mapping entries but not LSN sessions
Disabled	Enabled	Logs neither mapping entries nor LSN sessions

To log large scale NAT64 information by using the CLI

To set the logging and session logging parameters while adding an LSN group, at the command prompt, type:

```

1 add lsn group <groupname> -clientname <string> [-logging (ENABLED|
   DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
2
3 show lsn group

```

```
4 <!--NeedCopy-->
```

To set the logging and session logging parameters for an existing LSN group, at the command prompt, type:

```
1 set lsn group <groupname> [-logging (ENABLED|DISABLED)] [-  
    sessionLogging (ENABLED|DISABLED)]  
2  
3 show lsn group  
4 <!--NeedCopy-->
```

Sample Configuration

In this example of large scale NAT64 configuration, logging and session logging parameters are enabled for LSN group LSN-NAT64-GROUP-1.

The NetScaler appliance logs large scale NAT64 session and mapping information for connections from subscribers (in the network 2001:DB8:5001::/96).

Sample configuration:

```
1 add lsn client LSN-NAT64-CLIENT-1 Done  
2 Done  
3 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96  
4 Done  
5 add lsn pool LSN-NAT64-POOL-1  
6 Done  
7 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70  
8 Done  
9 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8  
    :300::/96  
10 Done  
11 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -  
    ip6profile LSN-NAT64-PROFILE-1 -logging ENABLED -sessionLogging  
    ENABLED  
12 Done  
13 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1  
14 Done  
15 <!--NeedCopy-->
```

Logging MSISDN Information for Large Scale NAT64

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber's operator.

You can configure a NetScaler appliance to include MSISDNs in large scale NAT64 LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs facilitates faster and ac-

curate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 and IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

Log Entry Type	Sample Log Entry
Session Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_SESSION 5532 0 : SESSION CREATED E164:5556543210 Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_ADDR_MAPPING 5533 0 : ADM CREATED E164:5556543210 Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:TD 23.0.0.1:80, Protocol: TCP
Session Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION DELETED E164:5556543210 Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM DELETED E164:5556543210 Client IP-Port:TD 2001:db8:5001::9-34937:0 , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

Configuration Steps

Perform the following tasks for including MSISDN information in LSN logs:

- **Create an LSN log profile.** An LSN log profile includes the log subscriber ID parameter, which

specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration.

- Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. MSISDN information is included in all LSN logs related to mobile subscribers of this LSN group.

To create an LSN log profile by using the CLI At the command prompt, type:

```
1 add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED |
  DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind an LSN log profile to an LSN group of an NAT64 LSN configuration by using the CLI At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

Sample Configuration

In this example of NAT64 LSN configuration, the LSN log profile LOG-PROFILE-MSISDN-1 has the log subscriber ID parameter enabled. LOG-PROFILE-MSISDN-1 is bound to LSN group LSN-NAT64-GROUP-1. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in network 2001:DB8:5001::/96).

```
1 add lsn logprofile LOG-PROFILE-MSISDN-1 -logSubscriberID ENABLED
2 Done
3 add lsn client LSN-NAT64-CLIENT-1
4 Done
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6 Done
7 add lsn pool LSN-NAT64-POOL-1
8 Done
9 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10 Done
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
   :300::/96
12 Done
13 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
   ip6profile LSN-NAT64-PROFILE-1
14 Done
```

```
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -logprofilename LOG-PROFILE-MSISDN-1
18 Done
19 <!--NeedCopy-->
```

Compact Logging for Large Scale NAT

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

Configuration Steps

Perform the following tasks for logging LSN information in compact format:

1. Create an LSN log profile. An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
2. Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

To create an LSN log profile by using the CLI At the command prompt, type:

```
1 add lsn logprofile <logprofilename> -logCompact (ENABLED|DISABLED)
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

Sample Configuration for NAT64:

```
1 add lsn logfile LOG-PROFILE-COMPACT-1 -logCompact ENABLED
2 Done
3 add lsn client LSN-NAT64-CLIENT-1
4 Done
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6 Done
7 add lsn pool LSN-NAT64-POOL-1
8 Done
9 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10 Done
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
12 Done
13 add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -
    ip6profile LSN-NAT64-PROFILE-1
14 Done
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -logProfileName LOG-PROFILE-COMPACT-1
18 Done
19 <!--NeedCopy-->
```

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the NetScaler large scale NAT64 functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv6 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- Create an HTTP header log profile. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.

- Bind the HTTP header to an LSN group of a large scale NAT64 configuration. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

To create an HTTP header log profile by using the the command line interface At the command prompt, type:

```
1 add lsn httphdrlogprofile <httphdrlogfilename> [-logURL ( ENABLED |
  DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (
  ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
2
3 show lsn httphdrlogprofile
4 <!--NeedCopy-->
```

To bind an HTTP header log profile to an LSN group by using the the command line interface At the command prompt, type:

```
1 bind lsn group <groupname> -httphdrlogfilename <string>
2
3 show lsn group <groupname>
4 <!--NeedCopy-->
```

Sample Configuration

```
1 add lsn httphdrlogprofile HTTP-HEADER-LOG-1
2 Done
3 add lsn client LSN-NAT64-CLIENT-1 Done
4 Done
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6 Done
7 add lsn pool LSN-NAT64-POOL-1
8 Done
9 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10 Done
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
   :300::/96
12 Done
13 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
   ip6profile LSN-NAT64-PROFILE-1
14 Done
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
```

```
17 bind lsn group LSN-NAT64-GROUP-1 -httpdrlogprofilename HTTP-HEADER-LOG
    -1
18 Done
19 <!--NeedCopy-->
```

Displaying Current Large Scale NAT64 Sessions

You can display the current large scale NAT64 sessions in order to detect any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some large scale NAT64 sessions on the basis of selection parameters.

Note

When more than a million large scale NAT64 sessions exist on the NetScaler appliance, Citrix recommends using the selection parameters to display selected large scale NAT64 sessions instead of displaying all of them.

To display all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session -nattype NAT64
2 <!--NeedCopy-->
```

To display selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session -nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname
    <string>] [-natIP <ip_addr> [-natPort <port>]]
2 <!--NeedCopy-->
```

Displaying Large Scale NAT64 Statistics

You can display statistics related to large scale NAT64 module, and evaluate its performance or troubleshoot problems. You can display a summary of statistics of all large scale NAT64 configurations or of a particular large scale NAT64 configuration. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

To display total statistics of large scale NAT64 by using the command line interface

At the command prompt, type:

```
1 stat lsn nat64
2 <!--NeedCopy-->
```

To display statistics for a specified large scale NAT64 configuration by using the command line interface

At the command prompt, type:

```
1 stat lsn group <groupname>
2 <!--NeedCopy-->
```

Clearing Large Scale NAT64 Sessions

You can remove any unwanted or inefficient large scale NAT64 sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected large scale NAT64 sessions from the NetScaler appliance.

To clear all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session -nattype NAT64
2
3 show lsn session -nattype NAT64
4 <!--NeedCopy-->
```

To clear selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session -nattype NAT64 [-network6 <ipv6_addr|*>] [-
  clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
2
3 show lsn session -nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname
  <string>] [-natIP <ip_addr> [-natPort <port>]]
4 <!--NeedCopy-->
```

Sample configuration:

Clear all large scale NAT64 sessions existing on a NetScaler appliance

```
1 flush lsn session - nattytype NAT64
2 Done
3 <!--NeedCopy-->
```

Clear all large scale NAT64 sessions related to client entity LSN-NAT64-CLIENT-1

```
1 flush lsn session - nattytype NAT64 -clientname LSN-NAT64-CLIENT-1
2 Done
3 <!--NeedCopy-->
```

Clear all large scale NAT64 sessions related to a subscriber network (2001:DB8:5001::/96) of LSN client entity LSN-NAT64-CLIENT-2

```
1 flush lsn session - nattytype NAT64 -network6 2001:DB8:5001::/96 -
  clientname LSN-NAT64-CLIENT-2
2 Done
3 <!--NeedCopy-->
```

IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following NAT64 related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

Points to Consider before you Configure IPFIX logging

Before you start configuring IPsec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see [Configuring the AppFlow feature](#).

Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

To enable LSN logging in the AppFlow configuration by using the CLI At the command prompt, type:

```
1 set appflow param -lsnLogging ( ENABLED | DISABLED )
2
3 show appflow param
4 <!--NeedCopy-->
```

To create an LSN log profile by using the CLIAt the command prompt, type At the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofileName>
2
3 show lsn group
4 <!--NeedCopy-->
```

To create an LSN log profile by using the GUI Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

Port Control Protocol for Large Scale NAT64

May 2, 2023

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- **(Optional) Create a PCP profile.** A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
 - Mapping: Enabled
 - Peer: Enabled
 - Minimum map life: 120 seconds
 - Maximum max life: 86400 seconds
 - Announce count: 10
 - Third Party: Disabled

- **Create a PCP server and bind a PCP profile to it.** Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) or (SNIP6) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- **Bind the PCP server to an LSN group of an LSN configuration.** Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

Note

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]
2
3 show pcp profile <name>
4 <!--NeedCopy-->
```

To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
    string>]
2
3 show pcp server <name>
4 <!--NeedCopy-->
```

Sample Configuration for NAT64

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-PROFILE-1, is bound to LSN group LSN-NAT64-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv6 subscribers in network 2001:DB8:5001::/96.

Sample configuration:

```
1 add pcp profile PCP-PROFILE-1 -minMapLife 400
2 Done
```

```
3 add pcp server PCP-SERVER-1 2001:DB8:6001::90 -pcpProfile PCP-PROFILE
  -1
4 Done
5 add lsn client LSN-NAT64-CLIENT-1
6 Done
7 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
8 Done
9 add lsn pool LSN-NAT64-POOL-1
10 Done
11 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
  :300::/96
14 Done
15 add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -
  ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-NAT64-GROUP-1 -pcpServer PCP-NAT64-SERVER-1
20 Done
21 <!--NeedCopy-->
```

LSN64 in a cluster setup

May 2, 2023

Large scale NAT64 configurations are supported on a NetScaler cluster setup.

A NetScaler cluster is a group of NetScaler appliances that are configured and managed as a single system. A NetScaler cluster provides scalability and availability. Each NetScaler appliance in a cluster setup acts as an independent LSN entity and is managed as a single system.

The LSN configuration in a cluster setup is same as in a standalone appliance except for a specific pool of LSN IP addresses are owned by only one node at a time. In other words, an LSN IP pool entity is configured as a spotted entity in a particular node. All the nodes of a cluster setup can have a specific LSN IP pool entity. To make sure that the packets related to an LSN session are received on the same cluster node that performed the NAT operation, policy based backplane (PBS) steering is configured. PBS steers the received related packets of an LSN session to the same cluster node.

Sample configuration:

```
1 add lsn client LSN-NAT64-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
```

```
6
7 Done
8
9 add lsn pool LSN-NAT64-POOL-1
10
11 Done
12
13 bind lsn pool LSN-NAT64-POOL-1 -ownerNode 1 203.0.113.61 -
    203.0.113.70
14
15 Done
16
17 bind lsn pool LSN-NAT64-POOL-1 -ownerNode 2 203.0.113.101 -
    203.0.113.110
18
19 Done
20
21 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
22
23 Done
24
25 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
    ip6profile LSN-NAT64-PROFILE-1
26
27 Done
28
29 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
30
31 Done
32
33 add ns acl6 NAT64-DFD ALLOW -srcIPv6 = 2001:DB8:5001:: -type DFD -
    dfdhash SIP -dfdprefix 64
34
35 Done
36
37 apply ns acls6 -type DFD
38
39 Done
40 <!--NeedCopy-->
```

Mapping Address and Port using Translation

May 2, 2023

Mapping Address and Port using Translation (MAP-T) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the IPv4 internet. MAP-T is built on stateless IPv4 and IPv6 address translation technologies. MAP-T is a mechanism that performs

double translation (IPv4 to IPv6 and vice versa) on customer edge (CE) devices and border routers (in ISP core network).

In a MAP-T deployment, the CE device implements a combination of stateful NAPT44 translation and stateless NAT46 translation. The CE device obtains NAT-IP and the port-block to be used for translation through DHCPv6 or any other method.

When an IPv4 packet from a subscriber device arrives at the CE device, the CE device performs NAPT44 and stores the NAPT44 binding information. After NAT44 translation, the packet is subjected to NAT46 translation and then forwarded to the border router (BR) device located in the ISP's core network. The BR device receives the IPv6 packets from the CE device, extracts and validates the NAT-IP and port-block embedded in the IPv6 header, and forwards the IPv4 packet to the IPv4 Internet. When the BR receives the IPv4 packet from the Internet, it translates the IPv4 packet to an IPv6 packet and send the IPv6 packet to the CE device.

MAP-T is stateless on a BR device, so it does not require the BR device to perform NAT on the traffic. Instead, NAT functionality is delegated to the CE devices. This delegation and stateless functionality in BR devices allows the BR deployment to scale in proportion to the volume of traffic.

The NetScaler appliance implements the BR functionality of a MAP-T solution as described by RFC 7599.

Configuring MAP-T

Configuring MAP-T on a NetScaler appliance consists of the following tasks:

- Add a default mapping rule
- Add a basic mapping rule
- Bind an IPv4 NAT address range of CE devices to a basic mapping rule
- Add a map domain and bind a basic mapping rule and default mapping rule to the domain

To add a default mapping rule by using the CLI

At the command prompt, type:

```
1 add MapDmr <name> -BRIPv6Prefix ( <ipv6_addr> | <*> )
2
3 show MapDmr <name>
4 <!--NeedCopy-->
```

To add a basic mapping rule by using the CLI

At the command prompt, type:

```

1 add MapBmr <name> -RuleIpv6Prefix <ipv6_addr> | <*> [-psidoffset <
  positive_integer>] [-EabitLength <positive_integer>] [-psidlength <
  positive_integer>]
2
3 show MapBmr <name>
4 <!--NeedCopy-->

```

To bind IPv4 NAT address range of CE devices to a basic mapping rule by using the CLI

At the command prompt, type:

```

1 bind MapBmr <name> (-network <ip_addr> [-netmask <netmask>])
2
3 show MapBmr <name>
4 <!--NeedCopy-->

```

To add a map domain by using the CLI

At the command prompt, type:

```

1 add MapDomain <name> -MapDmrName <string>
2
3 show MapDomain <name>
4 <!--NeedCopy-->

```

To bind a basic mapping rule to a map domain by using the CLI

At the command prompt, type:

```

1 bind MapDomain <name> -MapBmrName <string>
2
3 show MapDomain <name>
4 <!--NeedCopy-->

```

Sample configuration

```

1 add mapdmr DMR-1 -BRIPv6Prefix 2002:db8::/64
2
3 Done
4
5 add mapbmr BMR-1 -ruleIpv6Prefix 2002:db8:89ab::/48 -eabitLength 16 -
  psidlength 8 -psidoffset 6
6
7 Done
8
9 bind mapbmr BMR-1 -network 192.0.1.0 -netmask 255.255.255.0
10

```

```
11 Done
12
13 add MapDomain MAP-DOMAIN-1 -mapdmrname DMR-1
14
15 Done
16
17 bind MapDomain MAP-DOMAIN-1 -mapbmrname BMR-1
18 Done
19 <!--NeedCopy-->
```

Telco subscriber management

May 2, 2023

The number of subscribers in a telco network is increasing at an unprecedented rate, and managing them is becoming a challenge for service providers. Newer, faster, and smarter devices are placing high demand on the network and the subscriber management systems. It is no longer feasible to provide each subscriber the same standard of service, and the need for traffic processing on a per-subscriber basis is imperative.

The NetScaler appliance provides the intelligence to profile subscribers based on their information stored in the Policy and Charging Rules Function (PCRF). When a mobile subscriber connects to the Internet, the packet gateway associates an IP address with the subscriber and forwards the data packet to the appliance. The appliance receives the subscriber information dynamically, or you can configure static subscribers. This information enables the appliance to apply its rich traffic management capabilities, such as content switching, integrated caching, rewrite, and responder, on a per-subscriber basis to manage the traffic.

Before you configure the NetScaler appliance to manage subscribers, you must allocate memory to the module that stores subscriber sessions. For dynamic subscribers, you must configure an interface through which the appliance receives session information. Static subscribers must be assigned IDs, and you can associate them with policies.

You can also do the following:

- Subscriber policy enforcement and management.
- Configure the appliance to uniquely identify a subscriber by using only the IPv6 prefix instead of the complete IPv6 address.
- Use policies to optimize TCP traffic for both dynamic and static subscribers. These policies associate different TCP profiles with different types of users.
- Manage idle sessions on a NetScaler appliance.
- Enable logging to a log server.
- Remove LSN sessions for deleted subscriber sessions.

Allocating memory for the subscriber session store module

Each subscriber session entry consumes 1 KB of memory. Storing 500,000 subscriber sessions at any point in time requires 500 MB of memory. This value must be added to the minimum memory requirement, which is shown as part of the output of the “show extendedmemoryparam” command. In the following example, the output is for a NetScaler VPX instance with 3 packet engines and 8 GB memory.

To store 500,000 subscriber sessions on this appliance, the configured memory must be 2058+500 MB (500,000 x 1 KB = 500 MB.)

Note

The configured memory must be in multiples of 2 MB and must not exceed the maximum memory usage limit. The appliance must be restarted for the changes to take effect.

Example

```
1 show extendedmemoryparam
2     Extended Memory Global Configuration. This memory is utilized by
3       LSN and Subscriber Session Store Modules:
4     Active Memory Usage: 0 MBytes
5     Configured Memory Limit: 0 MBytes
6     Minimum Memory Required: 2058 MBytes
7     Maximum Memory Usage Limit: 2606 MBytes
8 Done
9 set extendedmemoryparam -memLimit 2558
10 Done
11 show extendedmemoryparam
12     Extended Memory Global Configuration. This memory is
13       utilized by LSN and Subscriber Session Store Modules:
14     Active Memory Usage: 2558 MBytes
15     Configured Memory Limit: 2558 MBytes
16     Minimum Memory Required: 2058 MBytes
17     Maximum Memory Usage Limit: 2606 MBytes
18 Done
19 <!--NeedCopy-->
```

Configure an interface for dynamic subscribers

The NetScaler appliance dynamically receives the subscriber information through any of the following types of interface:

- Gx Interface
- RADIUS Interface

- RADIUS and Gx Interface

Note

- Starting with NetScaler release 12.0 build 57.19, Gx interface is supported for a cluster deployment. For more information see Gx interface in a cluster topology.
- In an HA setup, the subscriber sessions are continually synchronized on the secondary node. In the event of a failover, the subscriber information is still available on the secondary node.

Gx interface

A Gx interface (as specified in 3GPP 29.212) is a standard interface based on the Diameter protocol that allows exchange of policy control and charging rules between a PCRF and a Policy and Charging Enforcement Function (PCEF) entity in a Telco network.

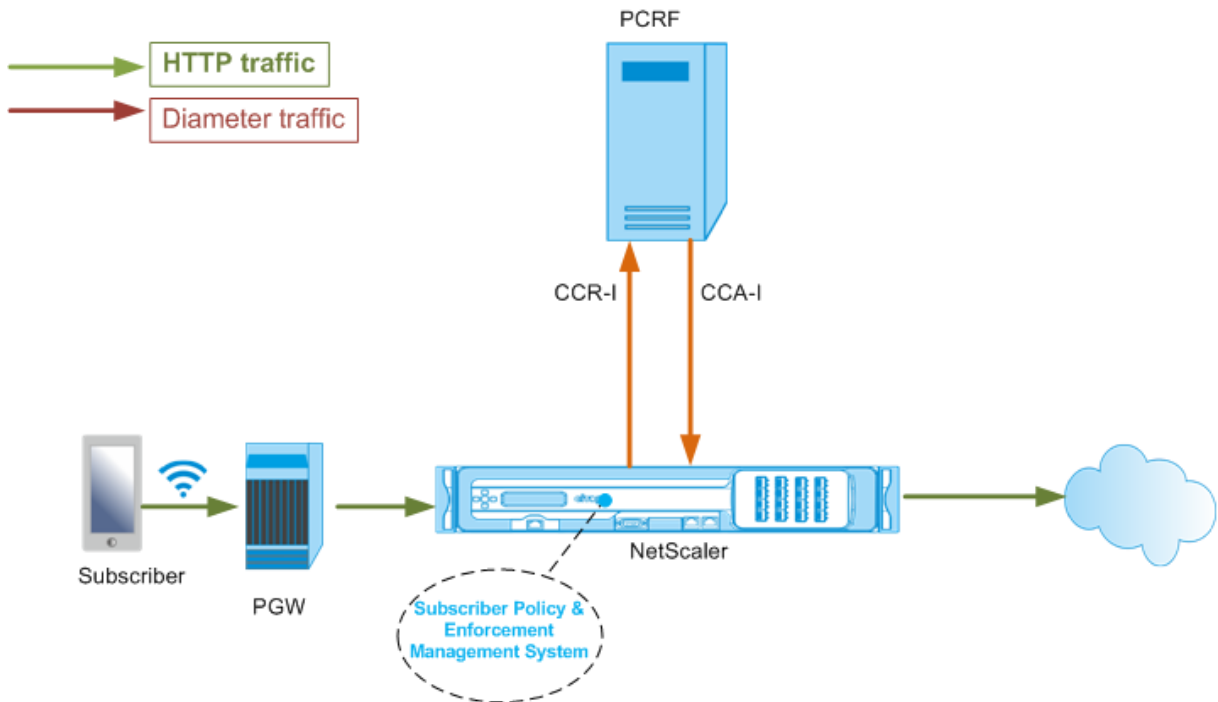

When an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the PCRF as a Diameter message. When the data packet arrives at the appliance from packet gateway (PGW), the appliance uses the subscriber IP address to query the PCRF to get the subscriber information. This is also known as secondary PCEF functionality.

The Policy and Charging Control (PCC) rules received by the appliance over the Gx interface are stored on the appliance during the subscriber session, that is, until the PCRF sends a Re-Auth-Request (RAR) message with a Session-Release-Cause AVP or the subscriber session is terminated from the CLI or the configuration utility. If there are any updates to an existing subscriber, the PCRF sends the updates in an RAR message. A subscriber session is initiated when a subscriber logs on to the network, and terminated when the subscriber logs off.

Note: If the PCRF server is down, the NetScaler appliance creates negative sessions for the pending or incoming Gx subscriber requests. When the PCRF server is back up again, the NetScaler appliance prevents a storm of requests by waiting for the negative sessions to expire before performing the specific subscriber requests.

The following illustration shows the high-level traffic flow. It assumes that the data plane traffic is HTTP. The appliance sends a Credit Control Request (CCR) over a Gx interface to the PCRF server and, in the credit control answer (CCA), receives the PCC rules and, optionally, other information, such as the Radio Access Technology (RAT) type, that applies to the particular subscriber. PCC rules include one or more policy (rule) names and other parameters. The appliance uses this information to retrieve the predefined rules stored on the appliance, and to direct the flow of traffic. It also stores this information in the subscriber policy and enforcement management system during the subscriber ses-

sion. After a subscriber session is terminated, the appliance discards all the information about the subscriber.

The following example shows the commands for configuring a Gx interface. The commands are in boldface.

To set up a Gx interface, perform the following tasks Add a DIAMETER service for each Gx interface. For example:

```

1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2
3 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
4 <!--NeedCopy-->

```

Add a non-addressable DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server. For more than one service, specify a persistenceType and the persistAVPno so that specific sessions are handled by the same PCRF server. For example:

```

1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
2
3 bind lb vserver vdiam pcrf-svc1
4
5 bind lb vserver vdiam pcrf-svc2
6 <!--NeedCopy-->

```

Configure NetScaler diameter identity and realm. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client. For example:

```
1 set ns diameter -identity netscaler.com -realm com
2 <!--NeedCopy-->
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server. Specify the PCRF realm to use as Destination-Realm AVP in diameters messages sent by the Gx client. For example:

```
1 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
2 <!--NeedCopy-->
```

Set the subscriber interface type to GxOnly. For example:

```
1 set subscriber param -interfaceType GxOnly
2 <!--NeedCopy-->
```

To see the Gx interface configuration and status, type:

```
1 show subscriber gxinterface
2 <!--NeedCopy-->
```

Example

```
1 show subscriber gxinterface
2   Gx Interface parameters:
3     PCRF Vserver: vdiam (DOWN)
4     Gx Client Identity...: netscaler1.com
5     Gx Client Realm .....: com
6     PCRF Realm: epc.mnc030.mcc234.3gppnetwork.org
7     Hold Packets On Subscriber Absence: YES
8     CCR Request Timeout: 4 Seconds
9     CCR Request Retry Attempts: 1
10    Gx HealthCheck enabled: NO
11    Gx HealthCheck TTL : 30 Seconds
12    CER Request Timeout: 10 Seconds
13    RevalidationTimeout: 30 Seconds
14    NegativeTTL: 60 Seconds
15    NegativeTTL Limited Success: NO
16    Purge SDB on Gx Failure: YES
17    ServicePath AVP code: 262099    ServicePath AVP VendorID: 3845
18    PCRF Connection State: PCRF is not ready
19    Done
20
21 <!--NeedCopy-->
```

ARGUMENTS

vServer Name of the load balancing or content switching virtual server to which the Gx connections are established. The service type of the virtual server must be DIAMETER or SSL_DIAMETER. This pa-

parameter is mutually exclusive with the service parameter. Therefore, you cannot set both service and the virtual server in the Gx interface.

Service Name of DIAMETER or SSL_DIAMETER service corresponding to PCRF to which the Gx connection is established. This parameter is mutually exclusive with the vserver parameter. Therefore, you cannot set both service and the virtual server in the Gx Interface.

pcrfRealm The realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by NetScaler Gx client (as a Diameter node).

holdOnSubscriberAbsence Set to Yes to hold packets until the subscriber session information is fetched from the PCRF server. If set to No, the default subscriber profile is applied until the subscriber session information is fetched from the PCRF server. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes.

requestTimeout Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for the number of times specified in the requestRetryAttempts parameter. If request is not complete even after retransmitting, then the default subscriber profile is applied to this subscriber. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes. Zero disables the timeout. Default value: 10

requestRetryAttempts Specify the number of times a request must be retransmitted if the request does not complete within the value specified in the requestTimeout parameter. Default value: 3.

healthCheck Set to Yes to enable inline health check of Gx peer. When enabled, NetScaler sends DWR packets to the PCRF server. When the Gx session is idle, the healthCheck timer expires and DWR packets are initiated to check if the PCRF server is active. Default value: No.

Note: This parameter is supported in NetScaler 12.1 build 51.xx and later.

healthCheckTTL Time in seconds defined for watchdog supervision. After the health check TTL time expires, DWR is sent to check the status of the PCRF server. Any CCR, CCA, RAR, or RAA message resets the timer.

Minimum value: 6 seconds. Default value: 30 seconds.

Note: This parameter is supported in NetScaler 12.1 build 51.xx and later.

cerRequestTimeout Time in seconds defined for retransmission of the capabilities exchange request. NetScaler initiates a new CER message if it does not receive a CEA from the PCRF within this configured time.

If no response is received from the PCRF server, the appliance tries to send the CER message 5 times. If there is no response even after 5 CER messages, the appliance closes the TCP connection and reports a failure. If the timeout value is set to 0, the application health check feature is disabled.

Minimum value: 0 seconds. Default value: 0 seconds.

Note: This parameter is supported in NetScaler 12.1 build 51.xx and later.

revalidationTimeout Time, in seconds, after which the Gx CCR-U request is sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout.

negativeTTL Time, in seconds, after which the Gx CCR-I request is resent for sessions that have not been resolved by PCRF because the server is down or there is no response or a failed response is received. Instead of polling the PCRF server constantly, a negative-TTL makes the appliance hold on to an unresolved session. For negative sessions, the appliance inherits the attributes from the default subscriber profile, if one is configured and from the RADIUS accounting message, if one is received. Zero value disables the negative sessions. The appliance does not install negative sessions even if a subscriber session could not be fetched. Default value: 600

negativeTTLLimitedSuccess Set to Yes to create negative session for partial success response code (2002). If set to No, regular session is created. Default value: No.

This parameter is supported in NetScaler 12.1 build 49.xx and later.

purgeSDBonGxFailure Set to Yes to flush subscriber database when the Gx interface fails. Gx interface failure includes both DWR monitoring (if enabled) and network healthCheck (if enabled). When set to Yes, all subscriber sessions are cleared.

Default value: No.

Note: This parameter is supported in NetScaler 12.1 build 51.xx and later.

servicePathAVP The AVP code in which PCRF sends the service path applicable to a subscriber.

servicePathVendorid The vendor id of the AVP in which PCRF sends the service path applicable to a subscriber.

To configure Gx interface by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **GxOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

Detect transport failures over established Gx connections

Note: This feature is supported in NetScaler 12.1 build 51.xx and later.

A NetScaler appliance can be configured to detect transport failures over established Gx connections by using device watchdog request (DWR) and device watchdog answer (DWA) messages.

After a Gx session is established, a predefined timer is triggered to detect if a session is idle. A DWR message is sent after the idle time timer expires. The idle time timer is reset each time the NetScaler appliance receives a message over an established Gx session. The peer's availability is confirmed based on the DWA message after a DWR message is sent.

- If the DWA is received, a peer's availability is confirmed and the watchdog timer is reset.
- If the DWA is not received and the watchdog timer expires twice consecutively, the session is considered as down and peer unavailable. The appliance closes the session and tries to establish a new session with the Gx peer.

When the watchdog timer expires twice without a response, the NetScaler appliance considers the Gx connection as faulty and initiates a connection closure. Once the connection is closed, no other watchdog request is sent towards the Gx peer. NetScaler appliance uses the next available Gx session for any PCRF requests.

To detect transport failures over established Gx connections by using the CLI At the command prompt, type:

```
1 set subscriber gxInterface [-vServer <string>] [-service <string>] [-healthCheck ( YES | NO )] [-healthCheckTTL<positive_integer>] [-cerRequestTimeout <positive_integer>] [-purgeSDBonGxFailure ( YES | NO )]
2 <!--NeedCopy-->
```

Example:

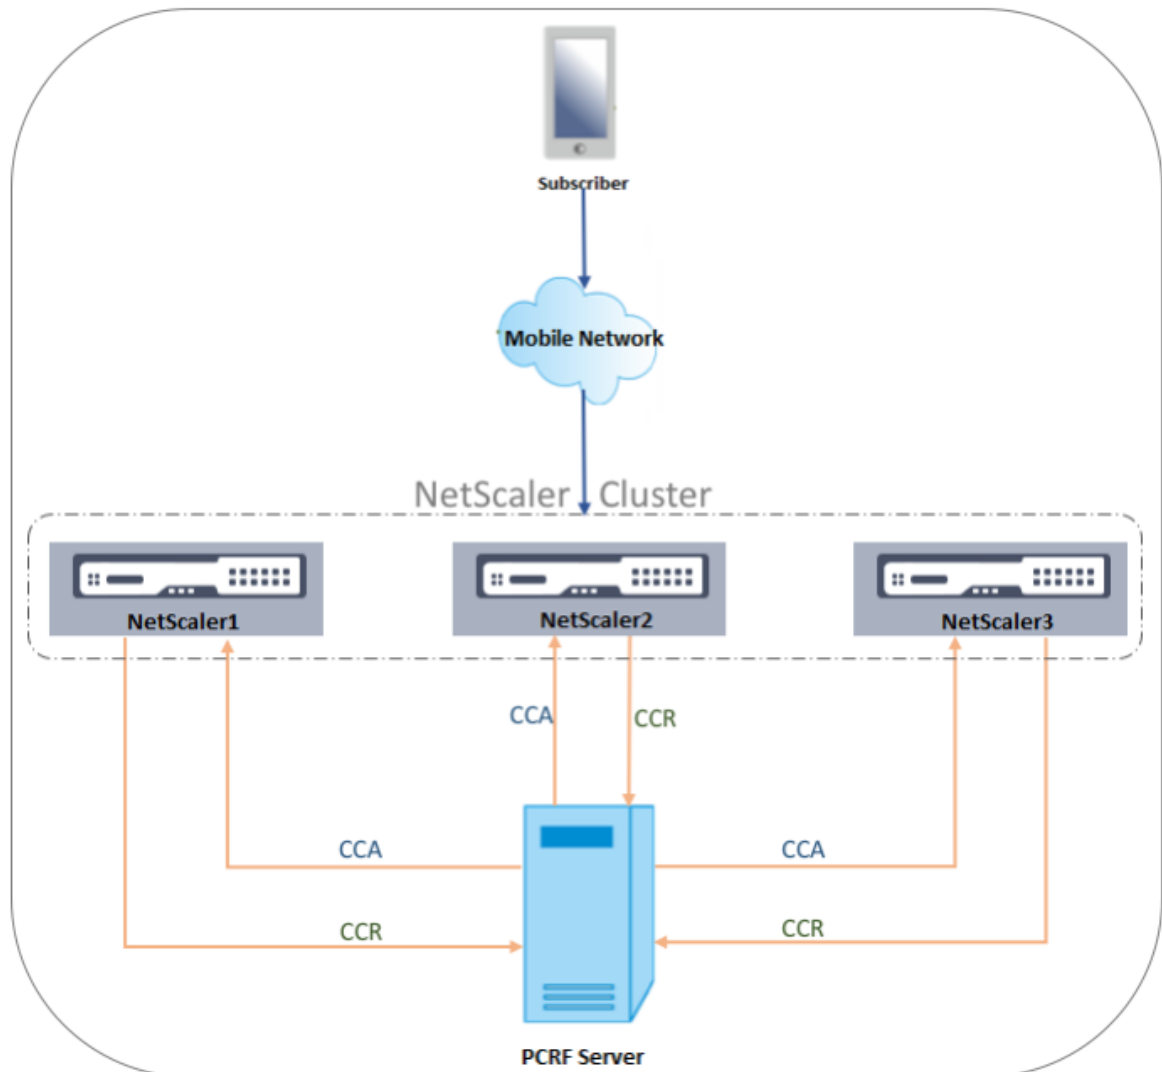

```
1 set subscriber gxInterface set subscriber gxInterface -vServer vdiam -healthCheck YES -healthCheckTTL 31 -cerRequestTimeout 15 purgeSDBonGxFailure YES
2 <!--NeedCopy-->
```

To detect transport failures over established Gx connections by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In **Interface Type**, select **GxOnly**.
4. Specify the values for all required parameters.
5. Select **Health Check** and specify values for **Health Check TTL** and **CER Request Timeout**.
6. Click **OK**.

Gx interface in a cluster topology

The NetScaler appliance supports Gx interface in a cluster topology.

The NetScaler nodes in the cluster communicate with an external PCRF server through the Gx interface. When a node receives client traffic, the appliance performs the following:

- Sends a CCR-I request to the PCRF server to fetch subscriber information.
- The PCRF server responds with a CCR-A.
- The NetScaler node then stores the received subscriber information in its subscriber store and applies the rules to the client traffic.

Each node maintains an independent subscriber store and subscriber sessions are not synchronized to other nodes.

As per the Diameter Base Protocol RFC 6733, each peer must be configured with a unique diameter identity to communicate with other peers over the diameter protocol. Hence, in a cluster deployment, configuration of diameter identity is spotted. The diameter parameters (identity, realm, server close propagation) for each node can be configured individually by using the GUI or the CLI.

When a node is added to a cluster, it assumes the default diameter parameters (identity=netscaler.com, realm=com, serverClosePropogation=NO). After the nodes are added, the diameter parameters for each node must be configured.

To configure the diameter parameters by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Change Diameter Parameters**.
3. In the Diameter Parameters page, select the NetScaler node for which you want to configure the diameter parameters and then click **Configure**.
4. In the Configure Diameter Parameters page, configure the diameter Identity, diameter Realm, and server Close Propagation for the selected node.
5. Click **OK**.

To configure the diameter parameters by using the CLI At the command prompt, type:

```
1 set ns diameter [-identity <string>] [-ownerNode <positive_integer>]
2 <!--NeedCopy-->
```

ARGUMENTS

Identity Diameter Identity is used to identify a Diameter node uniquely. Before setting up diameter configuration, the NetScaler appliance (as a Diameter node) must be assigned a unique diameter identity.

For example, set ns diameter -identity netscaler.com -ownerNode 1. So, whenever NetScaler system needs to use identity in diameter messages, it uses 'netscaler.com' as Origin-Host AVP as defined in RFC3588.

Maximum Length: 255

OwnerNode OwnerNode represents the ID of the cluster node for which the diameter ID is set. OwnerNode can be configured only through CLIP.

Minimum value: 0

Maximum value: 31

Example:

```
set ns diameter -identity netscaler1.com -ownerNode 1
```

Note:

The OwnerNode option is also added to the show ns diameter command.

Example:

```
1 show diameter -ownerNode <0-31>
2 <!--NeedCopy-->
```

When the show ns diameter command is executed, it displays the diameter parameters for a given node.

To configure a Gx interface for cluster deployment To set up a Gx interface, perform the following tasks:

Add a DIAMETER service for each Gx interface.

Example:

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
3 <!--NeedCopy-->
```

Add a DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server.

Example:

```
1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
2
3 bind lb vserver vdiam pcrf-svc1
4
5 bind lb vserver vdiam pcrf-svc2
6 <!--NeedCopy-->
```

Configure NetScaler diameter identity and realm on all the cluster nodes. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client.

Example:

```
1 set ns diameter -identity node0.netscaler.com -realm netscaler.com -  
  ownerNode 0  
2  
3 set ns diameter -identity node1.netscaler.com -realm netscaler.com -  
  ownerNode 1  
4 <!--NeedCopy-->
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server and set the PCRF realm as well.

Example:

```
1 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com  
2  
3 Set the subscriber interface type to GxOnly.  
4 <!--NeedCopy-->
```

Example:

```
1 set subscriber param -interfaceType GxOnly  
2 <!--NeedCopy-->
```

To see the Gx interface configuration and status, type:

```
1 show subscriber gxinterface  
2 <!--NeedCopy-->
```

RADIUS interface

With a RADIUS interface, the packet gateway forwards the subscriber information in a RADIUS Accounting Start message to the appliance through the RADIUS interface when an IP-CAN session is established. A service of type RADIUSListener processes RADIUS Accounting messages. Add a shared secret for the RADIUS client. If a shared secret is not configured, the RADIUS message is silently dropped. The following example shows the commands for configuring a RADIUS interface. The commands are in boldface.

To set up a RADIUS interface, perform the following tasks:

Create a RADIUS listener service at the SNIP address where the RADIUS messages are received. For example:

```
1 add service srad1 192.0.0.206 RADIUSLISTENER 1813  
2 <!--NeedCopy-->
```

Configure the subscriber RADIUS interface to use this service. For example:

```
1 set subscriber radiusInterface -listeningService srad1  
2 <!--NeedCopy-->
```

Set the subscriber interface type to RadiusOnly. For example:

```
1 set subscriber param -interfaceType RadiusOnly
2 <!--NeedCopy-->
```

Add a RADIUS client specifying a subnet and shared secret. For example:

```
1 add radius client 192.0.2.0/24 -radkey client123
2 <!--NeedCopy-->
```

A subnet of 0.0.0.0/0 implies that it is the default shared secret for all clients. To see the RADIUS interface configuration and status, type:

```
1 show subscriber radiusInterface
2 <!--NeedCopy-->
```

RADIUS Interface parameters:

Radius Listener Service: srad1(UP)

Done

Example:

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2
3 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
4 <!--NeedCopy-->
```

ARGUMENTS

ListeningService Name of the RADIUS listening service that processes the RADIUS accounting requests.

svrState The state of the RADIUS listening service.

The following illustration shows the high-level traffic flow.

To configure RadiusOnly interface by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **RadiusOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

RADIUS and Gx interface

With a RADIUS and Gx interface, when an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the appliance through the RADIUS interface. The appliance uses this subscriber ID to query the PCRF on the Gx interface to get the subscriber information. This is known as primary PCEF functionality. The following example shows the commands for configuring a RADIUS and Gx interface.

```

1 set subscriber param -interfaceType RadiusandGx
2 add service pcrf-svc 203.0.113.1 DIAMETER 3868
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
4 bind lb vserver vdiam pcrf-svc
5 set subscriber gxInterface -vServer vdiam -pcrfRealm testrealm1.net -
  holdOnSubscriberAbsence YES -revalidationTimeout 60 -negativeTTL 120
6 add service srad1 192.0.0.206 RADIUSLISTENER 1813 set subscriber
  radiusInterface -listeningService srad1
  
```

7 <!--NeedCopy-->

The following illustration shows the high-level traffic flow.

To configure RadiusAndGx interface by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **RadiusAndGx**.
4. Specify the values for the all required parameters.
5. Click **OK**.

Configure static subscribers

You can configure the subscribers manually on the NetScaler appliance by using the command line or the configuration utility. You create static subscribers by assigning a unique subscriber ID and optionally associating a policy with each subscriber. The following examples show the commands for configuring a static subscriber.

In the following examples, **subscriptionIdvalue** specifies the international telephone number, and **subscriptionIdType** (E164 in this example) specifies the general format for international telephone numbers.

```
1 add subscriber profile 203.0.113.6 -subscriberRules policy1 policy2
   -subscriptionIdType E164 -subscriptionIdvalue 98767543211
```

```
2     add subscriber profile 2002::a66:e8d3/64 -subscriberRules policy1
      policy3 -subscriptionIdtype E164 -subscriptionIdvalue
      98767543212
3     add subscriber profile 203.0.24.2 10 -subscriberRules policy2
      policy3 -subscriptionIdtype E164 -subscriptionIdvalue
      98767543213
4 <!--NeedCopy-->
```

To view the configured subscriber profiles, type:

```
show subscriber profile
```

```
1     > show subscriber profile
2
3     1) Subscriber IP: 203.0.24.2 VLAN:10
4     Profile Attributes:
5         Active Rules: policy2, policy3
6         Subscriber Id Type: E164
7         Subscriber Id Value: 98767543213
8     2) Subscriber IP: 2002::/64
9     Profile Attributes:
10        Active Rules: policy1, policy3
11        Subscriber Id Type: E164
12        Subscriber Id Value: 98767543212
13    3) Subscriber IP: 203.0.113.6
14    Profile Attributes:
15        Active Rules: policy1, policy2
16        Subscriber Id Type: E164
17        Subscriber Id Value: 98767543211
18
19        Done
20 <!--NeedCopy-->
```

Default subscriber profile

A default subscriber profile is used if the subscriber IP address is not found in the subscriber session store on the appliance. In the following example, a default subscriber profile is added with the subscriber rule policy1.

```
1     > add subscriber profile * -subscriberRules policy1
2 <!--NeedCopy-->
```

View and clear subscriber sessions

Use the following command to display all the static and dynamic subscriber sessions.

```
show subscriber sessions
```

```

1 > show subscriber sessions
2 1) Subscriber IP: 2002::/64
3   Session Attributes:
4     Active Rules: policy1, policy3
5     Subscriber Id Type: E164
6     Subscriber Id Value: 98767543212
7 2) Subscriber IP: *
8   Session Attributes:
9     Active Rules: policy1
10 3) Subscriber IP: 203.0.24.2 VLAN:10
11  Session Attributes:
12    Active Rules: policy2, policy3
13    Subscriber Id Type: E164
14    Subscriber Id Value: 98767543213
15 4) Subscriber IP: 203.0.113.6
16  Session Attributes:
17    Active Rules: policy1, policy2
18    Subscriber Id Type: E164
19    Subscriber Id Value: 98767543211
20 5) Subscriber IP: 192.168.0.11
21  Session Attributes:
22    Idle TTL remaining: 361 Seconds
23    Active Rules: policy1
24    Subscriber Id Type: E164
25    Subscriber Id Value: 1234567811
26    Service Path: policy1
27    AVP(44): 34 44 32 42 42 38 41 43 2D 30 30 30 30 30 30
28              31 31
29    AVP(257): 00 01 C0 A8 0A 02
30    PCRF-Host: host.pcrf.com
31    AVP(280): 74 65 73 74 2E 63 6F 6D
32 Done
33 <!--NeedCopy-->
```

Use the following command to clear a single session or the complete session store. If you do not specify an IP address, the complete subscriber session store is cleared.

```

1 clear subscriber sessions <ip>
2 <!--NeedCopy-->
```

Subscriber policy enforcement & management system

The NetScaler appliance uses the subscriber's IP address as the key to the subscriber policy enforcement and management system.

You can add subscriber expressions to read the subscriber information available in the Subscriber Policy Enforcement & Management System. These expressions can be used with policy rules and ac-

tions that are configured for NetScaler features, such as integrated caching, rewrite, responder, and content switching.

The following commands are an example of adding a subscriber-based responder action and policy. The policy evaluates to true if the subscriber rule value is “pol1.”

```
1   add responder action error_msg respondwith "HTTP/1.1 403 OK\r\n\r\n" +
    " You are not authorized to access Internet"
2   add responder policy no_internet_access "SUBSCRIBER.RULE_ACTIVE("
    pol1)" error_msg
3   <!--NeedCopy-->
```

The following example shows the commands to add a subscriber-based rewrite action and policy. The action inserts an HTTP header “X-Nokia-MSISDN” by using the value of AVP(45) in the subscriber session.

```
1   > add rewrite action AddHDR-act insert_http_header X-Nokia-MSISDN "
    SUBSCRIBER.AVP(45).VALUE"
2   > add rewrite policy AddHDR-pol "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.
    URL).EQUALS_ANY("patset-test")" AddHDR-act
3   <!--NeedCopy-->
```

In the following example, two policies are configured on the appliance. When the appliance checks the subscriber information and the subscriber rule is cache_enable, it performs caching. If the subscriber rule is cache_disable, the appliance does not perform caching.

```
1   > add cache policy nocachepol -rule "SUBSCRIBER.RULE_ACTIVE("
    cache_disable)" - action NOCACHE
2   > add cache policy cachepol -rule "SUBSCRIBER.RULE_ACTIVE("
    cache_enable)" - action CACHE -storeInGroup cg1
3   <!--NeedCopy-->
```

For a complete list of expressions starting with “SUBSCRIBER.” see the Policy Configuration Guide.

Important

NetScaler software release 12.1 supports IPANDVLAN key lookup method when the subscriber interface is set to GxOnly. For details, see IP address and VLAN ID key lookup method.

IPv6 prefix based subscriber sessions

A telco user is identified by the IPv6 prefix rather than the complete IPv6 address. The NetScaler appliance now uses the prefix instead of the complete IPv6 address (/128) to identify a subscriber in the database (subscriber store). For communicating with the PCRF server (for example, in a CCR-I message), the appliance now uses the framed-IPv6-Prefix AVP instead of the complete IPv6 address. The default prefix length is /64, but you can configure the appliance to use a different value.

To configure the IPv6 prefix by using the command line

```
set subscriber param [-ipv6PrefixLookupList <positive_integer> ...]
```

The first example command below sets a single prefix and the second example command sets multiple prefixes.

```
1 set subscriber param -ipv6PrefixLookupList 64
2 set subscriber param -ipv6PrefixLookupList 64 72 96
3 <!--NeedCopy-->
```

To configure the IPv6 prefix by using the configuration utility

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and in **IPv6 Prefix Lookup List**, specify one or more prefixes.

IP address and VLAN ID key lookup method

The NetScaler appliance uses the subscriber's IP address as the key lookup method to the subscriber policy enforcement and management system. This method is not effective if the IP addresses are overlapping. In such cases, you can use the VLAN ID as an additional subscriber lookup type. IPANDVLAN key lookup method is supported only when the subscriber interface is set to GxOnly. When IPANDVLAN is configured as the lookup method, the NetScaler appliance performs the following:

- Includes the originating VLAN ID in the Gx query for IPv4 subscribers.
- Includes the Gx VLAN AVP in all Gx responses. However, if there is a VLAN ID mismatch, the appliance ignores the responses.

For example, if the appliance sends a CCR-I with GxSessionId-a:IPv4-b:VLAN-c and the response contains GxSessionId-a:IPv4-b:VLAN-d, the response is dropped and a default subscriber entry is created.

Note

- Interface type RadiusAndGx and RadiusOnly cannot be configured together with key type IPANDVLAN.
- If the traffic is from an IPv6 address, the NetScaler appliance uses the IP lookup method.

To configure IP or IPANDVLAN as the key lookup method by using the CLI

At the command prompt, type:

```
1 set subscriber param [-keytype ( IP | IPANDVLAN )] [-interfaceType <
  interfaceType>]
2 <!--NeedCopy-->
```

Example:

```
1 set subscriber param -keytype IPANDVLAN -interfaceType GxOnly
2
3 set subscriber param -keytype IP -interfaceType GxOnly
4 <!--NeedCopy-->
```

Note

Changing the keytype parameter from IP to IPANDVLAN and conversely clears all subscriber data.

VLAN parameter

The VLAN parameter is also added for the following commands.

```
1 add subscriber profile <ip>@ [-vlan]
2
3 set subscriber profile <ip>@ [-vlan] [-subscriptionIdType <
  subscriptionIdType>]
4
5 show subscriber profile [<ip>@] [-vlan]
6
7 rm subscriber profile <ip>@ [-vlan <positive_integer>]
8 <!--NeedCopy-->
```

Arguments

ip Represents the subscriber IP address. This is a mandatory argument and cannot be changed after the subscriber profile is added.

vlan Represents the VLAN number on which the subscriber is located. The VLAN number cannot be changed after the subscriber profile is added.

Minimum value: 1

Maximum value: 4096

```
1 add subscriber profile 192.0.2.23 10
2
3 set subscriber profile 192.0.2.23 10 -subscriptionIdtype E164
4
5 show subscriber profile 192.0.2.23 10
```

```
6
7 rm subscriber profile 192.0.2.23 10
8
9 <!--NeedCopy-->
```

To configure IP or IPANDVLAN as the key lookup method by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In **Key Type**, select **IP** or **IPANDVLAN** as per your requirement.
4. Complete the configuration and click **OK**.

Idle session management of subscriber sessions in a Telco network

Subscriber session cleanup on a NetScaler appliance is based on control plane events, such as a RADIUS Accounting Stop message, a Diameter RAR (session release) message, or a “clear subscriber session” command. In some deployments, the messages from a RADIUS client or a PCRF server might not reach the appliance. Also, during heavy traffic, the messages might be lost. A subscriber session that is idle for a long time continues to consume memory and IP resources on the NetScaler appliance. The idle session management feature provides configurable timers to identify idle sessions, and cleans up these sessions based on the specified action.

A session is considered idle if no traffic from this subscriber is received on the data plane or the control plane. You can specify an update, terminate (inform PCRF and then delete the session), or delete (without informing PCRF) action. The action is taken only after the session is idle for the time specified in the idle timeout parameter.

To configure the idle session timeout and the associated action by using the command line

```
1 set subscriber param [-idleTTL <positive_integer>] [-idleAction <
  idleAction>]
2 <!--NeedCopy-->
```

Examples:

```
1 set subscriber param -idleTTL 3600 -idleAction ccrTerminate
2
3 set subscriber param -idleTTL 3600 -idleAction ccrUpdate
4
5 set subscriber param -idleTTL 3600 -idleAction delete
6 <!--NeedCopy-->
```

To disable the idle session timeout, set the idle timeout to zero.

```
set subscriber param -idleTTL 0
```

To configure the idle session timeout and the associated action by using the configuration utility

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and specify an **Idle Time** and **Idle Action**.

Subscriber session event logging

If you enable subscriber logging, you can track the RADIUS and Gx control plane messages specific to a subscriber, and use the historical data to analyze subscriber activities. Some of the key attributes are MSISDN and time stamp. The following attributes are also logged:

- Session Event (Install, Update, Delete, Error)
- Gx Message Type (CCR-I, CCR-U, CCR-T, RAR)
- Radius Message Type (Start, Stop)
- Subscriber IP
- SubscriberID Type (MSISDN(E164), IMSI)
- SubscriberID value

By using these logs, you can track users by IP address and, if available, MSISDN.

You can enable subscriber session logging to a local or remote syslog or nslog server. The following example shows how to enable subscriber logging to a remote syslog server.

```
1 > add syslogAction sysact1 192.0.2.0 -loglevel EMERGENCY ALERT
    CRITICAL ERROR WARNING NOTICE INFORMATIONAL -subscriberlog
    enabled
2 <!--NeedCopy-->
```

From these logs, you can learn about any activity related to a user, such as the time when a session was updated, deleted, or created (installed). Additionally, error messages are also logged.

Examples:

1. The following log entries are examples of RADIUS and Gx session creation, session update, and session deletion.

```
09/30/2015:16:29:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT
147 0 : Session Install, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164 -
30000000001
09/30/2015:16:30:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT
148 0 : Session Update, GX MsgType: CCR-U, IP: 100.10.1.1, ID: E164 - 30000000001
09/30/2015:17:27:56 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT
```

To configure subscriber aware LSN session termination by using the GUI

1. Navigate to **System > Large Scale NAT**.
2. In **Getting started**, click **Set LSN Parameter**.
3. Set the **Subscriber Aware Session Removal parameter**.

Troubleshooting

If your deployment is not working as expected, use the following commands to troubleshoot:

- show subscriber gxinterface
This command's output can include the following error messages (shown here with suggested responses):
 - Gx Interface Not Configured-Use set subscriber param command to configure the correct interface type.
 - PCRF not configured-Configure a Diameter vServer or Service on GxInterface-Use the set subscriber gx interface command to assign a Diameter virtual server or service to this interface.
 - PCRF is not ready-Check corresponding vserver/service for more details-Use the show LB vserver or show service command to check the state of the service.
 - NetScaler is waiting for CEA from PCRF-Capability negotiation between the PCRF and NetScaler might be failing. This could be an intermittent state. If it persists, check the DIAMETER settings on your PCRF server.
 - Memory is not configured to store subscriber sessions. Please use 'set extendedmemoryparam -memlimit <>' -Use the set extendedmemoryparam command to configure extended memory.
- show subscriber radiusinterface
If "Not Configured" is the output of this command, use the set subscriber radiusinterface command to specify a RADIUSListener service.

If subscriber logging is enabled, you can get more detailed information from the log files.

Subscriber aware traffic steering

May 2, 2023

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data

packet to the NetScaler appliance. The appliance communicates with the PCRF server over the Gx interface to get the policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Drop the packet.
- Perform only Large Scale NAT (LSN), if LSN is configured on the appliance.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

To configure traffic steering for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

Example:

```

1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2
3 add ns ip 192.168.20.1 255.255.255.0 -type snip
4
5 add ns ip 100.100.100.1 255.0.0.0 -type snip
6
7 add ns ip 200.200.200.1 255.0.0.0 -type snip
8
9 add ns ip 100.1.1.1 255.0.0.0 -type snip
10
11 add ns ip 200.201.1.1 255.0.0.0 -type snip

```

```
12 <!--NeedCopy-->
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

Example:

```
1 add vlan 10
2
3 add vlan 20
4
5 add vlan 100
6
7 add vlan 200
8
9 bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
10
11 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
12
13 bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
14
15 bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.1.1.1 255.0.0.0
16 <!--NeedCopy-->
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

Example:

```
1 set ns param -servicePathIngressVLAN 100
2
3 set subscriber gxinterface -servicepathAVP 1001 1005 -
  servicepathVendorid 10415
4
5 set subscriber param -interfaceType RadiusAndGx
6 <!--NeedCopy-->
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

Example:

```
1 add service sd1 10.102.232.200 DIAMETER 3868
2
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
4
5 bind lb vserver vdiam sd1
6
7 set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
```

```

8
9 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
  holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
10
11 add service srad1 10.102.232.236 RADIUSListener 1813
12
13 set subscriber radiusInterface -listeningService srad1
14 <!--NeedCopy-->

```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must already be configured as part of the global configuration. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:

```

1 add ns servicefunction SF1 -ingressVLAN 20
2
3 add ns servicepath pol1
4
5 bind ns servicepath pol1 -servicefunction SF1 -index 255
6
7 add subscriber profile * -subscriberrules default_path
8 <!--NeedCopy-->

```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

```

1 add lsn pool pool1
2
3 bind lsn pool pool1 200.201.1.1
4
5 add lsn client client1
6
7 bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
8
9 add lsn group group1 -clientname client1
10
11 bind lsn group group1 -poolname pool1
12 <!--NeedCopy-->

```

The appliance performs LSN by default. To override LSN, you must create a net profile with the `overrideLsn` parameter enabled, and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```
1 add netprofile np1
2
3 set netprofile np1 -overrideLsn ENABLED
4
5 set lb vserver vs1 -netprofile np1
6 <!--NeedCopy-->
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

```
1 add service vas1 192.168.10.2 ANY 80 -usip YES
2
3 add service sint 200.10.1.10 ANY 80 -usip YES
4
5 add lb vserver vs1 ANY -m MAC -l2Conn ON
6
7 add lb vserver vint ANY -m MAC -l2Conn ON
8
9 bind lb vserver vs1 vas1
10
11 bind lb vserver vint sint
12 <!--NeedCopy-->
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

Example:

```
1 add cs vserver cs1 ANY * 80 -l2Conn ON
2
3 add cs action csact1 -targetLBVserver vs1
4
5 add cs action csactint -targetLBVserver vint
6
7 add cs policy cspol1 -rule SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") &&
  SYS.VSERVER("vs1").STATE.EQ(UP) -action csact1
8
9 bind cs vserver cs1 -policyName cspol1 -priority 110
10
11 bind cs vserver cs1 -lbvserver vint
12 <!--NeedCopy-->
```

To configure traffic steering on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
 - Interface Type: Specify **RadiusAndGx**.
 - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
 - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

To configure service chaining on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
 - Interface Type: Specify **RadiusAndGx**.

- Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
 - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
 6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
 7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
 8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
 9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

Subscriber aware service chaining

May 2, 2023

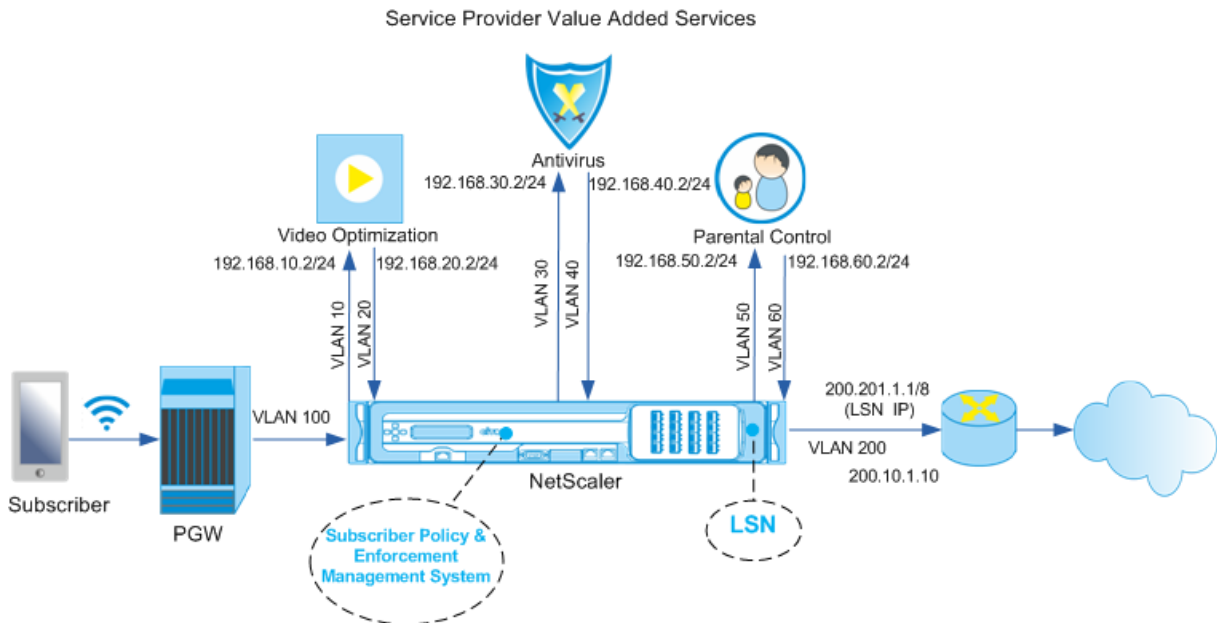

With the huge increase in the data traffic passing through telco networks, it is no longer feasible for service providers to steer all the traffic through all the value added services (VAS). A service provider should be able to optimize usage of VAS and intelligently steer traffic to improve the user experience. For example, video optimization is not required for traffic that does not include a video. Moreover, if a subscriber is connected to a 4G network, content can be streamed in high definition (HD), and video optimization might not be needed. However, video optimization improves the experience for a user in a 3G network. Similarly, caching provides a faster and better user experience and can be enabled depending on the subscriber plan. Another example of VAS is parental control. If parents provide a mobile handset to a minor child, they would like some kind of control over the websites that their child visits.

To do the above and more, service providers must be able to provide value-added services on a per-subscriber basis. In other words, entities in the service provider network must be capable of extracting the subscriber information and intelligently steering the packet on the basis of this information.

Service chaining determines the set of services through which the traffic from a subscriber must pass before going to the Internet. Instead of sending all the traffic to all the services, the NetScaler intelligently routes all requests from a subscriber to a specific set of services on the basis of the policy

defined for that subscriber.

The following figure shows the entities involved in service chaining. The values shown are configured in the procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

To configure service chaining for the above deployment by using the CLI

Add the appliance’s subnet IP (SNIP) addresses.

Example:

```

1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2
3 add ns ip 192.168.20.1 255.255.255.0 -type snip
4
5 add ns ip 192.168.30.1 255.255.255.0 -type snip
6
7 add ns ip 192.168.40.1 255.255.255.0 -type snip
8
9 add ns ip 192.168.50.1 255.255.255.0 -type snip
10
11 add ns ip 192.168.60.1 255.255.255.0 -type snip
12
13 add ns ip 100.1.1.1 255.0.0.0 -type snip
14
15 add ns ip 200.201.1.1 255.0.0.0 -type snip
16 <!--NeedCopy-->

```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses. Add an ingress and an egress VLAN for each VAS.

Example:

```
1 add vlan 10
2
3 add vlan 20
4
5 add vlan 30
6
7 add vlan 40
8
9 add vlan 50
10
11 add vlan 60
12
13 add vlan 100
14
15 add vlan 200
16
17 bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
18
19 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
20
21 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.30.1 255.255.255.0
22
23 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.40.1 255.255.255.0
24
25 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.50.1 255.255.255.0
26
27 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.60.1 255.255.255.0
28
29 bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
30
31 bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.201.1.1 255.0.0.0
32 <!--NeedCopy-->
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

Example:

```
1 set ns param -servicePathIngressVLAN 100
2
3 set subscriber gxinterface -servicepathAVP 1001 1005 -
  servicepathVendorid 10415
4
5 set subscriber param -interfaceType RadiusAndGx
6 <!--NeedCopy-->
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then,

specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

Example:

```
1 add service sd1 10.102.232.200 DIAMETER 3868
2
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
4
5 bind lb vserver vdiam sd1
6
7 set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
8
9 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
  holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
10
11 add service srad1 10.102.232.236 RADIUSListener 1813
12
13 set subscriber radiusInterface -listeningService srad1
14 <!--NeedCopy-->
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must be configured as part of the global configuration earlier. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:

```
1 add ns servicefunction SF1 -ingressVLAN 20
2
3 add ns servicefunction SF2 -ingressVLAN 40
4
5 add ns servicefunction SF3 -ingressVLAN 60
6
7 add ns servicepath pol1
8
9 bind ns servicepath pol1 -servicefunction SF1 -index 255
10
11 bind ns servicepath pol1 -servicefunction SF2 -index 254
12
13 bind ns servicepath pol1 -servicefunction SF3 -index 253
```

```
14
15 add ns servicepath pol2
16
17 bind ns servicepath pol2 -servicefunction SF2 -index 255
18
19 add ns servicepath pol3
20
21 bind ns servicepath pol3 -servicefunction SF1 -index 255
22
23 add subscriber profile * -subscriberrules default_path
24 <!--NeedCopy-->
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

Example:

```
1 add lsn pool pool1
2
3 bind lsn pool pool1 200.201.1.1
4
5 add lsn client client1
6
7 bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
8
9 add lsn group group1 -clientname client1
10
11 bind lsn group group1 -poolname pool1
12 <!--NeedCopy-->
```

The appliance performs LSN by default. To override LSN, you must create a net profile with `overrideLsn` parameter enabled and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```
1 add netprofile np1
2
3 set netprofile np1 -overrideLsn ENABLED
4
5 set lb vserver vs1 -netprofile np1
6 <!--NeedCopy-->
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

Example:

```
1 add service vas1 192.168.10.2 ANY 80 -usip YES
2
3 add service vas2 192.168.30.2 ANY 80 -usip YES
4
```

```
5 add service vas3 192.168.50.2 ANY 80 -usip YES
6
7 add service sint 200.10.1.10 ANY 80 -usip YES
8
9 add lb vserver vs1 ANY -m MAC -l2Conn ON
10
11 add lb vserver vs2 ANY -m MAC -l2Conn ON
12
13 add lb vserver vs3 ANY -m MAC -l2Conn ON
14
15 add lb vserver vint ANY -m MAC -l2Conn ON
16
17 bind lb vserver vs1 vas1
18
19 bind lb vserver vs2 vas2
20
21 bind lb vserver vs3 vas3
22
23 bind lb vserver vint sint
24 <!--NeedCopy-->
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

Example:

```
1 add cs vserver cs1 ANY * 80 -l2Conn ON
2
3 add cs action csact1 -targetLBVserver vs1
4
5 add cs action csact2 -targetLBVserver vs2
6
7 add cs action csact3 -targetLBVserver vs3
8
9 add cs action csactint -targetLBVserver vint
10
11 add cs policy cspol1 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") &&
    SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1
12
13 add cs policy cspol2 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF2") &&
    SYS.VSERVER("vs2").STATE.EQ(UP)" -action csact2
14
15 add cs policy cspol3 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF3") &&
    SYS.VSERVER("vs3").STATE.EQ(UP)" -action csact3
16
17 bind cs vserver cs1 -policyName cspol1 -priority 110
18
19 bind cs vserver cs1 -policyName cspol2 -priority 120
20
21 bind cs vserver cs1 -policyName cspol3 -priority 130
22
23 bind cs vserver cs1 -lbvserver vint
```

To configure service chaining on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
 - Interface Type: Specify **RadiusAndGx**.
 - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
 - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

Subscriber aware traffic steering with TCP optimization

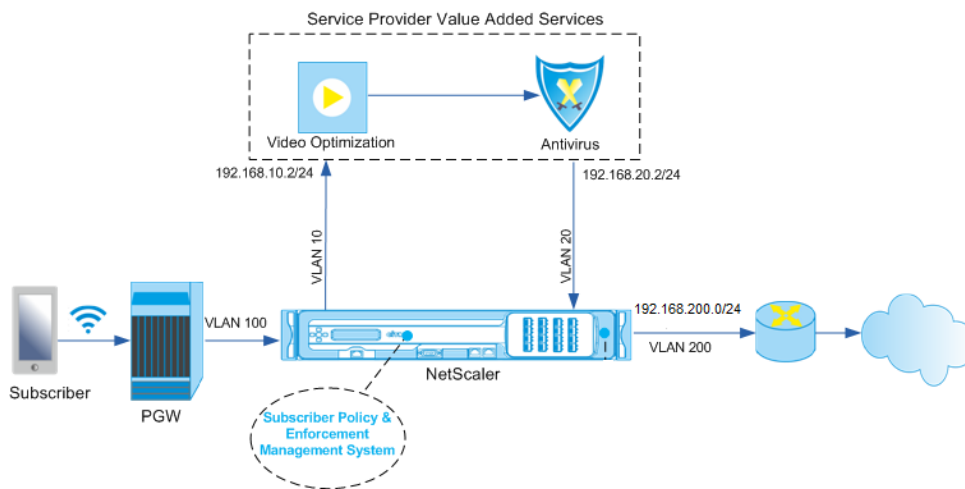

May 2, 2023

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the NetScaler appliance. The appliance communicates with the PCRF server over the Gx

interface to get the subscriber policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Perform only TCP optimization.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them and performs TCP optimization, depending on the defined rule, and then sends the packet out to the Internet.

Note

Support for the configuration shown below was introduced in release 11.1 build 50.10.

To configure traffic steering for the above deployment by using the CLI:

1. Add the appliance’s subnet IP (SNIP) addresses.

```

1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2
3 add ns ip 192.168.20.1 255.255.255.0 -type snip
4
5 add ns ip 192.168.100.1 255.255.255.0 -type snip
6
7 add ns ip 192.168.200.1 255.255.255.0 -type snip
8
9 add ns ip 10.102.232.236 255.255.255.0 -type snip
10 <!--NeedCopy-->

```

2. Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

```
1 add vlan 10
2
3 add vlan 20
4
5 add vlan 100
6
7 add vlan 200
8
9 add vlan 102
10
11 bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1
    255.255.255.0
12
13 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1
    255.255.255.0
14
15 bind vlan 100 -ifnum 1/2 -tagged -IPAddress 192.168.100.1
    255.255.255.0
16
17 bind vlan 200 -ifnum 1/2 -tagged -IPAddress 192.168.200.1
    255.255.255.0
18
19 bind vlan 102 -ifnum 1/1 -tagged -IPAddress 10.102.232.236
    255.255.255.0
20 <!--NeedCopy-->
```

3. Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Specify the PCRF realm and values for the subscriber Gx interface parameters. Also specify the service path AVP that indicates where the appliance can find the service path name within the subscriber session. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface, and specify the interface type as “RadiusAndGx”.

```
1 add service sd1 10.102.232.200 DIAMETER 3868
2
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER
    -persistAVPno 263
4
5 bind lb vserver vdiam sd1
6
7 set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
8
9 set extendedmemoryparam -memLimit 2558
10
11 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net
12
13 set subscriber gxinterface -servicepathAVP 1001 1005 -
    servicepathVendorid 10415
14
15 add service srad1 10.102.232.236 RADIUSListener 1813
16
17 set subscriber radiusInterface -listeningService srad1
```

```

18
19 set subscriber param -interfaceType RadiusAndGx
20 <!--NeedCopy-->

```

4. Specify a default subscriber profile (*) to be applied if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include the service path AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

```

1 add subscriber profile * -subscriberrules default_path
2 <!--NeedCopy-->

```

5. Create TCP profiles for the VAS and TCP optimization path, respectively. Traffic steered to VAS will not undergo any TCP optimization before or after leaving the VAS. Therefore, the TCP mode of the VAS profile should be set to TRANSPARENT while the TCP mode of the TCPOpt profile should be set to ENDPOINT.

```
add ns tcpProfile VAS -tcpMode TRANSPARENT
```

```
add ns tcpProfile TCPOpt -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -
initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering
ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop
ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enABLED
-tcpmode ENDPOINT
```

6. Configure load balancing for the VAS servers. Create a non-addressable virtual server of type TCP. Create TCP services with the IP addresses of the VAS servers, and bind the services to the virtual server. The virtual server and services will use the transparent TCP profile created for the VAS path:

```

1 add service vas1 192.168.10.2 TCP * -usip YES -useproxyport NO -
TCPB NO -tcpProfileName VAS
2
3 add service vas2 192.168.10.3 TCP * -usip YES -useproxyport NO -
TCPB NO -tcpProfileName VAS
4
5 add lb vserver vs1 TCP -m MAC -l2Conn ON - tcpProfileName VAS
6
7 bind lb vserver vs1 vas1
8
9 bind lb vserver vs1 vas2
10 <!--NeedCopy-->

```

7. Add a load balancing virtual server to capture VAS egress traffic. This vserver will monitor the VAS egress VLAN and will use the transparent TCP profile:

```

1 add lb vserver vsint TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(20)"
  - Listenpriority 30 -l2Conn ON -tcpProfileName VAS
2 <!--NeedCopy-->

```

8. Add a TCP optimization virtual server that listens for any traffic in the wireless-side VLAN and uses the endpoint TCP profile created for the TCP optimization path:

```

1 add lb vserver vs-TcpOpt TCP * * -Listenpolicy "client.vlan.id.eq
  (100)" - Listenpriority 20 -l2Conn ON -tcpProfileName TCPOpt
2 <!--NeedCopy-->

```

9. Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The CS virtual server receives the traffic and redirects it to the appropriate load balancing virtual server according to defined CS policies. Create a CS TCP virtual server that listens for any traffic in the wireless-side VLAN with highest priority and uses the endpoint TCP profile. Create a CS policy that evaluates to TRUE when “vas” is the subscriber rule, and specify a CS action that steers traffic to VAS. Make the TCP optimization virtual server the default LB vserver. Any subscriber traffic with a rule other than “vas” will go through the default LB vserver.

```

1 add cs vserver cs1 TCP * * -Listenpolicy "client.vlan.id.eq(100)"
  - Listenpriority 10 -l2Conn ON -tcpProfileName TCPOpt
2
3 add cs action csact1 -targetLBVserver vs1
4
5 add cs policy cspol1 -rule SUBSCRIBER.RULE_ACTIVE("\vas\") && SYS
  .VSERVER("\vs1\").STATE.EQ(UP)" -action csact1
6
7 bind cs vserver cs1 -policyName cspol1
8
9 bind cs vserver cs1 -lbvserver vs-TcpOpt
10 <!--NeedCopy-->

```

10. Add static or policy based routes to the internet. Dynamic routing is also supported in this configuration. The following example uses policy based routes:

```

1 add ns pbr pbr-vlan100-to-vlan200 ALLOW -nextHop 192.168.200.10 -
  vlan 100 -priority 10
2
3 add ns pbr pbr-vlan20-to-vlan200 ALLOW -nextHop 192.168.200.10 -
  vlan 20 -priority 11
4
5 apply ns pbrs
6 <!--NeedCopy-->

```

Note

The CS policies can contain IP addresses and port numbers in addition to the subscriber expressions—for example, `SUBSCRIBER.RULE_ACTIVE("vas") && && (CLIENT.TCP.DSTPORT.EQ(80))`

-
- Add IPv6 configuration (addresses, routes, PBRs) to support IPv6 subscribers. Happy Eyeballs client applications will work smoothly for both VAS and TCP optimization paths.
- Add VLANs, IP addresses, PBRs and LB virtual servers in front of VAS (vs1, vs2, etc.) to support multiple subscriber flows. Modify the listen policies of CS vserver “cs1” and LB vserver “vsint” to include the additional VLANs.

Policy based TCP profile selection

May 2, 2023

You can configure the NetScaler appliance to perform TCP optimization based on subscriber attributes. For example, the appliance can select different TCP profiles at run time, based on the network to which the user equipment (UE) is connected. As a result, you can improve a mobile user’s experience by setting some parameters in the TCP profiles and then using a policy to select the appropriate profile.

Create separate TCP profiles for subscribers connecting through a 4G network and for users connecting through any other network. Define a policy rule that is selected based on a subscriber parameter, such as Radio Access Technology type (RAT-Type). In the following examples, if RAT-Type is EUTRAN, a TCP profile that supports a faster connection is selected (Example 1). For all other RAT-Type values, a different TCP profile is selected (Example 2).

For more information about radio access technology and its policy configuration, see [RFC 29.212](#).

Note

The RAT-Type AVP (AVP code 1032) is of type “Enumerated” and is used to identify the radio access technology serving the UE.

The value “1004” indicates that the RAT is EUTRAN.

Example 1:

```
1 add ns tcpProfile tcp2 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd
  16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 1000000 -flavor BIC
  - dynamicReceiveBuffering DISABLED -sendBuffsize 1000000 -dsack
  DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 500 -maxburst 15
```

```
2
3 add appqoe action appact2 -priority HIGH -tcpprofile tcp2
4
5 add appqoe policy apppol2 -rule "SUBSCRIBER.AVP(1032).VALUE.
   GET_UNSIGNED32(0, BIG_ENDIAN).EQ(1004)" -action appact2
6
7 bind cs vserver <name> -policyname apppol2 -priority 20 -type request
8 <!--NeedCopy-->
```

Example 2:

```
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd
   16 -oooQSize 15000 -slowStartIncr 1 -bufferSize 150000 -flavor BIC
   - dynamicReceiveBuffering DISABLED -sendBuffsize 150000 -dsack
   DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 200 -maxburst 15
2
3 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
4
5 add appqoe policy apppol1 -rule "SUBSCRIBER.AVP(1032).VALUE.
   GET_UNSIGNED32(0, BIG_ENDIAN).NE(1004)" -action appact1
6
7 bind cs vserver <name> -policyname apppol1 -priority 10 -type request

Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

May 2, 2023

With the increase in control-plane traffic, the servers can become a bottleneck because the traffic is not optimally distributed among the servers. Therefore, messages must be load balanced. The NetScaler appliance supports Diameter, SIP, and SMPP load balancing.

SIP

NetScaler enables you to load balance SIP messages over UDP or over TCP (including TLS) to a group of proxy servers. NetScaler also provides Call-ID based persistence and Call-ID hash load balancing method using which you direct packets for a particular SIP session to the same load balanced SIP server.

The NetScaler default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for SIP protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

For more information, see [Load Balancing a Group of SIP Servers](#).

SMPP

Millions of short messages are exchanged daily between individuals and value-added service providers, such as banks, advertisers, and directory services, by using the short message peer to peer (SMPP) protocol. Often, message delivery is delayed because servers are overloaded and traffic is not optimally distributed among the servers.

The NetScaler appliance provides optimal distribution of messages across your servers, preventing poor performance and outages. The NetScaler appliance:

- Load balances messages originating from the server and from the client
- Monitors the health of the message centers
- Provides content switching support for the message centers
- Handles concatenated messages

Limitation: Message IDs, from the message center, longer than 59 bytes are not supported. If the message ID length returned by the message center is more than 59 bytes, ancillary operations fail and the NetScaler appliance responds with an error message.

For more information, see [SMPP Load Balancing](#)

Diameter

Diameter is a base protocol with more than 50 protocols (also called applications) built over it. Therefore, the diameter traffic generated in a Telco network is high. To optimally maintain this diameter traffic, the NetScaler appliance performs load balancing, content switching, and acts as a relay agent. Additionally, the appliance offers rewrite and responder functionality. The appliance supports rate limiting of Diameter messages.

For more information, see [Configuring Diameter Load Balancing](#).

Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers

May 2, 2023

Telecom service providers can configure the NetScaler appliance to function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the NetScaler appliance. This enables the NetScaler appliance to provide quick responses for repeated translations

and hence enhances the customer experience and also saves the bandwidth. The caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the NetScaler appliance returns the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the NetScaler appliance. The NetScaler appliance then returns the address to the client.

For requests for a domain that has been cached earlier, the NetScaler appliance serves the Address record of the domain from the cache without querying the configured DNS server and hence saves the bandwidth.

From 11.0 release onwards, NetScaler also logs the DNS requests that it receives and also the responses that it sends to the client. Telecom service providers can use this log to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
- Troubleshooting

For more information, see [Domain Name System](#).

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider

May 2, 2023

Scalability, high availability and performance are critical to service provider deployments. While many service providers deploy their infrastructure at a single location or multiple location, these deployments are subject to a number of inherent limitations, such as:

- If the site loses connectivity to all or part of the public Internet, it will be inaccessible to users and customers, which can have significant impact on the business.
- Users accessing the site from geographically distant locations may experience large and highly variable delays, which are exacerbated by the large number of round trips that HTTP requires to transfer content.

NetScaler appliance's Global Server Load Balancing (GSLB) overcomes these problems by distributing traffic among sites deployed in multiple geographic locations. By serving content from many different points in the Internet, GSLB alleviates the impact of network bandwidth bottlenecks and provides robustness in case of network failures at a particular site. Users can be automatically directed to the nearest or least loaded site at the time of the request, minimizing the likelihood of long download delays and/or service disruptions.

You can use NetScaler appliance's global server load balancing for:

- Disaster recovery or high availability by configuring an Active-standby data center setup that consists of an active and a standby data center. When a failover occurs as a result of a disaster event, the standby data center becomes operational.
- High availability and speed by configuring an active-active data center setup that consists of multiple active data centers. Client requests are load balanced across active data centers.
- Directing client requests to the data center that is closest in geographical distance or network distance by configuring a proximity setup.
- Full-DNS resolutions, GSLB processes DNS queries of the A, AAAA and CNAME types, and the DNS function option can process DNS queries of all other types, such as MX and PTR. Also, if the recursive resolution is enabled, the appliance will forward DNS queries for domain names that are not configured on the NetScaler appliance.

For more information, see [Global Server Load Balancing](#).

Bandwidth Utilization Using Cache Redirection Functionality

May 2, 2023

The volume of web traffic on the Internet is enormous and a large percentage of that traffic is redundant. Multiple clients ask web servers for the same content repeatedly leading to inefficient use of bandwidth. To relieve the origin web server of processing each request, Internet Service Providers (ISPs) can use the cache redirection feature of NetScaler appliance and serve the content from a cache server instead of from the origin server. The NetScaler appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers. Cache redirection feature of NetScaler is policy-based, and by default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

For more information, see [Cache Redirection](#).

NetScaler TCP Optimization

May 2, 2023

The NetScaler appliance provides advanced TCP tuning and optimization techniques and capabilities that are well suited to modern 3.5 and 4G networks, improving user experience and perceived download speeds significantly.

This section focuses on detailed instructions relevant to:

- Choosing and inserting an appropriate NetScaler T1000 Series model in a mobile network for TCP optimization
- Full configuration instructions related to not only TCP optimization but also for appropriate Layer-2 and Layer-3 configuration of the T1 device

The section includes the following topics:

- [Getting Started](#)
- [Management Network](#)
- [Licensing](#)
- [High Availability](#)
- [Gi-LAN Integration](#)
- [TCP Optimization Configuration](#)
- [Optimizing TCP Performance Using TCP NILE](#)
- [Analytics and Reporting](#)
- [Real-time Statistics](#)
- [SNMP](#)
- [Technical Recipes](#)
- [Troubleshooting Guidelines](#)
- [Frequently Asked Questions](#)

Getting Started

May 2, 2023

Hardware

NetScaler provides a wide breath of NetScaler models that might be loosely based on two factors:

- Capacity, currently ranging from hundreds of Mbps for the low-end VPX appliance to 160Gbps for the high-end 25000 MPX series appliance
- Telco grade, with the availability of the T1000 series for Telco datacenters.

Your NetScaler sales or Support representative can help you select the appropriate hardware for your demo, trial, or production needs.

The remainder of this section uses a NetScaler T1200 as a reference hardware. Note that putting aside superficial differences related to number and notation of available interfaces (see * in note) or well-documented limitations of NetScaler VPX (see * in note) the instructions should apply mostly verbatim regardless of the NetScaler model selected.

Note

* For instance a the T1010 model only has 12x1GbE typically marked as 1/1-1/12 rather than the 10/x notation used in this document.

** A NetScaler VPX instance typically doesn't support LACP aggregation; it might also not support VLAN tagging.

Initial Setup

Through Serial Console

After a serial cable is connected, you can log on to the NetScaler appliance with the following credentials:

- Username: nsroot
- Password: nsroot

Once logged in, configure the basic details of the NetScaler appliance as shown in the screen capture below.

Example:

```
1 set ns config -IPAddress <ip_addr> -netmask <netmask>
2
3 saveconfig
4
5 reboot -warm
6 <!--NeedCopy-->
```

After you restart the appliance, you might use SSH for further configuration of the T1100 nodes.

Through LOM

Lights out Management (LOM) port on the front panel of the NetScaler appliance allows operator to remotely monitor and manage the appliance independently of the operating system. Operator can change the IP address, power cycle, and perform a code dump by connecting to the NetScaler appliance through the LOM port.

Default IP Address of LOM port is 192.168.1.3

Figure. Intial Configuration of LOM Module

Set a static IP on your laptop and plug it directly into the LOM interface with a crossover cable or into a switch in the same broadcast domain as the LOM interface.

For initial configuration, type the port's default address: <http://192.168.1.3> in a web browser and change the LOM port's default IP address.

Refer to Configuration Guides for further details.

Software

The NetScaler TCP optimization for mobile networks is constantly evolving. The capabilities and tunings outlined in this document require a NetScaler Telco build. Here is an example showing the NetScaler Telco build.

Example:

```
1 show ver
2
3 NetScaler NS11.0: Build 64.957.nc, Date: Aug 26 2016, 02:00:23
4 <!--NeedCopy-->
```

If the T1000 has not shipped with the appropriate build revision, contact the NetScaler Customer Support.

Important

Both the appliances should have the same software image.

SSH Client

A NetScaler appliance can be configured by using either the CLI or the HTML5 GUI. However, this section provides only CLI-based instructions.

While the CLI is accessible through the NetScaler serial console, an SSH client is normally recommended to allow for remote NetScaler configuration.

Management Network

May 2, 2023

Connectivity

Most NetScaler devices offer redundant 1GbE OAM ports, notated as 0/1 and 0/2. To provide for redundancy in case of a switch failure, you should connect the relevant ports to different upstream switches.

A high-level overview of the recommended connectivity is outlined in the following diagram:

After the NetScaler appliance is connected to the management network, subsequent configuration steps can be performed remotely using SSH or web connectivity to the CLI and GUI respectively.

Routing

The add route command may be used to configure any routes appropriate to the management network. The relevant gateway should be reachable on the NSIP subnet, as shown below.

Example:

```
1 add route <network> <netmask> <gateway>
2 <!--NeedCopy-->
```

Licensing

May 2, 2023

A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

Example:

```
1 shell ls /nsconfig/license/  
2  
3 CNS_V3000_SERVER_PLT_Retail.lic ssl  
4 <!--NeedCopy-->
```

Do a warm restart to apply the new license, as shown in the screen capture below.

Example:

```
1 reboot -warm  
2  
3 Are you sure you want to restart NetScaler (Y/N)? [N]:y  
4  
5 Done  
6 <!--NeedCopy-->
```

After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a 3Gbps Premium license has been successfully installed.

Example:

```
1 > show license  
2  
3           License status:  
4  
5                   Web Logging: YES  
6  
7                   ...  
8  
9                   Model Number ID: 3000  
10  
11                  License Type: Premium License  
12  
13 Done  
14  
15 <!--NeedCopy-->
```

High Availability

May 2, 2023

High availability (HA) refers to an active-standby operational mode of a NetScaler device pair. Each

device has its own dedicated management IP address. All other IP addresses are owned by the active device in the pair.

Connectivity

While there are multiple connectivity options for a NetScaler HA pair, the most recommended one is depicted in the following diagram:

In the above diagram, the N+1 red links between each T1000 and the respective switch imply N+1 redundancy - as explained in [Connectivity](#). For instance, considering a 45 Gbps Gi-LAN N=5 is an appropriate value, with 6x10GbE LACP channels between each switch and the respective T1000 as well as between the two switches.

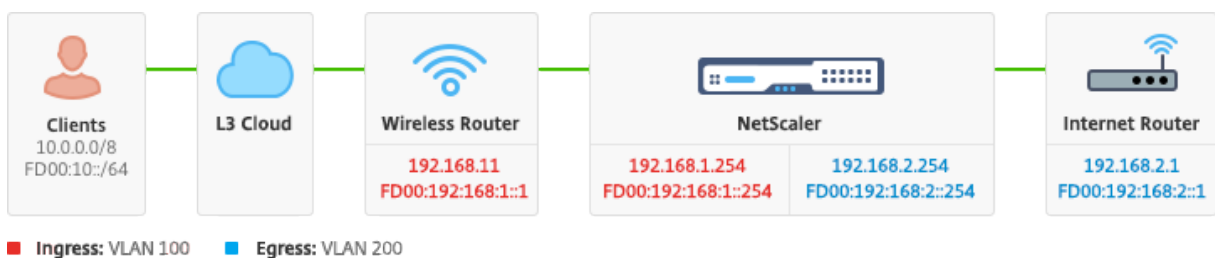

An extra pair of links is recommended between the NetScaler pair, to provide for HA communication isolation from the OAM network.

Gi-LAN Integration

May 2, 2023

Typically, a NetScaler appliance is inserted as a separate L3 inline node in the Gi-LAN, similarly to an L3 router.

Figure: A simple depiction of a Gi-LAN

Connectivity

A physical NetScaler connectivity to upstream switches is recommended to provide for sufficient redundancy. For example, assuming that a NetScaler appliance is inserted in a Gi-LAN that is handling a total (uplink+downlink) of 24Gbps, connectivity with 4x10GbE or more interfaces is recommended. This effectively provides for N+1 redundancy in case of a link failure.

The relevant ports on the upstream switch should be configured for LACP port aggregation. The relevant configuration on NetScaler is outlined below:

Connectivity Configuration:

```
1 set interface 10/1 - tagall ON - lacpMode ACTIVE - lacpKey 1
2
3 set interface 10/2 - tagall ON - lacpMode ACTIVE - lacpKey 1
4
5 set interface 10/3 - tagall ON - lacpMode ACTIVE - lacpKey 1
6
7 set interface 10/4 - tagall ON - lacpMode ACTIVE - lacpKey 1
8 <!--NeedCopy-->
```

You can verify the appropriate functionality of LACP using the “show interface” command:

show interface:

```
1 sh interface LA/1
2
3 1) Interface LA/1 (802.3ad Link Aggregate) #39
4
5 flags=0x4100c020 <ENABLED, UP, AGGREGATE, UP, HAMON, 802.1
6 q>
7 MTU=1500, native vlan=1, MAC=02:e0:ed:33:88:b0, uptime 340
8 h11m56s
9
10 Requested: media NONE, speed AUTO, duplex NONE, fctl NONE,
11 throughput 0
12
13 Actual: throughput 4000
14
15 LLDP Mode: NONE,
16
17 RX: Pkts(918446) Bytes(110087414) Errs(0) Drops(795989)
18 Stalls(0)
19
20 TX: Pkts(124113) Bytes(15255532) Errs(0) Drops(0) Stalls
21 (0)
22
23 NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)
24 Muted(0)
```

```
23           Bandwidth thresholds are not set.
24
25 Disable the remaining unused interfaces and turn off the monitor.
26
27 set interface 10/5 - haMonitor OFF
28 <!--NeedCopy-->
```

Command:

```
1 set interface 10/24 - haMonitor OFF
2
3 disable interface 10/5
4
5 disable interface 10/24
6 <!--NeedCopy-->
```

Configuration of physical interfaces is not shared across the two NetScaler units. Hence, the above commands must be run across both NetScaler nodes in case of an HA pair deployment.

HA Configuration

All other configuration parameters are shared between the NetScaler nodes of an HA pair. Hence, HA sync should be enabled prior to any other configuration commands being run. Basic HA configuration involves the following steps:

1. Using the exact same NetScaler hardware, software, and license: HA pairs are not supported between different models (i.e. a T1100 and an MPX21550) or same models with different firmware levels. Refer to the appropriate instructions on upgrading an existing HA pair - [Upgrading to Release 11.1](#).
2. Establishing the HA pair.

Example:

```
1 netScaler-1> add HA node 1 <netScaler-2-NSIP>
2
3 netScaler-2> add HA node 1 <netScaler-1-NSIP>
4 <!--NeedCopy-->
```

3. Verify the HA pair establishment running the following command in either node; both nodes should be visible, one of them as Primary (active), the other as a Secondary (standby).

Example:

```
1 show HA node
2 <!--NeedCopy-->
```

4. Enable failsafe mode and maxFlips. This ensures that in case of a route monitor failure on both nodes at least one node remains active without active/standby status constantly switching.

Example:

```
1 set HA node -failsafe ON
2
3 set HA node -maxFlips 3 -maxFlipTime 1200
4 <!--NeedCopy-->
```

5. Finally, enable HA sync to occur over the dedicated intra-NetScaler ports rather than the OAM network.

Example:

```
1 add vlan 4080 -aliasName syncVlan
2
3 set HA node -syncvlan 4080
4 <!--NeedCopy-->
```

Note

The VLAN 4080 in the commands in the above example shouldn't be taken literally. Any unused VLAN-ID might be reserved.

VLAN Configuration

After the physical interfaces have been appropriately configured, you might configure the appropriate Gi-LAN VLANs. For instance, consider a rather simple Gi-LAN environment with an ingress/egress VLAN pair with 100/101 VLAN-identifier respectively.

The following commands configure the relevant VLANs on top of the LACP channel created in the prior step.

```
1 add vlan 100
2 add vlan 101
3 bind vlan 100 -ifnum LA/1 -tagged
4 bind vlan 101 -ifnum LA/1 -tagged
5 <!--NeedCopy-->
```

IPv4 Configuration

Typically, a NetScaler appliance requires one SNIP per VLAN. The example below assumes that the networks outlined in the Gi-LAN integration diagram, given in the beginning of this page, have a /24 subnet mask:

```
1 add ns ip 192.168.1.254 255.255.255.0 -vserver DISABLED -mgmtAccess
  DISABLED
2 add ns ip 192.168.2.254 255.255.255.0 -vserver DISABLED -mgmtAccess
  DISABLED
3 <!--NeedCopy-->
```

After the SNIPs have been configured they should be associated with the appropriate VLAN:

```
1 bind vlan 100 - IPAddress 192.168.1.254 255.255.255.0
2 bind vlan 101 - IPAddress 192.168.2.254 255.255.255.0
3 <!--NeedCopy-->
```

IPv4 Static Routing

The example outlined in the [Management Network](#) section calls for only a couple of static routing rules:

- A 10.0.0.0/8 static route to the clients through the ingress router
- A default route to the internet through the egress router

Example:

```
1 add route 0.0.0.0 0.0.0.0 192.168.2.1
2 add route 10.0.0.0 255.0.0.0 192.168.1.1
3 <!--NeedCopy-->
```

IPv4 Policy-Based (VLAN - VLAN) routing

A NetScaler appliance allows for policy-based routing instead of static routing, with routing decisions usually keyed against the incoming interface and/or VLAN rather than destination IP. Policy-based routing is either a convenient alternative, in case the client source IP address range is subject to periodic changes, or a mandatory consideration, in case a packet's destination IP address is not sufficient by itself to reach a routing decision (i.e. in case of overlapping client IP addresses across multiple VLANs).

Example:

```
1 add ns pbr fromWirelessToInternet ALLOW - nextHop 192.168.2.1 - vlan
   100 -priority 10
2
3 Done
4
5 add ns pbr fromInternetToWireless ALLOW - nextHop 192.168.1.1 - vlan
   200 -priority 20
6
7 Done
8
9 apply ns pbrs
10 <!--NeedCopy-->
```

IPv6 Configuration

The following commands assign IPv6 SNIP per vlan. The example below assumes that the networks outlined in the Figure: A simple depiction of a Gi-LAN in this page have a /64 subnet mask:

Command:

```
1 add ns ip6 fd00:192:168:1::254/64 -vServer DISABLED -mgmtAccess
  DISABLED
2 add ns ip6 fd00:192:168:2::254/64 -vServer DISABLED -mgmtAccess
  DISABLED
3 bind vlan 100 -IPAddress fd00:192:168:1::254/64
4 bind vlan 200 -IPAddress fd00:192:168:2::254/64
5 <!--NeedCopy-->
```

IPv6 Routing

After IPv6 addressing is complete, IPv6 static routing might be configured:

- A fd00:10::/64 static route to the clients via the ingress router
- A default route to the internet via the egress router

Example:

```
1 add route6 fd00:10::/64 fd00:192:168:1::1
2 add route6 ::/0 fd00:192:168:2::1
3 <!--NeedCopy-->
```

Or using policy-based routing:

Example:

```
1 add ns pbr6 fromWirelessToInternetv6 ALLOW -vlan 100 -priority 10 -
  nextHop fd00:192:168:2::1
2
3 add ns pbr6 fromInternetToWirelessv6 ALLOW -vlan 200 -priority 20 -
  nextHop fd00:192:168:1::1
4
5 apply ns pbr6
6 <!--NeedCopy-->
```

LACP Redundancy and Failover

In case of an HA configuration, it's recommended to leverage the throughput option to configure a low threshold for the LACP channel. For instance, consider a 25Gbps Gi-LAN and a 4x10GbE channel between each NetScaler appliance in the HA pair and the upstream switch to provide N+1 link redundancy:

Example:

```
1 set interface LA/1 - haMonitor ON - throughput 29000
2 <!--NeedCopy-->
```

In case of a double-link failure between the primary appliance and the upstream switch the maximum Gi-LAN throughput that can be supported would fall to 20Gbps. A 29Gbps low threshold per the example above would result in a redundancy switchover event to the secondary appliance (which has not suffered similar link failures) so that Gi-LAN traffic is not affected.

Route Monitors

In addition to LACP redundancy, route monitor checks might be configured and associated with the HA pair configuration. Route monitor checks can be useful to detect failures between the NetScaler appliance and the next-hop routers, especially if said routers are not directly connected but through an upstream switch.

A typical HA route monitor configuration per the sample Gi-LAN in section 2.5.1 is outlined below:

```
1 add route 192.168.1.0 255.255.255.0 192.168.1.1 -msr ENABLED -monitor arp
2 add route 192.168.2.0 255.255.255.0 192.168.2.1 -msr ENABLED -monitor arp
3 bind HA node -routeMonitor 192.168.1.0 255.255.255.0
4 bind HA node -routeMonitor 192.168.2.0 255.255.255.0
5 <!--NeedCopy-->
```

TCP optimization configuration

May 2, 2023

Before configuring TCP optimization, apply the following basic configuration settings on the NetScaler appliance:

Initial configuration:

```
1 enable ns feature LB IPv6PT
2 enable ns mode FR L3 USIP MBF Edge USNIP PMTUD
3 disable ns feature SP
4 disable ns mode TCPB
5 set lb parameter -preferDirectRoute NO
6 set lb parameter -vServerSpecificMac ENABLED
7 set l4param -l2ConnMethod Vlan
8 set rsskeytype -rsstype SYMMETRIC
9 set ns param -useproxyport DISABLED
```

10 <!--NeedCopy-->

Note

Restart the NetScaler appliance if you change the rsskeytype system parameter.

TCP termination

For NetScaler T1 to apply TCP optimization it needs to first terminate incoming TCP traffic. Towards this end, a wildcard TCP vserver should be created and configured to intercept ingress traffic and then forward it to the Internet router.

Static or dynamic routing environment

For environments with static or dynamic routing in place, vserver can rely on routing table info to forward packets towards internet router. Default route must point to the internet router and also routing entries for client subnets towards wireless router should be in place:

Example:

```

1 add lb vserver vsrv-wireless TCP * * -persistenceType NONE -
  Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER(\"vsrv-wireless
  \").STATE.EQ(UP)" -m IP -cltTimeout 9000
2 add route 0.0.0.0 0.0.0.0 192.168.2.1
3 add route 10.0.0.0 255.0.0.0 192.168.1.1
4 <!--NeedCopy-->
  
```

VLAN-to-VLAN (PBR) environment

There are customer environments where subscriber traffic is segmented to multiple flows and needs to be forwarded to different routers based on incoming traffic parameters. Policy Based Routing (PBR) can be used to route packets based on incoming packet parameters, such as VLAN, MAC address, Interface, source IP, source port, destination IP address, and destination port.

Example:

```

1 add lb vserver vsrv-wireless TCP * * -m IP -l2Conn ON -listenpolicy "
  CLIENT.VLAN.ID.EQ(100) || CLIENT.VLAN.ID.EQ(101) || CLIENT.VLAN.ID.
  EQ(102)"
2
3 add ns pbr pbr-vlan100-to-vlan200 ALLOW -vlan 100 -nexthop 172.16.200.1
4
5 add ns pbr pbr-vlan101-to-vlan201 ALLOW -vlan 101 -nexthop 172.16.201.1
6
7 add ns pbr pbr-vlan102-to-vlan202 ALLOW -vlan 102 -nexthop 172.16.202.1
8 <!--NeedCopy-->

```

Using Policy Based Routing to route TCP optimized traffic is a new feature added in release 11.1 50.10. For previous releases, having multiple “mode MAC” vserver entities per VLAN is an alternative solution for multi-VLAN environments. Each vserver has a bound service representing the internet router for the particular flow.

Example:

```

1 add server internet_router_1 172.16.200.1
2
3 add server internet_router_2 172.16.201.1
4
5 add server internet_router_3 172.16.202.1
6
7 add service svc-internet-1 internet_router_1 TCP * -usip YES -
  useproxyport NO
8
9 add service svc-internet-2 internet_router_2 TCP * -usip YES -
  useproxyport NO
10
11 add service svc-internet-3 internet_router_3 TCP * -usip YES -
  useproxyport NO
12
13 bind service svc-internet-1 -monitorName arp
14
15 bind service svc-internet-2 -monitorName arp
16
17 bind service svc-internet-3 -monitorName arp
18
19 add lb vserver vsrv-wireless-1 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ
  (100) && SYS.VSERVER(\"vsrv-wireless-1\").STATE.EQ(UP)" -m MAC -
  l2Conn ON
20
21 add lb vserver vsrv-wireless-2 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ
  (101) && SYS.VSERVER(\"vsrv-wireless-2\").STATE.EQ(UP)" -m MAC -
  l2Conn ON
22
23 add lb vserver vsrv-wireless-3 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ
  (102) && SYS.VSERVER(\"vsrv-wireless-3\").STATE.EQ(UP)" -m MAC -
  l2Conn ON
24

```

```

25 bind lb vserver vsrv-wireless-1 svc-internet-1
26
27 bind lb vserver vsrv-wireless-2 svc-internet-2
28
29 bind lb vserver vsrv-wireless-3 svc-internet-3
30 <!--NeedCopy-->

```

Note:

The vserver mode is MAC in contrast to previous examples where it is mode IP. This is required to retain the destination IP information when we have service(s) bound to vserver. Also, the additional PBR configuration need to route non-optimized traffic.

TCP optimization

Out-of-the-box NetScaler TCP termination is configured for TCP pass-through functionality. TCP pass-through essentially means that NetScaler T1 may transparently intercept a client-server TCP stream but does not retain separate client/server buffers or otherwise apply any optimization techniques.

To enable TCP optimization a TCP profile, named as nstcpprofile, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level and it should be modified as follows:

Command:

```

1 add ns tcpProfile nstcpprofile -WS ENABLED -SACK ENABLED -WSVal 8 -mss
  1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA
  ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -
  spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -
  fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
2 <!--NeedCopy-->

```

Note:

If there is not any profile explicitly created and bound to vserver and service, the profile nstcp_default_profile is bound by default.

In case of multiple TCP profiles requirement, extra TCP profiles can be created and associated with the appropriate virtual server

Command:

```

1 add ns tcpProfile custom_profile -WS ENABLED -SACK ENABLED -WSVal 8 -
  mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA
  ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -
  spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -
  fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT

```

```
2
3 set lb vserver vsrv-wireless -tcpProfileName custom_profile
4 <!--NeedCopy-->
```

Note:

For deployments with vserver -m MAC and service, same profile should be associated with service.

```
1 set service svc-internet -tcpProfileName custom_profile
2 <!--NeedCopy-->
```

TCP optimization capabilities

Most of the relevant TCP optimization capabilities of a NetScaler appliance are exposed through a corresponding TCP profile. Typical CLI parameters that should be considered when creating a TCP profile are the following:

1. **Window Scaling (WS):** TCP Window scaling allows increasing the TCP receive window size beyond 65535 bytes. It helps improving TCP performance overall and specially in high bandwidth and long delay networks. It helps with reducing latency and improving response time over TCP.
2. **Selective acknowledgment (SACK):** TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgement the receiver can inform the sender about all the segments which are received successfully, enabling sender to only retransmit the segments which were lost. This technique helps T1 improve overall throughput and reduce the connection latency.
3. **Window Scaling Factor (WSVal):** Factor used to calculate the new window size. It must be configured with a high value in order to allow the advertised window by NS to be at least equal to the buffer size.
4. **Maximum Segment Size (MSS):** MSS of a single TCP segment. This value depends on the MTU setting on intermediate routers and end clients. A value of 1460 corresponds to an MTU of 1500.
5. **maxBurst:** Maximum number of TCP segments allowed in a burst.
6. **Initial Congestion Window size(initialCwnd):** TCP initial congestion window size determines the number of bytes which can be outstanding in beginning of the transaction. It enables T1 to send those many bytes without bothering for congestion on the wire.
7. **Maximum OOO packet queue size(oooQSize):** TCP maintains Out Of Order queue to keep the OOO packets in the TCP communication. This setting impacts system memory if the queue size is long as the packets need to be kept in runtime memory. Thus this needs to be kept at optimized level based on the kind of network and application characteristics.
8. **Minimum RTO(minRTO):** The TCP retransmission timeout is calculated on each received ACK based on internal implementation logic. The default retransmission timeout happens at 1 second to start with and this can be tweaked with this setting. For second retransmission of these

packets RTO will be calculated by $N*2$ and then $N*4 \dots N*8 \dots$ goes on till last retransmission attempt.

9. **bufferSize/sendBufferSize**: these refer to the maximum amount of data that the T1 may receive from the server and buffer internally without sending to the client. They should be set to a value larger (at least double) than the Bandwidth Delay Product of the underlying transmission channel.
10. **flavor**: this refers to the TCP congestion control algorithm. Valid values are Default, BIC, CUBIC, Westwood and Nile.
11. **Dynamic receive buffering**: allows the receive buffer to be adjusted dynamically based on memory and network conditions. It will fill up the buffer as much as it's required to keep the client's download pipe full instead of filling up, by reading ahead from server, a fixed size buffer, as latter is specified in TCP profile and typically based on criteria such as $2*BDP$, for a connection. NetScaler T1 monitors the network conditions to the client and estimates how much it should read ahead from the server.
12. **Keep-Alive (KA)**: Send periodic TCP keep-alive (KA) probes to check if peer is still up.
13. **rstWindowAttenuate**: Defending TCP against spoofing attacks. It will reply with corrective ACK when a sequence number is invalid.
14. **rstMaxAck**: Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number.
15. **spoofSynDrop**: Drop of invalid SYN packets to protect against spoofing.
16. **Explicit Congestion Notification(ecn)**: It sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption.
17. **Forward RTO-Recovery**: In case of spurious retransmissions, the congestion control configurations are reverted to their original state.
18. **TCP maximum congestion window (maxcwnd)**: TCP maximum congestion window size that is user configurable.
19. **Forward acknowledgment (FACK)**: To avoid TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either T1 or a client) control the amount of data injected into the network during retransmission timeouts.
20. **tcpmode**: TCP optimization modes for specific profile. There are two TCP optimization modes - Transparent and Endpoint.
 - Endpoint. In this mode, the appliance manages the client and server connections separately.
 - Transparent. In the transparent mode the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them.

Silently dropping idle connections

In a telco network, almost 50 percent of a NetScaler appliance's TCP connections become idle, and the appliance sends RST packets to close them. The packets sent over radio channels activate those channels unnecessarily, causing a flood of messages that in turn cause the appliance to generate a flood of service-reject messages. The default TCP profile now includes DropHalfClosedConnOnTimeout and DropEstConnOnTimeout parameters, which by default are disabled. If you enable both of them, neither a half closed connection nor an established connection causes a RST packet to be sent to the client when the connection times out. The appliance just drops the connection.

```
1 set ns tcpProfile nstcpprofile -DropHalfClosedConnOnTimeout ENABLED
2 set ns tcpProfile nstcpprofile -DropEstConnOnTimeout ENABLED
3 <!--NeedCopy-->
```

Analytics and Reporting

May 2, 2023

The TCP Speed Reporting is a NetScaler feature which extracts TCP connection statistics, as a measure of TCP download and upload performance, and is utilized in [TCP Insight](#) reports of the NetScaler Application Delivery Management (ADM). To achieve this, NetScaler monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count and duration) for the identified maximum burst. TCP Speed Reporting feature is enabled by default, support both TCP and HTTP vServers and depends on the Appflow/ULFD reporting infrastructure.

Real-time Statistics

September 21, 2020

The stat command might be used to verify that TCP optimization is properly applied:

Command:

```
1 > stat lb vserver vsrv-wireless
2 Virtual Server Summary
3
4 vsrv...eless          vsvrIP  port  Protocol  State  Health
5                       actSvcs
6                       *    0      TCP       UP     100
7
8 1
```

37	svc-internet	0	0	0	0	0	0

The Total counters should constantly increase for an operational system. In addition, the Rate counters should be non-zero.

Note

The preceding output is from an operational yet idle lab system, explaining the zero rate.

SNMP

May 2, 2023

SNMP agent can be queried for system specific information from a remote device (SNMP Manager). Based on the query, the agent searches for the equal object identifier (OID) in the management information base (MIB) for the data requested and sends the information to the SNMP Manager. The following are the most useful SNMP OIDs for Telco deployments:

Memory

- **resMemUsage (1.3.6.1.4.1.5951.4.1.1.41.2)**

Percentage of memory utilization on NetScaler.

Packet Engine CPU

- **resCpuUsage (1.3.6.1.4.1.5951.4.1.1.41.1)**

CPU utilization percentage.

- **nsCPUTable (1.3.6.1.4.1.5951.4.1.1.41.6)**

This table contains information about each CPU in NetScaler.

Indexed on: nsCPUname

- **nsCPUname (1.3.6.1.4.1.5951.4.1.1.41.6.1.1)**

The name of the CPU.

- **nsCPUusage (1.3.6.1.4.1.5951.4.1.1.41.6.1.2)**

CPU utilization percentage.

Throughput

- **allNicTotRxMbits (1.3.6.1.4.1.5951.4.1.1.71.1)**

Number of megabits received by the NetScaler appliance.

- **allNicTotTxMbits (1.3.6.1.4.1.5951.4.1.1.71.2)**

Number of megabits transmitted by the NetScaler appliance.

- **ipTotRxPkts (1.3.6.1.4.1.5951.4.1.1.43.25)**

IP packets received.

- **ipTotRxMbits (1.3.6.1.4.1.5951.4.1.1.43.27)**

Megabits of IP data received.

- **ipTotTxPkts (1.3.6.1.4.1.5951.4.1.1.43.28)**

IP packets transmitted.

- **ipTotTxMbits (1.3.6.1.4.1.5951.4.1.1.43.30)**

Megabits of IP data transmitted.

Connections

Active connections:

- **tcpActiveServerConn (1.3.6.1.4.1.5951.4.1.1.46.8)**

Connections to a server currently responding to requests.

Total connections:

- **tcpCurServerConn (1.3.6.1.4.1.5951.4.1.1.46.1)**

Server connections, including connections in the Opening, Established, and Closing state.

- **tcpCurClientConn (1.3.6.1.4.1.5951.4.1.1.46.2)**

Client connections, including connections in the Opening, Established, and Closing state.

Note: Because of SYN-Cookie, this doesn't include Client in Opening state

- **tcpTotZombieClntConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.26)**

Client connections that are flushed because the client has been idle for some time.

- **tcpTotZombieSvrConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.27)**

Server connections that are flushed because there have been no client requests in the queue for some time.

Errors

- **tcpErrSynGiveUp (1.3.6.1.4.1.5951.4.1.1.46.37)**

Attempts to establish a connection on the NetScaler that timed out.

- **tcpErrRetransmitGiveUp (1.3.6.1.4.1.5951.4.1.1.46.60)**

Number of times NetScaler terminates a connection after retransmitting the packet seven times on that connection. Retransmission happens when receiving end doesn't acknowledge the packet.

- **ifInDiscards (1.3.6.1.2.1.2.2.1.13)**

The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

- **ifOutDiscards (1.3.6.1.2.1.2.2.1.19)**

The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

- **ifErrTxOverflow (1.3.6.1.4.1.5951.4.1.1.54.1.36)**

Number of packets that have passed through the overflow queues, during transmission on the specified interface, since the NetScaler appliance was started or the interface statistics were cleared. This gets incremented only on congested ports.

Optimized/Bypass connections

- **tcpOptimizationEnabled (1.3.6.1.4.1.5951.4.1.1.46.131)**

Total number of connections enabled with TCP optimization.

- **tcpOptimizationBypassed (1.3.6.1.4.1.5951.4.1.1.46.132)**

Total number of connections bypassed TCP Optimization.

Technical Recipes

May 2, 2023

The NetScaler T1 models provide advanced features and a powerful policy configuration language that allow for evaluation of complex decision in runtime.

While it is not possible to evaluate all capabilities that are potentially unlocked by the T1000 features and policy configuration guide, technical recipes consider implementation of various requirements brought in by Telco operators. Feel free to re-use the “recipes” as is or adapt to your environment.

Per-user Connection Limit

The NetScaler T1 model can be configured to limit the number of connections per unique subscriber IP. With the below configuration, N concurrent TCP connections per IP (CLIENT.IP.SRC) is allowed. For every attempt for connection beyond the configured threshold, T1 sends an RST. For maximum 2 concurrent connections per user:

Command:

```
1 add stream selector streamSel_usrlimit CLIENT.IP.SRC
2 add ns limitIdentifier limitId_usrlimit -threshold 2 -mode CONNECTION -
  selectorName streamSel_usrlimit
3 add responder policy respPol_usrlimit "SYS.CHECK_LIMIT(\"
  limitId_usrlimit\")" RESET
4 bind lb vserver vsrv-wireless -policyName respPol_usrlimit -priority 1
  -gotoPriorityExpression END
5 <!--NeedCopy-->
```

Smooth Insertion/Deletion of Vserver

Many operators concern about TCP connections disruption when the NetScaler T1 model is activated inline for TCP optimization or when it is disabled for maintenance purposes. To avoid breaking existing connections when vserver is introduced, the following configuration needs to be applied before configuring or activating vserver for TCP optimization:

Command:

```
1 add ns acl acl-ingress ALLOW -vlan 100
2 add forwardingSession fwd-ingress -aclname acl-ingress
3 apply ns acls
4 <!--NeedCopy-->
```

Forwarding sessions are effective on top of routing (either static or dynamic or PBR) and create session entries for traffic that is routed (L3 mode). Any existing connection is handled by forwarding

session due to corresponding sessions, and upon vserver introduction it starts capturing only new TCP connections.

ACLs can be configured to capture only specific ports like vserver, in order to avoid creating sessions for unnecessary traffic, which is memory consuming. Another option is to remove specific configuration after vserver activation.

For maintenance purposes, vserver should be disabled and its state appears as OUT OF SERVICE. When this happens, the vserver terminates all connections immediately by default. To make vserver to still serve the existing connections and not accept new, the following configuration should be applied:

Command:

```
1 set lb vserver vsrv-wireless -downStateFlush DISABLED
2 <!--NeedCopy-->
```

New connections go through the routing table, and corresponding session entries are created due to forwarding sessions.

Policy-Based TCP Profiling

Policy-based TCP Profile selection allows operators to configure TCP profile dynamically for clients coming from different traffic domains (i.e. 3G or 4G). Some of the QoS metrics are different for these traffic domains, and in order to achieve better performance, you need to change some of the TCP parameter dynamically. Consider a case where clients coming from 3G and 4G hit same vserver and use same TCP profile, which have negative impact on some client's performance. AppQoE functionality can classify these clients and dynamically change TCP profile on vserver.

Example:

```
1 enable feature AppQoE
2
3 add ns tcpProfile nstcpprofile1 -WS ENABLED -SACK ENABLED -WSVal 8 -mss
  1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  slowStartIncr 1 -bufferSize 4000000 -flavor BIC -KA ENABLED -
  sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spooofSynDrop
  ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -tcpmode
  ENDPOINT
4
5 add ns tcpProfile nstcpprofile2 -WS ENABLED -SACK ENABLED -WSVal 8 -mss
  1460 -maxBurst 15 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  slowStartIncr 1 -bufferSize 128000 -flavor BIC -KA ENABLED -
  sendBuffsize 6000000 -rstWindowAttenuate ENABLED -spooofSynDrop
  ENABLED -frto ENABLED -maxcwnd 64000 -fack ENABLED -tcpmode ENDPOINT
6
7 add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
8
```

```
9 add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
10
11 add appqoe policy appqoe_4G -rule "CLIENT.VLAN.ID.EQ(100)" -action
    action_1
12
13 add appqoe policy appqoe_3G -rule "CLIENT.VLAN.ID.EQ(200)" -action
    action_2
14
15 bind lb vserver vsrv-wireless -policyName appqoe_4G -priority 100
16
17 bind lb vserver vsrv-wireless -policyName appqoe_3G -priority 110
18 <!--NeedCopy-->
```

The NetScaler T1 model is capable to receive the subscriber information dynamically through Gx or Radius or Radius and Gx interface and apply different TCP profile on a per-subscriber basis.

Command:

```
1 add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
2
3 add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
4
5 add appqoe policy appqoe_4G -rule "SUBSCRIBER.RULE_ACTIVE(\"3G\")" -
    action action_1
6
7 add appqoe policy appqoe_3G -rule "SUBSCRIBER.RULE_ACTIVE(\"4G\")" -
    action action_2
8 <!--NeedCopy-->
```

For integration of the NetScaler T1 model with operator control-plane network, see [Telco Subscriber Management](#).

Scalability

May 2, 2023

Because TCP optimization is resource intensive, a single NetScaler appliance, even a high end –appliance, might not be able to sustain high Gi-LAN throughputs. To expand the capacity of your network, you can deploy NetScaler appliances in an N+1 cluster formation. In a cluster deployment, the NetScaler appliances work together as a single system image. The client traffic is distributed across the cluster nodes with the help of external switch device.

Topology

Figure 1 is an example of a cluster consisting of four T1300-40G nodes.

The setup shown in Figure 1 has the following properties:

1. All cluster nodes belong to the same network (also known as an L2 cluster).
2. Data plane and backplane traffic are handled by different switches.
3. Assuming Gi-LAN throughput is 200 Gbps and that a T1300-40G appliance can sustain 80Gbps of throughput, we need three T1300-40G appliances. To provide redundancy in case of single cluster node failure, we deploy four appliances in total.
4. Each node will receive up to 67Gbps of traffic (50Gbps in normal operating conditions and 67Gbps in case of single cluster node failure), so it needs 2x40Gbps connections to the upstream switch. To provide redundancy in case of switch failure, we deploy a couple of upstream switches and double the number of connections.
5. Cluster Link Aggregation (CLAG) is used to distribute traffic across cluster nodes. A single CLAG handles both client and server traffic. Link Redundancy is enabled on the CLAG, so only one

“subchannel” is selected at any given time and handles the traffic. If some link fails or throughput falls below specified threshold, the other subchannel is selected.

6. The upstream switch performs symmetric port-channel load balancing (for example, source-dest-ip-only algorithm of Cisco IOS 7.0(8) N1(1)) so that forward and reverse traffic flows are handled by the same cluster node. This property is desirable because it eliminates packet re-ordering, which would degrade TCP performance.
7. Fifty percent of data traffic is expected to be steered to backplane, which means each node will steer up to 34Gbps to other cluster nodes (25Gbps in normal operating conditions and 34Gbps in case of single cluster node failure). Thus, each node needs at least 4x10G connections to the backplane switch. To provide redundancy in case of switch failure, we deploy a couple of backplane switches and double the number of connections. Link redundancy is not currently supported for backplane, so Cisco VPC or equivalent technology is desired to achieve switch-level redundancy.
8. MTU size of steered packets is 1578 bytes, so backplane switches must support an MTU more than 1500 bytes.

Note: The design depicted in Figure 1 is also applicable to T1120 and T1310 appliances. For T1310 we would use 40GbE interfaces for the backplane connections, since it lacks 10GbE ports.

Note: While this document uses Cisco VPC as an example, if working with non-Cisco switches alternate equivalent solutions could be used, such as Juniper’s MLAG.

Note: While other topologies such as ECMP instead of CLAG are possible, they are not currently supported for this particular use case.

Configuring TCP Optimization in a NetScaler T1000 Cluster

After physical installation, physical connectivity, software installation, and licensing are completed, you can proceed with the actual cluster configuration. The configurations described below apply to the cluster depicted in Figure 1.

Note: For more information about cluster configuration, see [Setting up a NetScaler cluster](#).

Assume that the four T1300 nodes in Figure 1 have the following NSIP addresses:

Four T1300 nodes with NSIP address:

```
1 T1300-40-1: 10.102.29.60
2 T1300-40-2: 10.102.29.70
3 T1300-40-3: 10.102.29.80
4 T1300-40-4: 10.102.29.90
```

The cluster will be managed through the cluster IP (CLIP) address, which is assumed to be 10.78.16.61.

Setting Up the Cluster

To begin configuring the cluster shown in Figure 1, log on to the first appliance that you want to add to the cluster (for example, T1300-40-1) and do the following.

1. At the command prompt, enter the following commands:

Command:

```
1 > add cluster instance 1
2 > add cluster node 0 10.102.29.60 -state ACTIVE
3 > add ns ip 10.102.29.61 255.255.255.255 -type clip
4 > enable cluster instance 1
5 > save ns config
6 > reboot -warm
```

2. After the appliance restarts, connect to the Cluster IP (CLIP) address and add the rest of the nodes to the cluster:

Command:

```
1 > add cluster node 1 10.102.29.70 -state ACTIVE
2 > add cluster node 2 10.102.29.80 -state ACTIVE
3 > add cluster node 3 10.102.29.90 -state ACTIVE
4 > save ns config
```

3. Connect to the NSIP address of each of the newly added nodes and join the cluster:

Command:

```
1 > join cluster -clip 10.102.29.61 -password nsroot
2 > save ns config
3 > reboot -warm
```

4. After the nodes restart, proceed with backplane configuration. On the cluster IP address, enter the following commands to create an LACP channel for the backplane link of each cluster node:

Command:

```
1 > set interface 0/10/[1-8] -lacpkey 1 -lacpmode ACTIVE
2 > set interface 1/10/[1-8] -lacpkey 2 -lacpmode ACTIVE
3 > set interface 2/10/[1-8] -lacpkey 3 -lacpmode ACTIVE
4 > set interface 3/10/[1-8] -lacpkey 4 -lacpmode ACTIVE
```

5. Similarly, configure dynamic LA and VPC on the backplane switches. Make sure the MTU of the backplane switch interfaces is at least 1578 bytes.
6. Verify the channels are operational:

Command:

```
1 > show channel 0/LA/1
```

```
2 > show channel 1/LA/2
3 > show channel 2/LA/3
4 > show channel 3/LA/4
```

7. Configure the cluster node backplane interfaces.

Command:

```
1 > set cluster node 0 -backplane 0/LA/1
2 > set cluster node 1 -backplane 1/LA/2
3 > set cluster node 2 -backplane 2/LA/3
4 > set cluster node 3 -backplane 3/LA/4
```

8. Check the cluster status and verify that the cluster is operational:

```
1 > show cluster instance
2 > show cluster node
```

For more information on cluster setup, see [Setting up a NetScaler cluster](#)

Distributing Traffic Across Cluster Nodes

After you have formed the NetScaler cluster, deploy Cluster Link Aggregation (CLAG) to distribute traffic across cluster nodes. A single CLAG link will handle both client and server traffic.

On the cluster IP address, execute the following commands to create the Cluster Link Aggregation (CLAG) group shown in Figure 1:

Command:

```
1 > set interface 0/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
2 > set interface 1/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
3 > set interface 2/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
4 > set interface 3/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
```

Configure dynamic link aggregation on the external switches.

Then, enable Link Redundancy as follows:

Code:

```
1 > set channel CLA/1 -linkRedundancy ON -lrMinThroughput 240000
```

Finally, check the channel status by entering:

Command:

```
1 > show channel CLA/1
```

The channel should be UP and the actual throughput should be 320000.

For more information about cluster link aggregation, see the following topics:

- [Dynamic Cluster Link Aggregation](#)
- [Link Redundancy in a Cluster with LACP.](#)

Because we will be using MAC-based forwarding (MBF), configure a linkset and bind it to the CLAG group as follows:

Command:

```
1 > add linkset LS/1
2 > bind linkset LS/1 -ifnum CLA/1
```

More information about linksets, see the following topics:

- [Configuring Linksets](#)
- [Using Cluster LA Channel with Linksets](#)

Configuring VLAN and IP Addresses

We will be using striped IP configuration, which means that IP addresses are active on all nodes (default setting). See [Striped, Partially Striped, and Spotted Configurations](#) for more information about this topic.

1. Add the ingress and egress SNIPs:

Command:

```
1 > add ns ip 172.16.30.254 255.255.255.0 -type SNIP
2 > add ns ip 172.16.31.254 255.255.255.0 -type SNIP
3 > add ns ip6 fd00:172:16:30::254/112 -type SNIP
4 > add ns ip6 fd00:172:16:31::254/112 -type SNIP
```

2. Add the corresponding ingress and egress VLANs:

Command:

```
1 > add vlan 30 -aliasName wireless
2 > add vlan 31 -aliasName internet
```

3. Bind VLANs with IPs and linkset:

Command:

```
1 > bind vlan 31 -ifnum LS/1 -tagged
2 > bind vlan 30 -ifnum LS/1 -tagged
3 > bind vlan 30 -IPAddress 172.16.30.254 255.255.255.0
4 > bind vlan 31 -IPAddress 172.16.31.254 255.255.255.0
5 > bind vlan 30 -IPAddress fd00:172:16:30::254/112
6 > bind vlan 31 -IPAddress fd00:172:16:31::254/112
```

More ingress and egress VLANs can be added if needed.

Configuring TCP Optimization

At this point, we have applied all cluster specific commands. To complete the configuration, follow the steps described in [TCP optimization configuration](#).

Configuring Dynamic Routing

A NetScaler cluster can be integrated into the dynamic routing environment of the customer's network. Following is an example of dynamic routing configuration using BGP routing protocol (OSPF is also supported).

1. From the CLIP address, enable BGP and dynamic routing on ingress and egress IP addresses:

Command:

```
1 > enable ns feature bgp
2 > set ns ip 172.16.30.254 -dynamicRouting ENABLED
3 > set ns ip 172.16.31.254 -dynamicRouting ENABLED
```

2. Open vtysh and configure BGP for the egress side:

Code:

```
1 > shell
2 root@ns# vtysh
3 ns# configure terminal
4 ns(config)# router bgp 65531
5 ns(config-router)# network 10.0.0.0/24
6 ns(config-router)# neighbor 172.16.31.100 remote-as 65530
7 ns(config-router)# neighbor 172.16.31.100 update-source
   172.16.31.254
8 ns(config-router)# exit
9 ns(config)# ns route-install propagate
10 ns(config)# ns route-install default
11 ns(config)# ns route-install bgp
12 ns(config)# exit
```

3. Configure the egress-side BGP peer to advertise the default route to the NetScaler cluster. For example:

Command:

```
1 router bgp 65530
2 bgp router-id 172.16.31.100
3 network 0.0.0.0/0
4 neighbor 172.16.31.254 remote-as 65531
```

4. Follow similar steps to configure the ingress side.
5. From vtysh verify that configuration is propagated to all cluster nodes, by entering:

Command:

```
1 ns# show running-config
```

6. Finally, log on to NSIP address of each cluster node and verify routes advertised from BGP peer:

Command:

```
1 > show route | grep BGP
```

Optimizing TCP Performance using TCP Nile

April 16, 2024

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

Congestion Control Strategies

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

NILE Algorithm

Citrix Systems has developed a new congestion-control algorithm, NILE, a TCP optimization algorithm designed for high-speed networks such as LTE, LTE advanced and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions and carrier aggregation.

The NILE algorithm:

- Bases queue-latency estimates on round-trip time measurements.
- Uses a congestion-window-increase function that is inversely proportional to the measured queue latency. This method results in approaching the network congestion point more slowly than does the standard TCP method, and reduces the packet losses during congestion.
- Can distinguish between random loss and congestion based loss on the network by using the estimated queue latency.

The telecom service providers can use the NILE algorithm in their TCP infrastructure to:

- Optimize mobile and long-distance networks—The NILE algorithm achieves higher throughput compared to standard TCP. This feature is especially important for mobile and long-distance networks.
- Decrease application perceived latency and enhance subscriber experience—The Nile algorithm uses packet loss information to determine whether the transmission-window size should be increased or decreased, and uses queuing delay information to determine the size of the increment or decrement. This dynamic setting of transmission-window size decreases the application latency on the network.

To configure NILE support using the command line interface

At the command prompt, type the following:

```
1 set ns tcpProfile <name> [-flavor NILE]
2 <!--NeedCopy-->
```

Configuring NILE support using the configuration utility

1. Navigate to **System > Profiles > TCP Profiles** and click **TCP profiles**.
2. From the **TCP Flavor** drop-down list, select **NILE**.

Example:

```
1 set ns tcpProfile tcpprofile1 -flavor NILE
2 <!--NeedCopy-->
```

Proportional Rate Recovery (PRR) Algorithm

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

TCP Fast Open (TFO)

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP

profile bound to a virtual server of a NetScaler appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the NetScaler appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

How TFO works

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the NetScaler appliance can include data in the SYN-ACK segment even though it has not received the final ACK segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the NetScaler appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client's IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The NetScaler appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

Note: If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the NetScaler appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.

5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

Note: If the server acknowledges the event with only a SYN segment, the NetScaler appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

Configuring TCP Fast Open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

To enable or disable TFO by using the command line At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

Note: The default value is DISABLED.

```
1 add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
2 set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3 unset tcpprofile <TCP Profile Name> - tcpFastOpen
4 <!--NeedCopy-->
```

Examples:

```
add tcpprofile Profile1 -tcpFastOpen
Set tcpprofile Profile1 -tcpFastOpen Enabled
unset tcpprofile Profile1 -tcpFastOpen
```

To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1 set tcpparam -tcpfastOpenCookieTimeout <Timeout Value>
2 <!--NeedCopy-->
```

Example:

```
1 set tcpprofile -tcpfastOpenCookieTimeout 30secs
2 <!--NeedCopy-->
```

To configure the TCP Fast Open by using the GUI

1. Navigate to **Configuration > System > Profiles >** and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **TCP Fast Open** checkbox.
3. Click **OK** and then **Done**.

To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to **Configuration > System > Settings > Change TCP Parameters** and then **Configure TCP Parameters** page to set the TCP Fast Open Cookie timeout value.

TCP Hystart

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

Configuring TCP Hystart

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

To configure Hystart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

```
1 add tcpprofile <profileName> -hystart ENABLED
2 set tcpprofile <profileName> -hystart ENABLED
3 unset tcpprofile <profileName> -hystart
4 <!--NeedCopy-->
```

Examples:

```
1 add tcpprofile Profile1 - tcpFastOpen
2 Set tcpprofile Profile1 - tcpFastOpen Enabled
3 unset tcpprofile Profile1 - tcpFastOpen
4 <!--NeedCopy-->
```

To configure Hystart support by using the GUI

1. Navigate to **Configuration > System > Profiles >** and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.

Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server's traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

Configuring Policy Based TCP Profile Selection

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your NetScaler appliance can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

Configuring using the command line interface

To enable AppQoE by using the command line interface:

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

```
1 enable ns feature appqoe
2
3 show ns feature
4 <!--NeedCopy-->
```

To bind a TCP profile while creating an AppQoE action using the command line interface At the command prompt, type the following AppQoE action command with tcpprofiletobind option.

Binding a TCP Profile:

```
1 add appqoe action <name> [-priority <priority>] [-respondWith ( ACS |
  NS ) [<CustomFile>] [-altContentSvcName <string>] [-altContentPath <
  string>] [-maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth
  <positive_integer>] [-priqDepth <positive_integer>] [-
  dosTrigExpression <expression>] [-dosAction ( SimpleResponse |
  HICResponse )] [-tcpprofiletobind <string>]
2
3 show appqoe action
4 <!--NeedCopy-->
```

To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
1 add appqoe policy <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
1 bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <
  priority>
2 bind lb vserver <name> - policyName <appqoe_policy_name> -priority <
  priority>
3 bind cr vserver <name> -policyName <appqoe_policy_name> -priority <
  priority>
4 <!--NeedCopy-->
```

Example:

```
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle
  ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500 -
  slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -
  sendBufferSize 4194304 -rstWindowAttenuate ENABLED -spooofSynDrop
  ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack ENABLED
  -tcpmode ENDPOINT
2
3 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
4
5 add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -
  action appact1
6
7 bind lb vserver lb2 -policyName apppol1 -priority 1 -
  gotoPriorityExpression END -type REQUEST
8
9 bind cs vserver cs1 -policyName apppol1 -priority 1 -
  gotoPriorityExpression END -type REQUEST
10 <!--NeedCopy-->
```

Configuring Policy based TCP Profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

To configure AppQoE policy by using the GUI

1. Navigate to **App-Expert > AppQoE > Actions**.
2. In the details pane, do one of the following:
3. To create a new action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.
5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
 - a) Name—name
 - b) Action type—respondWith
 - c) Priority—priority
 - d) Policy Queue Depth—polqDepth

- e) Queue Depth—priqDepth
 - f) DOS Action—dosAction
6. Click **Create**.

To bind AppQoE policy by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:
 - a) Select a policy type as AppQoE from the drop-down list.
 - b) Select a traffic type from the drop-down list.
4. In the **Policy Binding** section, do the following:
 - a) Click **New** to create a new AppQoE policy.
 - b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

SACK Block Generation

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

Note: A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

Client Reneging

A NetScaler appliance can handle client reneging during SACK based recovery.

Memory checks for marking end_point on PCB is not considering total available memory

In a NetScaler appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

Unnecessary retransmissions due to missing SACK blocks

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.

SNMP for number of connections bypassed optimization because of overload

The following SNMP ids have been added to a NetScaler appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.13 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

Dynamic Receive Buffer

To maximize TCP performance, a NetScaler appliance can now dynamically adjust the TCP receive buffer size.

Troubleshooting Guidelines

May 2, 2023

Technical Support

All troubleshooting and escalation queries require a recent NetScaler techsupport bundle, which captures current configuration, firmware version installed, log files, outstanding cores, and others.

Example:

```
1 show techsupport
2
3 showtechsupport data collector tool - $Revision: #5 $!
4 ...
5 <!--NeedCopy-->
```

All the data will be collected under

```
1 ...
2 Archiving all the data into "/var/tmp/support/collector_P_192
  .168.121.117_18Jun2015_09_53.tar.gz" ....
3 Created a symbolic link for the archive with /var/tmp/support/support.
  tgz
4 /var/tmp/support/support.tgz ---- points to ---> /var/tmp/support/
  collector_P_192.168.121.117_18Jun2015_09_53.tar.gz
5 <!--NeedCopy-->
```

After a techsupport bundle has been generated, it might be copied using SCP.

Traces

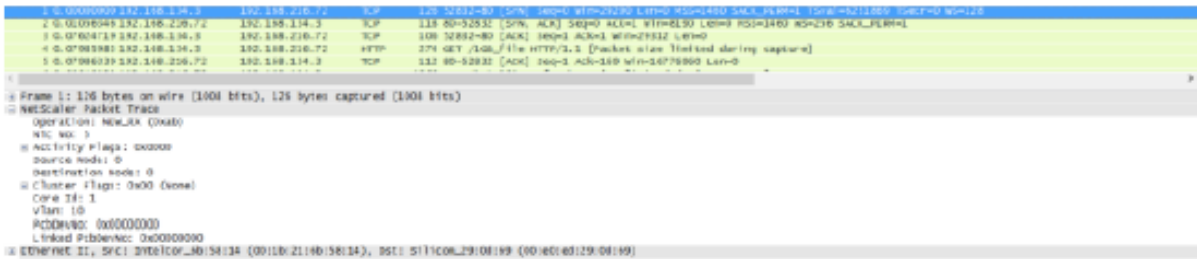

NetScaler TCP optimization issues normally require NetScaler traces to troubleshoot properly. Note that one should try to capture traces under similar conditions, i.e. on the same cell, during the same time of day, using the same user equipment and application, and others.

The start nstrace and stop nstrace commands might be used to capture traces:

- It's strongly recommended that the appropriate filter is used to avoid capturing extraneous, unnecessary packets on the trace. For instance use start nstrace -filter 'IP == 10.20.30.40' to only capture packets being sent to or received from IP address 10.20.30.40, which is the user equipment IP address.
- Do not use the -tcpdump option, since it strips the nstrace headers which are required for debugging.

Trace Analysis

After a NetScaler trace has been captured, it might be viewed with Wireshark 1.12 or later. Verify that the captured traces include the appropriate NetScaler Packet Trace headers, as shown in the screen capture below:

The additional debug headers are also visible per the illustration below:

Connection Table

When the issue is related to TCP optimization and it can be reproduced or it’s on-going, it is best to get also the connection table when the issue occurs from the primary T1 node.

To get the table you shall need to switch to the BSD shell and run the following command:

```

1 shell
2 ...
3
4 nscli -U 127.0.0.1:nsroot:nsroot show connectiontable -detail full link
  > /var/tmp/contable.log
5 <!--NeedCopy-->
    
```

Note

The command might be executed for a longer time and management CPU might be stressed at that time (depends on the number of connection table entries), but it’s not service affecting.

Frequently Asked Questions

May 2, 2023

Timeouts

Important

Before using *any nsapimgr* knob, consult with Citrix Customer Support.

The following is a list of different idle connection timeouts that can be set on NetScaler T1 virtual servers and services. Idle timeout set for client or server connections at the vserver or service level are applicable only for the connections in TCP ESTABLISHED state and are idle.

- Load Balancing virtual server `cltTimeout` parameter specifies the time in seconds that a connection from a client to a Load Balancing virtual server must be idle, before the appliance closes the connection.
- Service `svrTimeout` parameter specifies the time in seconds that a connection from the appliance to a service or server must be idle, before the appliance closes the connection.
- Service `cltTimeout` parameter specifies the time in seconds that a connection from a client to a service must be idle, before the appliance closes the connection.

When a service is bound to a Load Balancing virtual server, then the `cltTimeout` for the Load Balancing virtual server takes precedence, and the service `cltTimeout` for service is ignored.

In case of there is not service bound to Load Balancing virtual server, global idle timeout, namely `tcpServer`, is used for server side connections. It can be configured as follows:

Command:

```
1 set ns timeout - tcpServer 9000
2 <!--NeedCopy-->
```

Connections in other state have different timeout values:

- Half open connections idle timeout: 120 seconds (hardcoded value)
- `TIME_WAIT` connections idle timeout: 40 seconds (hardcoded value)
- Half close connections idle timeout. By default it is 10s and can be configured between 1s and 600s using the snippet

Command:

```
1 set ns timeout - halfclose 10
2 <!--NeedCopy-->
```

When half-close timeout is triggered, connection is moved to zombie state. When zombie timeout expires, zombie cleanup kicks in and T1 sends RST on both client and server side for given connection by default.

- **Zombie timeout:** Interval at which the zombie cleanup process must run to clean up inactive TCP connections. Default timeout value is 120s and can be configured between 1s and 600s.

Command:

```
1 set ns timeout -zombie 120
2 <!--NeedCopy-->
```

Maximum Segment Size Table

A NetScaler T1 appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted. Specific function is enabled by default without option to disable.

However, there is caveat as standard SYN cookies limit connections to the use of only eight Maximum Segment Size (MSS) values. If connection MSS does not match with any predefined value, it will pick up the next available lower value towards both client and server side.

The predefined TCP Maximum Segment Size (MSS) values are the following and can be configured through a new nsapimgr knob.

1460	1440	1330	1220	956	536	384	128
------	------	------	------	-----	-----	-----	-----

The new MSS table:

- Need not contain Jumbo-Frame support. Even though by default 8 values are reserved in the MSS table for jumbo frames, the table settings can be modified to include standard Ethernet-sized frames only.
- Should have 16 values
- Should have values in descending order
- Should include 128 as the last value

If the new MSS table is valid, the table is stored and the old values are switched out at the SYN-cookie rotation time. Otherwise the new table returns an error. Changes are applied to new connections while existing connections preserve the old MSS table until the connections expire or are terminated.

To display the current MSS table in a NetScaler appliance, type the following command.

Command:

```
1 >shell
2
3 #nsapimgr -d mss_table
```

Example:

```
1 #nsapimgr -d mss_table
2
3 MSS table
4
5 {
6   9176,9156,8192,7168,6144,4196,3072,2048,1460,1440,1330,1212,956,536,384,128
7   }
8
9 Done.
```

To change the mss table, type the following command:

Command:

```
1 >shell
2
3 #nsapimgr -s mss_table=<16 comma seperated values>
```

Example:

```
1 #nsapimgr -ys mss_table
   =9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
2
3 # nsapimgr -d mss_table
4
5 MSS table
6
7 {
8   9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
9   }
10
11 Done.
```

An example using standard Ethernet-sized values is depicted below:

Example:

```
1 #nsapimgr -ys mss_table
   =1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128
2
3 # nsapimgr -d mss_table
4
5 MSS table
6
7 {
8   1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128
9   }
10
11 Done.
```

To make this change permanent even after the NetScaler appliance restarts, include the command `#nsapimgr -ys mss_table=<16 comma seperated values>` in the “/nsconfig/rc.netscaler”file. If the “rc.netscaler”file doesn’t exist, create it under the “/nsconfig”folder, and then append the command.

Memory Overload Protection

A NetScaler Packet Processing Engine (PPE) starts bypassing connections from TCP optimization if the memory in use by that one PPE is more than a specified high watermark value. If a PPE memory utilization goes above ~2.6GB, then it starts bypassing *any new* connections from optimization. The existing connections (ones admitted for optimization previously) continues getting optimization. This watermark value has been purposefully selected and is not recommended for tuning.

Note

If you believe that there is a good reason to change that watermark value, contact Customer Support.

Support for Happy Eyeballs Clients

If the NetScaler appliance receives a SYN for a destination for which the state is unknown, the appliance first checks the reachability of the server and then acknowledges the client. This probing mechanism enables clients with dual IP stacks to discover the reachability of dual-stack internet servers. If the client discovers that both IPv6 and IPv4 access are available, it establishes a connection to the server that responds more quickly, and resets the other. For the connection for the NetScaler appliance receives a reset, it will reset the corresponding server side connection.

Note: This feature has no user configurable TCP settings to be disabled/enabled on the NetScaler appliance.

For more information on Happy Eyeballs support, see RFC 6555.

NetScaler Video Optimization

June 1, 2023

Warning:

Video optimization is supported only for a forward proxy telco solution. Do not enable video optimization for any other type of use case. Video optimization is not supported on admin partition and cluster topologies.

The NetScaler appliance provides optimization techniques and capabilities to optimization ABR video traffic for video traffic over mobile networks. This improves user experience and reduces the overall network bandwidth consumption.

The section includes the following topics:

- [Getting Started](#)
- [Licensing](#)
- [Configuring Video Optimization over TCP](#)
- [Configuring Video Optimization over UDP](#)

Getting Started

May 2, 2023

Media files have been driving an increasing amount of traffic over mobile networks, and migration to faster networking technologies has dramatically increased the volume of encrypted video traffic. The traditional media delivery technology (Progressive Download) is failing to deliver acceptable quality of experience (QoE) at a high transmission rate. This has led to the introduction of the Adaptive Bit Rate (ABR) protocol. It can adapt the streaming bit rate to the available network bandwidth and restrict streaming quality to match the capability of the handset receiving the video. However, the ABR protocol does not work as well in mobile networks as it does over the internet. Mobile operators must, therefore, optimize ABR traffic.

A NetScaler appliance has unique capabilities to detect incoming video traffic and selectively optimize ABR videos.

How NetScaler Video Optimization Works

A NetScaler appliance can identify and optimize encrypted ABR traffic (including Facebook video traffic) over TCP, and YouTube ABR traffic over QUIC. The appliance has the following capabilities:

1. Detect Progressive Download (PD) videos over HTTP.
2. Detect and optimize ABR videos over HTTP.
3. Detect and optimize ABR videos over HTTPS.
4. Detect and optimize YouTube ABR videos over QUIC.

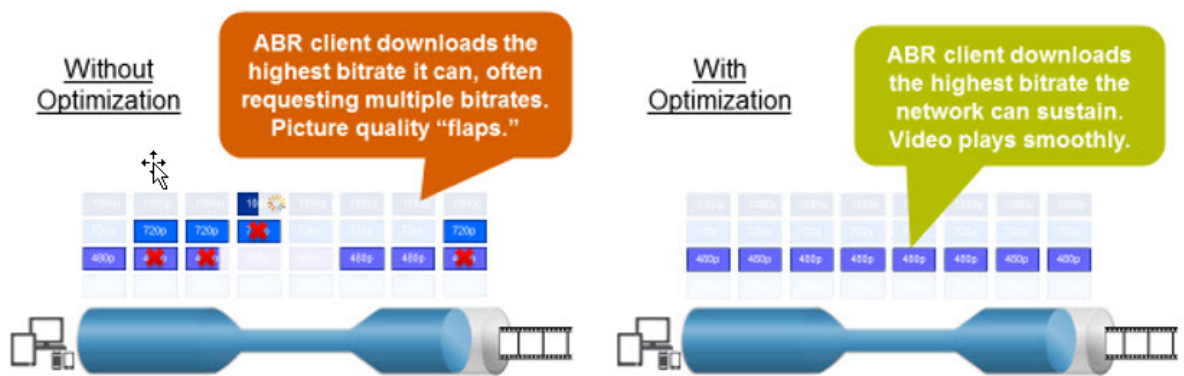

Also, the appliance uses the following support domains for detecting video traffic over TCP and QUIC protocols.

- Unencrypted ABR videos over TCP. Appliance detects all standard compliant video streaming web sites. The appliance detects ABR sessions by inspecting the response video payload header, URL, and HTTP headers.
- Encrypted ABR video over TCP. Appliance detects ABR sessions using a generic and heuristic algorithm based on domain, SSL header and traffic patterns. Using this, the appliance has a built-in support to detect top video web sites, with 95 percent accuracy and we continue to add support for new video types. NetScaler also has a program to provide additional verification for top encrypted ABR sites for a region or country to ensure network coverage.
- Encrypted ABR videos over QUIC. The appliance detects ABR sessions for QUIC based video provider, such as YouTube. The detection algorithm is on the basis of a heuristic leveraging the QUIC headers and domain. NetScaler will continue to add support for newer video sites using QUIC.

Benefits

Optimizing the ABR video traffic can provide the following benefits:

- Manage the network during congestion in peak hours.
- Improve video play consistency and reduce video stalling.
- Enable new video service offerings (for example, Binge-on video services).
- Enable customers to select the best sustainable video quality.
- Provide a consistent user experience for the subscriber.

Video Optimization over TCP

NetScaler optimization of ABR traffic over TCP works as follows:

1. HTTP or HTTPS traffic that the appliance receives over TCP is sent to the corresponding load balancing virtual server.
2. The built-in detection policies bound to the virtual server combined with other proprietary detection algorithms evaluate the traffic.
3. The policies use a set of built-in video detection signatures to detect the video type. The policy that matches traffic applies an action that categorizes the video type as one of the following:
 - a) Clear-text PD
 - b) Clear-text ABR
 - c) Encrypted ABR
 - d) Other
4. The optimization policies bound to the same virtual server evaluate the traffic and determine the optimization bit rate to apply to the traffic.

5. The optimization bit rate is applied if the traffic is either clear-text ABR or encrypted ABR.

A mobile service provider can improve the quality of experience (QoE) by setting the download speed for 2G, 3G, and 4G mobile traffic. This reduces the video start times or buffering events. Optimization can also reduce the amount of network bandwidth consumed by video sessions.

The optimization techniques include dynamic burst control and random sampling.

Dynamic Burst Control

NetScaler ABR optimization adapts dynamically to changing network conditions. It allows an initial burst rate of 1.3 times the configured pacing rate for 15 seconds. The initial burst rate applies to the beginning of every optimized ABR video session, even when multiple sessions use the same TCP connection or group of TCP connections.

The appliance also supports recovery bursts in the event that the bit rate supported by the network drops below the configured pacing rate. For example, if the effective bit rate drops at the 7th second and recovers at 15th second of the initial burst, the appliance recovers the loss during the next burst cycle. By doing so, the appliance dynamically optimizes the network bandwidth for all subscribers so that the quality of video remains consistent per pixel.

Note: When a recovery burst happens during an initial burst, the pacing bit rate must not exceed the maximum recovery-burst and initial-burst rates (you must not add the Recovery Burst factor on top of the Initial Burst factor). Otherwise, it might be so fast that the media player shifts to a higher quality mode. However, if necessary, you can extend the duration of the Initial Burst to compensate the unused bandwidth.

Random Sampling

To estimate the savings from video optimization, the NetScaler appliance implements random sampling. With this technique, the appliance randomly selects a configurable percentage of the detected video traffic (the random sampling parameter is an integer number ranging from 0 to 100, so less than 1 percent is not possible). These randomly selected and non-optimized transactions (and sessions) become a reference group, and they are identified in the transaction logs (along with other characteristics, such as byte size and timer fields). The characteristics of the optimized sessions are also logged, and the reporting engine compares statistics of the optimized and reference groups to estimate the savings from optimization (including the savings from ABR Optimization).

Video Optimization over UDP

Google has introduced a new transport protocol called QUIC. Google's QUIC protocol is very similar to TCP+TLS+HTTP/2 and is implemented on top of UDP. NetScaler can detect YouTube ABR videos

streamed over the QUIC protocol, and apply ABR video optimization in a similar way as ABR over TCP.

Licensing

May 2, 2023

The Video Optimization feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other NetScaler platforms, the feature works with the purchase of a CNS Premium license. Before you configure the video optimization feature, your appliance must have a suitable license.

License support for Telco platforms:

- **CBM_TXXX_SERVER_Retail.lic**
- **CBM_TPRE_SERVER_Retail.lic**
- **CNS_WEBF_SSERVER_Retail.lic**

Where XXX is the throughput, for example, NetScaler T1000.

License support for other NetScaler platforms:

- **CNS_XXX_SERVER_PLT_Retail.lic**

Where XXX is the throughput.

To upload a Premium license file, follow the steps given below:

1. A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the `/nsconfig/license` of the appliance, as shown in the screen capture below.

```
1 > shell ls /nsconfig/license/  
2 CNS_V3000_SERVER_PLT_Retail.lic ssl  
3 <!--NeedCopy-->
```

2. Do a warm restart to apply for the new license, as shown in the screen capture below.

```
1 > reboot -warm  
2 Are you sure you want to restart NetScaler (Y/N)? [N]:y  
3 Done  
4 <!--NeedCopy-->
```

3. After the restart completes, verify that the license has been properly applied, by using the `show license CLI`.

In the example below a Premium license with Premium edition has been successfully installed.

```
1 > show license
2
3 License status:
4
5 Video Optimization: YES
6
7 ...
8
9 Model Number ID: 110050
10
11 License Type: Premium License
12 <!--NeedCopy-->
```

Configuring Video Optimization over TCP

May 2, 2023

Warning:

As part of video optimization, the video pacing functionality is deprecated and will be removed from the NetScaler appliance in forthcoming releases.

To optimize video traffic over TCP, begin by enabling the video optimization feature. The appliance then activates the built-in detection policies to detect the incoming video traffic and identify the type of video. User configurable optimization policies for each video type specify the optimization bit rate needed for optimizing the traffic.

Configuring Video Optimization over TCP by using the CLI

To configure video optimization on a NetScaler appliance, you perform the following tasks:

1. Enable the video optimization feature.
2. Add virtual servers for HTTP and HTTPS traffic.
3. Bind all the built-in detection policies to a load balancing virtual server for HTTP traffic.
4. Bind all the built-in detection policies to an SSL-bridge load balancing virtual server for HTTPS traffic.
5. Add the desired optimization policies for HTTP and HTTPS traffic.
6. Bind optimization policies to a load balancing virtual server for HTTP Traffic.
7. Bind optimization policies to an SSL-bridge load balancing virtual server for HTTPS traffic.

Enabling Video Optimization

If you want the NetScaler appliance to detect, optimize, and report video traffic, you must enable the Video Optimization feature and set optimization to ON. After enabling the feature you can use built-in detection policies to identify the incoming video traffic, and you can configure optimization policies to optimize encrypted ABR traffic. To optimize ABR video traffic, you must configure the download bit rate (also called the *padding rate*).

You must also enable the load balancing feature, and if you want to use video optimization for HTTPS traffic you must enable the SSL feature.

To enable the video optimization feature At the command prompt, type the following command:

```
1 enable ns feature VideoOptimization
2 <!--NeedCopy-->
```

Note

If you want to monitor the video optimization performance and video insight reports you must enable the AppFlow feature and then access the Video Analytics feature on NetScaler Application Delivery Management (ADM). For more information, see [Video Insight](#) documentation.

Creating Virtual Servers for HTTP and HTTPS Video Traffic

A NetScaler appliance uses different virtual servers for detecting and optimizing the different types of incoming video traffic. The appliance supports the following types of virtual servers for TCP traffic.

- **HTTP Load Balancing virtual server.** For detecting HTTP video traffic, the appliance uses an HTTP load balancing virtual server. It manages HTTP video requests that the appliance receives from clients.
- **SSL-Bridge Load Balancing virtual server.** To detect encrypted video traffic, you must configure an SSL bridge virtual server on the appliance.

To add an HTTP Load Balancing virtual server for detecting HTTP video traffic

At the command prompt, type the following:

```
1 add lb vserver <name> HTTP * 80 -persistenceType NONE
2 <!--NeedCopy-->
```

Example:

```
1 add lb vserver ProxyVserver-HTTP HTTP * 80 -persistenceType NONE -
  cltTimeout 120
2 <!--NeedCopy-->
```

To add an SSL Bridge virtual server for detecting HTTPS video traffic

At the command prompt, type the following:

```
1 add lb vserver <name> SSL_BRIDGE * 443 -persistenceType NONE
2 <!--NeedCopy-->
```

Example:

```
1 add lb vserver ProxyVserver-SSL SSL_BRIDGE * 443 -persistenceType NONE
  -cltTimeout 180
2 <!--NeedCopy-->
```

Binding Built-In Detection Policies to an HTTP Load Balancing Virtual Server

To detect video traffic over an HTTP connection, you must bind all the built-in detection policies to a load balancing virtual server. You must bind the policies to either request-time or response-time processing, depending on the policy type.

Note:

The `ns_videoopt_http_body_detection` video optimization policy does not support the `CONNECT` HTTP request method.

To bind detection policies for different video types to an HTTP load balancing virtual server

At the command prompt, type the appropriate command for each type. The available commands are:

```
1 bind lb vserver <name> -policyName ns_videoopt_http_abr_netflix -
  priority <integer> -type (REQUEST | RESPONSE)
2
3 bind lb vserver <name> -policyName ns_videoopt_http_abr_netflix2 -
  priority <integer> -type (REQUEST | RESPONSE)
4
5 bind lb vserver <name> -policyName ns_videoopt_http_abr_youtube -
  priority <integer> -type (REQUEST | RESPONSE)
6
7 bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube -
  priority <integer> -type (REQUEST | RESPONSE)
8
```

```

9 bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube2 -
  priority <integer> -type (REQUEST | RESPONSE)
10
11 bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube3 -
  priority <integer> -type (REQUEST | RESPONSE)
12
13 bind lb vserver <name> -policyName ns_videoopt_http_abr_generic -
  priority <integer> -type (REQUEST | RESPONSE)
14 <!--NeedCopy-->

```

Example:

```

1 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_abr_netflix -priority 400 type RESPONSE
2
3 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_abr_netflix2 -priority 500 -type RESPONSE
4
5 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_abr_youtube -priority 600 -type RESPONSE
6
7 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_pd_youtube -priority 800 -type RESPONSE
8
9 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_pd_youtube2 -priority 900 -type RESPONSE
10
11 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_pd_youtube3 -priority 1000 -type REQUEST
12
13 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_abr_generic -priority 1100 -type RESPONSE
14 <!--NeedCopy-->

```

Binding the HTTP Body Content Detection Policy to Load Balancing Virtual Server

To detect video traffic over HTTP, you must bind the body content detection policy to the load balancing virtual server. You can use the following command:

```

1 bind lb vserver <name> -policyName ns_videoopt_http_body_detection -
  priority <integer> -type (REQUEST | RESPONSE)
2 <!--NeedCopy-->

```

Example:

```

1 bind lb vserver ProxyVserver-HTTP -policyName
  ns_videoopt_http_body_detection -priority 1500 -type REQUEST
2 <!--NeedCopy-->

```

Binding Built-In Detection Policies to an SSL-Bridge Load Balancing Virtual Server

To detect video traffic over an HTTPS connection, you must bind built-in detection policies to an SSL Bridge load balancing virtual server.

To bind a detection policy to an SSL bridge load balancing virtual server

At the command prompt, type the appropriate command for each type. The available commands are:

```
1 bind lb vserver <name> -policyName ns_videopt_https_abr_netflix -
  priority <positive_integer> -type (REQUEST | RESPONSE)
2
3 bind lb vserver <name> -policyName ns_videopt_https_abr_youtube -
  priority <positive_integer> -type (REQUEST | RESPONSE)
4
5 bind lb vserver <name> -policyName ns_videopt_https_abr_generic -
  priority <positive_integer> -type (REQUEST | RESPONSE)
6 <!--NeedCopy-->
```

Example:

```
1 bind lb vserver ProxyVserver-SSL -policyName
  ns_videopt_https_abr_netflix -priority 120 -type REQUEST
2
3 bind lb vserver ProxyVserver-SSL -policyName
  ns_videopt_https_abr_youtube -priority 140 -type REQUEST
4
5 bind lb vserver ProxyVserver-SSL -policyName
  ns_videopt_https_abr_generic -priority 150 -type REQUEST
6 <!--NeedCopy-->
```

Adding Optimization Policies for Pacing ABR traffic

To optimize ABR traffic, you have to configure optimization policies and the associated actions. You then bind the policies to the same load balancing virtual servers to which you bound the detection policies. For each policy, create the action first, so that you can include it when you create the policy.

To add an optimization action

At the command prompt, type:

```
1 add videooptimization pacingaction <action Name> -rate <integer> [-
  comment <string>]
2 <!--NeedCopy-->
```

Where the **rate** parameter specifies the rate in Kbps at which to send the traffic (the pacing rate).

Example:

```
1 add videooptimization pacingaction MyOptAct2000 -rate 2000
2 <!--NeedCopy-->
```

To add an optimization policy

At the command prompt, type:

```
1 add videooptimization pacingpolicy <name> -rule <expression> -action <
  string>
2 <!--NeedCopy-->
```

Example:

```
1 add videooptimization pacingpolicy myOptPolicy2000 -rule TRUE -action
  MyOptAct2000
2 <!--NeedCopy-->
```

Binding Optimization Policies to an HTTP Load Balancing Virtual Server

To optimize ABR video traffic over an HTTP connection, you must bind the optimization policies to a load balancing virtual server to which the detection policies are bound.

To bind an optimization policy to a Load Balancing virtual server

At the command prompt, type the following command:

```
1 bind lb vserver <name> -policyName <policy_name> -priority <
  positive_integer> -type (REQUEST | RESPONSE)
2 <!--NeedCopy-->
```

Example:

```
1 bind lb vserver ProxyVserver-HTTP -policyName myOptPolicy2000 -priority
  3400 -type REQUEST
2 <!--NeedCopy-->
```

Binding Optimization Policies to SSL-bridge Virtual Servers

To optimize ABR video traffic over an HTTPS connection, you must bind the optimization policies to the SSL Bridge virtual server to which the built-in detection policies are bound.

To bind an optimization policy to SSL Bridge virtual server for pacing encrypted traffic

At the command prompt, type the following command:

```
1 bind lb vserver <name> -policyName <policy_name> -priority <
   positive_integer> -type (REQUEST |RESPONSE)
2 <!--NeedCopy-->
```

Example:

```
1 bind lb vserver ProxyVserver-SSL -policyName myOptPolicy2000 -priority
   3400 -type REQUEST
2 <!--NeedCopy-->
```

Setting video optimization pacing parameters

The CLI enables you to set the video optimization pacing parameters, such as random sampling percentage.

To set the random sampling percentage

At the command prompt, type the following command:

```
1 set videooptimization parameter -RandomSamplingPercentage <realNumber>
2 <!--NeedCopy-->
```

Where, a realNumber is a value from 0.0 to 100.0.

Example:

```
1 set videooptimization parameter -RandomSamplingPercentage 50
2 <!--NeedCopy-->
```

Configuring Video Optimization over TCP by using the GUI

The GUI enables you to:

- Enable video optimization feature.
- Create HTTP load balancing virtual server.
- Create SSL-bridge load balancing virtual server.
- Bind built-in detection policies to HTTP load balancing virtual server.
- Bind built-in detection policies to SSL-bridge load balancing virtual server.
- Create an optimization policy.
- Create an optimization action.

- Configuring optimization pacing parameter.
- Bind optimization policy to load balancing virtual server for HTTP traffic.
- Bind optimization policy to SSL-bridge load balancing virtual server for HTTPS traffic.

To enable video optimization feature

1. In the navigation pane, expand **System**, and then click **Settings**.
2. On the **Settings** page, click the **Configure Advanced Features** link.
3. On the **Configure Advanced Features** page, select the **Video Optimization** check box.
4. Click **OK**, and then click **Close**.

To create load balancing virtual server for HTTP traffic

1. Sign in to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the Load Balancing Virtual Server screen, set the following parameters:
 - a) **Name**. Name of the load balancing virtual server.
 - b) **Protocol**. Select protocol type as HTTP
 - c) **IP Address Type**. IP address type: IPv4 or IPv6.
 - d) **IP Address**. IPv4 or IPv6 address assigned to the virtual server.
 - e) **Port**. Port number of the virtual server.
4. Click **OK** to continue with configuration of other, optional, parameters. For more information, see *Creating a Virtual Server*.
5. Click **Create** and **Close**.

To create load balancing virtual server for HTTPS traffic

1. Sign in to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
 - a) **Name**. Name of the load balancing virtual server.
 - b) **Protocol**. Select protocol type as SSL-bridge.
 - c) **IP Address Type**. IP address type: IPv4 or IPv6.
 - d) **IP Address**. IPv4 or IPv6 address assigned to the virtual server.
 - e) **Port**. Port number of the virtual server.

4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see [Creating a Virtual Server](#).
5. Click **Create** and then **Close**.

To bind a built-in detection policy to a load balancing virtual server

1. Sign in to the NetScaler appliance and navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the load balancing virtual server and click **Edit**.
 - a) In the **Advanced Setting** section, click **Policies**.
 - b) In the **Policies** section, click the **+** icon to access the **Policies** slider.
 - c) In the **Policies** section, set the following parameters.
 - d) Choose Policy. Select a video optimization detection policy from the drop-down list.
 - e) Choose Type. Select the policy type as Request.
 - f) Click **Continue**.
3. Select the video detection policy from the list and click **Close**.

To bind a built-in detection policy to a SSL-bridge load balancing virtual server

1. Log on to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
 - a) Choose Policy. Select video optimization detection policy from the drop-down list.
 - b) Choose Type. Select the policy type as Request.
6. Click **Continue**.
7. Select the video detection policy from the list and click **Close**.

To create a video optimization action

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Actions**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Action** page, set the following parameters.
 - a) **Name**. Name of the optimization action.

- b) **ABR Optimization Rate (Kbps)**. Pacing rate at which to send the ABR video traffic. The default rate for ABR optimization is 1000 Kbps. The minimum value is 1, and the maximum value is 2147483647.
 - c) **Comment**. A short description of the action.
4. Click **Create** and **Close**.

To create a video optimization policy

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Policy** page, set the following parameters.
 - a) **Name**. Name of the optimization policy
 - b) **Expression**. Custom regex expressions that implement the policy.
 - c) **Action**. Optimization action associated with the policy to handle the incoming video traffic.
 - d) **UNDEF Action**. Undefined event if the incoming request does not match the optimization policy.
 - e) **Comment**. A short description of the policy.
 - f) **Log Action**. Select the audit log action that creates the desired log messages.
4. Click **Create**, and then click **Close**.

To set video optimization pacing parameters

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. In the **Video Optimization** page, click **Change Video Optimization Settings** link.
3. In the **Video Optimization Settings** page, set the following parameter.
 - a) **Random Sampling Percentage (%)**. Percentage of packets selected for random sampling.
4. Click **OK** and **Close**.

To bind a video optimization policy to an HTTP load balancing virtual server

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.

3. Set the following parameters.
 - a) **Bind Point**. The point at which to apply the optimization policy during request or response processing.
 - b) **Connection Type**. Connection type as Request or Response.
 - c) **Virtual Server**. The load balancing virtual server to which to bind the policy.
 - d) Click **Continue**.
4. In the **Bind Point** section, do one of the following:
 - a) Select a policy from the list.
 - b) Click **Add Binding** to access the **Policies Binding** slider.
 - i. Select an existing policy or add a new policy.
 - ii. Enter binding details and click **Bind**.
5. Click **Close**.

To bind a video optimization policy to an SSL-bridge load balancing virtual server

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.
3. On the **Video Optimization Policy Manager** page, set the following parameters.
 - a) Bind Point. The point at which to apply the optimization policy during request/response processing.
 - b) Connection Type. Connection type as Request or Response.
 - c) Virtual Server. The SSL-bridge load balancing virtual server to which to bind the policy.
4. Click **Continue**.
5. In the **Bind Point** section, do one of the following:
 - a) Select a policy binding from the list.
 - b) Click **Add Binding** to access the **Policies Binding** slider.
 - i. Select an existing policy or add a new policy.
 - ii. Enter binding details and click **Bind**.
6. Click **Close**.

Configuring Video Optimization over UDP

May 2, 2023

To optimize QUIC ABR video traffic over UDP, begin by enabling the video optimization feature. After you complete the configuration, the appliance detects QUIC based ABR video traffic and applies the optimization bit rate that is configured on the appliance.

Configuring video optimization for QUIC by using the CLI

To configure video optimization for QUIC video traffic over UDP, you must perform the following tasks:

1. Enable Video Optimization.
2. Create a QUIC service.
3. Create a QUIC load balancing virtual server.
4. Bind QUIC web service to the loading balancing virtual server.
5. Create video optimization policy for pacing QUIC based UDP traffic.
6. Bind optimization policy to a QUIC based load balancing virtual server.

Enabling video optimization for QUIC traffic

If you want the NetScaler appliance to detect, optimize, and report video traffic, you must enable the Video Optimization feature and set optimization ON.

Note

If you want to use video optimization for QUIC traffic, you must enable the load balancing and AppFlow features.

To enable the video optimization At the command prompt, type the following command:

```
1 enable ns feature VideoOptimization
2 <!--NeedCopy-->
```

Creating a service for QUIC traffic

A NetScaler appliance uses a QUIC service for the load balancing virtual server to connect to the egress router in the static routing mode.

Note

Currently, dynamic routing is not supported.

To create a load balancing web service for QUIC video traffic At the command prompt, type:

```
1 add service <name> <router-IP> <serviceType> <port> -usip yes -
  useproxyport [yes | no]
2 <!--NeedCopy-->
```

Example:

```
1 add service svc-quic 10.102.29.200 QUIC 443 -usip yes -useproxyport
  no
2
3 where IP address is the internet router address.
4 <!--NeedCopy-->
```

Creating a load balancing virtual server for QUIC traffic

A NetScaler appliance uses a load balancing virtual server for detecting and optimizing QUIC video traffic over UDP.

To create a load balancing virtual server for QUIC video traffic At the command prompt, type:

```
1 add lb vserver <name> <serviceType> <ip> <port> -m MAC
2 <!--NeedCopy-->
```

Example:

```
1 add lb vserver vs-quic QUIC * 443 -persistenceType NONE -m MAC -
  cltTimeout 120
2 <!--NeedCopy-->
```

Binding a QUIC web service to the load balancing virtual server

After you have created the web services and load balancing virtual server for QUIC traffic, you must bind the services to the virtual server.

To bind a web service to load balancing virtual server for QUIC video traffic At the command prompt, type:

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

Example:

```
1 bind lb vserver vs-quic svc-quic
2 <!--NeedCopy-->
```

Creating Video Optimization Policy for QUIC based UDP traffic

To optimize QUIC based UDP traffic, you have to configure optimization pacing policies and its actions. You must then, bind the policies to QUIC based load balancing virtual servers. For each policy, create an action first so that you can associate it to the policy.

To add an optimization action At the command prompt, type:

```
1 add videooptimization pacingaction <action Name> -rate <integer> [-  
    comment <string>]  
2 <!--NeedCopy-->
```

Where, the **rate** parameter specifies the rate in Kbps at which to send the traffic (the pacing rate).

Example:

```
1 set videooptimization parameter -QUICPacingRate 1000  
2 <!--NeedCopy-->
```

where 1000 represents the desired pacing rate in Kbits/sec.

To add an optimization policy At the command prompt, type:

```
1 add videooptimization pacingpolicy <name> -rule <expression> -action <  
    string>  
2 <!--NeedCopy-->
```

Example:

```
1 add videooptimization pacingpolicy myOptPolicy2000 -rule TRUE -action  
    MyOptAct2000  
2 <!--NeedCopy-->
```

Binding Optimization Policies to a QUIC Load Balancing Virtual Server To optimize QUIC video traffic over a UDP connection, you must bind the optimization policies to a QUIC load balancing virtual server.

To bind an optimization policy to a QUIC Load Balancing virtual server At the command prompt, type the following command:

```
1 bind lb vserver <name> -policyName <policy_name> -priority <  
    positive_integer> -type (REQUEST)  
2 <!--NeedCopy-->
```

Note

The pacing policies must be bound to a QUIC load balancing virtual server only at request time.

Example:

```
1 bind lb vserver vs-quic -policyName myOptPolicy2000 -priority 3400 -  
   type REQUEST  
2 <!--NeedCopy-->
```

Configuring video optimization for QUIC by using the GUI

To configure the feature on the appliance through the GUI, you must perform the following tasks:

1. Enable video optimization
2. Configure a QUIC servers
3. Configure QUIC service
4. Configure a QUIC load balancing virtual server
5. Bind the QUIC web service to the load balancing virtual server
6. Create optimization policy.
7. Create optimization action.
8. Configuring optimization pacing parameter.
9. Bind optimization policy to load balancing virtual server for QUIC traffic.

To enable video optimization

1. Log on to the NetScaler appliance and navigate to **System > Settings**.
2. On the details page, select **Configure Advanced Features** link.
3. On the **Configure Advanced Features** page, select the **Video Optimization** check box.

To create a QUIC servers

1. Log on to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Servers** screen.
2. In the details pane, click **Add**.
3. On the **Create Server** page, set the following parameters:
 - a) Name. Name of the QUIC server.
 - b) IP address. IP address of the QUIC server
 - c) Traffic Domain. Domain name of the server.
 - d) Enabling after creating. Initial state of the server.
 - e) Comments. Brief information about the server.

4. Click **Create**.

To create a QUIC service

1. Log on to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Services screen**.
2. In the details pane, click **Add**.
3. On the **Load Balancing Service** page, set the following parameters:
 - a) **Service Name**. Name of the QUIC service.
 - b) **IP address**. IP address assigned to the QUIC service.
 - c) **Protocol**. Select protocol as QUIC.
 - d) **Port**. Port number of the web service.
4. Click **OK** to continue. You can then configure other, optional, parameters. For more, see [Configuring Services](#).
5. Once you configure the optional parameters, click **OK** and **Close**.

To create a load balancing virtual server

1. Log on to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page, set the following parameters:
 - a) **Name**. Name of the load balancing virtual server.
 - b) **Protocol**. The protocol used by the service to send QUIC requests.
 - c) **IP Address Type**. IP address type: IPv4 or IPv6.
 - d) **IP Address**. IP 4 or IP6 IP address assigned to the virtual server.
 - e) **Port**. Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see [Creating a Virtual Server](#).

To bind a load balancing virtual server to a QUIC service

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select a virtual server.
2. Click **Services and Service Groups** to access the **Load Balancing Virtual Server Service Binding** screen.
3. Select a QUIC based web service and click **Bind**.
4. Click **Done**.

To bind a load balancing virtual server to a QUIC service

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select a virtual server.
2. Click **Services and Service Groups** to access the **Load Balancing Virtual Server Service Binding** screen.
3. Select a QUIC based web service and click **Bind**.
4. Click **Done**.

To create a video optimization action for QUIC traffic

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Actions**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Action** page, set the following parameters.
 - a) **Name**. Name of the optimization action.
 - b) **ABR Optimization Rate (Kbps)**. Pacing rate at which to send the ABR video traffic. The default rate for ABR optimization is 1000 Kbps. The minimum value is 1, and the maximum value is 2147483647.
 - c) **Comment**. A short description of the action.
4. Click **Create** and **Close**.

To create a video optimization policy for QUIC traffic

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Policy** page, set the following parameters.
 - a) **Name**. Name of the optimization policy
 - b) **Expression**. Custom regex expressions that implement the policy.
 - c) **Action**. Optimization action associated with the policy to handle the incoming video traffic.
 - d) **UNDEF Action**. Undefined event if the incoming request does not match the optimization policy.
 - e) **Comment**. A short description of the policy.
 - f) **Log Action**. Select the audit log action that creates the desired log messages.
4. Click **Create**, and then click **Close**.

To bind a video optimization policy to an QUIC load balancing virtual server

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.
3. On the **Video Optimization Policy Manager** page, set the following parameters.
 - a) Bind Point. The point at which to apply the optimization policy during request processing.
Note: The pacing policies must be bound to a QUIC load balancing virtual server only at request time.
 - b) Connection Type. Connection type as Request or Response.
 - c) Virtual Server. The load balancing virtual server to which to bind the policy.
4. Click **Continue**.
5. In the **Bind Point** section, do one of the following:
 - a) Select a policy from the list.
 - b) Click **Add Binding** to access the **Policies Binding** slider.
 - i. Select an existing policy or add a new policy.
 - ii. Enter binding details and click **Bind**.
6. Click **Close**.

NetScaler URL Filtering

July 27, 2023

Note:

URL categorisation in the URL filtering feature is deprecated in this release.

URL Filtering provides policy-based control of websites by using the information contained in URLs. This feature helps network administrators monitor and control user access to malicious websites on mobile networks.

As an administrator, you can configure a URL filtering policy by using either the URL Categorization feature or the URL List feature.

URL List. Controls access to blacklisted websites and webpages by blocking access to URLs that are in a URL set imported into the appliance.

URL Categorization. Controls access to websites and webpages by filtering traffic based on a predefined list of categories.

URL List

July 21, 2023

The URL List feature enables you to control access to customized URL lists (up to one million entries). The feature filters websites by applying a URL filtering policy bound to a virtual server.

As an administrator, you must import the URL List into the NetScaler appliance. This imported list is internally stored as a Policy data set called a *URL Set*. The appliance then applies a unique fast URL matching algorithm to the incoming URL requests. If the incoming URL request matches an entry in the set, the appliance applies the associated policy action to control access.

URL List Types

Each entry in a URL set can include a URL and, optionally, its metadata (URL category, category groups, or any other related data). For URLs with a metadata, the appliance uses a policy expression that evaluates the metadata. For more information, see [URL Sets](#).

Custom URL List. You can create a customized URL set of up to 1,000,000 URL entries and import it as a text file into your appliance. The list can contain URLs with or without metadata (which could be like a URL category). The NetScaler platform automatically detects whether metadata is present. It also supports storing the imported lists securely. For more information, see [URL Set](#).

You can host the URL list and configure the NetScaler appliance to periodically update the list without requiring manual intervention. Once the URL list is updated, the appliance can automatically detect the metadata and the categories by using policy expressions to evaluate each incoming URL and then apply actions such as allow, block, redirect, or notify the user.

URL List Policy Expressions

The following table describes the basic expressions you can use to evaluate incoming traffic. After you import an URL List to the appliance, it is called a *URL Set*.

Expression	Operation
<code><URL expression>.</code> <code>URLSET_MATCHES_ANY(<URLSET>)</code>	Evaluates to TRUE if the URL exactly matches any entry in the URL set.

Expression	Operation
<code><URL expression>. GET_URLSET_METADATA(<URLSET>)</code>	<p>The GET_URLSET_METADATA() expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there is no match.</p>
<code><URL expression>.GET_ URLSET_METADATA(<URLSET>).EQ(< METADATA>)</code>	<p>Evaluates to TRUE if the matched metadata is equal to <METADATA>.</p>
<code><URL expression>. GET_URLSET_METADATA(<URLSET>). TYPECAST_LIST_T(' , ').GET(0).EQ(< CATEGORY>)</code>	<p>Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata, but match only the 1<sup>st</sup> field.</p>
<code>HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)</code>	<p>Joins the host and URL parameters, which can then be used as a <URL expression> for matching.</p>

URL List Policy Actions

The most common enforcement action for URLs that match a URL list is to restrict access. Create a URL list policy with a desired URL list matching expression and enforcement action. The policy group usage depends upon the incoming traffic type (HTTP or HTTPS) and the virtual server configured on the appliance. You can use a Responder policy for HTTP traffic or a Video Optimization policy for HTTPS traffic. Specify actions to apply to the URLs that match the expressions in the policies. The following table lists the available actions.

Action Type	Policy	Description
ALLOW	Responder	Allow the request to access the target URL.
REDIRECT	Responder	Redirect the request to the URL specified as the target.
DENY	Responder	Deny the request.
RESET	Responder, VideoOptimization	Reset the connection.
DROP	Responder, VideoOptimization	Drop the connection.

Prerequisites

To configure URL List feature, make sure you have configured the following server.

DNS Server for DNS Requests

You must configure a DNS server if you import a URL Set from a hostname URL.

At the command prompt, type:

```
1 add dns nameServer ((<IP> [-local]) | <dnsVserverName>) [-state (
  ENABLED | DISABLED )] [-type <type>] [-dnsProfileName <string>]
2 <!--NeedCopy-->
```

Example:

```
1 add dns nameServer 10.140.50.5
2 <!--NeedCopy-->
```

Importing a custom URL list

To import a URL set, see [URL Set](#) topic.

Configuring a URL List for HTTP traffic

The NetScaler appliance supports HTTP and HTTPS traffic. To configure a load balancing virtual server for HTTP traffic and bind URL list policies to the server, do the following:

- Add URL List actions.
- Add URL List policies.
- Add an HTTP load balancing virtual server for HTTP traffic
- Bind the URL List policies to the HTTP load balancing virtual server for HTTP traffic

To add a URL list action

At the command prompt, type the following:

```
1 add responder action <name> <type> (<target> | <htmlpage>) [-comment <
  string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <
  string>]
2 <!--NeedCopy-->
```

To add a HTTP load balancing virtual server for HTTP traffic

At the command prompt, type the following:

```
1 add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltT
  imeout <secs>]
2 <!--NeedCopy-->
```

Example:

```
1 add lb vserver vsrv-HTTP HTTP * 80 -persistenceType NONE -cltTimeout
  120
2 <!--NeedCopy-->
```

To bind URL list policy to HTTP load balancing virtual server

At the command prompt, type the following:

```
1 bind lb vserver <vServerName> -policyName <string> [-priority <
  positive_integer>]
2 <!--NeedCopy-->
```

Configuring URL List for HTTPS traffic

The NetScaler appliance supports HTTP and HTTPS traffic. To configure a SSL-bridge load balancing virtual server for HTTPS traffic and bind URL list policies to the server, do the following:

- Add URL List actions.
- Add URL List policies.
- Add a SSL-bridge load balancing virtual server for HTTP traffic
- Bind the URL List policies to the SSL-bridge load balancing virtual server for HTTP traffic

To add a URL List policy for HTTPS traffic

At the command prompt, type:

```
1 add videooptimization detectionpolicy <name> -rule <expression> -action
  <string> [-undefAction <string>] [-comment <string>] [-logAction <
  string>]
2 <!--NeedCopy-->
```

To add a SSL-bridge load balancing virtual server

At the command prompt type:

```
1 add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltT
  imeout <secs>]
2 <!--NeedCopy-->
```

Example:

```
1 add lb vserver vsrv-HTTPS SSL_BRIDGE * 443 -persistenceType NONE -
  cltTimeout 180
2 <!--NeedCopy-->
```

To bind URL List policy with SSL-bridge load balancing by using the CLI

At the command prompt type:

```
1 bind lb vserver <vServerName> -policyName <string> [-priority <
  positive_integer>]
2 <!--NeedCopy-->
```

Configuring a URL List by using the GUI

The GUI enables you to:

- Import a URL list.
- Add a URL list.
- Configure URL list actions.
- Configure URL list policies for HTTP traffic.
- Add an HTTP load balancing virtual server for HTTP traffic.
- Add an SSL-bridge load balancing virtual server for HTTPS traffic.
- Bind URL list policies to the HTTP load balancing virtual server.
- Bind a URL list policies to the SSL-bridge load balancing virtual server.

To import a URL list

1. In the navigation pane, expand **AppExpert > URL Sets**.
2. In the details pane, click **Import**.
3. On the **Configure URL Set** page, set the following parameters.
 - a) **Name**. Name of the URL set.
 - b) **URL**. Web address of the location at which to access the URL Set.
 - c) **Overwrite**. Overwrite a previously imported URL set.
 - d) **Delimiter**. Character sequence that delimits a CSV file record.

- e) **Row Separator.** Row separator used in the CSV file. A single character value is permitted for example “/n”.
 - f) **Interval.** Interval in seconds, rounded off to the nearest 15 minutes, at which the URL set is updated.
 - g) **Private Set.** Option to prevent exporting the URL set
 - h) **Canary URL.** Internal URL for testing whether the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters
4. Click **Create**, and then **Close**.

To add a URL list

1. In the navigation pane, expand **AppExpert > URL Sets**.
2. In the details pane, click **Add**.
3. On the **Create URL Set** page, set the following parameters.
 - a) **Name.** The name of the URL set that was given when it was imported.
 - b) **Comments.** A short description about the URL set.
4. Click **Create**.

To configure a URL list action

1. Log on to the NetScaler appliance and navigate to **Configuration** tab page.
2. In the menu pane, navigate to **AppExpert > Responder > Actions**.
3. In the details pane, click **Add**.
4. On the **Create Responder Action** page, set the following parameters.
 - a) **Name.** Name of the URL List policy action.
 - b) **Type.** Select an action type.
 - c) **Expression.** Use the expression editor to create the policy expression.
 - d) **Comments.** A short description about the policy action.
5. Click **Create** and **Close**.

To configure a URL list policy

1. In the navigation pane, expand **AppExpert > Responder > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Responder Policy** page, set the following parameters.
 - a) **Name.** Name of the URL List policy action.

- b) **Action.** Select the URL List action that you prefer to associate with the policy.
 - c) **Log Action.** Select the log action.
 - d) **AppFlow.** Select an AppFlow action.
 - e) **Expression.** Use the expression editor to create the policy expression.
 - f) **Comments.** A short description about the policy.
4. Click **Create** and **Close**.

To add an HTTP load balancing virtual server

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
 - a) **Name.** Name of the load balancing virtual server.
 - b) **Protocol.** Choose protocol type as HTTP.
 - c) **IP Address Type.** IP addressable type.
 - d) **IP Address.** IP 4 or IP6 IP address assigned to the virtual server.
 - e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see *Creating a Virtual Server*.

To bind a URL List policy to the HTTP load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
 - a) **Choose Policy.** Select a URL categorization policy from the drop-down list.
 - b) **Choose Type.** Select the policy type as Request.
6. Click **Continue**.
7. In the **Policies** page, select the URL List policy from the list and click **Select**.
8. In the **Policies** slider, click **Bind** and **Close**.

To add URL List policy for HTTPS traffic

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Detection**.

2. On the **Detection** page, click the **Video Optimization Detection Policies** link.
3. On the **Video Optimization Detection Policies** page, click **Add**.
4. On the **Create Video Optimization Detection Policy** page, set the following parameters.
 - a) **Name**. Name of the optimization policy
 - b) **Expression**. Configure policy using custom expressions.
 - c) **Action**. Optimization action associated with the policy to handle the incoming video traffic.
 - d) **UNDEF Action**. Undefined event if the incoming request does not match the optimization policy.
 - e) **Comment**. A short description of the policy.
 - f) **Log Action**. Select an audit log action that specifies the action to be performed for the log messages.
5. Click **Create** and **Close**.

To add a SSL-bridge load balancing virtual server for HTTPS traffic

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
 - a) **Name**. Name of the load balancing virtual server.
 - b) **Protocol**. Select protocol type as SSL-bridge.
 - c) **IP Address Type**. IP address type: IPv4 or IPv6.
 - d) **IP Address**. IPv4 or IPv6vIP address assigned to the virtual server.
 - e) **Port**. Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see “Creating a Virtual Server” topic.

To bind a URL List Policy to the SSL-bridge load balancing virtual server

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. Set the following parameters.
 - a) **Choose Policy**. Select video detection policy from the drop-down list.
 - b) **Choose Type**. Select the policy type as Request.
6. Click **Continue**.

7. Select the video detection policy from the list and click **Close**.

Configuring Audit Log Messaging

Audit logging enables you to review a condition or a situation in any phase of URL List process. When a NetScaler appliance receives an incoming URL, if the responder policy has an URL Set advanced policy expression, the audit log feature collects URL Set information in the URL and stores the details as a log message for any target allowed by audit logging.

The log message contains the following information:

1. Timestamp.
2. Log message type.
3. The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency).
4. Log message information, such as URL set name, policy action, URL.

To configure audit logging for URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see [Audit Logging](#).

URL List Semantics

The following table lists the URL Match patterns and describes how the URLs within a URL list are matched against the incoming-request URLs. For example, the pattern `www.example.com/bar` matches only with one page at `www.example.com/bar`. To match all the pages whose URL starts with `www.example.com/bar`, you would add an asterisk (*) to the end of the URL.

Semantics	URL Pattern	Matched	Unmatched
Subdomain matching	domain.com	domain.com; www.domain.com; sub.one.domain.com	yourdomain.com; wwwdomain.com
URL matching, exact path	domain.com/example/bar/index.html	domain.com/example/bar/index.html; www.domain.com/example/bar/index.html;	do-main.com/example/bar/index.html; s.domain.com/example/bar/index.html

Semantics	URL Pattern	Matched	Unmatched
URL matching, exact path	domain.com/example/bar/index.html	domain.com/example/bar/index.html; www.domain.com/example/bar/index.html? s.domain.com/example/bar/index.html	do-main.com/example/bar/index.html
URL matching, subpath matching	domain.com/example/bar/index.html	www.domain.com/example/bar/index.html; do-main.com/example/bar/index.html/one.jpg	

URL Categorization

July 27, 2023

Note:

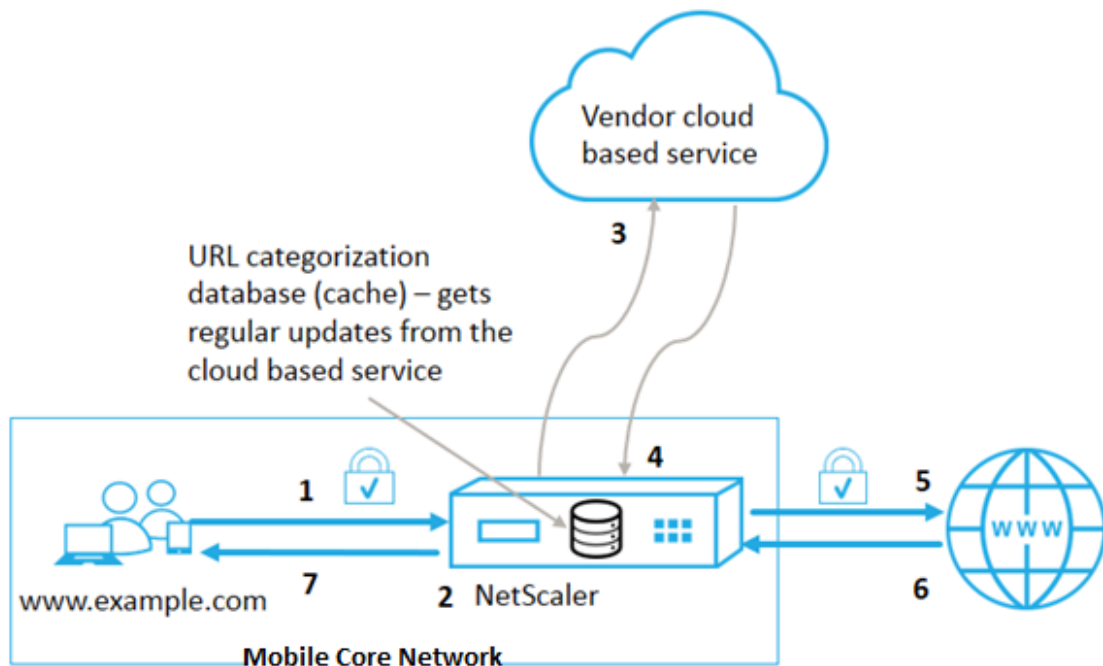

URL categorisation in the URL filtering feature is deprecated in this release.

URL Categorization restricts user access to specific websites and website categories. As a subscribed service in collaboration with [NetSTAR](#), the feature enables enterprise customers to filter web traffic using a commercial categorization database. The [NetSTAR](#) database has a vast number (billions) of URLs classified into different categories, such as social networking, gambling, adult content, new media, and shopping. In addition to categorization, each URL has a reputation score kept up to date based on the site’s historical risk profile. We can use [NetSTAR](#) data to filter the traffic by configuring advanced policies based on categories, category groups (such as Terrorism, Illegal drugs), or site-reputation scores.

For example, you might block access to dangerous sites, such as sites infected with malware, or selectively restrict access to adult content or entertainment streaming media.

How URL Categorization Works

The following figure shows how the NetScaler URL Filtering service is integrated with a commercial URL Categorization database and cloud services for frequent updates.

The components interact as follows:

1. Client sends internet bound URL request.
2. A NetScaler policy attempts to evaluate the request in terms of categorization details (such as category, category group, and site-reputation score) retrieved from the URL categorization database. If the database returns the category details, the process jumps to step 5.
3. If the database does not return categorization details, the request is sent to a cloud-based lookup service maintained by a URL categorization vendor. However, the appliance does not wait for a response. Instead, it marks the URL as Uncategorized and jumps to step 5. However, it continues to monitor the cloud query feedback and uses it to update the cache so that future requests can benefit from the cloud lookup.
4. The NetScaler appliance receives the URL category details (category, category group, and reputation score) from the cloud-based service and stores it in the cloud cache.
5. If the policy allows the URL, the request is sent to the origin server. Otherwise, the appliance drops or redirects the request, or responds with a custom HTML page.
6. The origin server responds with the requested data to the NetScaler appliance.
7. The appliance sends the response to the client.

You can use the URL filtering feature to detect sites that violate safe internet usage mandates issued by the government and implement policies to block these sites. Sites that host adult content, streaming media, or social networking identified as unsafe for children or banned as illegal.

Prerequisites

The feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other NetScaler platforms, the feature works with the purchase of a CNS Premium license.

Note: In addition to a Basic CBM license and a CBM Premium license, the appliance must have a URL Threat Intelligence license with a subscription service for 1 year or 3 years. Before enabling and configuring the feature, you must install the following licenses:

License support for Telco platforms:

- **CBM_TXXX_SERVER_Retail.lic**
- **CBM_TPRE_SERVER_Retail.lic**
- **CNS_WEBF_SSERVER_Retail.lic**

Where XXX is the throughput, for example, NetScaler T1000.

License support for other NetScaler platforms:

- **CNS_XXX_SERVER_PLT_Retail.lic**

Where XXX is the throughput.

URL Categorization Policy Expressions

The following table lists the different URL categorization policy expressions for identifying incoming URLs and applies a configured action.

Expression	Operation
<code><text>. URL_CATEGORIZE (<min_reputation>, <max_reputation>)</code>	Returns a URL_CATEGORY object. Reputation score is a number from 1 to 4. To get objects all reputation scores use 0.0 as <code><min_reputation></code> and <code>.</code> If is greater than 0, the returned object does not contain a category with reputation lower than <code>.</code> If is greater than 0, the returned object does not contain a category with reputation higher than <code>.</code> If the category fails to resolve in a timely manner, the undef value is returned.

Expression	Operation
. CATEGORY	Returns the category string for this object. If the URL does not have a category, or if the URL is malformed, the returned value is “Uncategorized”.
. GROUP	Returns a string identifying the object’s category group. This is a higher level grouping of categories, which is useful in operations that require less detailed information about the URL category. If the URL does not have a category, or if the URL is malformed, the returned value is “Uncategorized”.
. REPUTATION	Returns the reputation score as a number from 1 to 4, where 4 indicates the riskiest reputation. If the category is “Uncategorized,” the reputation value is 2.

Sample Policy Expressions

Policy	Policy Expressions
Policy to select requests for URLs that are in the Search Engine category	add responder policy p1 ‘HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.EQ(“Search Engine”)
Policy to select requests for URLs that are in the Adult category group	add responder policy p1 ‘HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.GROUP.EQ(“Adult”)
Policy to select requests for Search Engine URLs with a reputation score equal to 4.	add responder policy p2 ‘HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.EQ(“Search Engine”)
Policy to select requests for Search Engine and Shopping URLs	add policy patset good_categories; bind policy good_categories “Search Engine”; bind policy good_categories “Shopping”; add responder policy p3 ‘HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.EQUALS_ANY(“good_categories”)

Policy	Policy Expressions
Policy to select requests for Search Engine URLs with a reputation score equal to 4.	add responder policy p5 'CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(4,0). CATEGORY.EQ("Search Engine")

URL Categorization Policy Actions

A URL filtering policy evaluates the traffic to identify requests belonging to a particular category. The following table lists the actions that you can assign to a URL filtering policy.

Policy Action	Policy Group	Description
ALLOW	Responder	Allow the incoming request to access the target URL
REDIRECT	Responder	Redirect the incoming request to the URL specified as the target.
DENY	Responder	Deny incoming request.
RESET	Responder, VideoOptimization	Reset connection.
DROP	Responder, VideoOptimization	Drop connection.

Note

For encrypted traffic, the VideoOptimization policy includes actions that implement the URL Filtering actions.

Configuring URL Categorization

To configure URL categorization, begin by enabling the URL Filtering feature. You must then configure the cache memory limits, categorization policy, and virtual servers for HTTP and HTTPS traffic. Configuring URL Categorization by using the CLI.

To use the CLI configure URL categorization on a NetScaler appliance, do the following:

- Set up URL Categorization.
 - Enable the URL Filtering feature.
 - Configure shared memory to limit cache memory.
 - Configure URL categorization parameters.

- Configure URL categorization for HTTP traffic.
 - Add URL categorization actions.
 - Add URL categorization policies.
 - Add a load balancing virtual server for HTTP traffic.
 - Bind URL categorization policies to the load balancing virtual server.
- Configure URL categorization for HTTPS traffic.
 - Add URL categorization policies.
 - Add a SSL-Bridge load balancing virtual server.
 - Bind URL categorization policies to the load balancing virtual server.

Setting up URL Categorization

To set up the feature, you must enable the URL Categorization feature, configure the filtering parameters and set the shared memory limit.

To enable URL Filtering feature

At the command prompt, type:

```
enable ns feature URLFiltering VideoOptimization Responder IC SSL  
AppFlow
```

To configure shared memory limit

At the command prompt, type:

```
1 set cache parameter [-memLimit <megaBytes>]  
2 <!--NeedCopy-->
```

Where memLimit is the memory limit for caching.

Example:

```
set cache parameter -memLimit 10
```

To configure URL categorization parameters

At the command prompt, type:

```
1 set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer>]  
    [-TimeOfDayToUpdateDB <HH:MM>]  
2 <!--NeedCopy-->
```

***Example:**

```
set urlfiltering parameter -HoursBetweenDBUpdates 3 -TimeOfDayToUpdateDB
03:00
```

Configuring URL categorization for HTTP traffic

To configure the URL categorization feature for HTTP traffic, you must configure a loading balancing virtual server, add URL categorization policies and bind the policies to the virtual server. By doing so, the virtual server receives the HTTP traffic and based on policy evaluation, the system assigns a filtering action.

To add URL categorization action for HTTP traffic

At the command prompt, type:

```
add responder action <name> <type> (<target> | <htmlpage>)[-comment
<string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <
string>]
```

Example:

```
add responder action act_url_categorize respondwith "\"HTTP/1.1 200
OK\r\n\r\n\" + HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE
(0,0).CATEGORY + \"\n\""
```

To add URL categorization policy for HTTP traffic

At the command prompt, type:

```
add responder policy <name> <rule> <action> [<undefAction>] [-comment
<string>] [-logAction <string>] [-appflowAction <string>]
```

Example:

```
add responder policy pol_url_categorize_http "HTTP.REQ.HOSTNAME.
APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ(\"Adult\") || HTTP
.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ(\"
Gambling\")"RESET
```

To add an HTTP load balancing virtual server

If a virtual server for HTTP traffic is not already configured, at the command prompt, type:

```
add lb vserver <name> [-td <positive_integer>] <serviceType> [-clt
Timeout <secs>]
```

Example:

```
add lb vserver vsrv-HTTP HTTP * 80 -persistenceType NONE -cltTimeout
120
```

To bind URL categorization policy with load balancing virtual server

At the command prompt, type:

```
bind lb vserver <name> -policyName <string> [-priority <positive_integer
>]
```

Example:

```
bind lb vserver vsrv-HTTP -policyName pol_url_categorize_http -
priority 10 -gotoPriorityExpression END -type REQUEST
```

Configuring URL categorization for HTTPS traffic

To configure the URL categorization feature for HTTPS traffic, you must configure a SSL-bridge loading balancing virtual server, add URL categorization policies and bind the policies to the SSL-bridge virtual server. By doing so, the server receives the HTTPS traffic and based on policy evaluation, the system assigns a filtering action.

To add URL categorization policy for HTTPS traffic

At the command prompt, type:

```
add videooptimization detectionpolicy <name> -rule <expression>
-action <string> [-undefAction <string>] [-comment <string>] [-
logAction <string>]
```

Example:

```
add videooptimization detectionpolicy pol_url_categorize_https_block_adult
-rule "CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(0,0).CATEGORY.EQ("
Adult")" -action RESET
```

To add SSL-Bridge load balancing virtual server

At the command prompt, type:

```
add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltTimeout <secs>]
```

Example:

```
add lb vserver vsrv-HTTPS SSL_BRIDGE * 443 -persistenceType NONE -cltTimeout 180
```

To bind categorization policy with SSL-Bridge virtual server

At the command prompt, type:

```
bind lb vserver <name> -policyName <string> [-priority <positive_integer>]
```

Example:

```
bind lb vserver vsrv-HTTPS -policyName pol_url_categorize_https_block_adult -priority 20 -type REQUEST
```

Configuring URL Categorization by using the GUI

The GUI enables you to:

- Enable the URL Categorization feature.
- Add URL Categorization actions for HTTP traffic.
- Add URL Categorization policies for HTTP traffic.
- Add URL Categorization policies for HTTPS traffic.
- Add a load balancing virtual server for HTTP traffic.
- Add an SSL bridge load balancing virtual server for HTTPS traffic.
- Bind URL Categorization policies to the load balancing virtual server.
- Bind URL Categorization policies to the SSL-Bridge load balancing virtual server.
- Configure shared memory limit.
- Configure URL categorization parameters.

To enable URL categorization

1. In the navigation pane, expand **System** and then click **Settings**.
2. On the **Settings** page, click **Configure Advanced Features** link.

3. On the **Configure Advanced Features** page, select **URL Filtering** check box.
4. Click **OK** and **Close**.

To add a URL categorization action

1. In the navigation pane, expand **AppExpert > Responder > Action**.
2. In the details pane, click **Add**.
3. On the **Create Responder Action** page, set the following parameters.
 - a) **Name**. Name of the URL categorization policy action.
 - b) **Type**. Select an action type.
 - c) **Expression**. Use the expression editor to create the policy expression.
 - d) **Comments**. A short description of the policy action.
4. Click **Create** and **Close**.

To add a URL categorization policy for HTTP traffic

1. In the navigation pane, expand **AppExpert > Responder > Policies**.
2. On the details pane, click **Add**.
3. On the **Create Responder Policy** page, set the following parameters.
 - a) **Name**. Name of the URL categorization policy action.
 - b) **Action**. Select the URL Categorization action that you prefer to associate with the policy.
 - c) **Log Action**. Select the log action.
 - d) **AppFlow**. Select an AppFlow action.
 - e) **Expression**. Use the expression editor to create the policy expression.
 - f) **Comments**. A short description about the policy action.
4. Click **Create** and **Close**.

To add a categorization policy for HTTPS traffic

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Detection**.
2. On the **Detection** page, click the **Video Optimization Detection Policies** link.
3. On the Video Optimization Detection Policies page, click **Add**.
4. On the **Create Video Optimization Detection Policy** page, set the following parameters.
 - a) **Name**. Name of the optimization policy
 - b) **Expression**. Configure policy using custom expressions.

- c) **Action.** Optimization action associated with the policy to handle the incoming video traffic.
 - d) **UNDEF Action.** Undefined event if the incoming request does not match the optimization policy.
 - e) **Comment.** A short description about the policy.
 - f) **Log Action.** Select an audit log action that specifies the action to be performed for the log messages.
5. Click **Create** and **Close**.

To add a load balancing virtual server for HTTP traffic

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page set the following parameters:
 - a) **Name.** Name of the load balancing virtual server.
 - b) **Protocol.** Choose protocol type as HTTP.
 - c) **IP Address Type.** IPv4 or IPv6.
 - d) **IP Address.** IPv4 or IPv6, VIP address assigned to the virtual server.
 - e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters.
5. Click **Create** and **Close**.

To add an SSL-bridge load balancing virtual server

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. On the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page, set the following parameters:
 - a) **Name.** Name of the load balancing virtual server.
 - b) **Protocol.** Select protocol type as SSL-bridge.
 - c) **IP Address Type.** IP addressable type.
 - d) **IP Address.** IP 4 or IP6 IP address assigned to the virtual server.
 - e) **Port.** Port number of the virtual server.
4. Choose **OK** to continue configuration other optional parameters.
5. Click **Create** and then **Close**.

To bind a URL categorization policy to the HTTP load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** page.
2. On the details pane, select the load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. Set the following parameters.
 - a) **Choose Policy**. Select URL categorization policy from the drop-down list.
 - b) **Choose Type**. Select the policy type as Request.
6. Click **Continue**.
7. Select the URL categorization policy from the list and click **Close**.

To bind a categorization policy to the SSL-bridge load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click **+** icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
 - a) **Choose Policy**. Select video detection policy from the drop-down list.
 - b) **Choose Type**. Select the policy type as Request.
6. Click **Continue**.
7. Select the video detection policy from the list and click **Close**.

To configure the shared memory limit

1. Sign on to the appliance and navigate to **Optimization > Integrated Caching**.
2. In the details pane, click **Change cache settings** link.
3. On the **Cache Global Settings** page, set the following parameters.
 - a) **Memory Usage Limit (MB)**.
 - b) **Active memory Usage Limit**.
 - c) **Via Header**.
 - d) **Maximum Post Body Length to be Cached**
 - e) **Global Undefined-Result Action**
 - f) **Enable HA Object Persist**
 - g) **Verify Cached Object Persist**
 - h) **Prefetches**

4. Click **OK** and **Close**.

To configure URL categorization parameters

1. Sign to the appliance and navigate to **Security**.
2. On the details pane, click **Change URL filtering settings** link.
3. In the **Configuring URL Filtering Params** page, set the following parameters.
 - a) Hours Between DB Updates. URL Filtering hours between database updates. Minimum value: 0 and Maximum value: 720.
 - b) Time of Day to Update DB. URL Filtering time of day to update the database.
4. Click **OK** and **Close**.

Configuring Audit Log Messaging

When a NetScaler appliance receives an incoming URL, if the responder policy has a URL Filtering expression, the audit log feature collects categorization information and displays it as log messages to any target audit log server that is configured. The info is logged.

- Source IP address (the IP address of the client that made the request).
- Destination IP address (the IP address of the requested server).
- Requested URL containing the schema, the host, and the domain name (<http://www.example.com>).
- URL category that the URL filtering framework returns.
- URL category group that the URL filtering framework returned.
- URL reputation number that the URL filtering framework returned.
- Audit log action taken by URL Categorization policy.

To configure audit logging for the URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see [Audit Logging](#) topic.

Storing Failure Errors Using SYSLOG Messaging

At any stage of the URL Filtering process, if there is a system-level failure, the NetScaler appliance uses the audit log mechanism to store logs in the ns.log file. The errors are stored as text messages in SYSLOG format so that, an administrator can view it later in a chronological order of event occurrence.

These logs are also sent to an external SYSLOG server for archival. For more information, see [article CTX229399](#).

For example, if a failure occurs when you initialize the URL Filtering SDK, the error message is stored in the following messaging format.

```
Oct 3 15:43:40 <local0.err> ns URLFiltering[1349]: Error initializing NetStar SDK (SDK error=-1). (status=1).
```

The NetScaler appliance stores the error messages under four different failure categories:

- Download failure. If an error occurs when you try to download the categorization database.
- Integration failure. If an error occurs when you integrate an update into the existing categorization database.
- Initialization failure. If an error occurs when you initialize the URL Categorization feature, set categorization parameters, or end a categorization service.
- Retrieval failure. If an error occurs when the appliance retrieves the categorization details of the request.

URL Reputation Score

The URL Categorization feature provides policy-based control to restrict blacklisted URLs. You can control access to websites based on URL category, reputation score, or URL category and reputation score. If a network administrator monitors a user accessing highly risky websites, he or she can use a responder policy bound to the URL reputation score to block such risky websites.

Upon receiving an incoming URL request, the appliance retrieves the category and reputation score from the URL categorization database. Based on the reputation score returned by the database, the appliance assigns a reputation rating for websites. The value can range from 1 to 4, where 4 is the riskiest type of websites, as shown in the following table.

URL Reputation Rating	Reputation Comment
1	Clean site.
2	Unknown site.
3	Potentially dangerous or affiliated to dangerous site.
4	Malicious site.

FAQs

April 22, 2024

This section provides the FAQ on the following NetScaler features

- [Authentication, Authorization, and Auditing](#)
- [Admin Partition](#)
- [AppFlow](#)
- [Call Home](#)
- [Clustering](#)
- [Connection Management](#)
- [Content Switching](#)
- [Debugging](#)

- [Installing, Upgrading, and Downgrading](#)
- [Load Balancing](#)
- [NetScaler GUI](#)
- [SSL](#)

Authentication, Authorization, and Auditing

April 22, 2024

Web Application Firewall protection

- Is it necessary to upgrade NetScaler to a version that addresses security vulnerabilities if the Web Application Firewall protection feature is enabled?

Yes, because the Web Application Firewall protection feature does not resolve security vulnerabilities on NetScaler. It only offers protection against malicious attacks. We recommend you to always upgrade NetScaler to the latest version as it contains the latest security fixes.

- What are the licensing requirements for the Web Application Firewall feature?

This feature is available with all the licenses (Standard, Enterprise, and Premium).

Admin Partition

May 2, 2023

Where can I get the NetScaler configuration file for a partition?

The configuration file (*ns.conf*) for the default partition is available in the */nsconfig* directory. For admin partitions, the file is available in the */nsconfig/partitions/<partitionName>* directory.

How can I configure integrated caching in a partitioned NetScaler appliance?

Note

Integrated caching in admin partitions is supported from NetScaler 11.0 onwards.

To configure integrated caching (IC) on a partitioned NetScaler, after defining the IC memory on the default partition, the superuser can configure the IC memory on each admin partition such that the total IC memory allocated to all admin partitions does not exceed the IC memory defined on the default partition. The memory that is not configured for the admin partitions remains available for the default partition.

For example, if a NetScaler appliance with two admin partitions has 10 GB of IC memory allocated to the default partition, and the IC memory allocation for the two admin partitions is as follows:

- Partition1: 4 GB
- Partition2: 3 GB

Then, the default partition has $10 - (4 + 3) = 3$ GB of IC memory available for use.

Note

If all IC memory is used by the admin partitions, no IC memory is available for the default partition.

What is the scope for L2 and L3 parameters in admin partitions?

Note

- Applicable from NetScaler 11.0 onwards.
- For ARP to work in non-default partition, you must enable the “proxyArp” parameter in the “set l2param” command.

On a partitioned NetScaler appliance, the scope of updating the L2 and L3 parameters is as follows:

- For L2 parameters that are set by using the “set L2Param” command, the following parameters can be updated only from the default partition, and their values are applicable to all the admin partitions:

maxBridgeCollision, bdgSetting, garpOnVridIntf, garpReply, proxyArp, resetInterfaceOn-HAfailover, and skip_proxying_bsd_traffic.

The other L2 parameters can be updated in specific admin partitions, and their values are local to those partitions.

- For L3 parameters that are set by using the “set L3Param” command, all parameters can be updated in specific admin partitions, and their values are local to those partitions. Similarly, the values that are updated in the default partition are applicable only to the default partition.

How to enable dynamic routing in an admin partition?

Note

Dynamic routing in admin partitions is supported from NetScaler 11.0 onwards.

While dynamic routing (OSPF, RIP, BGP, ISIS, BGP+) is by default enabled on the default partition, in an admin partition, it must be enabled by using the following command:

```
> set L3Param -dynamicRouting ENABLED
```

Note

A maximum of 63 partitions can run dynamic routing (62 admin partitions and 1 default partition).

On enabling dynamic routing on an admin partition, a virtual router (VR) is created.

- Each VR maintains its own vlan0 which will be displayed as `vlan0_<partition-name>`.
- All unbound IP addresses that are exposed to ZebOS are bound to vlan0.
- The default VR (of the default partition) shows all the VRs that are configured.
- The default VR shows the VLANs that are bound to these VRs (except default VLANs).

Where can I find the logs for a partition?

NetScaler logs are not partition-specific. Log entries for all partitions must be stored in the `/var/log/` directory.

How can I get audit logs for an admin partition?

In a partitioned NetScaler, you cannot have specific log servers for a specific partition. The servers that are defined at the default partition are applicable across all admin partitions. Therefore, to view the audit logs for a specific partition, you have to use the “show audit messages” command.

Note

The users of an admin partition do not have access to the shell and therefore are not able to access the log files.

How can I get web logs for an admin partition?

You can get the web logs for an admin partition as follows:

- **For NetScaler 11.0 and later versions**

The web logging feature must be enabled on each of the partitions that require web logging. Using the NetScaler Web Logging (NSWL) client, the NetScaler retrieves the web logs for all the partitions with which the user is associated.

- **For versions prior to NetScaler 11.0**

Web logs can be obtained only by `nsroot` and other superusers. Also, even though web logging is enabled on the default partition, the NetScaler Web Logging (NSWL) client fetches web logs for all the partitions.

To view the partition for each log entry, customize the log format to include the %P option. You can then filter the logs to view the logs for a specific partition.

How can I get the trace for an admin partition?

You can get the trace for an admin partition as follows:

- **For NetScaler 11.0 and later versions**

In a partitioned NetScaler appliance, the `nstrace` operation can be performed on individual admin partitions. The trace files are stored in the `/var/partitions/<partitionName>/nstrace/` directory.

Note: You cannot get the trace of an admin partition by using the GUI. You must use the CLI.

- **For versions prior to NetScaler 11.0**

The `nstrace` operation can only be performed on the default partition. Therefore, packet captures are available for the entire NetScaler system. To get partition-specific packet captures, use VLAN-ID based filters.

How can I get the technical support bundle specific to an admin partition?

To get the tech support bundle for a specific partition, run the following command from the default partition:

```
> show techsupport -scope partition <partitionName>
```

Note: This command also gives system-specific information.

AppFlow

May 2, 2023

- **Which build of NetScaler supports AppFlow?**

AppFlow is supported on NetScaler appliances running version 9.3 and above with nCore build.

- **What is the format used by AppFlow to transmit data?**

AppFlow transmits information in the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information.

- **What do AppFlow records contain?**

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response-status codes, server response time, and latency). IPFIX flow records are based on templates that must be sent before sending flow records.

- **After an upgrade to NetScaler Version 9.3 Build 48.6 Cl, why does an attempt to open a virtual server from the GUI result in the error message “The AppFlow feature is only available on NetScaler Ncore”?**

AppFlow is supported only on nCore appliances. When you open the virtual server configuration tab, clear the **AppFlow** check box.

- **What does the transaction ID in an AppFlow records contain?**

A transaction ID is an unsigned 32-bit number identifying an application-level transaction. For HTTP, a transaction corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. A typical transaction has four flow records. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for the transaction.

- **What is an AppFlow action ?**

An AppFlow action is a set of collectors to which the flow records are sent if the associated AppFlow policy matches.

- **What commands can I run on the NetScaler appliance to verify that the AppFlow action is a hit?**

The show AppFlow action. For example:

```
1 > show appflow action
2 1) Name: aFL-act-collector-1
3   Collectors: collector-1
4   Hits: 0
5   Action Reference Count: 2
6 2) Name: apfl-act-collector-2-and-3
7   Collectors: collector-2, collector-3
8   Hits: 0
9   Action Reference Count: 1
10 3) Name: apfl-act-collector-1-and-3
11  Collectors: collector-1, collector-3
12  Hits: 0
13  Action Reference Count: 1
14 <!--NeedCopy-->
```

- **What is an AppFlow collector?**

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. You can remove unused collectors.

- **What NetScaler version is required for using AppFlow?**

Use NetScaler version 9.3.49.5 or higher, and remember that AppFlow is available in only the nCore builds.

- **What transport protocol does AppFlow use?**

AppFlow uses UDP as the transport protocol.

- **What ports need to be opened if I have a firewall in the network?**

Port 4739. It is the default UDP port the AppFlow collector uses for listening on IPFIX messages. If the user changes the default port, that port must be opened on the firewall.

- **How can I change the default port AppFlow uses?**

When you add an AppFlow collector by using the add appflowCollector command, you can specify the port to be used.

```
1 > add appflowCollector coll1 -IPAddress 10.102.29.251 -port 8000
2 Done
3 <!--NeedCopy-->
```

- **What does setting `clientTrafficOnly` do?**

NetScaler generates AppFlow records only for client-side traffic.

- **How many collectors can be configured at a time?**

You can configure up to four AppFlow collectors at a time on the NetScaler appliance. Note that the maximum number of collectors that can be configured on a NetScaler appliance is four.

Call Home

May 22, 2023

- **What is Call Home on a NetScaler appliance?**

Call Home monitors, and notifies critical events on a NetScaler appliance. By enabling Call Home, you can automate the error notification process. You not only avoid calling NetScaler support, raise a service request, and upload system data before NetScaler support can troubleshoot the issue, but also identify and resolve issues before it occurs.

- **Is Call Home enabled by default on a NetScaler appliance?**

Yes, Call Home is enabled by default on the appliance. If you upgrade to the latest software from an older version where Call Home was disabled by default, the upgrade process automatically enables the feature. If you later choose to disable it, the updated setting is remembered for all further upgrades. For information, see [Call Home](#).

- **What are the pre-requisites for Call Home to work?**

Access to an Internet connection.

Note: If your NetScaler appliance does not have an Internet connectivity, you can configure a proxy server through which NetScaler can generate System Logs and upload it to the Citrix technical support server (CIS).

- **What are the benefits of using Call Home?**

- Monitor hardware and software error conditions.
- Notify about the occurrence of critical events that impact your network.
- Send performance data and System Logs to Citrix to:
 - * Analyze and improve product quality.
 - * Provide real-time troubleshooting information for proactive issue identification, and faster issue resolution.

- **Which release of NetScaler software supports Call Home?**

NetScaler release 10.0 and later.

- **What NetScaler platform models support Call Home?**

Call Home feature is enabled by default on all NetScaler platforms and all appliance models (MPX, VPX, and SDX).

- NetScaler MPX: All MPX models.
- NetScaler VPX: All VPX models. In addition, it is supported on VPX appliances that obtain their licenses from external or central licensing pools. However, the feature remains the same as for a standard VPX appliance.
- NetScaler SDX: Monitors the disk drive and assigned SSL chips for any errors or failures. The VPX instances, however, do not have access to the Power Supply Unit (PSU) and therefore their status is not monitored. In an SDX platform, you can configure Call Home either directly on an individual instance or through the SVM.

- **Should I configure SNMP alarm for Call Home to notify error conditions?**

No, you need not configure SNMP for Call Home to monitor error conditions, because SNMP and Call Home uploads are independent of each other. If you want to be notified each time an error condition occurs, you can configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever a Call Home upload happens. The SNMP alert notifies the local administrator about the occurrences of critical events.

- **How do I contact a technical support?**

For all critical hardware-related events, Call Home automatically creates a service request to NetScaler. For other errors, after you review the System Logs, you can contact the NetScaler technical support team to open a service request for further investigation. To contact support, visit <https://www.netscaler.com/resources/support>.

- **What error conditions does Call Home monitor in a NetScaler appliance?**

Call Home supports monitoring of the following events in a NetScaler appliance:

- Compact flash drive errors
- Hard disk drive errors
- Power supply unit failure
- SSL card failure
- Warm restart
- Memory anomalies
- Rate limit drops

- **Do you need a separate license for Call Home?**

No, Call Home does not require a separate license. You can enable it in all NetScaler platform licenses.

- **What data does Call Home send to NetScaler support server and how frequently is it sent?**

Call Home collects and sends two types of data to the CIS. They are:

- Basic System information (running NetScaler version, deployment mode (standalone, HA, cluster), hardware details and so on). It is sent at the time of Call Home registration and as part of periodic heartbeats. The heartbeat is sent once every 30 days, but you can configure this interval anywhere from 1 to 30 days. However, a value of less than 5 days is not recommended, because frequent uploads are usually not very useful.
- An abbreviated version of the `show tech support bundle` when there is an error condition. It is sent upon the first occurrence of a particular error condition since the appliance was last started. That is, a reoccurrence of the same error condition does not trigger another upload unless the appliance was rebooted after the previous occurrence.

- **Can Call Home generate and upload system logs through a proxy server?**

Yes. If your NetScaler appliance does not have direct Internet connectivity, you can configure a proxy server and upload System Logs to the Citrix technical support server (CIS).

- **Can I review Call Home data before it is sent to CIS?**

Unfortunately, you cannot review Call Home data before it is sent to CIS. Call Home does not collect any other data in addition to the data that you will provide when contacting the NetScaler support team.

- **How secure and private are the Call Home uploads?**

Call Home provides data security and privacy in the following ways:

- Uses a secure SSL/TLS channel to transfer data to Citrix servers.
- Uploaded data is reviewed only by authorized personnel and is not shared with any third party.

Clustering

April 27, 2021

Click [here](#) for FAQs on clustering.

Connection Management

May 2, 2023

- **What is an admin connection?**

An admin connection establishes a connection to the NSIP address and allows administrators to configure and monitor the NetScaler appliance.

- **What are the types of admin connections?**

There are two types of admin connections:

- SSH connection –Admin users use an SSH client to log on through the NSIP address.
- NITRO API connection –Admin users use NITRO APIs to automate the logon process to the NetScaler appliance.

Note

Admin users can also log on through the GUI to log on, by using a browser to connect to the NSIP address. The GUI internally opens a NITRO API connection. Therefore, a GUI session is equivalent to a NITRO API connection, and FAQs related to the NITRO API apply to GUI.

- **How many concurrent admin connections are allowed on a NetScaler appliance?**

The appliance allows up to 20 concurrent admin connections.

- **Which login credentials are required for an admin logon?**

Admin logon requires a user name and a password.

Note: An authentication key can be used instead of a password.

- **Which external authentication methods does a NetScaler appliance support?**

The appliance supports the following external authentication methods:

- RADIUS
- LDAP
- TACACS

- **What is a client?**

A client is a device (laptop or desktop), used by the admin user to open an admin connection.

- **What is a session token?**

A session token is a unique identifier that the NetScaler appliance issues to a client that sends a NITRO API logon request.

- API clients can reuse the session token, if it has not expired, for subsequent API requests on new TCP connections
- GUI clients internally open NITRO API connections and keep the session token active during the GUI session.

- **What is an active session on a NetScaler appliance?**

A CLI session is considered active if the session has not expired and has an open SSH connection with a NetScaler appliance.

A NITRO API session is considered active if the session token timeout has not expired on the NetScaler appliance.

- **How does NetScaler enforce the concurrent connection limit?**

Every time the NetScaler appliance receives an admin connection request (SSH or NITRO API), it checks the number of admin connections it has open. If the number is lower than 20, a new connection is opened.

- **Which counter reflects the number of admin connections on a NetScaler appliance?**

The connection counter (`nsconfigd_cur_clients`) reflects the number of active connections. This counter is incremented when a client opens new connection to the appliance, and is decremented when a connection is closed.

- **Which counter reflects the number of active tokens on the NetScaler appliance?**

The `configd_cur_tokens` counter reflects the number of active tokens on the NetScaler appliance.

- **How does NetScaler appliance handle errors on a connection?**

The NetScaler appliance immediately closes the client (CLI, API, and GUI) connection if it encounters errors on a connection.

- **Does a CLI or GUI session on a connection to the management address count against the admin connection limit?**

Yes, all CLI and GUI connections are TCP based connections, and every TCP connection to the management address counts against the admin connection limit.

- **Does a NITRO session count against the admin connection limit?**

A NITRO session counts against the admin connection limit if there is an open TCP connection using the session token issued by the NetScaler appliance.

- **What is the default timeout period for API, GUI, and CLI sessions on NetScaler appliance?**

The following table lists the default timeout period for API, GUI, and CLI sessions on the NetScaler appliance:

	CLI default timeout period (min)	API default timeout period (min)	GUI default timeout period (min)
NetScaler Releases			
NetScaler 9.3	None	30 Minutes	30 Minutes

NetScaler Releases	CLI default timeout period (min)	API default timeout period (min)	GUI default timeout period (min)
NetScaler 10.1	None	30 Minutes	30 Minutes
NetScaler 10.5	15 Minutes	30 Minutes	15 Minutes
Onwards			

- **How can you set the CLI sessions time out on a NetScaler appliance?**

The CLI session timeout can be configured by running the following command at the CLI prompt:

```
set cli mode -timeout \

```

- **How do you override the default timeout period when using the NITRO API?**

You can override the default timeout period for a NITRO API by setting the timeout duration in the “timeout” field of the login object. If the session timeout is set to zero, the session token has an infinite timeout.

Note: An infinite timeout is not advisable, because sessions that do not time out continue to count against the admin connection count.

- **What happens if a user account is deleted from the NetScaler appliance after an admin session is created?**

For internal system users, the NetScaler appliance closes the existing CLI or NITRO API session. For external system users, the session remains active until it expires.

- **Can NITRO API clients use a single session token to open multiple admin connections on the NetScaler appliance?**

Yes. Each such connection counts against the admin connection limit.

- **If management access is enabled for a SNIP address, do admin connections to that address count against the limit for the number of admin connections?**

Yes, admin connections to management address (SNIP) count against the admin connection limit on NetScaler.

- **Can a NetScaler admin log on to the NetScaler appliance after the maximum connections limit is reached?**

Yes. One more admin connection is allowed after the maximum connection limit is reached.

- **Can NITRO API endpoints open multiple admin connections on NetScaler the appliance?**

Yes, NITRO API endpoints can open multiple admin connections and exhaust the concurrent admin connection limit on a NetScaler appliance. In such situations, an extra SSH/CLI connection

is allowed and the admin can force closure of old API sessions, or reduce the session timeout duration for the existing API sessions.

- **Can same client open multiple API sessions on a NetScaler appliance?**

Yes, a client can open multiple API sessions by repeatedly logging on. For example, the client might log back on after a reboot.

Note: Repeated client logons count against the admin connection limit on NetScaler appliance.

- **Can API clients use the entire API session token limit?**

Yes, API clients can use the entire API session token limit, provided by repeatedly logging on without using a previously issued token.

Note: If a client’s session timeout is zero, the token is valid forever. Repeated logons using new session tokens can count against the limit for API session tokens.

- **Do CLI sessions count against the API session token limit?**

No, CLI sessions are not counted against the API session token limit.

- **Can admin users use telnet to open a CLI session?**

No. Only an SSH client can open a CLI session.

- **What is connection limit and API session limit applicable for various NetScaler releases?**

The following table lists the maximum concurrent admin connection and active API session limits applicable for various NetScaler releases:

NetScaler Releases	9.3	10.1 (Before 130.x)	10.1 (Before 130.10)	10.1 (From 130.10)
Maximum number of concurrent admin connections	20	20	20	20
Maximum number of active API sessions*	1000	20	1000	1000

Note:

- API sessions are considered active if they have not timed out. For example, if 500 API sessions were created but 100 have expired, 400 API sessions are active.
- An API session need not open a TCP connection to the NetScaler appliance.

Content Switching

May 2, 2023

- **I have installed a non-NetScaler load balancing appliance on the network. However, I would like to use the content switching feature of the NetScaler appliance to direct the client requests to the load balancing appliance. Is it possible to use the Content switching feature of the NetScaler appliance with a non-NetScaler load balancing appliance?**

Yes. You can use the Content switching feature of the NetScaler appliance with the load balancing feature of the NetScaler appliance or a non-NetScaler load balancing appliance. However, when using the non-NetScaler load balancing appliance, make sure that you create a load balancing virtual server on the NetScaler appliance and bind it to the non-NetScaler load balancing appliance as a service.

- **How is a Content switching virtual server different from a load balancing virtual server?**

A Content switching virtual server is capable only of sending the client requests to other virtual servers. It does not communicate with the servers.

A Load balancing virtual server balances the client load among servers and communicates with the servers. It monitors server availability and can be used to apply different load balancing algorithms to distribute the traffic load.

Content switching is a method used to direct client requests for specific types of content to targeted servers by way of load balancing virtual servers. You can direct the client requests to the servers best suited to handle them. This result in reduced overheads to process the client requests on the servers.

- **I want to implement the Content switching feature of the NetScaler appliance to direct the client requests. What types of client request can I direct by using the Content switching feature?**

You can direct only HTTP, HTTPS, FTP, TCP, Secure TCP, and RTSP client requests by using the Content switching feature. To direct HTTPS client requests, you must configure the SSL offload feature on the appliance.

- **I want to create Content switching rules on the NetScaler appliance. What are the various elements of the client request on which I can create a content switching rule?**

You can create the content switching rules based on the following elements and their values in the client request:

- URL
- URL tokens

- HTTP version
- HTTP Headers
- Source IP address of the client
- Client version
- Destination TCP port

• **I understand that the content switching feature of the NetScaler appliance helps enhance the performance of the network. Is this correct?**

Yes. You can direct the client requests you the servers best suited to handle them. The result is reduced overhead for processing the client requests on the servers.

• **Which feature of the NetScaler appliance should I configure on the NetScaler appliance to enhance the site manageability and response time to the client requests?**

You can configure the content switching feature of the NetScaler appliance to enhance the site manageability and response time to the client request. This feature enables you to create content groups within the same domain name and IP address. This approach is flexible, unlike the common approach of explicitly partitioning the content into different domain names and IP addresses, which are visible to the user.

Multiple partitions dividing a website into various domain names and IP addresses force the browser to create a separate connection for each domain it finds when rendering and fetching the content of a webpage. These additional WAN connections degrade the response time for the webpage.

• **I have hosted a web site on a web server farm. What advantages does the NetScaler content switching feature offer for this type of setup?**

The content switching feature provides the following advantages on a NetScaler appliance in a site that is based in a web server farm:

- Manage the site content by creating a content group within the same domain and IP address.
- Enhance the response time to client requests by using the content group within the same domain and IP address.
- Avoid the need for full content replication across domains.
- Enable application-specific content partitioning. For example, you can direct client requests to a server that handles only dynamic content or only static content, as appropriate for the request.
- Support multi-homing of multiple domains on the same server and use the same IP address.
- Reuse connections to the servers.

• **I want to implement the content switching feature on the NetScaler appliance. I want to**

direct the client requests to the various servers after evaluating the various parameters of each request. What approach should I follow to implement this setup when configuring the content switching feature?

You can use policy expressions to create policies for the content switching feature. An expression is a condition evaluated by comparing the qualifiers of the client request to an operand by using an operator. You can use the following parameters of the client request to create an expression:

- **Method**- HTTP request method.
- **URL**- URL in the HTTP header.
- **URL TOKENS**- Special tokens in the URL.
- **VERSION**- HTTP request version.
- **URL QUERY**- Contains the URL Query LEN, URL LEN, and HTTP header.
- **SOURCEIP**- IP address of the client.

Following is a complete list of the operators that you can use to create an expression:

- == (equals)
- != (not equals)
- EXISTS
- NOT EXISTS
- CONTAINS
- NOT CONTAINS
- GT (greater than)
- LT (less than)

You can also create various rules, which are logical aggregations of a set of expressions. You can combine multiple expressions to create rules. To combine expressions, you can use the && (AND) and

- **I want to configure a rule based policy along with a URL based policy for the same content switching virtual server. Is it possible to create both types of policies for the same content switching virtual server?**

Yes. You can create both type of policies for the same content switching virtual server. However, be sure to assign priorities to set an appropriate precedence for the policies.

- **I want to create content switching policies that evaluate the domain name, along with a prefix and suffix of a URL, and direct the client requests accordingly. Which type of content switching policy should I create?**

You can create a Domain and Exact URL policy. When this type of policy is evaluated, the NetScaler appliance selects a content group if the complete domain name and the URL in

the client request match the ones configured. The client request must match the configured domain name and exactly match the prefix and suffix of the URL if they are configured.

- **I want to create content switching policies that evaluate the domain name, along with a partial prefix and suffix of URL, and direct the client requests accordingly. Which type of content switching policy should I create?**

You can create a Domain and Wildcard URL policy for the content switching virtual server. When this type of policy is evaluated, the NetScaler appliance selects a content group if the request matches the complete domain name and partially matches the URL prefix.

- **What is a Wildcard URL policy?**

You can use wildcards to evaluate partial URLs in client requests to the URL you have configured on the NetScaler appliance. You can use wildcards in the following types of URL-based policies:

- Prefix only. For example, the `/sports/*` expression matches all URLs available under the `/sports` URL. Similarly, the `/sports*` expression matches all URLs whose prefix is `/sports`.
- Suffix only. For example the `/*.jsp` expression matches all URLs with a file name extension of `.jsp`.
- Prefix and Suffix. For example, the `/sports/*.jsp` expression matches all URLs under the `/sports/` URL that also have the `.jsp` file name extension. Similarly, the `/sports*.jsp` expression matches all URLs with a prefix of `/sports*` and a file name extension of `.jsp`.

- **What is a Domain and Rule policy?**

When you create a Domain and Rule policy, the client request must match the complete domain and the rule configured on the NetScaler appliance.

- **What is the default precedence set for evaluating policies?**

By default, the rule based policies are evaluated first.

- **If some of the content is the same for all client requests, what type of precedence should I use for evaluating policies?**

If some of the content is the same for all the users and different content must be served on the basis of client attributes, you can use URL-based precedence for policy evaluation.

- **What policy expression syntaxes are supported in content switching?**

Content switching supports two types of policy expressions:

- **Classic Syntax-** Classic syntax in content switching starts with the keyword `REQ` and is more advanced than the Advanced policy. Classic policies cannot be bound to an action. Therefore, the target load balancing virtual server can be added only after binding the content switching virtual server.

- **Advanced policy:** Advanced policy generally starts with the key word HTTP and is easier to configure. A target load balancing virtual server action can be bound to a Advanced policy, and the policy can be used on multiple content switching virtual servers.

- **Can I bind a single content switching policy to multiple virtual servers?**

Yes. You can bind a single content switching policy to multiple virtual servers by using policies with defined actions. Content switching policies that use an action can be bound to multiple content switching virtual servers because the target load balancing virtual server is no longer specified in the content switching policy. The ability to bind a single policy to multiple content switching virtual servers helps to further reduce the size of the content switching configuration.

For more information, see the following Knowledge Center articles and NetScaler documentation topics:

- See CTX122918 - [How to Bind the Same Content Switching Policy to Two Content Switching virtual server on a NetScaler Appliance.](#)
- See CTX122736 - [How to Bind the Same Advanced Policy to Multiple Content Switching Virtual Servers using Policy Labels.](#)
- [Configuring Basic Content Switching.](#)

- **Can I create an action based policy using classic expressions?**

No. As of now NetScaler does not support policies using classic syntax expressions with actions. The target load balancing virtual server must be added when binding the policy instead of defining it in an action.

Debugging

May 2, 2023

- **How can I determine the interface (CLI, GUI, or API) through which an operation was performed?**

The NetScaler keeps track of the interfaces through which operations are performed. You can view this information in syslogs (in the GUI, navigate to Configuration > System > Auditing > Audit Messages > Syslog messages) or in the ns.log (located at the /var/log/ directory) file.

For example, operations that are performed through the API are flagged as “API CMD_EXECUTED.”

Integrated Caching

May 2, 2023

Content Groups

- **How is a DEFAULT content group different from other content groups?**

The behavior of the DEFAULT content group is the same as any other group. The only attribute that makes the DEFAULT content group special is that if an object is being cached and no content group has been created. The object is cached in the DEFAULT group.

- **What is the ‘cache-Control’ option of the content group level?**

You can send any cache-control header the browser. There is a content group level option, -cacheControl, which enables you to specify the cache-control header that you want to be inserted in the response to the browser.

- **What is the ‘Minhit’ option in content group level?**

`Minhit` is an integer value specifying the minimum number of select to a cache policy before the object is cached. This value is configurable at the content group level. Following is the syntax to configure this value from the CLI.

```
add/set cache contentGroup \
```

- **What is the use of the expireAtLastByte option?**

The expireAtLastByte option enables the integrated cache to expire the object when it is downloaded. Only requests that are outstanding requests then are served from the cache. any new requests are sent to the server. This setting is useful when the object is frequently modified, as in the case of stock quotes. This expiry mechanism works along with the Flash Cache feature. To configure a expireAtLastByte option, run the following command from the CLI:

```
add cache contentGroup \<Group_Name> -expireAtLastByte YES
```

Cache policy

- **What is a caching policy?**

Policies determine which transactions are cacheable and which are not. Also, policies add or override the standard HTTP caching behavior. Policies determine an action, such as CACHE or NOCACHE, depending on the specific characteristics of the request or response. If a response matches the policy rules, the object in the response is added to the content group configured in the policy. If you have not configured a content group, the object is added to the DEFAULT content group.

- **What is a policy hit?**

A select occurs when a request or response matches a cache policy.

- **What is a miss?**

A miss occurs when a request or response does not match any cache policy. A miss can also occur if the request or response matches a cache policy but some override of RFC behavior prevents the object from being stored in the cache.

- **I have configured Integrated Caching feature of the NetScaler appliance. When adding the following policy, an error message appears. Is there any error in the command?**

```
add cache policy image_caching -rule exp1 | ns_ext_not_jpeg -  
action cache  
  
\> ERROR: No such command
```

In the preceding command, the expression must be within the quotation marks. Without quotation marks, the operator is considered to be the pipe operator.

Memory Requirements

- **What are the commands that I can run on the NetScaler appliance to check the memory allocated to cache?**

To display the memory allocated for cache in the NetScaler appliance, run any of the following commands from the CLI:

- `show cache parameter`

In the output, check the value of the Memory usage limit parameter. This is the maximum memory allocated for cache.

- `show cache \<Content_Group_Name>`

In the output, check the values of the Memory usage and Memory usage limit parameters indicating the memory used and allocated for the individual content group.

- **My NetScaler appliance has 2 GB of memory. Is there any recommended memory limit for cache?**

For any model of the NetScaler appliance, you can allocate half of the memory to the cache. However, Citrix recommends allocating a little less than half of the memory, because of internal memory dependency. You can run the following command to allocate 1 GB of memory to the cache:

```
set cache parameter -memLimit 1024
```

- **Is it possible to allocate memory for individual content groups?**

Yes. Even though you allocate memory for the integrated cache globally by running the `set cache parameter -memlimit<Integer>`, you can allocate memory to individual content groups by running the `set cache <Content_Group_Name> -memLimit <Integer>` command. The maximum memory you can allocate to content groups (combined) cannot exceed the memory you have allocated to the integrated cache.

- **What is the dependency of memory between integrated cache and TCP buffer?**

If the NetScaler appliance has 2 GB memory, then the appliance reserves approximately 800 MB to 900 MB of memory and the remaining is allocated to the FreeBSD operating system. Therefore, you can allocate up to 512 MB of memory to the integrated cache and the rest is allocated to the TCP buffer.

- **Does it affect the caching process if I do not allocate global memory to the integrated cache?**

If you do not allocate memory to the integrated cache, all requests are sent to the server. To make sure that you have allocated memory to the integrated cache, run the `show cache parameter` command. Actually no objects are cached if the global memory is 0, so it must be set first.

Verification commands

- **What are the options for displaying cache statistics?**

You can use either of the following options to display the statistics for cache:

- `stat cache`

To display the summary of the cache statistics.

- `stat cache -detail`

To display the full details of the cache statistics.

- **What are the options for displaying the cached content?**

To display the cached content, you can run the `show cache object` command.

- **What is the command that I can run to display the characteristics of an object stored in cache?**

If the object stored in the cache is, for example, `GET //10.102.12.16:80/index.html`, you can display the details about the object by running the following command from the CLI of the appliance:

```
show cache object -url '/index.html'-host 10.102.3.96 -port 80
```

- **Is it mandatory to specify the group name as a parameter to display the parameterized objects in cache?**

Yes. It is mandatory to specify the group name as a parameter to display the parameterized objects in the cache. For example, consider that you have added the following policies with the same rule:

```
1 add cache policy p2 -rule ns_url_path_cgibin -action CACHE -
  storeInGroup g1
2 add cache policy p1 -rule ns_url_path_cgibin -action CACHE -
  storeInGroup g2
3 <!--NeedCopy-->
```

In this case, for the multiple requests, if policy p1 is evaluated, its select counter is incremented and the policy stores the object in the g1 group, which has select parameters. Therefore, you have to run the following command to display the objects from the cache:

```
show cache object -url "/cgi-bin/setCookie.pl"-host 10.102.18.152
  groupName g1
```

Similarly, for another set of multiple requests, if policy p2 is evaluated, its select counter is incremented and the policy stores the object in the g2 group, which does not have select parameters. Therefore, you have to run the following command to display the objects from the cache:

```
show cache object -url "/cgi-bin/setCookie2.pl"-host 10.102.18.152
```

- **I notice that there are some blank entries in the output of the nscachemgr command. What are those entries?**

Consider the following sample output of the `nscachemgr` command. The blank entries in this output are highlighted in bold face for your reference:

```
1 root@ns# /netscaler/nscachemgr -a
2 //10.102.3.89:80/image8.png
3 //10.102.3.97:80/staticdynamic.html
4 //10.102.3.97:80/
5 //10.102.3.89:80/image1.png
6 //10.102.3.89:80/file5.html
7 //10.102.3.96:80/
8 //10.102.3.97:80/bg_logo_segue.png
9 //10.102.3.89:80/file500.html
10 //10.102.3.92:80/
11 //10.102.3.96:80/cgi-bin/rfc/ccProxyReval.pl
12 Total URLs in IC = 10
13 <!--NeedCopy-->
```

The blank entries in the output are due to the default caching properties for GET / HTTP/1.1.

Flushing Objects

- **How can I flush a selective object from the cache?**

You can identify an object uniquely by its complete URL. To flush such an object, you can perform any of the following tasks:

- Flush cache
- Flush content group
- Flush the specific object

To flush the specific object, you have to specify the query parameters. You specify the `inval-Param` parameter to flush the object. This parameter applies only to a query.

- **Does any change in the cache configuration trigger flushing of cache?**

Yes. When you change to the cache configuration, all the SET cache commands inherently flush the appropriate content groups.

- **I have updated the objects on the server. Do I need to flush the cached objects?**

Yes. When you update objects on the server, you must flush the cached objects, or at least the relevant objects and content groups. The integrated cache is not affected by an update to the server. It continues to serve the cached objects until they expire.

Flash Cache

- **What is Flash Cache feature of the NetScaler appliance?**

The phenomenon of Flash crowds occurs when many clients access the same content. The result is a sudden surge in traffic toward the server. The Flash Cache feature enables the NetScaler appliance to improve performance in such a situation by sending only one request to the server. All other requests are queued on the appliance and the single response is served to the requests. You can use either of the following commands to enable the Fast Cache feature:

- `add cache contentGroup \<Group_Name> -flashCache YES`
- `set cache contentGroup \<Group_Name> -flashCache YES`

- **What is the limit for Flash Cache clients?**

The number of Flash Cache clients depends on the availability of resources on the NetScaler appliance.

Default Behavior

- **Does the NetScaler appliance proactively receive objects upon expiry?**

The NetScaler appliance never proactively receives objects on expiry. This is true even for the negative objects. The first access after expiry triggers a request to the server.

- **Does the integrated cache add clients to the queue for serving even before it starts receiving the response?**

Yes. The integrated cache adds clients to the queue for serving even before it starts receiving the response.

- **What is the default value for the Verify cached object using parameter of the cache configuration?**

HOSTNAME_AND_IP is the default value.

- **Does the NetScaler appliance create log entries in the log files?**

Yes. The NetScaler appliance creates log entries in the log files.

- **Are compressed objects stored in the cache?**

Yes. Compressed objects are stored in the cache.

Interoperability with other features

- **What happens to objects that are currently stored in cache and are being accessed through SSL VPN?**

Objects stored in the cache and accessed regularly are served as cache, select when accessed through the SSL VPN.

- **What happens to objects stored in the cache when accessed through SSL VPN and later accessed through a regular connection?**

The objects stored through the SSL VPN access are served as a select when accessed through the regular connection.

- **When using web logging, how do I differentiate entries that indicate response served from cache from those served by the server?**

For responses served from the integrated cache, the server log field contains the value IC. For responses served from a server, the server log field contains the value sent by the server. Following is a sample log entry for an integrated caching transaction:

```
"10.102.1.52 - "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 4.0; .NET CLR 1.0.3705)""GET /"200 0 "IC"10.102.1.45"
```

Along with a client request, the response logged is the one sent to the client and not necessarily the one sent by the server.

Note

When using the web logging, the responses from the integrated cache contains the value IC in the server log field. The server log field is present in the NSWL client with “%o1” format specifier.

Miscellaneous

- **What do you mean by configuring relexpiry and absexpiry?**

By configuring `relexpiry` and `absexpiry`, it means that you are overriding the header irrespective of what appears in the header. You can configure a different expiry setting and the content group level. With `relexpiry`, the expiration of the header is based on the time at which the object is received by the NetScaler. With `absexpiry`, expiration is based on the time configured on the NetScaler. `Relexpiry` is configured in terms of seconds. `Absexpiry` is a time of day.

- **What do you mean by configuring weakpos and heuristic?**

The `weakpos` and `heuristic` are like fallback values. If there is an expiry header, it is considered only if the last-modified header is present. The NetScaler appliance sets expiry based on the last-modified header and the heuristic parameter. The heuristic expiry calculation determines the time to expiry by checking the last-modified header. Some percentage of the duration since the object was last modified is used as time to expiry. The heuristic of an object that remains

unmodified for longer periods of time and is likely to have longer expiry periods. The `–heurExpiryParam` specifies what percentage value to use in this calculation. Otherwise, the appliance uses the `weakpos` value.

- **What should I consider before configuring dynamic caching?**

If there is some parameter that is in name-value form and does not have the full URL query, or the appliance receives the parameter in a cookie header or POST body, consider configuring dynamic caching. To configure dynamic caching, you have to configure the `hitParams` parameter.

- **How is hexadecimal encoding supported in the parameter names?**

On the NetScaler appliance, the %HEXHEX encoding is supported in the parameter names. In the names that you specify for `hitParams` or `invalParams`, you can specify a name that contains %HEXHEX encoding in the names. For example, `name`, `name%65`, and `n %61m%65` are equivalent.

- **What is the process for selecting a hitParam parameter?**

Consider the following excerpt of an HTTP header for a POST request:

```

1  POST /data2html.asp?param1=value1&param2=&param3&param4=value4
2  HTTP/1.1
3  Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg,
4  application/vnd.ms-powerpoint, application/vnd.ms-excel,
5  application/msword, application/x-shockwave-flash, */*
6  Referer: http://10.102.3.97/forms.html
7  Accept-Language: en-us
8  Content-Type: application/x-www-form-urlencoded
9  Accept-Encoding: gzip, deflate
10 User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)
11 Host: 10.102.3.97
12 Content-Length: 153
13 Connection: Keep-Alive
14 Cache-Control: no-cache
15 Cookie: ASPSESSIONIDQGQGRNY=NNLLKDADEENOAFLLCCDGFSDMO
16 S1=This+text+is+only+text%2C+not+more+and+not+less%2C+%0D%0Ajust+
   text+to+be+itself%2C+namely+%22Text%22+to+be+posted+as+text
   +%28what+else...%29&B1=Submit
17 <!--NeedCopy-->
```

In the preceding request, you can use `S1` and `B1`, highlighted in bold face for your reference, as `hitParams` depending on your requirements. Also, if you use `-matchCookies YES` in the `ASPSESSIONIDQGQGRNY` content group, then you can also use these parameters as `hitParams`.

- **What happens to the queued clients if the response is not cacheable?**

If the response is not cacheable, all the clients in the queue receive the same response that the first client receives.

- **Can I enable the Poll every time (PET) and Flash Cache features on the same content**

group?

No. You cannot enable PET and Flash Cache on the same content group. The integrated cache does not perform the AutoPET function on Flash Cache content groups. The PET feature ensures that the integrated cache does not serve a stored object without consulting the server. You can configure PET explicitly for a content group.

• When are the log entries created for the queued clients?

The log entries are created for the queued clients soon after the appliance receives the response header. The log entries are created only if the response header does not make the object non-cacheable.

• What is the meaning of the DNS, HOSTNAME, and HOSTNAME_AND_IP values of the Verify cached object using parameter of the cache configuration?

The meanings are as follows:

- `set cache parameter -verifyUsing HOSTNAME`

The command ignores the destination IP address.

- `set cache parameter -verifyUsing HOSTNAME_AND_IP`

The command matches the destination IP address.

- `set cache parameter -verifyUsing DNS`

The command uses the DNS server.

• I have set weakNegRelExpiry to 600, which is 10 minutes. I noticed that 404 responses are not getting cached. What is the reason?

This completely depends on your configuration. By default, 404 responses are cached for 10 minutes. If you want all 404 responses to be fetched from the server, specify `-weakNegRelExpiry 0`. You can fine-tune the `-weakNegRelExpiry` to a desired value, such as higher or lower to get the 404 responses cached appropriately. If you have configured `-absExpiry` for positive responses, then it might not yield the desired results.

• When the user accesses the site by using the Mozilla Firefox browser, the updated content is served. However, when the user accesses the site by using the Microsoft Internet Explorer browser, stale content is served. What could be the reason?

The Microsoft Internet Explorer browser might be taking the content from its local cache instead of the NetScaler integrated cache. The reason can be that the Microsoft Internet Explorer browser is not respecting the expiry related header in the response.

To resolve this issue, you can disable the local cache of the Internet Explorer and clear the offline content. After clearing the offline content, the browser must display the updated content.

- **What if Hits are zero?**

Check to see if the server time and NS time are in sync. And the weakPosrelexpiry limit set must bear the time difference between NS and server as following:

```
1 root@ns180\# date
