- For CRLs: `/var/netscaler/ssl/crlfile`
- For DH keys: `/nsconfig/ssl/dhfile`

Imports from both HTTP and HTTPS servers are supported. However, the import fails if the file is on an HTTPS server that requires client certificate authentication for access.

### Notes:

- The import command is not stored in the configuration (`ns.conf`) file, because reimporting the file after a restart might cause an error.
- The import command fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the `/etc/ssl` directory on NetScaler to authenticate the HTTPS server.

## Import a certificate file

You can use the CLI and GUI to import a file (resource) from a remote host.

### Import a certificate file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl certFile [<name>] [<src>]
2 <!--NeedCopy-->
```

### Example:

```
1 import ssl certfile my-certfile http://www.example.com/file_1
2 <!--NeedCopy-->
```

```
1 show ssl certfile
2 Name : my-certfile
```

```
3 URL : http://www.example.com/file_1
4 <!--NeedCopy-->
```

To remove a certificate file, use the `rm ssl certFile` command, which accepts only the 'name' argument.

### Import a key file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl keyFile [<name>] [<src>]
2 <!--NeedCopy-->
```

#### Example:

```
1 import ssl keyfile my-keyfile http://www.example.com/key_file
2 <!--NeedCopy-->
```

```
1 show ssl keyfile
2 Name : my-keyfile
3 URL : http://www.example.com/key_file
4 <!--NeedCopy-->
```

To remove a key file, use the `rm ssl keyFile` command, which accepts only the 'name' argument.

### Import a CRL file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl crlFile [<name>] [<src>]
2 <!--NeedCopy-->
```

To remove a CRL file, use the `rm ssl crlFile` command, which accepts only the <name> argument.

#### Example:

```
1 import ssl crlfile my-crlfile http://www.example.com/crl_file
2
3 show ssl crlfile
4
5 Name : my-crlfile
6 URL : http://www.example.com/crl_file
7 <!--NeedCopy-->
```

## Import a DH file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl dhFile [<name>] [<src>]
2 <!--NeedCopy-->
```

### Example:

```
1 import ssl dhfile my-dhfile http://www.example.com/dh_file
2 show ssl dhfile
3 Name : my-dhfile
4 URL : http://www.example.com/dh_file
5 <!--NeedCopy-->
```

To remove a DH file, use the `rm ssl dhFile` command, which accepts only the `<name>` argument.

## Import an SSL resource by using the GUI

Navigate to **Traffic Management > SSL > Imports**, and then select the appropriate tab.

## Import PKCS#8 and PKCS#12 certificates

If you want to use certificates and keys that you already have on other secure servers or applications in your network, you can export them, and then import them to the NetScaler appliance. You might have to convert exported certificates and keys before you can import them to the NetScaler appliance.

For the details of how to export certificates from secure servers or applications in your network, see the documentation of the server or application from which you want to export.

### Note:

For installation on the NetScaler appliance, key and certificate names cannot contain spaces or special characters other than those characters supported by the UNIX file system. Follow the appropriate naming convention when you save the exported key and certificate.

A certificate and private key pair is commonly sent in the PKCS#12 format. The appliance supports PEM and DER formats for certificates and keys. To convert PKCS#12 to PEM or DER, or PEM or DER to PKCS#12, see the “Convert SSL certificates for import or export” section later in this page.

The NetScaler appliance does not support PEM keys in PKCS#8 format. However, you can convert these keys to a supported format by using the OpenSSL interface, which you can access from the CLI or the configuration utility. Before you convert the key, you need to verify that the private key is in PKCS#8 format. Keys in PKCS#8 format typically start with the following text:

```
1 -----BEGIN ENCRYPTED PRIVATE KEY-----
2
3
4
5 1euSSZQZKgrgUQ==
6
7
8
9 -----END ENCRYPTED PRIVATE KEY-----
10 <!--NeedCopy-->
```

### Open the OpenSSL interface from the CLI

1. Open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance by using the administrator credentials.
3. At the command prompt, type shell.
4. At the shell prompt type `openssl`.

### Open the OpenSSL interface from the GUI

Navigate to **Traffic Management > SSL** and, in the Tools group, select **OpenSSL interface**.

### Convert a non-supported PKCS#8 key format to an encrypted supported key format by using the OpenSSL interface

At the OpenSSL prompt, type one of the following commands, depending on whether the non-supported key format is of type RSA or ECDSA:

```
1 OpenSSL>rsa- in <PKCS#8 Key Filename> -des3 -out <encrypted Key
 Filename>
2
3 OpenSSL>ec -in <PKCS#8 Key Filename> -des3 -out <encrypted Key Filename
 >
4 <!--NeedCopy-->
```

### Parameters for converting an unsupported key format to a supported key format

- **PKCS#8 Key Filename:** The input file name of the incompatible PKCS#8 private key.
- **encrypted Key Filename:** The output file name of the compatible encrypted private key in PEM format.
- **unencrypted Key Filename:** The output file name of the compatible unencrypted private key in PEM format.

## Convert SSL certificates for import or export

A NetScaler appliance supports the PEM and DER formats for SSL certificates. Other applications, such as client browsers and some external secure servers, require various public key cryptography standard (PKCS) formats. The appliance can convert the PKCS#12 format to PEM or DER format for importing a certificate to the appliance, and can convert PEM or DER to PKCS#12 for exporting a certificate. For more security, conversion of a file for import can include encryption of the private key with the DES or DES3 algorithm.

### Notes:

- If you use the GUI to import a PKCS#12 certificate, and the password contains a dollar sign (\$), back quote (`), or escape (\) character, the import might fail. If it does, the ERROR: Invalid password message appears. If you must use a special character in the password, be sure to prefix it with an escape character (\) unless all imports are performed by using the CLI.
- Starting from NetScaler release 14.1 build 21.x, the length of the path is increased from 63 to 255 characters for the certificate and key parameters in the following commands:
  - convert ssl pkcs12
  - convert ssl pkcs8

## Convert the format of a certificate by using the CLI

At the command prompt, type the following command:

```
1 convert ssl pkcs12 <outfile> [-import [-pkcs12File <inputFilename>] [-des | -des3] [-export [-certFile <inputFilename>] [-keyFile <inputFilename>]]
2 <!--NeedCopy-->
```

During the operation, you are prompted to enter an import password or an export password. For an encrypted file, you are also prompted to enter a passphrase.

### Example:

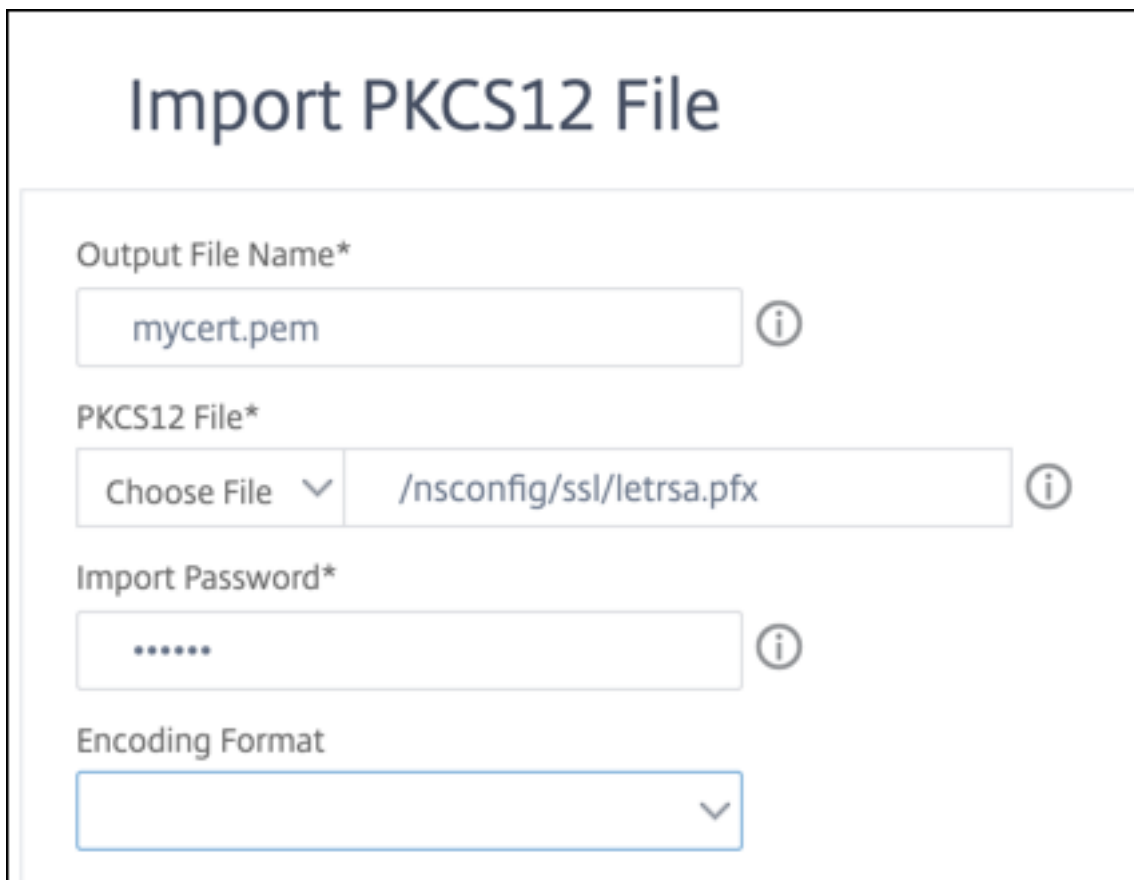

```
1 convert ssl pkcs12 Cert-Import-1.pem -import -pkcs12File Cert-Import-1.pfx -des
2
3 convert ssl pkcs12 Cert-Client-1.pfx -export -certFile Cert-Client-1 -keyFile Key-Client-1
4 <!--NeedCopy-->
```

## Convert the format of a certificate by using the GUI

1. Navigate to **Traffic Management > SSL** and, in the **Tools** group, select **Import PKCS#12**.

2. Specify the PEM certificate name in the **Output File Name** field.
3. Browse to the location of the PFX certificate on your local computer or the appliance.

4. Click **OK**.
5. Click **Manage Certificates / Keys / CSRs** to view the converted PEM file.

6. You can view the uploaded PFX file and the converted PEM file.

<input type="checkbox"/>	letrsa.pem	File	Mon Mar 30 12:44:01 2020	Mon Mar 30 12:44:11 2020
<input type="checkbox"/>	mycert.pem	File	Mon Mar 30 15:14:28 2020	Mon Mar 30 15:14:28 2020

7. Navigate to **SSL > Certificates > Server Certificates** and click **Install**.
8. Specify a **Certificate-Key Pair Name**.
9. Browse to the location of the PEM file.
10. Specify the password when prompted.
11. Click **Install**.

**Install Server Certificate**

Certificate-Key Pair Name\*

12. Bind the certificate-key pair to an SSL virtual server.

## Bind an SSL certificate to a virtual server on the NetScaler appliance

December 28, 2023

An SSL certificate is an essential part of SSL encryption and decryption processes. The certificate is used during an SSL handshake to establish the identity of the SSL server, which is the NetScaler appliance as it acts as the SSL termination point for the clients.

The certificate used for processing the SSL transactions must be bound to the virtual server (SSL) that receives the SSL data.

## To bind an SSL certificate to an SSL virtual server using the command line interface

At the command prompt, type:

```
1 bind ssl vs <vServerName> -certKeyName <certificate-KeyPairName>
2 show ssl vs <vServerName>
3 <!--NeedCopy-->
```

### Example:

```
> bind ssl vs sslserver -certKeyName ssltestcert
Done
> show ssl vs sslserver

Advanced SSL configuration for VServer sslserver:
DH: DISABLED
DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA: ENABLED Refresh Count: 0
Session Resync: ENABLED Timeout: 120 seconds
Cipher Redirect: DISABLED
SSLV2 Redirect: DISABLED
ClearText Ports: 0
Client Auth: DISABLED
SSL Redirect: DISABLED
Non FIPS Ciphers: DISABLED
SNI: DISABLED
SSLV2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.1: ENABLED TLSv1.2: ENABLED
Push Encryption Trigger: Always
Send Close-Notify: YES

ECC Curve: P_256, P_384, P_224, P_521

1) CertKey Name: ssltestcert Server Certificate

1) Cipher Name: DEFAULT
Description: Predefined Cipher Alias

Done
```

## To bind an SSL certificate to an SSL virtual server using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Select a virtual server of type SSL and click **Edit**.
3. In the **Load Balancing Virtual Server** page, under the **Certificates** section, click **No Server Certificate**.

4. In the **Server Certificate Binding** page, click **Click to select**.
5. Select the SSL certificate and click **Select**.
6. Click **Bind** to bind the SSL certificate to the virtual server.
7. Click **Done**.

You have completed binding the SSL certificate to the virtual server.

### Note

When you try to bind a certificate-key pair to a virtual server that already has a certificate-key pair bound to it, NetScaler unbinds the old certkey and binds the new one. The following message appears:

**Warning:** Current certificate replaces the previous binding

Existing connections where the handshake is complete are not affected. The other connections are terminated.

## SSL profiles

May 2, 2023

You can use an SSL profile to specify how a NetScaler appliance processes SSL traffic. A profile is a collection of SSL parameter settings for SSL entities, such as virtual servers, services, and service groups, and offers ease of configuration and flexibility. You are not limited to configuring only one set of global parameters.

You can create multiple sets (profiles) of global parameters and assign different sets to different SSL entities. SSL profiles are classified into two categories:

- **Front-end profiles:** Contain parameters applicable to the front-end entity (entity that receives requests from a client).
- **Back-end profiles:** Contain parameters applicable to the back-end entity (entity that sends client requests to a server).

Unlike a TCP or HTTP profile, an SSL profile is optional. Once SSL profiles are enabled, all the SSL endpoints inherit the default profiles. The same profile can be reused across multiples entities. If an entity does not have a profile attached, the values set at the global level apply. For dynamically learned services, current global values apply.

Compared to the alternate way that requires configuration of SSL parameters, ciphers, and ECC curves on individual SSL endpoints, SSL profiles on the NetScaler appliance simplify configuration management by acting as a single point of SSL configuration for all related endpoints. Using SSL profiles, you can resolve configuration issues related to cipher reordering and downtime when ciphers are re-ordered.

SSL profiles help in setting required SSL parameters and cipher bindings on those SSL endpoints on which traditionally one cannot set these parameters and bindings. SSL profiles can also be set on secure monitors.

The SSL profile infrastructure has been enhanced to use the latest ciphers and protocols. Differences between the legacy profile (old profile) and the enhanced SSL profile (new profile) are highlighted.

### Differences between the old and the new SSL profile infrastructure

Differences	Old Profile	New Profile
Ciphers and ECC Curves included in the profile	No	Yes
Inserting a cipher or cipher group in the middle of an existing list	Unbind all the ciphers and bind again in the order of the required priority.	Add a cipher and assign it a priority. If a priority is not specified, the cipher is assigned the lowest priority in the list.
Unbinding all the ciphers	<code>unbind ssl vserver &lt;name&gt; ciphername -ALL</code>	<code>unbind ssl profile -cipherName FlushAllCiphers</code> (Release 12.1 and later include the <code>FlushAllCiphers</code> parameter for unbinding all the ciphers or cipher groups from a profile, because ALL is treated like a cipher group.)
State of SSLv3	n/a	Disabled on the default front-end profile ( <code>ns_default_ssl_profile_frontend</code> ). Note: Before you enable this profile, SSLv3 is enabled globally. After you enable the profile, SSLv3 is disabled on the front-end default profile.

## SSL profile infrastructure

December 29, 2023

Vulnerabilities in SSLv3 and RC4 implementation have emphasized the need to use the latest ciphers and protocols to negotiate the security settings for a network connection. Implementing any changes to the configuration, such as disabling SSLv3 across thousands of SSL end points, is a cumbersome process. Therefore, settings that were part of the SSL end points configuration have been moved to the SSL profiles, along with the default ciphers. To implement changes in the configuration, including cipher support, you need only modify the profile that is bound to the entities.

The default front-end and default back-end SSL profiles contain all the default ciphers and ECC curves, in addition to the settings that were part of the old profiles. Sample outputs for the default profiles are provided in the appendix. The Enable Default Profile operation automatically binds the default front-end profile to all front-end entities, and the default back-end profile to all back-end entities. You can modify a default profile to suit your deployment. You can also create custom profiles and bind them to SSL entities.

The front-end profile contains parameters applicable to a front-end entity (the entity that receives requests from a client). Typically, this entity is an SSL virtual server, transparent SSL service, or internal services on the NetScaler appliance. The back-end profile contains parameters applicable to a back-end entity (entity on the ADC appliance that sends client requests to a back-end server). Typically, this entity is an SSL service or service group on the NetScaler appliance. If you try to configure an unsupported parameter, the error `ERROR: Specified parameters are not applicable for this type of SSL profile` appears. Some SSL parameters, such as CRL memory size, OCSP cache size, UndefAction Control, and UndefAction Data, are not part of any profile, because these parameters are independent of entities. These parameters are present in **Traffic Management > SSL > Advanced SSL Settings**. For information about SSL parameters supported on a secure monitor, see [Set SSL parameters on a secure monitor](#).

An SSL profile supports the following operations:

- **Add:** Creates an SSL profile on the NetScaler appliance. Specify whether the profile is front end or back end. Default is front end.
- **Set:** —Modifies the settings of an existing profile.
- **Unset:** Sets the specified parameters to their default values. If you do not specify any parameters, an error message appears. If you unset a profile on an entity, the profile is unbound from the entity.
- **Remove:** Deletes a profile. A profile that is being used by any entity cannot be deleted. Clearing the configuration deletes all the entities. As a result, the profiles are also deleted.
- **Bind:** Binds a profile to an SSL entity.
- **Unbind:** Unbinds a profile from an SSL entity.
- **Show:** Displays all the profiles that are available on the NetScaler appliance. If a profile name is specified, the details of that profile are displayed. If an entity is specified, the profiles associated with that entity are displayed.

#### **Important:**

- An SSL profile takes precedence over SSL parameters. That is, if you configure SSL parameters using the `set ssl parameter` command, and later bind a profile to an SSL entity, the settings in the profile take precedence.
- After the upgrade, if you enable the default profiles, you cannot undo the changes. That

is, the profiles cannot be disabled. Save the configuration and create a copy of the configuration file (ns.conf) before enabling the profiles. However, if you do not want to use the features in the default profile, you can continue to use the old SSL profiles. For more information about these profiles, see [Legacy SSL profile](#).

- In the GUI and CLI, a confirmation prompt is added when you enable the default profile to prevent enabling it by mistake.

Protocols lower than TLSv1.2 are disabled on the SSL internal services. If the default (enhanced) profile is enabled, then the `ns_default_ssl_profile_internal_frontend_service` profile is bound to the SSL internal services and SSLv3, TLSv1.0, and TLSv1.1 protocols are disabled in the profile.

**Command:**

```
1 set ssl parameter -defaultProfile ENABLED
2 Save your configuration before enabling the Default profile. You
 cannot undo the changes. Are you sure you want to enable the
 Default profile? [Y/N]Y
3 Done
4 <!--NeedCopy-->
```

By default, some SSL parameters, called *global parameters*, apply to all the SSL end points. However, if a profile is bound to an SSL end point, the global parameters do not apply. The settings specified in the profile apply instead.

**Points to note**

1. A profile can be bound to multiple virtual servers, but a virtual server can have only one profile bound to it.
2. To delete a profile that is bound to a virtual server, first unbind the profile.
3. A cipher or cipher group can be bound to multiple profiles at different priorities.
4. A profile can have multiple ciphers and cipher groups bound at different priorities.
5. Changes to a cipher group are immediately reflected in all the profiles and in all the virtual servers that one of the profiles is bound to.
6. If a cipher suite is part of a cipher group, edit the cipher group to remove that cipher suite before removing the cipher suite from the profile.
7. If you do not assign a priority to a cipher suite or cipher group attached to a profile, it is assigned the lowest priority within the profile.
8. You can create a custom cipher group (also called a user-defined cipher group) from existing cipher groups and cipher suites. If you create cipher group A and add existing cipher groups X and Y to it, in that order, Y is assigned at a lower priority than X. That is, the group that is added first has a higher priority.

9. If a cipher suite is part of two cipher groups attached to the same profile, the cipher suite is not added as part of the second cipher group. The cipher suite at the higher priority is in effect when traffic is processed.
10. Cipher groups are not expanded in the profile. As a result, the number of lines in the configuration file (ns.conf) is greatly reduced. For example, if two cipher groups containing 15 ciphers each are bound to a thousand SSL virtual servers, expansion adds 30\*1000 cipher-related entries in the configuration file. With the new profile, it would have only two entries: one for each cipher group that is bound to a profile.
11. Creating a user-defined cipher group from existing ciphers and cipher groups is a copy-paste operation. Any changes in the original group are not reflected in the new group.
12. A user-defined cipher group lists all the profiles that it is a part of.
13. A profile lists all the SSL virtual server, services, and service groups that it is bound to.
14. If the default SSL profile feature is enabled, use the profile to set or change any of the attributes of an SSL entity. For example, virtual server, service, service group, or an internal service.

### Save the configuration by using the CLI

At the command prompt, type:

```
1 save config
2
3 shell
4
5 root@ns# cd /nsconfig
6
7 root@ns# cp ns.conf ns.conf.NS<currentreleasenum><currentbuildnumber>
8 <!--NeedCopy-->
```

#### Example:

```
1 save config
2 shell
3 root@ns# cd /nsconfig
4 root@ns# cp ns.conf ns.conf.NS.11.0.jun.16
5 <!--NeedCopy-->
```

### Enable the default profile

#### Important:

- Save your configuration before you upgrade the software and enable the default profiles.
- From release 11.1 build 51.x, in the GUI and CLI, a confirmation prompt appears when you

enable the default profile to avoid enabling it by mistake.

**Command:** The following command enables the default profile and binds this profile to the SSL entities to which a profile is already bound. That is, if a profile (for example P1) is already bound to an SSL entity, the default front-end profile or the default back-end profile replaces P1. The older profile (P1) is not deleted. It is now an enhanced SSL profile and contains the earlier settings, and the ciphers and ECC curves. If you do not want the default profile, you can explicitly bind P1 to the SSL entity.

```
1 set ssl parameter -defaultProfile ENABLED
2 Save your configuration before enabling the Default profile. You
 cannot undo the changes. Are you sure you want to enable the
 Default profile? [Y/N]Y
3 Done
4 <!--NeedCopy-->
```

Upgrade the software to a build that supports the enhanced profile infrastructure, and then enable the default profiles.

#### Notes:

- If a legacy profile (P1) is already bound to an SSL entity, and you enable the default profile, the default profile overrides the earlier binding. That is, the default profile is bound to the SSL entities. If you do not want the default profile to be bound, you must bind P1 to the SSL entity again.
- A single operation (Enable Default Profile or `set ssl parameter -defaultProfile ENABLED`) enables (binds) both the default front-end profile and the default back-end profile.

## Parameters that are part of the default profiles

Run the following commands to list the parameters that are part of the default front-end and back-end profiles.

```
1 sh ssl profile ns_default_ssl_profile_frontend
2 sh ssl profile ns_default_ssl_profile_backend
3 <!--NeedCopy-->
```

#### Example:

```
1 > sh ssl profile ns_default_ssl_profile_frontend
2 1) Name: ns_default_ssl_profile_frontend (Front-End)
3 SSLv3: DISABLED TLSv1.0: ENABLED TLSv1.1: ENABLED TLSv1.2:
 ENABLED TLSv1.3: DISABLED
4 Client Auth: DISABLED
5 Use only bound CA certificates: DISABLED
6 Strict CA checks: NO
```

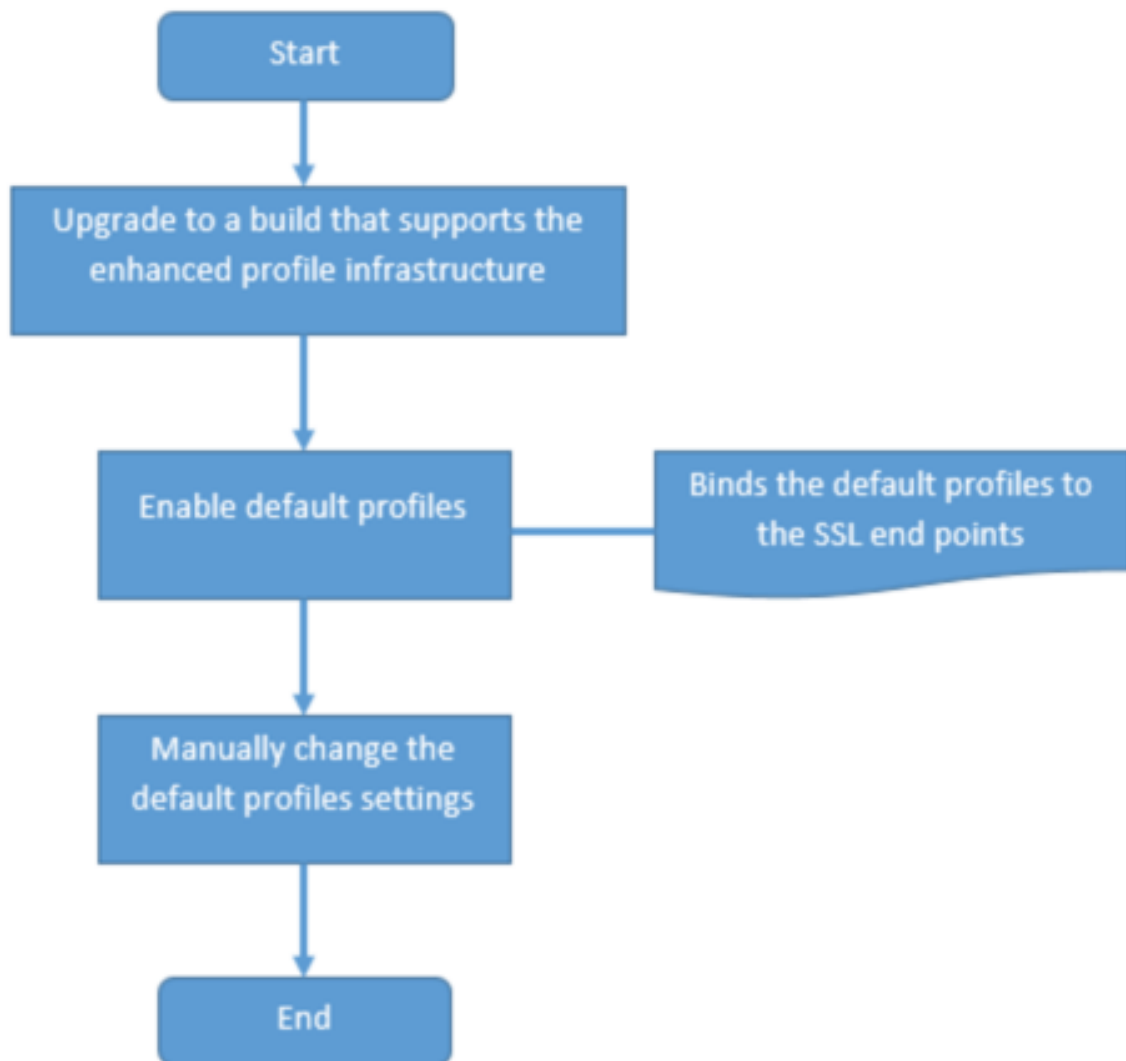

```
7 Session Reuse: ENABLED Timeout: 120 seconds
8 DH: DISABLED
9 DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA:

78
79 1) Cipher Name: DEFAULT_BACKEND Priority :1
80 Description: Predefined Cipher Alias
81 Done
82 <!--NeedCopy-->
```

## Use case

After you enable the default profiles, they are bound to all the SSL end points. The default profiles are editable. If your deployment uses most of the default settings and changes only a few parameters, you can edit the default profiles. The changes are immediately reflected across all the end points. You can also create custom SSL profiles with some custom and some default parameters and bind it to the SSL entities.

The following flowchart explains the steps that you must perform:

1. For information about upgrading the software, see [Upgrading the System Software](#).
2. Enable the default profiles by using the CLI or GUI.
  - At the command line, type: `set ssl parameter -defaultProfile ENABLED`
  - If you prefer to use the GUI, navigate to **Traffic Management > SSL > Change advanced SSL settings**, scroll down, and select **Enable Default Profile**.

If a profile was not bound to an end point before the upgrade, a default profile is bound to the SSL end point. If a profile was bound to an end point before the upgrade, the same profile is bound after the upgrade, and default ciphers are added to the profile.

1. (Optional) Manually change any settings in the default profile.
  - At the command line, type: `set ssl profile <name>` followed by the parameters

to modify.

- If you prefer to use the GUI, navigate to **System > Profiles**. In **SSL Profiles**, select a profile and click **Edit**.

## SSL profile parameters

You can set the following SSL parameters in an SSL profile. You can set some of these parameters in an SSL virtual server. For more information about SSL virtual server parameters, see [SSL virtual server parameters](#).

## Support for secure renegotiation at the back end of a NetScaler appliance

This feature is supported on the following platforms:

- VPX
- MPX platforms containing N2 or N3 chips
- Intel Coletto SSL chip based platforms

This feature is not yet supported on the FIPS platform.

Secure renegotiation is denied by default on the back end of an ADC appliance. That is, the `denySSLReneg` parameter is set to ALL (default).

To allow secure renegotiation on the back end, select from one of the following settings for the `denySSLReneg` parameter:

- NO
- FRONTEND\_CLIENT
- FRONTEND\_CLIENTSERVER
- NONSECURE

## Enable secure renegotiation by using the CLI

At the command prompt, type:

```
set ssl profile <name> -denySSLReneg <denySSLReneg>
```

### Example:

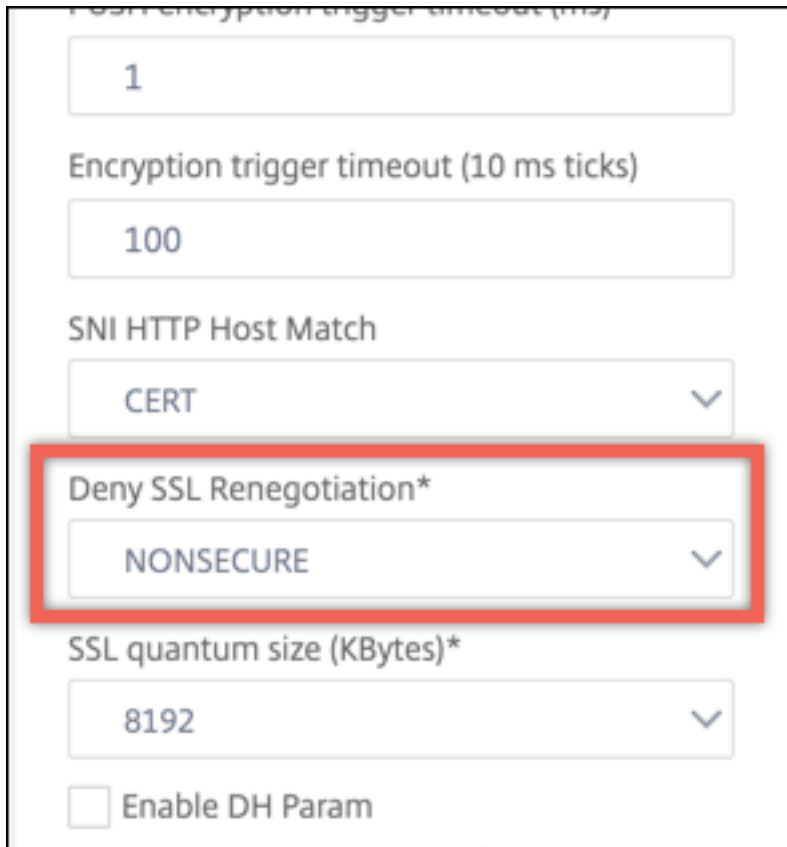

```
1 set ssl profile ns_default_ssl_profile_backend -denySSLReneg NONSECURE
2 Done
3
4 sh ssl profile ns_default_ssl_profile_backend
5 1) Name: ns_default_ssl_profile_backend (Back-End)
```

```
6 SSLv3: DISABLED TLSv1.0: ENABLED TLSv1.1: ENABLED TLSv1.2:
 ENABLED TLSv1.3: DISABLED
7 Server Auth: DISABLED
8 Use only bound CA certificates: DISABLED
9 Strict CA checks: NO
10 Session Reuse: ENABLED Timeout: 300 seconds
11 DH: DISABLED
12 Ephemeral RSA: DISABLED
13 Deny SSL Renegotiation NONSECURE
14 Non FIPS Ciphers: DISABLED
15 Cipher Redirect: DISABLED
16 SSL Redirect: DISABLED
17 Send Close-Notify: YES
18 Strict Sig-Digest Check: DISABLED
19 Push Encryption Trigger: Always
20 PUSH encryption trigger timeout: 1 ms
21 SNI: DISABLED
22 OCSP Stapling: DISABLED
23 Strict Host Header check for SNI enabled SSL sessions: NO
24 Push flag: 0x0 (Auto)

Enable DH Param

## Host header validation

**Note:** This parameter is introduced in release 13.0 build 52.x.

With HTTP/1.1, clients had to use multiple connections to process multiple requests. With HTTP/2, clients can reuse connections across domains that are covered by the same certificate. For an SNI enabled session, the ADC appliance must be able to control how the HTTP host header is validated to accommodate this change. In earlier builds, the request was dropped if the parameter was enabled (set to “Yes”) and the request did not contain the host header for an SNI enabled session. If the parameter was disabled (set to “No”), the appliance did not perform the validation. A new parameter [SNIHTTPHostMatch](#) is added to an SSL profile and SSL global parameters to have better control on this validation. This parameter can take three values; CERT, STRICT, and NONE. These values work as follows for SNI enabled sessions only. SNI must be enabled on the SSL virtual server or the profile bound to the virtual server, and the HTTP request must contain the host header.

- CERT - Connection is forwarded if the host header value in the request is covered by the certificate used to establish this SSL session.
- STRICT - Connection is forwarded only if the host header value in the request matches the server name value passed in the Client Hello message of the SSL connection.
- NO - The host header value is not validated.

Possible values: NO, CERT, STRICT

Default value: CERT

With the introduction of the new parameter `SNIHTTPHostMatch` there is a change in the behavior of the `dropReqWithNoHostHeader` parameter. The setting of the `dropReqWithNoHostHeader` parameter no longer affects how the host header is validated against the SNI certificate.

## Set SSL profile parameters by using the CLI

At the command prompt, type:

```

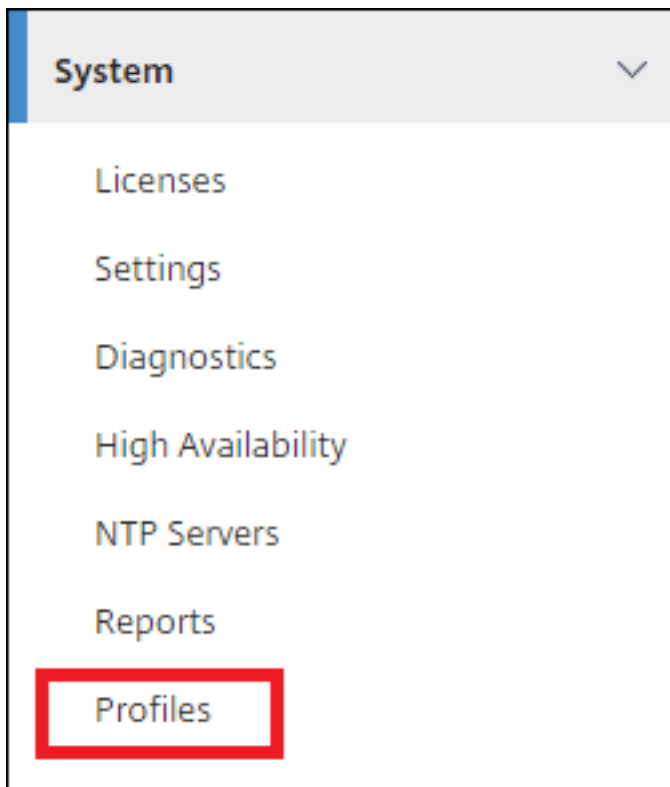

1 set ssl profile <name> [-ssllogProfile <string>] [-dh (ENABLED |
 DISABLED) -dhFile <string>] [-dhCount <positive_integer>][-
 dhKeyExpSizeLimit (ENABLED | DISABLED)] [-eRSA (ENABLED |

4. Click **OK**.

5. Click **Done**.

To reuse an existing SSL profile:

1. Navigate to **System > Profiles**.
2. Select an existing profile and click **Add**.
3. Specify a different name, change any parameters, and click **OK**.

4. Click **Done**.

### TLS session ticket extension

An SSL handshake is a CPU-intensive operation. If session reuse is enabled, the server/client key exchange operation is skipped for existing clients. They are allowed to resume their sessions. This action improves the response time and increases the number of SSL transactions per second that a server can support. However, the server must store details of each session state, which consumes memory and is difficult to share among multiple servers if requests are load balanced across servers.

NetScaler appliances support the SessionTicket TLS extension. Use of this extension indicates that the session details are stored on the client instead of on the server. The client must indicate that it supports this mechanism by including the session ticket TLS extension in the client Hello message. For new clients, this extension is empty. The server sends a new session ticket in the NewSessionTicket handshake message. The session ticket is encrypted by using a key-pair known only to the server. If a server cannot issue a new ticket now, it completes a regular handshake.

This feature is available only in front-end SSL profiles, and only at the front end of communication in which the appliance acts as a server and generates session tickets.

### Limitations

- This feature is not supported on a FIPS platform.
- This feature is supported only with TLS versions 1.1 and 1.2.
- SSL session ID persistency is not supported with session tickets.

### Enable TLS session ticket extension by using the CLI

At the command prompt, type:

```
1 set ssl profile <name> -sessionTicket (ENABLED | DISABLED) [-
 sessionTicketLifeTime <positive_integer>
2 <!--NeedCopy-->
```

### Arguments:

**sessionTicket:** State of TLS session ticket extension. Use of this extension indicates that the session details are stored on the client instead of on the server, as defined in RFC 5077.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**sessionTicketLifeTime:** Specify a time, in seconds, after which the session ticket expires and a new SSL handshake must be initiated.

Default value: 300

Minimum value: 0

Maximum value: 172800

**Example:**

```
1 add ssl profile profile1 -sessionTicket ENABLED -sessionTicketlifeTime
 300
2 Done
3 <!--NeedCopy-->
```

### Enable TLS session ticket extension by using the GUI

1. Navigate to **System > Profiles**. Select **SSL Profiles**.
2. Click **Add** and specify a name for the profile.
3. Select **Session ticket**.
4. Optionally, specify **Session Ticket Lifetime (secs)**.

### Secure implementation of session tickets

By using TLS session tickets, clients can use abbreviated handshakes for faster reconnection to servers. However, if session tickets aren't encrypted or changed for long periods of time, they can pose a security risk. You can secure session tickets by encrypting them with a symmetric key. To achieve forward secrecy, you can specify a time interval at which the session-ticket key is refreshed.

The appliance generates the session ticket keys by default. However, if multiple appliances in a deployment need to decrypt each other's session tickets, they must all use the same session-ticket key. Therefore, you must set (add or load) the same session-ticket key data manually on all the appliances. Session-ticket key data includes the following information:

- Session ticket name.
- Session AES key used to encrypt or decrypt the ticket.
- Session HMAC key used to compute the digest of the ticket.

You can now configure session ticket key data of length 64 bytes to support 256-bit HMAC keys as recommended in RFC 5077. Key lengths of 48 bytes are also supported for backward compatibility.

**Note:**

While typing the session-ticket key data manually, ensure that the configuration across all the

NetScaler appliances in an HA setup or in a cluster setup is the same.

The `sessionTicketKeyLifeTime` parameter specifies how often a session-ticket key is refreshed. You can set the `prevSessionTicketKeyLifeTime` parameter to specify how long the previous session-ticket key will be maintained for decrypting tickets using that key, after a new key is generated. The `prevSessionTicketKeyLifeTime` setting extends the time for which a client can use an abbreviated handshake to reconnect. For example, if `sessionTicketKeyLifeTime` is set to 10 minutes and `prevSessionTicketKeyLifeTime` to 5 minutes, a new key is generated after 10 minutes and used for all new sessions. However, previously connected clients have another 5 minutes for which previously issued tickets are honored for an abbreviated handshake.

### Configure SSL session-ticket data by using the CLI

At the command prompt, type:

```
1 set ssl profile <name> -sessionTicket ENABLED -sessionTicketLifeTime <
 positive_integer> -sessionTicketKeyRefresh (ENABLED | DISABLED)] -
 sessionTicketKeyLifeTime <positive_integer> [-
 prevSessionTicketKeyLifeTime <positive_integer>]
2 <!--NeedCopy-->
```

#### Arguments:

**sessionTicket:** Use session tickets as described by RFC 5077. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the **ENABLED** setting, a server issues a session ticket to a client, which the client can use to perform an abbreviated handshake.

Possible values: ENABLED, DISABLED. Default: DISABLED

**sessionTicketLifeTime:** Lifetime, in seconds, of the session ticket. After this time expires, clients cannot use this ticket to resume their sessions.

Maximum value: 172800. Minimum value: 0. Default: 300.

**sessionTicketKeyRefresh:** When the time specified by the session-ticket key lifetime parameter expires, regenerate the session-ticket key used to encrypt or decrypt the session tickets. Automatically enabled if sessionTicket is enabled. Disabled if an administrator enters the session-ticket data.

Possible values: ENABLED, DISABLED. Default: ENABLED

**sessionKeyLifeTime:** Lifetime, in seconds, of a symmetric key used to encrypt the session tickets issued by a NetScaler appliance.

Maximum value: 86400. Minimum value: 600. Default: 3000

**prevSessionKeyLifeTime:** Time, in seconds, for which the previous symmetric key used to encrypt session tickets remains valid for existing clients after the session-ticket key lifetime expires. Within

this time, existing clients can resume their sessions by using the previous session ticket key. Session tickets for new clients are encrypted by using the new key.

Maximum value: 172800. Minimum value: 0. Default: 0

**Example:**

```
1 set ssl profile ns_default_ssl_profile_frontend -sessionTicket ENABLED
 -sessionTicketLifeTime 120 -sessionTicketKeyRefresh ENABLED -
 sessionTicketKeyLifeTime 100 -prevSessionTicketKeyLifeTime 60
2
3 Done
4
5 show ssl profile ns_default_ssl_profile_frontend
6
7 Session Ticket: ENABLED
8 Session Ticket Lifetime: 120 (secs)
9 Session Key Auto Refresh: ENABLED
10 Session Key Lifetime: 100 (secs)
11 Previous Session Key Lifetime: 60 (secs)
12 <!--NeedCopy-->
```

**Configure SSL session-ticket data by using the GUI**

1. Navigate to **System > Profiles**, and select **SSL Profile**.
2. Select **ns\_default\_ssl\_profile\_frontend** and click **Edit**.
3. In the **Basic Settings** section, click the pencil icon and set the following parameters:
  - Session Ticket
  - Session Ticket Lifetime (secs)
  - Session Ticket Key Auto Refresh
  - Session Ticket Key Lifetime (secs)
  - Previous Session Ticket Key Lifetime (secs)
4. Click **OK**.

**Type SSL session ticket data manually by using the CLI**

At the command prompt, type:

```
1 set ssl profile <name> -sessionTicket ENABLED
2
3 set ssl profile <name> -sessionTicketKeyData
4
5 show ssl profile ns_default_ssl_profile_frontend
6 <!--NeedCopy-->
```

**Arguments:**

**sessionTicket:** Use of session tickets as described by RFC 5077. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the **ENABLED** setting, a server issues a session ticket to a client, which the client can use to perform an abbreviated handshake.

Possible values: ENABLED, DISABLED. Default: DISABLED

**sessionTicketKeyData:** Contains the session ticket name (0–15 bytes), the session AES key used to encrypt or decrypt the session ticket (16–31 bytes), and the session HMAC key used to compute the digest of the ticket (32–63 bytes). Externally generated by an administrator and added to a NetScaler appliance.

Maximum length: 64 bytes

**Example:**

```
1 set ssl profile ns_default_ssl_profile_frontend -sessionTicket ENABLED
2
3 Done
4
5 set ssl profile ns_default_ssl_profile_frontend -sessionTicketKeyData
 11
6

### Type SSL session ticket data manually by using the GUI

1. Navigate to **System > Profiles**, and select **SSL Profile**.
2. Select **ns\_default\_ssl\_profile\_frontend** and click **Edit**.
3. In the **Basic Settings** section, click the pencil icon and set the following parameters:
  - Session Ticket
  - Session Ticket Key Data
  - Confirm Session Ticket Key Data
4. Click **OK**.

### Support for Extended Master Secret in SSL handshake on NetScaler non-FIPS platforms

Extended Master Secret (EMS) is an optional extension to the Transport Layer Security (TLS) protocol. A new parameter is added that applies to both front-end and back-end SSL profiles to support EMS on

the NetScaler appliance. If the parameter is enabled and the peer supports EMS, the ADC appliance uses the EMS calculation. If the peer does not support EMS, then the EMS calculation is not used for the connection even though the parameter is enabled on the appliance. For more information about EMS, see RFC 7627.

**Note:** EMS is only applicable for handshakes that use TLS protocol version 1.0, 1.1, or 1.2.

### Platform support for EMS

- MPX and SDX platforms containing either Cavium N3 chips or Intel Coletto Creek crypto cards. The following platforms ship with Intel Coletto chips:
  - MPX 5900
  - MPX/SDX 8900
  - MPX/SDX 26000
  - MPX/SDX 26000-50S
  - MPS/SDX 26000-100G
  - MPX/SDX 15000-50G

You can also use the `show hardware` command to identify whether your appliance has Coletto (COL) or N3 chips.

- MPX and SDX platforms without crypto cards (software-only).
- Software-only platforms: VPX, CPX, and BLX.

EMS cannot be enabled on the following platforms:

- MPX 9700 FIPS and MPX 14000 FIPS platforms.
- MPX and SDX platforms containing Cavium N2 crypto chips.

If the parameter is enabled, the ADC appliance attempts to use EMS in TLS 1.2, TLS 1.1, and TLS 1.0 connections. The setting does not affect TLS 1.3 or SSLv3 connections.

To allow EMS to be negotiated with the peer, enable the setting on the SSL profile bound to the virtual server (front end) or service (back end).

### Enable EMS using the CLI

At the command prompt, type:

```
set ssl profile <profile name> [-allowExtendedMasterSecret (YES | NO)]
```

Examples

```

1 set ssl profile ns_default_ssl_profile_frontend -
 allowExtendedMasterSecret YES
2
3 set ssl profile ns_default_ssl_profile_backend -
 allowExtendedMasterSecret YES
4 <!--NeedCopy-->

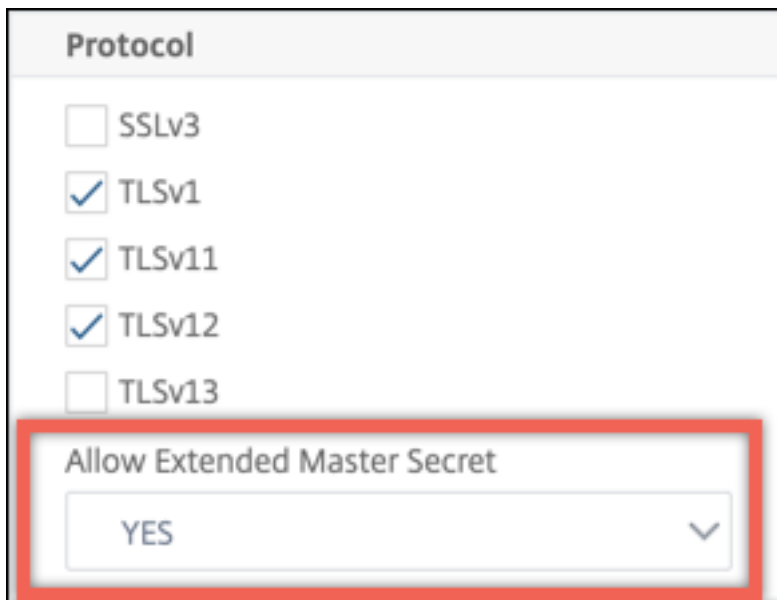

```

The following table shows the default value of the `allowExtendedMasterSecret` parameter on different default and user-defined profiles.

Profile	Default setting
Default front-end profile	NO
Default front-end secure profile	YES
Default back-end profile	NO
User-defined profile	NO

### Enable EMS using the GUI

1. Navigate to **System > Profiles > SSL Profile**.
2. Add a profile or edit a profile.
3. Set **Allow Extended Master Secret** to YES.

## Support for processing of ALPN extension in the client hello message

A parameter `alpnProtocol` is added to the front-end SSL profiles to negotiate the application protocol in the ALPN extension for the connections handled by the SSL\_TCP virtual server. Only the protocol specified in the SSL profile is negotiated, if the same protocol is received in the ALPN extension of the client hello message.

**Note:** The `alpnProtocol` parameter is supported only on front end SSL profiles and is applicable to the SSL connections handled by SSL\_TCP type virtual servers.

### Set the protocol in the front-end SSL profile using the CLI

At the command prompt, type:

```
set ssl profile ns_default_ssl_profile_frontend -alpnProtocol <
protocol_name>
```

The `alpnProtocol` parameter can take three values. Maximum length: 4096 bytes.

- **NONE:** Application protocol negotiation does not take place. This setting is the default.
- **HTTP1:** HTTP1 can be negotiated as the application protocol.
- **HTTP2:** HTTP2 can be negotiated as the application protocol.

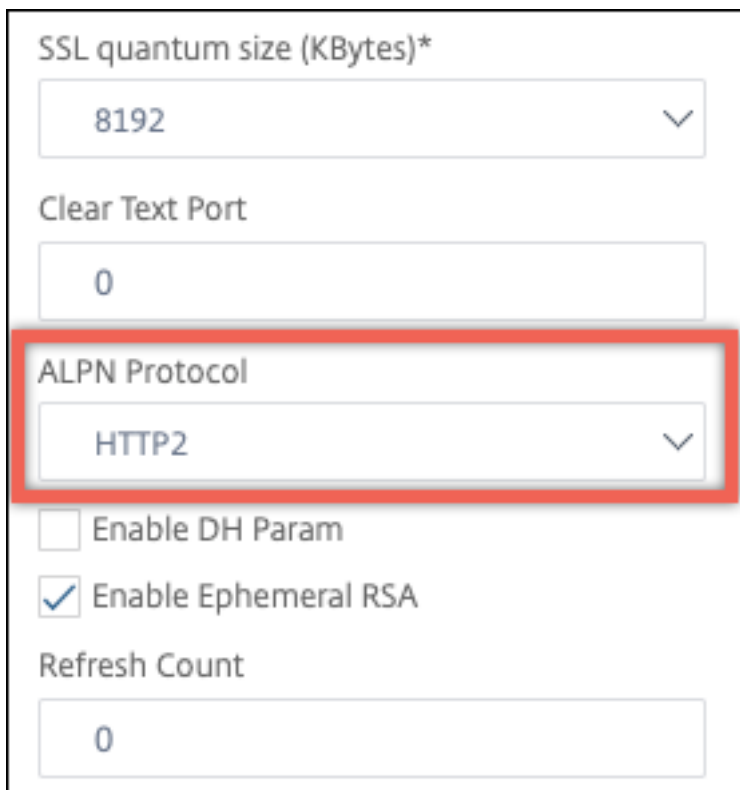

### Example:

```
1 set ssl profile ns_default_ssl_profile_frontend -ALPNProtocol HTTP2
2 > sh ssl profile ns_default_ssl_profile_frontend
3 1) Name: ns_default_ssl_profile_frontend (Front-End)
4 SSLv3: DISABLED TLSv1.0: ENABLED TLSv1.1: ENABLED TLSv1.2:
5 ENABLED TLSv1.3: DISABLED
6 Client Auth: DISABLED
7 Use only bound CA certificates: DISABLED
8 Strict CA checks: NO
9 Session Reuse: ENABLED Timeout: 120 seconds
10 DH: DISABLED
11 DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA:
12 ENABLED Refresh Count: 0
13 Deny SSL Renegotiation ALL
14 Non FIPS Ciphers: DISABLED
15 Cipher Redirect: DISABLED
16 SSL Redirect: DISABLED
17 Send Close-Notify: YES
18 Strict Sig-Digest Check: DISABLED
19 Zero RTT Early Data: DISABLED
20 DHE Key Exchange With PSK: NO
21 Tickets Per Authentication Context: 1
22 Push Encryption Trigger: Always
23 PUSH encryption trigger timeout: 1 ms
24 SNI: DISABLED
```

```
23 OCSP Stapling: DISABLED
24 Strict Host Header check for SNI enabled SSL sessions: NO
25 Match HTTP Host header with SNI: CERT
26 Push flag: 0x0 (Auto)
27 SSL quantum size: 8 kB
28 Encryption trigger timeout 100 mS
29 Encryption trigger packet count: 45
30 Subject/Issuer Name Insertion Format: Unicode
31
32 SSL Interception: DISABLED
33 SSL Interception OCSP Check: ENABLED
34 SSL Interception End to End Renegotiation: ENABLED
35 SSL Interception Maximum Reuse Sessions per Server: 10
36 Session Ticket: DISABLED
37 HSTS: DISABLED
38 HSTS IncludeSubDomains: NO
39 HSTS Max-Age: 0
40 HSTS Preload: NO
41 Allow Extended Master Secret: NO
42 Send ALPN Protocol: HTTP2
43
44 Done
45 <!--NeedCopy-->
```

### Set the protocol in the front-end SSL profile using the GUI

1. Navigate to **System > Profiles**, and select **SSL Profile**.
2. Select **ns\_default\_ssl\_profile\_frontend** and click **Edit**.
3. In the **ALPN Protocol** list, select **HTTP2**.

SSL quantum size (KBytes)\*

### Load an old configuration

Enabling the default profiles is not reversible. However, if you decide that your deployment does not require the default profiles, you can load an older configuration that you saved before you enabled the default profiles. The changes are effective after you restart the appliance.

### Load an old configuration by using the CLI

At the command prompt, type:

```
1 shell
2
3 root@ns# clear config
4
5 root@ns# cd /nsconfig
6
7 root@ns# cp ns.conf.NS.11.0.jun.16 ns.conf
8
9 root@ns# reboot
10 <!--NeedCopy-->
```

## Rate limiting SSL renegotiations

When SSL renegotiation is enabled, there is no limit to the number of renegotiation requests. As a result, the NetScaler is susceptible to DoS attacks that can ultimately cause the NetScaler to stop processing SSL traffic completely. The parameter `maxRenegRate` is introduced in the SSL profile to mitigate this issue by limiting the number of renegotiation requests received in one second on an SSL entity.

This parameter is configurable only when `denySSLReneg` is not set to ALL. When `maxRenegRate` is set to zero, rate limiting is disabled (default setting). When it is set to an integer value between 1 and 65535, rate limiting is enabled and the maximum number of renegotiation requests per second to each entity bound to the SSL profile are limited to this integer value. For example, if you set the `maxRenegRate` parameter to 100 in the SSL profile `ssl-profile-1`, and this profile is bound to two virtual servers v1 and v2, then v1 has a limit of 100 and v2 has a limit of 100 renegotiation requests.

Note:

This feature is not supported with the DTLS protocol.

### To add the limit while creating an SSL profile using the CLI

At the command prompt, type:

```
add ssl profile pf1 -denySSLReneg (NO | FRONTEND_CLIENT | FRONTEND_CLIENTSERVER | NONSECURE)-maxRenegRate 100
```

### To set the limit on an existing SSL profile using the CLI

At the command prompt, type:

```
set ssl profile pf1 denySSLReneg (NO | FRONTEND_CLIENT | FRONTEND_CLIENTSERVER | NONSECURE)-maxRenegRate 100
```

#### Example

In the following commands “maxRenegRate” is set to 100. As a result, a maximum of 100 requests per second are allowed to all the entities to which the profile is bound.

```
set ssl profile pf1 denySSLReneg (NO | FRONTEND_CLIENT | FRONTEND_CLIENTSERVER | NONSECURE)-maxRenegRate 100
```

```
add ssl profile pf1 -denySSLReneg (NO | FRONTEND_CLIENT | FRONTEND_CLIENTSERVER | NONSECURE)-maxRenegRate 100
```

### To specify the limit using the GUI

1. Navigate to **System > Profiles > SSL Profile**.
2. Click **Add** to create a profile, or select an existing profile.
3. For a new profile, specify a name.
4. Set **Deny SSL Renegotiation** to any value other than **All**.
5. Specify the **Maximum Renegotiation Rate**.
6. Click **OK**.
7. Click **Done**.

## Secure front-end profile

February 1, 2021

In addition to a default front-end and a default back-end profile, a new default secure front-end profile is available from release 12.1. The settings required for an A+ rating (as of May 2018) from Qualys SSL Labs are preloaded into this profile. Earlier, you had to explicitly set each of the parameters required for an A+ rating on an SSL front-end profile or an SSL virtual server. Now you can bind the `ns_default_ssl_profile_secure_frontend` profile to your SSL virtual server and the required parameters are automatically set on your SSL virtual server.

**Note:**

The secure front-end profile is not editable.

When you enable the default profile, the default front-end profile is automatically bound to all the SSL virtual servers. To get an A+ rating, you must explicitly bind the `ns_default_ssl_profile_secure_frontend` profile and also bind an SHA2/SHA256 server certificate to your SSL virtual server.

### Secure front-end profile parameters

The parameters with their default settings are listed here:

```
1 SSLv3: DISABLED TLSv1.0: DISABLED TLSv1.1: DISABLED TLSv1.2: ENABLED
 TLSv1.3: DISABLED
2
3 Deny SSL Renegotiation: NONSECURE
4
5 HSTS: ENABLED
6
7 HSTS IncludeSubDomains: YES
8
```

```

9 HSTS Max-Age: 15552000
10
11 Cipher Name: SECURE Priority :1
12 <!--NeedCopy-->

```

## Secure cipher alias

A new secure cipher alias is added and bound to the secure front-end profile. To list the ciphers that are part of this alias, at the command prompt type: show cipher SECURE

```

1 show cipher SECURE
2
3 1) Cipher Name: TLS1.2-ECDHE-RSA-AES256-GCM-SHA384 Priority : 1
4 Description: TLSv1.2 Kx=ECC-DHE Au=RSA Enc=AES-GCM(256)
5 Mac=AEAD HexCode=0xc030
6 2) Cipher Name: TLS1.2-ECDHE-RSA-AES128-GCM-SHA256 Priority : 2
7 Description: TLSv1.2 Kx=ECC-DHE Au=RSA Enc=AES-GCM(128)

17 Done
18 <!--NeedCopy-->

```

## Configuration

Perform the following steps:

1. Add a load balancing virtual server of type SSL.
2. Bind a SHA2/SHA256 certificate.
3. Enable the default profile.
4. Bind the secure front-end profile to the SSL virtual server.

### Get an A+ rating for an SSL virtual server by using the CLI

At the command prompt, type:

```

1 add lb vserver <name> <serviceType> <IPAddress> <port>
2 bind ssl vserver <vServerName> -certkeyName <string>
3 set ssl parameter -defaultProfile ENABLED

```

```

4 set ssl vsriver <vServerName> -sslProfile
 ns_default_ssl_profile_secure_frontend
5 show ssl vsriver [<vServerName>]
6 <!--NeedCopy-->

```

**Example:**

```

1 add lb vsriver ssl-vsvr SSL 192.0.2.240 443
2
3 bind ssl vsriver ssl-vsvr -certkeyName letrsa
4
5 set ssl parameter -defaultProfile ENABLED
6
7 Save your configuration before enabling the Default profile. You cannot
 undo the changes. Are you sure you want to enable the Default
 profile? [Y/N]y
8
9 set ssl vsriver ssl-vsvr -sslProfile
 ns_default_ssl_profile_secure_frontend
10 <!--NeedCopy-->

```

```

1 sh ssl vsriver ssl-vsvr
2
3 Advanced SSL configuration for VServer ssl-vsvr:

```

## Legacy SSL profile

May 2, 2023

### Note:

Citrix recommends using the enhanced profiles instead of legacy profiles. For information about the enhanced profile infrastructure, see [SSL profile infrastructure](#).

### Important:

Bind an SSL profile to an SSL virtual server. Do not bind a DTLS profile to an SSL virtual server. For information about DTLS profiles, see [DTLS Profiles](#).

You can use an SSL profile to specify how a NetScaler processes SSL traffic. The profile is a collection of SSL parameter settings for SSL entities, such as virtual servers, services, and service groups, and offers ease of configuration and flexibility. You are not limited to configuring only one set of global parameters. You can create multiple sets (profiles) of global parameters and assign different sets to different SSL entities. SSL profiles are classified into two categories:

- Front end profiles, containing parameters applicable to the front-end entity. That is, they apply to the entity that receives requests from a client.
- Back-end profiles, containing parameters applicable to the back-end entity. That is, they apply to the entity that sends client requests to a server.

Unlike a TCP or HTTP profile, an SSL profile is optional. Therefore, there is no default SSL profile. The same profile can be reused across multiples entities. If an entity does not have a profile attached, the values set at the global level apply. For dynamically learned services, current global values apply.

The following table lists the parameters that are part of each profile.

Front end profile	Back-end profile
cipherRedirect, cipherURL	denySSLReneg
clearTextPort*	encryptTriggerPktCount
clientAuth, clientCert	nonFipsCiphers
denySSLReneg	pushEncTrigger
dh, dhFile, dhCount	pushEncTriggerTimeout
dropReqWithNoHostHeader	pushFlag
encryptTriggerPktCount	quantumSize
eRSA, eRSACount	serverAuth
insertionEncoding	commonName
nonFipsCiphers	sessReuse, sessTimeout
pushEncTrigger	<a href="#">SNIEnable</a>
pushEncTriggerTimeout	ssl3
pushFlag	sslTriggerTimeout
quantumSize	strictCAChecks
redirectPortRewrite	tls1
sendCloseNotify	-
sessReuse, sessTimeout	-
<a href="#">SNIEnable</a>	-
ssl3	-
sslRedirect	-
sslTriggerTimeout	-

Front end profile	Back-end profile
strictCAGhecks	-
tls1, tls11, tls12	-

\* The clearTextPort parameter applies only to an SSL virtual server.

An error message appears if you try to set a parameter that is not part of the profile. For example, if you try to set the clientAuth parameter in a back-end profile.

Some SSL parameters, such as CRL memory size, OCSP cache size, UndefinedAction Control, and UndefinedAction Data, are not part of any of the preceding profiles, because these parameters are independent of entities.

An SSL profile supports the following operations:

- **Add**—Creates an SSL profile on the NetScaler. Specify whether the profile is front end or back end. Front end is the default.
- **Set**—Modifies the settings of an existing profile.
- **Unset**—Sets the specified parameters to their default values. If you do not specify any parameters, an error message appears. If you unset a profile on an entity, the profile is unbound from the entity.
- **Remove**—Deletes a profile. A profile that is being used by any entity cannot be deleted. Clearing the configuration deletes all the entities. As a result, the profiles are also deleted.
- **Show**—Displays all the profiles that are available on the NetScaler. If a profile name is specified, the details of that profile are displayed. If an entity is specified, the profiles associated with that entity are displayed.

## Create an SSL profile by using the CLI

- To add an SSL profile, type:

```
1 add ssl profile <name> [-sslProfileType (BackEnd | FrontEnd)]
2 <!--NeedCopy-->
```

- To modify an existing profile, type:

```
1 set ssl profile <name>
2 <!--NeedCopy-->
```

- To unset an existing profile, type:

```
1 unset ssl profile <name> [-dh] [-dhFile] [-dhCount] [-eRSA]...
2 <!--NeedCopy-->
```

- To unset an existing profile from an entity, type:

```
1 unset ssl vserver <vServerName> - sslProfile
2 <!--NeedCopy-->
```

- To remove an existing profile, type:

```
1 rm ssl profile <name>
2 <!--NeedCopy-->
```

- To display an existing profile, type:

```
1 sh ssl profile <name>
2 <!--NeedCopy-->
```

### Create an SSL profile by using the GUI

Navigate to **System > Profiles**, select the SSL Profiles tab, and create an SSL profile.

### Enable stricter control on client certificate validation

The NetScaler appliance accepts valid Intermediate-CA certificates if a single Root-CA has issued them. That is, if only the Root-CA certificate is bound to the virtual server, and that Root-CA validates any of the intermediate certificates sent with the client certificate, the appliance trusts the certificate chain and the handshake is successful.

However, if a client sends a chain of certificates in the handshake, the intermediate certificates can be validated by using a CRL or OCSP responder only if that certificate is bound to the SSL virtual server. Therefore, even if one of the intermediate certificates is revoked, the handshake is successful. As part of the handshake, the SSL virtual server sends the list of CA certificates that are bound to it. For stricter control, you can configure the SSL virtual server to accept only a certificate that one of the CA certificates bound to that virtual server has signed. To do so, you must enable the [ClientAuthUseBoundCACChain](#) setting in the SSL profile bound to the virtual server. The handshake fails if one of the CA certificates bound to the virtual server has not signed the client certificate.

For example, say two client certificates, clientcert1 and clientcert2, are signed by the intermediate certificates Int-CA-A and Int-CA-B, respectively. The intermediate certificates are signed by the root certificate Root-CA. Int-CA-A and Root-CA are bound to the SSL virtual server. In the default case

(ClientAuthUseBoundCACChain disabled), both clientcert1 and clientcert2 are accepted. However, if ClientAuthUseBoundCACChain is enabled, the NetScaler appliance only accepts clientcert1.

### Enable stricter control on client certificate validation by using the CLI

At the command prompt, type: `set ssl profile <name> -ClientAuthUseBoundCACChain Enabled`

### Enable stricter control on client certificate validation by using the GUI

1. Navigate to **System > Profiles**, select the **SSL Profiles** tab, and create an SSL profile, or select an existing profile.
2. Select **Enable Client Authentication using bound CA Chain**.

## Migrate the SSL configuration to the enhanced SSL profile

April 15, 2024

#### Note:

The terms “default” and “enhanced” are used interchangeably for the enhanced SSL profile.

A typical deployment has hundreds of virtual servers, services, and other SSL entities configured. Each entity might have its own SSL settings. Adding or changing a setting on all the entities can be a cumbersome process. To address this need and simplify the configuration process, you can use SSL profiles and attach them to different entities.

An SSL profile is a collection of SSL parameter settings for SSL entities, such as virtual servers, services (including internal services), and service groups. It offers ease of configuration and flexibility because you are not limited to configuring only one set of global parameters. There are two types of profiles:

- Front-end profile: Applies to the entities that receive requests from a client.
- Back-end profile: Applies to entities that send client requests to the back-end server.

### Problem statement

When you enable the default profile, the inbuilt default SSL profiles are automatically bound to all the front-end and back-end SSL entities. The profile comes with some default settings and when you enable the default profile, your custom settings are lost. Manually fixing a large configuration can be

tedious, time-consuming, and error prone. Therefore, customers are hesitant to migrate to the default profile.

## Solution

From release 14.1 build 21.x, you can run a script from the NetScaler GUI that parses your configuration and creates custom profiles based on your existing settings. The script checks the configuration of your SSL entities and creates profiles for the same settings. Then, it sets the applicable profile for each SSL entity.

Perform the following steps to migrate the SSL configuration:

1. Save the configuration.
2. Run the script.
3. Review the output file.
4. Enable the default profile.
5. Batch the file.

### Important

Save the configuration before running the script. At the NetScaler CLI, type: `save config`. Also, ensure that the default profile is enabled before you batch the file. For a large configuration, running the script can take up to 30 minutes.

## To migrate the SSL configuration by using the NetScaler GUI

1. Navigate to **System > Diagnostics**. Under **Maintenance**, click **Save configuration**.
2. Navigate to **Traffic Management > SSL > Tools > SSL Profile Converter**.
3. Click **Run SSL Profile Conversion**.
4. Click **View File** to review the output file. Click **Download File** to download the output file and review offline.
5. Go back to the SSL page. Under **Settings**, click **Change advanced SSL settings**.
6. In the **Change Advanced SSL settings** page, select **Enable Default Profile**.
7. Navigate to **System > Diagnostics**. Under **Utilities**, click **Batch configuration**.
8. Provide the **File Path** and click **Run**.

## Result

When you run this script, it scans the existing NetScaler configuration file.

Output file location when using admin partitions and running the script from CLI: `/nsconfig/partitions/<partition_name>/sslprofile_cmds.txt`.

Output file location when using the default partition and running the script from CLI or GUI: `/nsconfig/sslprofile_cmds.txt`.

This file contains all the enhanced SSL profile commands corresponding to the existing configuration. You need to review the file and then batch it.

The custom profiles are created with the required settings based on your configuration. The applicable profile is bound to the various front-end and back-end SSL entities.

Your SSL entities now have the same settings as before the default profile was enabled. The difference is that these settings are now part of the SSL default profile. To change the settings on multiple SSL entities, you only have to modify the associated profile. The settings are applied to all the SSL entities that the profile is attached to.

### **To migrate the SSL configuration by using the NetScaler CLI**

You can also run the script from the CLI. At the command prompt, type:

```
1 save config
2 convert SSL defaultprofile
3 <!--NeedCopy-->
```

The output folders are specified in the Results section. You must review the file, enable the default profile, and then batch the file.

## **Certificate revocation lists**

November 21, 2023

A certificate issued by a CA typically remains valid until its expiration date. However, in some circumstances, the CA might revoke the issued certificate before the expiration date. For example, when an owner's private key is compromised, a company's or individual's name changes, or the association between the subject and the CA changes.

A Certificate Revocation List (CRL) identifies invalid certificates by serial number and issuer.

Certificate authorities issue CRLs regularly. You can configure the NetScaler appliance to use a CRL to block client requests that present invalid certificates.

If you already have a CRL file from a CA, add that to the NetScaler appliance. You can configure refresh options. You can also configure the NetScaler to sync the CRL file automatically at a specified interval, from either a web location or an LDAP location. The appliance supports CRLs in either the PEM or the DER file format. Be sure to specify the file format of the CRL file being added to the NetScaler appliance.

If you have used the ADC as a CA to create certificates that are used in SSL deployments, you can also create a CRL to revoke a particular certificate. This feature can be used, for example, to ensure that self-signed certificates that are created on the NetScaler are not used either in a production environment or beyond a particular date.

**Note:**

By default, CRLs are stored in the `/var/netscaler/ssl` directory on the NetScaler appliance.

### Create a CRL on the ADC appliance

Since you can use the ADC appliance to act as a CA and create self-signed certificates, you can also revoke the following certificates:

- Certificates that you have created.
- Certificates whose CA certificate you own.

The appliance must revoke invalid certificates before creating a CRL for those certificates. The appliance stores the serial numbers of revoked certificates in an index file and updates the file each time it revokes a certificate. The index file is automatically created the first time a certificate is revoked.

### Revoke a certificate or create a CRL by using the CLI

At the command prompt, type the following command:

```
1 create ssl crl <CAcertFile> <CAkeyFile> <indexFile> (-revoke <
 input_filename> | -genCRL <output_filename>)
2 <!--NeedCopy-->
```

**Example:**

```
1 create ssl crl Cert-CA-1 Key-CA-1 File-Index-1 -revoke Invalid-1
2
3 create ssl crl Cert-CA-1 Key-CA-1 File-Index-1 -genCRL CRL-1
4 <!--NeedCopy-->
```

### Revoke a certificate or create a CRL by using the GUI

1. Navigate to **Traffic Management > SSL** and, in the Getting Started group, select CRL Management.
2. Enter the certificate details and, in the **Choose Operation** list, select **Revoke Certificate**, or **Generate CRL**.

## Add an existing CRL to the ADC

Before you configure the CRL on the NetScaler appliance, make sure that the CRL file is stored locally on the NetScaler appliance. In an HA setup, the CRL file must be present on both ADC appliances, and the directory path to the file must be the same on both appliances.

## Add a CRL on the NetScaler by using the CLI

At the command prompt, type the following commands to add a CRL on the NetScaler and verify the configuration:

```
1 add ssl crl <crlName> <crlPath> [-inform (DER | PEM)]
2
3 show ssl crl [<crlName>]
4 <!--NeedCopy-->
```

### Example:

```
1 > add ssl crl crl-one /var/netscaler/ssl/CRL-one -inform PEM
2
3 Done
4
5 > show ssl crl crl-one
6
7 Name: crl-one Status: Valid, Days to expiration: 29
8 CRL Path: /var/netscaler/ssl/CRL-one
9 Format: PEM CAcert: samplecertkey
10 Refresh: DISABLED
11 Version: 1
12 Signature Algorithm: sha1WithRSAEncryption
13 Issuer: C=US,ST=California,L=Santa Clara,O=NetScaler Inc.,
14 OU=SSL Acceleration,CN=www.ns.com/emailAddress=
15 support@NetScaler appliance.com
16 Last_update:Jun 15 10:53:53 2010 GMT
17 Next_update:Jul 15 10:53:53 2010 GMT
18
19 1) Serial Number: 00
20 Revocation Date:Jun 15 10:51:16 2010 GMT
21
22 Done
23 <!--NeedCopy-->
```

## Add a CRL on the NetScaler by using the GUI

Navigate to **Traffic Management > SSL > CRL**, and add a CRL.

## Configure CRL refresh parameters

A CRL is generated and published by a Certificate Authority periodically or, sometimes, immediately after a particular certificate is revoked. Citrix recommends that you update CRLs on the NetScaler appliance regularly, for protection against clients trying to connect with certificates that are not valid.

The NetScaler appliance can refresh CRLs from a web location or an LDAP directory. When you specify refresh parameters and a web location or an LDAP server, the CRL does not have to be present on the local hard disk drive at the time you run the command. The first refresh stores a copy on the local hard disk drive, in the path specified by the CRL File parameter. The default path for storing the CRL is `/var/netscaler/ssl`.

Note: In release 10.0 and later, the method for refreshing a CRL is not included by default. Specify an HTTP or LDAP method. If you are upgrading from an earlier release to release 10.0 or later, you must add a method and run the command again.

## Configure CRL autorefresh by using the CLI

At the command prompt, type the following commands to configure CRL auto refresh and verify the configuration:

```

1 set ssl crl <crlName> [-refresh (ENABLED | DISABLED)] [-CAcert <
 string>] [-server <ip_addr|ipv6_addr|*> | -url <URL>] [-method (
 HTTP | LDAP)] [-port <port>] [-baseDN <string>] [-scope (Base |
 One)] [-interval <interval>] [-day <positive_integer>] [-time <HH:
 MM>][-bindDN <string>] {
2 -password }
3 [-binary (YES | NO)]
4
5 show ssl crl [<crlName>]
6 <!--NeedCopy-->

```

### Example:

```

1 set CRL crl1 -refresh enabled -method ldap -inform DER -CAcert ca1
 -server 10.102.192.192 -port 389 -scope base -baseDN "cn=
 clnt_rsa4_multicert_der,ou=eng,o=ns,c=in" -time 00:01
2
3 set ssl crl crl1 -refresh enabled -method http -cacert ca1 -port 80
 -time 00:10 -url http://10.102.192.192/crl/ca1.crl
4
5
6 > sh crl
7
8 1) Name: crl1 Status: Valid, Days to expiration:
 355
9 CRL Path: /var/netscaler/ssl/crl1
10 Format: PEM CAcert: ca1

```

```
11 Refresh: ENABLED Method: HTTP
12 URL: http://10.102.192.192/crl/ca1.crl
 Port:80
13 Refresh Time: 00:10
14 Last Update: Successful, Date:Tue Jul 6 14:38:13 2010
15 Done
16 <!--NeedCopy-->
```

## Configure CRL autorefresh using LDAP or HTTP by using the GUI

1. Navigate to **Traffic Management > SSL > CRL**.
2. Open a CRL, and select **Enable CRL Auto Refresh**.

### Note

If the new CRL has been refreshed in the external repository before its actual update time as specified by the **Last Update time** field of the CRL, you must do the following:

Immediately refresh the CRL on the NetScaler appliance.

To view the last update time, select the CRL, and click **Details**.

## Synchronize CRLs

The NetScaler appliance uses the most recently distributed CRL to prevent clients with revoked certificates from accessing secure resources.

If CRLs are updated often, the NetScaler appliance needs an automated mechanism to fetch the latest CRLs from the repository. You can configure the appliance to update CRLs automatically at a specified refresh interval.

The appliance maintains an internal list of CRLs that need to be updated at regular intervals. At these specified intervals, the appliance scans the list for CRLs that need to be updated. It then connects to the remote LDAP server or HTTP server, retrieves the latest CRLs, and then updates the local CRL list with the new CRLs.

### Note:

If the CRL check is set to mandatory when the CA certificate is bound to the virtual server, and the initial CRL refresh fails, the following action is taken for connections:

All client-authentication connections with the same issuer as the CRL are rejected as REVOKED until the CRL is successfully refreshed.

You can specify the interval at which the CRL refresh must be carried out. You can also specify the exact time.

### Synchronize CRL autorefresh by using the CLI

At the command prompt, type the following command:

```
1 set ssl crl <crlName> [-interval <interval>] [-day <integer>] [-time <
 HH:MM>]
2 <!--NeedCopy-->
```

#### Example:

```
1 set ssl crl CRL-1 -refresh ENABLE -interval MONTHLY -days 10 -time
 12:00
2 <!--NeedCopy-->
```

### Synchronize CRL refresh by using the GUI

1. Navigate to **Traffic Management > SSL > CRL**.
2. Open a CRL, select **enable CRL Auto Refresh**, and specify the interval.

### Perform client authentication by using a certificate revocation list

If a certificate revocation list (CRL) is present on a NetScaler appliance, a CRL check is performed regardless of whether performing the CRL check is set to mandatory or optional.

The success or failure of a handshake depends on a combination of the following factors:

- Rule for CRL check
- Rule for client certificate check
- State of the CRL configured for the CA certificate

### To configure CRL check by using the CLI

At the command prompt, type the following command:

```
1 bind ssl vsrv <vServerName> -certkeyName <string> [(-CA -crlCheck (
 Mandatory | Optional))]
2 sh ssl vsrv
3 <!--NeedCopy-->
```

#### Example:

```
1 bind ssl vs v1 -certkeyName ca -CA -crlCheck mandatory
2 > sh ssl vs v1
3
4 Advanced SSL configuration for VServer v1:
5
```

```

### Configure CRL check by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open an SSL virtual server.
2. Click in the **Certificates** section.
3. Select a certificate and, in the **OCSP and CRL Check** list, select **CRL Mandatory**.

### Result of a handshake with a revoked or valid certificate

Rule for CRL check	Rule for client certificate check	State of the CRL configured for the CA certificate	Result of a handshake with a revoked certificate	Result of a handshake with a valid certificate
Mandatory	Mandatory	Present	Failure	Success
Mandatory	Mandatory	Expired	Failure	Failure

Rule for CRL check	Rule for client certificate check	State of the CRL configured for the CA certificate	Result of a handshake with a revoked certificate	Result of a handshake with a valid certificate
Mandatory	Mandatory	Missing	Failure	Failure
Mandatory	Mandatory	Undefined	Failure	Failure
Optional	Mandatory	Present	Failure	Success
Optional	Mandatory	Expired	Success	Success
Optional	Mandatory	Missing	Success	Success
Optional	Mandatory	Undefined	Success	Success
Mandatory	Optional	Present	Success	Success
Mandatory	Optional	Expired	Success	Success
Mandatory	Optional	Missing	Success	Success
Mandatory	Optional	Undefined	Success	Success
Optional	Optional	Present	Success	Success
Optional	Optional	Expired	Success	Success
Optional	Optional	Missing	Success	Success
Optional	Optional	Undefined	Success	Success

**Note:**

- The CRL check is optional by default. To change from optional to mandatory or conversely, you must first unbind the certificate from the SSL virtual server, and then bind it again after changing the option.
- In the output of the `sh ssl vserver` command, OCSP check: optional implies that a CRL check is also optional. The CRL check settings are displayed in the output of the `sh ssl vserver` command only if the CRL check is set to mandatory. If the CRL check is set to optional, the CRL check details do not appear.

**Monitor certificate status with OCSP**

August 4, 2023

Online Certificate Status Protocol (OCSP) is an Internet protocol that is used to determine the status of a client SSL certificate. NetScaler appliances support OCSP as defined in RFC 2560. OCSP offers significant advantages over certificate revocation lists (CRLs) in terms of timely information. Up-to-date revocation status of a client certificate is especially useful in transactions involving large sums of money and high-value stock trades. It also uses fewer system and network resources. NetScaler implementation of OCSP includes request batching and response caching.

### **OCSP implementation**

OCSP validation on a NetScaler appliance begins when the appliance receives a client certificate during an SSL handshake. To validate the certificate, the appliance creates an OCSP request and forwards it to the OCSP responder. To do so, the appliance uses a locally configured URL. The transaction is in a suspended state until the appliance evaluates the response from the server and determines whether to allow the transaction or reject it. If the response from the server is delayed beyond the configured time and no other responders are configured, the appliance allows the transaction or display an error, depending on whether the OCSP check was set to optional or mandatory, respectively.

The appliance supports batching of OCSP requests and caching of OCSP responses to reduce the load on the OCSP responder and provide faster responses.

### **OCSP request batching**

Each time the appliance receives a client certificate, it sends a request to the OCSP responder. To help avoid overloading the OCSP responder, the appliance can query the status of more than one client certificate in the same request. For this feature to work efficiently, a timeout needs to be defined so that processing of a single certificate is not inordinately delayed while waiting to form a batch.

### **OCSP response caching**

Caching of responses received from the OCSP responder enables faster responses to the clients and reduces the load on the OCSP responder. Upon receiving the revocation status of a client certificate from the OCSP responder, the appliance caches the response locally for a predefined length of time. When a client certificate is received during an SSL handshake, the appliance first checks its local cache for an entry for this certificate. If an entry is found that is still valid (within the cache timeout limit), it is evaluated and the client certificate is accepted or rejected. If a certificate is not found, the appliance sends a request to the OCSP responder and stores the response in its local cache for a configured length of time.

**Note:** Cache timeout limit can be set to a maximum of 43200 minutes (30 days). In release 12.1 build 49.x and earlier, the limit was 1440 minutes (one day). The increased limit helps reduce the lookups on the OCSP server and avoid any SSL/TLS connection failures in case the OCSP server is not reachable due to network or other problems.

## OCSP responder configuration

Configuring OCSP involves adding an OCSP responder, binding the OCSP responder to a certification authority (CA) certificate, and binding the certificate to an SSL virtual server. If you need to bind a different certificate to an OCSP responder that has already been configured, you need to first unbind the responder and then bind the responder to a different certificate.

### Add an OCSP responder by using the CLI

At the command prompt, type the following commands to configure OCSP and verify the configuration:

```
1 add ssl ocsponder <name> -url <URL> [-cache (ENABLED | DISABLED)
 [-cacheTimeout <positive_integer>]] [-batchingDepth <
 positive_integer>][-batchingDelay <positive_integer>] [-resptimeout
 <positive_integer>] [-responderCert <string> | -trustResponder] [-
 producedAtTimeSkew <positive_integer>][-signingCert <string>][-
 useNonce (YES | NO)][-insertClientCert(YES | NO)]
2 <!--NeedCopy-->
```

```
1 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
 positive_integer>]
2 <!--NeedCopy-->
```

```
1 bind ssl vserver <vServerName>@ (-certkeyName <string> (CA [-ocspCheck
 (Mandatory | Optional)]))
2 <!--NeedCopy-->
```

```
1 show ssl ocsponder [<name>]
2 <!--NeedCopy-->
```

### Example:

```
1 add ssl ocsponder ocsponder1 -url "http:// www.myCA.org:80/
 ocsponder/" -cache ENABLED -cacheTimeout 30 -batchingDepth 8 -
 batchingDelay 100 -resptimeout 100 -responderCert responder_cert -
 producedAtTimeSkew 300 -signingCert sign_cert -insertClientCert YES
2 <!--NeedCopy-->
```

```
1 bind ssl certKey ca_cert -ocspResponder ocsponder1 -priority 1
2 <!--NeedCopy-->
```

```
1 bind ssl vs1 -certkeyName ca_cert -CA -ocspCheck Mandatory
2 <!--NeedCopy-->
```

```
1 sh ocspResponder ocsp_responder1
2
3 1)Name: ocsp_responder1
4 URL: http://www.myCA.org:80/ocsp/, IP: 192.128.22.22
5 Caching: Enabled Timeout: 30 minutes
6 Batching: 8 Timeout: 100 mS
7 HTTP Request Timeout: 100mS
8 Request Signing Certificate: sign_cert
9 Response Verification: Full, Certificate: responder_cert
10 ProducedAt Time Skew: 300 s
11 Nonce Extension: Enabled
12 Client Cert Insertion: Enabled
13 Done
14 <!--NeedCopy-->
```

```
1 show certkey ca_cert
2
3 Name: ca_cert Status: Valid, Days to expiration:8907
4 Version: 3
5 ...
6
7 1) VServer name: vs1 CA Certificate
8 1) OCSP Responder name: ocsp_responder1 Priority: 1
9 Done
10 <!--NeedCopy-->
```

```
1 sh ssl vs vs1
2
3 Advanced SSL configuration for VServer vs1:
4 DH: DISABLED
5 ...
6
7 1) CertKey Name: ca_cert CA Certificate OCSPCheck: Mandatory
8 1) Cipher Name: DEFAULT
9 Description: Predefined Cipher Alias
10 Done
11 <!--NeedCopy-->
```

### Modify an OCSP responder by using the CLI

You cannot modify the responder name. All other parameters can be changed using the `set ssl ocspResponder` command.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 set ssl ocsponder <name> [-url <URL>] [-cache (ENABLED | DISABLED)
] [-cacheTimeout <positive_integer>] [-batchingDepth <
 positive_integer>] [-batchingDelay <positive_integer>] [-resptimeout
 <positive_integer>] [-responderCert <string> | -trustResponder] [-
 producedAtTimeSkew <positive_integer>] [-signingCert <string>] [-
 useNonce (YES | NO)]
2
3 unbind ssl certKey [<certkeyName>] [-ocspResponder <string>]
4
5 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
 positive_integer>]
6
7 show ssl ocsponder [<name>]
8 <!--NeedCopy-->
```

### Configure an OCSP responder by using the GUI

1. Navigate to **Traffic Management > SSL > OCSP Responder**, and configure an OCSP responder.
2. Navigate to **Traffic Management > SSL > Certificates**, select a certificate, and in the **Action** list, select **OCSP Bindings**. Bind an OCSP responder.
3. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, open a virtual server, and click in the Certificates section to bind a CA certificate.
4. Optionally, select **select OCSP Mandatory**.

## OCSP stapling

August 4, 2023

The NetScaler implementation of CRL and OCSP reports the revocation status of client certificates only. To check the revocation status of a server certificate received during an SSL handshake, a client must send a request to a certificate authority.

For websites with heavy traffic, many clients receive the same server certificate. If each client sent a query for the revocation status of the server certificate, the certificate authority would be inundated with OCSP requests to check the validity of the certificate.

### OCSP stapling solution

To avoid unnecessary congestion, the NetScaler appliance now supports OCSP stapling. That is, at the time of the SSL handshake, the appliance can now send the status of a server certificate to a client after validating the response from an OCSP responder. The status of a server certificate is “stapled”

to the certificate that the appliance sends to the client as part of the SSL handshake. To use the OCSP stapling feature, you must enable it on an SSL virtual server and add an OCSP responder on the appliance.

#### Notes

- All the intermediate certificates include the OCSP response extension when the following conditions are met:
  - TLS 1.3 protocol is used
  - Client sends a status request

Earlier, only the server certificate included this extension in the response to the status request from the client.

- With the other protocols (including TLS 1.2), the server sends the OCSP response for only the server certificate. That is, RFC 6961 is not supported with the TLS 1.2 protocol.
- NetScaler appliances support OCSP stapling as defined in RFC 6066.
- OCSP stapling is supported only on the front-end of NetScaler appliances.
- The ADC appliance behaves as follows when TLS 1.3 protocol is used: If the cached OCSP response is invalid (empty or expired), a request is sent to the OCSP responder but the SSL handshake is completed without waiting for the response. When the response is received, it is cached and is available for future status requests from clients.
- NetScaler support for OCSP stapling is limited to handshakes using TLS protocol version 1.0 or higher.

### **OCSP response caching of server certificates**

#### Note

When the TLS 1.3 protocol is used, the OCSP response is cached for the server certificate and all the intermediate certificates.

During the SSL handshake, when a client requests the revocation status of the server certificate, the appliance first checks its local cache for an entry for this certificate. If a valid entry is found, it is evaluated and the server certificate and its status are presented to the client. If a revocation status entry is not found, the appliance sends a request for the revocation status of the server certificate to the OCSP responder. If it receives a response, it sends the certificate and the revocation status to the client. If the next update field is present in the OCSP response, the response is cached for the configured length of time (value specified in the timeout field.)

**Note:** You can clear the cached response, of the server certificate, from the OCSP responder even before the timeout expires. In release 12.1 build 49.x and earlier, it was not possible to discard the cached status in the certificate-key pair until the configured timeout was over.

To clear the cached status by using the CLI, at the command prompt, type:

```
1 clear ssl certKey <certkey name> -ocspstaplingCache
2 <!--NeedCopy-->
```

**Example:**

```
1 clear ssl certKey s1 -ocspstaplingCache
2 <!--NeedCopy-->
```

To clear the cached status by using the GUI

1. In the GUI, navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. In the details pane, select a certificate.
3. In the **Select Action** list, select **Clear**. When prompted to confirm, click **Yes**.

## OCSP stapling configuration

Configuring OCSP stapling involves enabling the feature and configuring OCSP. To configure OCSP, you must add an OCSP responder, bind the OCSP responder to a CA certificate, and bind the certificate to an SSL virtual server.

**Note:**

OCSP responders with only HTTP based URL are supported.

### Enable OCSP stapling by using the CLI

At the command prompt, type:

```
1 set ssl vserver <name> -ocspstapling [ENABLED | DISABLED]
2 <!--NeedCopy-->
```

**Example:**

```
1 set ssl vserver vip1 -ocspStapling ENABLED
2 Done
3
4 sh ssl vserver vip1
5
6 Advanced SSL configuration for VServer vip1:
7 DH: DISABLED
```

```

8 DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA:
 ENABLED Refresh Count: 0
9 Session Reuse: ENABLED Timeout: 120 seconds
10 Cipher Redirect: DISABLED
11 SSLv2 Redirect: DISABLED
12 ClearText Port: 0
13 Client Auth: DISABLED
14 SSL Redirect: DISABLED
15 Non FIPS Ciphers: DISABLED
16 SNI: ENABLED
17 OCSP Stapling: ENABLED
18 SSLv2: DISABLED SSLv3: DISABLED TLSv1.0: ENABLED TLSv1.1: ENABLED
 TLSv1.2: ENABLED
19 Push Encryption Trigger: Always
20 Send Close-Notify: YES
21
22 ECC Curve: P_256, P_384, P_224, P_521
23
24 1) CertKey Name: server_certificate1 Server Certificate
25
26 1) Cipher Name: DEFAULT
27 Description: Default cipher list with encryption strength >= 128
 bit
28 Done
29 <!--NeedCopy-->

```

**Note:** If the default (enhanced) profile is enabled, use the `set ssl profile <profile name> -ocspStapling [ENABLED | DISABLED]` command to enable or disable OCSP.

### Enable OCSP stapling by using the GUI

1. Navigate to **Traffic Management > SSL > Virtual Server**.
2. Open a virtual server and, in **SSL Parameters**, select **OCSP Stapling**.

### OCSP configuration

An OCSP responder is added dynamically or manually to send OCSP stapling requests. An internal responder is dynamically added when you add a server certificate and its issuer certificate based on the OCSP URL in the server certificate. A manual OCSP responder is added from the CLI or GUI. To send an OCSP request for a server certificate, the NetScaler appliance selects an OCSP responder based on the priority assigned to it when binding it to an issuer certificate. If a responder fails to send an OCSP stapling request, the responder with the next highest priority is selected for sending the request. For example, if only one responder is manually configured and it fails and a dynamically bound responder exists, it is selected for sending the OCSP request.

If the OCSP URL is other than HTTP, an internal OCSP responder is not created.

**Note**

A manually added OCSP responder takes precedence over a dynamically added responder.

---

**Difference between a manually created OCSP responder and an internally created OCSP responder**

---

**Manually created OCSP responder**

Created manually and explicitly bound to the issuer certificate with a priority.

Priority between 1 and 127 is reserved for a configured responder.

URL and batching depth can be changed.

Deleted directly.

Can be bound to any CA certificate.

Saved in the configuration (ns.conf).

If you bind three OCSP responders to the same issuer certificate with priorities 1, 2, and 3 respectively, and later unbind priority 2, the other priorities are not affected.

**Internally (dynamically) created OCSP responder**

Created and bound by default, while adding a server certificate and its issuer certificate (CA certificate). Name starts with “ns\_internal\_”.

Priority is automatically assigned from 128 onwards.

URL and batching depth cannot be changed.

Deleted only when you delete the server certificate or the CA certificate.

Bound by default to one CA certificate. Cannot be bound to any other CA certificate.

Add commands are not saved in the configuration. Only set commands are saved.

Three OCSP responders are automatically bound to an issuer certificate with priorities 128, 129, and 130 respectively. If you remove the server certificate that was used to create a responder bound with priority 129, then that responder is deleted. Also, the priority for the next responder (priority 130) is automatically changed to 129.

---

**Example of request handling:**

1. Add a virtual server (VIP1).
2. Add issuer certificate (CA1) and bind it to VIP1.
3. Add three certificates S1, S2, and S3. Internal responders resp1, resp2, and resp3 respectively are created by default.
4. Bind S3 to VIP1.
5. A request comes to VIP1. Responder resp3 is selected.

To create an internal OCSP responder dynamically, the appliance needs the following:

- Certificate of the issuer of the server certificate (usually the CA certificate).
- Certificate-key pair of the server certificate. This certificate must contain the OCSP URL provided by the certificate authority. The URL is used as the name of the dynamically added internal responder.

An internal OCSP responder has the same default values as a manually configured responder.

**Note:**

Caching is disabled by default on an internal responder. Use the `set ssl ocsponder` command to enable caching.

### Configure OCSP by using the CLI

At the command prompt, type the following commands to configure OCSP and verify the configuration:

```

1 add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <
 string> | -fipsKey <string> | -hsmKey <string>] [-inform <inform>]
 [-expiryMonitor (ENABLED | DISABLED) [-notificationPeriod <
 positive_integer>]] [-bundle (YES | NO)]
2
3 add ssl ocsponder <name> -url <URL> [-cache (ENABLED | DISABLED)
 [-cacheTimeout <positive_integer>]] [-resptimeout <positive_integer
 >] [-responderCert <string> | -trustResponder] [-producedAtTimeSkew
 <positive_integer>][-signingCert <string>][-useNonce (YES | NO)][
 -insertClientCert (YES | NO)]
4
5 bind ssl certKey [<certkeyName>] [-ocsponder <string>] [-priority <
 positive_integer>]
6
7 show ssl ocsponder [<name>]
8 <!--NeedCopy-->

```

**Parameters:**

**httpMethod:**

HTTP method used to send OCSP requests. For requests, less than 255 bytes long, you can configure the HTTP GET method for queries to an OCSP server. If you specify the GET method but the length is greater than 255 bytes, the appliance uses the default method (POST).

Possible values: GET, POST

Default value: POST

**ocsUrlResolveTimeout:**

Time, in milliseconds, to wait for an OCSP URL resolution. After this time elapses, the responder with the next higher priority is selected. If all the responders fail, an error message appears or the connection is dropped, depending on the settings on the virtual server.

Minimum value: 100

Maximum value: 2000

### Example:

```

1 add ssl certkey root_ca1 -cert root_cacert.pem
2 add ssl ocsponder ocsponder1 -url "http:// www.myCA.org:80/
 ocsponder/" -cache ENABLED -cacheTimeout 30 -resptimeout 100 -
 responderCert responder_cert -producedAtTimeSkew 300 -signingCert
 sign_cert -insertClientCert YES
3 bind ssl certKey root_ca1 -ocsponder ocsponder1 -priority 1
4 sh ocsponder ocsponder1
5 1)Name: ocsponder1
6 URL: http://www.myCA.org:80/ocsponder/, IP: 192.128.22.22
7 Caching: Enabled Timeout: 30 minutes
8 Batching: 8 Timeout: 100 mS
9 HTTP Request Timeout: 100mS
10 Request Signing Certificate: sign_cert
11 Response Verification: Full, Certificate: responder_cert
12 ProducedAt Time Skew: 300 s
13 Nonce Extension: Enabled
14 Client Cert Insertion: Enabled
15 Done
16
17 show certkey root_ca1
18 Name: root_ca1 Status: Valid, Days to expiration:8907
19 Version: 3
20 ...
21 1) OCSP Responder name: ocsponder1 Priority: 1
22 Done
23 <!--NeedCopy-->

```

### Modify OCSP by using the CLI

You cannot modify the name of an OCSP responder, but you can use the `set ssl ocsponder` command to change any of the other parameters.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1 set ssl ocsponder <name> [-url <URL>] [-cache (ENABLED | DISABLED)
] [-cacheTimeout <positive_integer>] [-resptimeout <
 positive_integer>] [-responderCert <string> | -trustResponder] [-
 producedAtTimeSkew <positive_integer>] [-signingCert <string>] [-
 useNonce (YES | NO)]
2

```

```
3 unbind ssl certKey [<certkeyName>] [-ocspResponder <string>]
4
5 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
 positive_integer>]
6
7 show ssl ocspResponder [<name>]
8 <!--NeedCopy-->
```

### Configure OCSP by using the GUI

1. Navigate to **Traffic Management > SSL > OCSP Responder**, and configure an OCSP responder.
2. Navigate to **Traffic Management > SSL > Certificates**, select a certificate, and in the **Action** list, select **OCSP Bindings. Bind an OCSP responder**.
3. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, open a virtual server, and click in the Certificates section to bind a CA certificate.
4. Optionally, select **OCSP Mandatory**.

#### Note:

The insert client certificate parameter in the `add ssl ocspResponder` and the `set ssl ocspResponder` commands is no longer valid. That is, the parameter is ignored during configuration.

## Ciphers available on the NetScaler appliances

January 4, 2024

Your NetScaler appliance ships with a predefined set of cipher groups. To use ciphers that are not part of the DEFAULT cipher group, you have to explicitly bind them to an SSL virtual server. You can also create a user-defined cipher group to bind to the SSL virtual server. For more information about creating a user-defined cipher group, see [Configure user-defined cipher groups on the ADC appliance](#).

#### Notes

- From release 13.0 build 71.x and later, TLS1.3 hardware acceleration is supported on the following platforms:
  - MPX 5900
  - MPX/SDX 8900
  - MPX/SDX 9100

- MPX/SDX 15000
  - MPX/SDX 15000-50G
  - MPX/SDX 16000
  - MPX/SDX 26000
  - MPX/SDX 26000-50S
  - MPX/SDX 26000-100G
  - Software-only support for the TLSv1.3 protocol is available on all other NetScaler MPX and SDX appliances except NetScaler FIPS appliances.
- TLSv1.3 is only supported with the enhanced profile. To enable the enhanced profile, see [Enable the enhanced profile](#).
  - To use TLS1.3, you must use a client that conforms to the RFC 8446 specification.
  - RC4 cipher is not included in the default cipher group on the NetScaler appliance. However, it is supported in the software on the N3-based appliances. RC4 encryption, including the handshake, is done in software.
  - Citrix recommends that you do not use this cipher because it is considered insecure and deprecated by RFC 7465.
  - Use the 'show hardware' command to identify whether your appliance has N3 chips.

```

1 sh hardware
2
3 Platform: NSMPX-22000 16*CPU+24*IX+12*E1K+2*E1K+4*CVM N3 2200100
4
5 Manufactured on: 8/19/2013
6
7 CPU: 2900MHZ
8
9 Host Id: 1006665862
10
11 Serial no: ENUK6298FT
12
13 Encoded serial no: ENUK6298FT
14 <!--NeedCopy-->

```

- To display information about the cipher suites bound by default at the front end (to a virtual server), type: `sh cipher DEFAULT`
- To display information about the cipher suites bound by default at the back end (to a service), type: `sh cipher DEFAULT_BACKEND`
- To display information about all the cipher groups (aliases) defined on the appliance, type: `sh cipher`
- To display information about all the cipher suites that are part of a specific cipher group, type:

`sh cipher <alias name>`. For example, `sh cipher ECDHE`.

The following links list the cipher suites supported on different NetScaler platforms and on external hardware security modules (HSMs):

- **NetScaler MPX/SDX Intel Lewisburg appliance:** [Cipher support on a NetScaler MPX/SDX Intel Lewisburg SSL chip based appliance](#)
- **NetScaler MPX/SDX (N3) appliance:** [Cipher support on a NetScaler MPX/SDX \(N3\) appliance](#)
- **NetScaler MPX/SDX Intel Coletto appliance:** [Cipher support on a NetScaler MPX/SDX Intel Coletto SSL chip-based appliance](#)
- **NetScaler VPX appliance:** [Cipher support on a NetScaler VPX appliance](#)
- **NetScaler MPX/SDX 14000 FIPS appliance:** [Cipher support on a NetScaler MPX/SDX 14000 FIPS appliance](#)
- **External HSM (Thales/Safenet):** [Cipher supported on an External HSM \(Thales/Safenet\)](#)
- **NetScaler VPX FIPS and MPX FIPS appliances:** [Cipher support on NetScaler VPX FIPS and MPX FIPS appliances](#)

**Note:**

For DTLS cipher support, see [DTLS cipher support on NetScaler VPX, MPX, and SDX appliances](#).

**Table1 - Support on virtual server/frontend service/internal service:**

Protocol/Platform	MPX/SDX (N2)	MPX/SDX (N3)	VPX	MPX/SDX 14000** FIPS	MPX 5900/8900 MPX 15000-50G MPX 26000-100G

For the detailed list of ECDSA ciphers supported, see [ECDSA Cipher Suites support](#).

**Notes**

- TLS-Fallback\_SCSV cipher suite is supported on all appliances from release 10.5 build 57.x
- HTTP Strict Transport Security (HSTS) support is policy-based.
- All SHA-2 signed-certificates (SHA256, SHA384, SHA512) are supported on the front end of all appliances. In release 11.1 build 54.x and later, these certificates are also supported on the back-end of all appliances. In release 11.0 and earlier, only SHA256 signed-certificates are supported on the back end of all appliances.
- In release 11.1 build 52.x and earlier, the following ciphers are supported only on the front end of the MPX 9700 and MPX/SDX 14000 FIPS appliances:
  - TLS1.2-ECDHE-RSA-AES-256-SHA384
  - TLS1.2-ECDHE-RSA-AES256-GCM-SHA384 From release 11.1 build 53.x, and in release 12.0, these ciphers are also supported on the back end.
- All ChaCha20-Poly1035 ciphers use a TLS pseudo random function (PSF) with the SHA-256

hash function.

## Perfect Forward Secrecy (PFS)

Perfect Forward Secrecy ensures protection of current SSL communications even if the session key of a web server is compromised at a later point in time.

### Why do you need Perfect Forward Secrecy (PFS)?

An SSL connection is used to secure the data being passed between a client and a server. This connection begins with the SSL handshake that takes place between a client's browser and the contacted web server. It is during this handshake that the browser and the server exchange certain information to arrive upon a session key which serves as a means to encrypt the data throughout the rest of the communication.

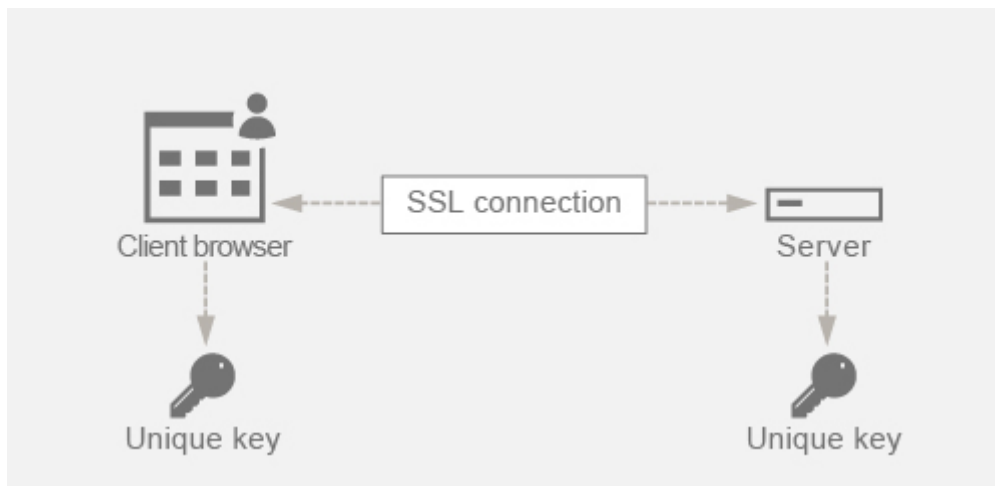

RSA is the most commonly used algorithm for key exchange. The browser uses the server's public key to encrypt and send across the pre-master secret to a server. This pre-master secret is used to arrive at the session key. The problem in the RSA key exchange approach is that if an attacker manages to get hold of the server's private key at any point in time in the future, then the attacker gets hold of the pre-master secret using which the session key can be obtained. This session key can now be used by the attacker to decrypt all the SSL conversations. As a result, your historical SSL communication that was secure earlier is no longer secure because the server's stolen private key can be used to arrive at the session key and thus decrypt any saved historical conversation as well.

The need is to be able to protect the past SSL communication even if the server's private key has been compromised. Configuring Perfect Forward Secrecy (PFS) helps address this issue.

## How does PFS help?

PFS protects the past SSL communication by having the client and server agree upon a new key for each session and keeping the computation of this session key a secret. It works on the basis that compromise of a server key must not result in compromise of the session key. Session key is derived separately at both ends and is never transferred over the wire. The session keys are also destroyed once the communication is complete. These facts ensure that even if someone gets access to the server's private key, they would not be able to arrive at the session key. Therefore, they would not be able to decrypt the past data.

## Explanation with example

Assume that we are using DHE for attaining PFS. The DH algorithm ensures that even though a hacker gets hold of the server's private key, the hacker cannot arrive at the session key. The reason is that the session key and the random numbers (used to arrive at the session key) are kept secret at both ends and never exchanged over the wire.

PFS can be achieved by using the Ephemeral Diffie-Hellman key exchange which creates new temporary keys for each SSL session.

The flip side of creating a key for each session is that it requires extra computation. However, this issue can be overcome by using the Elliptic Curve which has smaller key sizes.

## Configure PFS on NetScaler appliance

PFS can be configured on a NetScaler by configuring DHE or ECDHE ciphers. These ciphers ensure that the secret session key created is not shared on the wire (DH algorithm) and that the session key remains alive only for a short time (Ephemeral). Both the configurations are explained in the following sections.

**Note:** Using ECDHE ciphers instead of DHE makes the communication more secure with smaller key sizes.

### Configure DHE by using the GUI

1. Generate a DH key.
  - a. Navigate to **Traffic Management > SSL > Tools**.
  - b. Click **Create Diffie Helman (DH) Key**.  
**Note:** Generating a 2048-bit DH key can take up to 30 minutes.
2. Enable DH Param for the SSL virtual server and attach the DH key to the SSL virtual server.
  - a. Navigate to **Configuration > Traffic Management > Virtual Servers**.
  - b. Select the virtual server on which you want to enable DH.
  - c. Click **Edit**, click **SSL Parameters**, and click **Enable DH Param**.
3. Bind the DHE ciphers to the virtual server.
  - a. Navigate to **Configuration > Traffic Management > Virtual Servers**.
  - b. Select the virtual server on which you want to enable DH and click the pencil icon to edit.
  - c. Under **Advanced Settings**, click the plus icon next to **SSL Ciphers** and select the DHE cipher groups and click **OK** to bind.  
**Note:** Ensure that the DHE ciphers are at the top of the cipher list bound to the virtual server.

### Configure ECDHE by using the GUI

1. Bind the ECC curves to the SSL virtual server.
  - a. Navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers**.
  - b. Select the SSL virtual server which you want to edit, click **ECC Curve** and click **Add Binding**.
  - c. Bind the required ECC curve to the virtual server.
2. Bind the ECDHE ciphers to the virtual server.
  - a. Navigate to **Configuration > Traffic Management > Virtual Servers** and select the virtual server on which you want to enable DH.
  - b. Click **Edit > SSL Ciphers** and select the ECDHE cipher groups and click **Bind**.  
**Note:** Ensure that the ECDHE ciphers are at the top of the cipher list bound to the virtual server.

**Note:** For each case verify that the NetScaler appliance supports the ciphers you would like to use for the communication.

## Configure PFS using an SSL profile

**Note:** Option to configure PFS (cipher or ECC) using an SSL profile is introduced from 11.0 64.x release onwards. Ignore the following section if on older versions.

To enable PFS using an SSL profile, a similar configuration (as explained in earlier configuration sections) needs to be done but on the SSL profile instead of directly configuring on a virtual server.

### Configure PFS using an SSL profile by using the GUI

1. Bind the ECC curves and the ECDHE ciphers on the SSL profile.

**Note:** ECC curves are already bound by default to all the SSL profiles.

- a. Navigate to **System > Profiles > SSL Profiles** and choose the profile you want to enable PFS on.
  - b. Bind the ECDHE ciphers.
2. Bind the SSL profile to the virtual server.
    - a. Go to **Configuration > Traffic Management > Virtual Servers** and select the virtual server.
    - b. Click the pencil icon to edit the SSL profile.
    - c. Click **OK** and click **Done**.

**Configure PFS using SSL using the CLI** At the command prompt, type:

1. Bind ECC curves to the SSL profile.

```
1 bind sslprofile <SSLProfileName> -eccCurveName <Name_of_curve>
2 <!--NeedCopy-->
```

2. Bind the ECDHE cipher group.

```
1 bind sslprofile <SSLProfileName> cipherName <ciphergroupName>
2 <!--NeedCopy-->
```

3. Set the priority of the ECDHE cipher as 1.

```
1 set sslprofile <SSLProfileName> cipherName <ciphergroupName>
 cipherPriority <positive_integer>
2 <!--NeedCopy-->
```

4. Bind the SSL profile to the virtual server.

```
1 set SSL vserver <vservname> sslProfile <SSLProfileName>
2 <!--NeedCopy-->
```

## ECDHE ciphers

January 4, 2024

All NetScaler appliances support the ECDHE cipher group on the front end and the back end. On an SDX appliance, if an SSL chip is assigned to a VPX instance, the cipher support of an MPX appliance applies. Otherwise, the normal cipher support of a VPX instance applies.

For more information about the builds and platforms that support these ciphers, see [Ciphers available on the NetScaler appliances](#).

ECDHE cipher suites use elliptical curve cryptography (ECC). Because of its smaller key size, ECC is especially useful in a mobile (wireless) environment or an interactive voice response environment, where every millisecond is important. Smaller key sizes save power, memory, bandwidth, and computational cost.

A NetScaler appliance supports the following ECC curves:

- P\_256
- P\_384
- P\_224
- P\_521
- X\_25519 (Supported only on TLS 1.3 and on the front end in release 14.1-12.x and later.)

You can bind all five curves to the SSL front-end entities. By default, the curves are bound in the following order: X\_25519, P\_256, P\_384, P\_224, P\_521. When you upgrade to release 14.1-12.x, the curve bindings in any existing SSL virtual servers and SSL profiles aren't modified. To use X25519, you must modify the configuration and bind X25519 manually. Alternately, to add X25519 at the front of the list, use the 'ALL'ec\_curve option in the `bind ssl vservice` or `bind ssl profile` commands. This command internally unbinds and binds all the curves in the default order.

You can bind the first four ECC curves to the SSL back-end entities. By default, all four curves are bound in the following order: P\_256, P\_384, P\_224, P\_521.

To change the order, you must first unbind all the curves, and then bind them in the desired order.

### Bind ECC curves to an SSL virtual server by using the CLI

ECC curves supported: P\_256, P\_384, P\_224, P\_521, and X\_25519.

At the command prompt, type:

```
bind ssl vservice <vServerName > -eccCurveName <eccCurveName >
```

#### Example:

```
1 bind ssl vserver v1 -eccCurveName P_224
2
3 sh ssl vserver v1
4
5 Advanced SSL configuration for VServer v1:
6 DH: DISABLED
7 Ephemeral RSA: ENABLED Refresh Count: 0
8 Session Reuse: ENABLED Timeout: 120 seconds
9 Cipher Redirect: DISABLED
10 SSLv2 Redirect: DISABLED
11 ClearText Port: 0
12 Client Auth: DISABLED
13 SSL Redirect: DISABLED
14 Non FIPS Ciphers: DISABLED
15 SNI: DISABLED
16 SSLv2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.1: DISABLED

21 1) Cipher Name: DEFAULT
22 Description: Predefined Cipher Alias
23 Done
24 <!--NeedCopy-->
```

### **Bind ECC curves to an SSL virtual server by using the GUI**

ECC curves supported: P\_256, P\_384, P\_224, P\_521, and X\_25519.

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Select an SSL virtual server and click **Edit**.
3. In **Advanced Settings**, click **ECC Curve**.

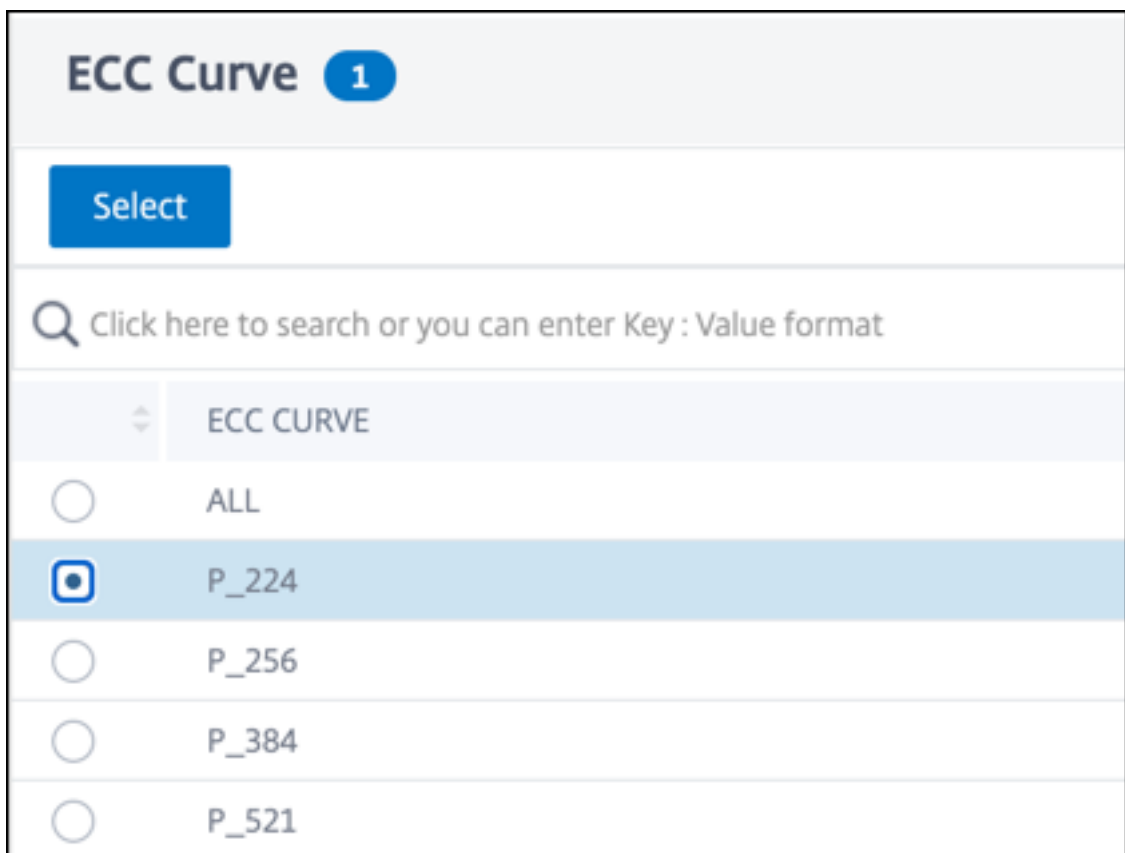

4. Click inside the ECC curve section.
5. In the **SSL Virtual Server ECC Curve Binding** page, click **Add Binding**.

6. In **ECC Curve Binding**, click **Select ECC Curve**.

7. Select a value, and then click **Select**.

8. Click **Bind**.

9. Click **Close**.
10. Click **Done**.

### Bind ECC curves to an SSL service by using the CLI

ECC curves supported: P\_256, P\_384, P\_224, and P\_521.

At the command prompt, type:

```
bind ssl service <vServerName > -eccCurveName <eccCurveName >
```

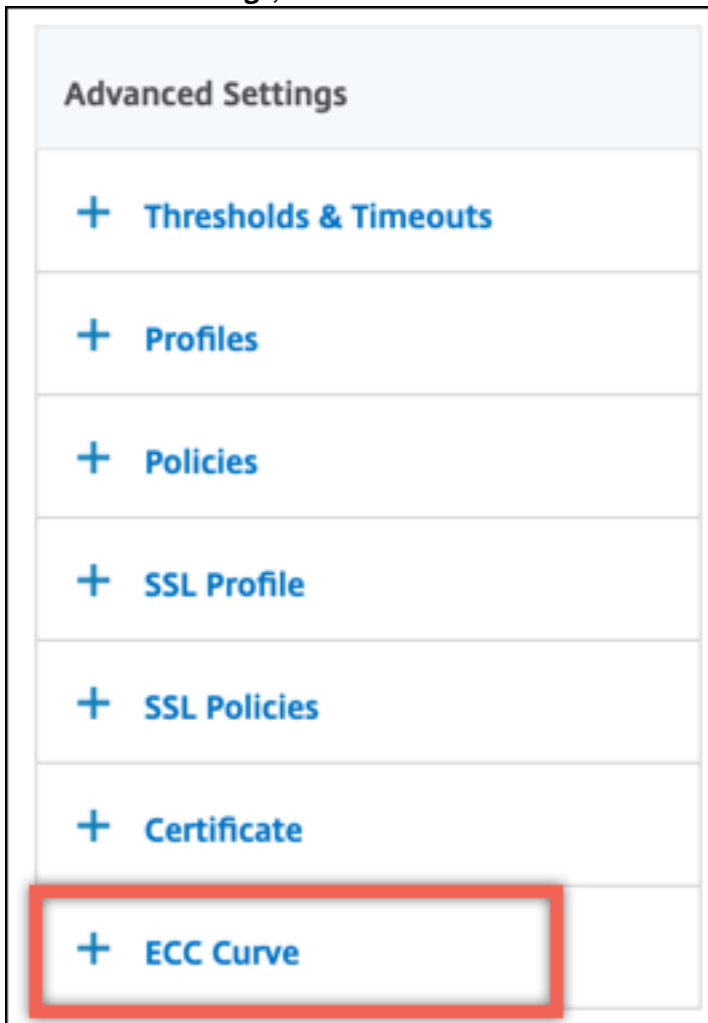

#### Example:

```
1 > bind ssl service sslsvc -eccCurveName P_224
2 Done
3 > sh ssl service sslsvc
4
5 Advanced SSL configuration for Back-end SSL Service sslsvc:
6 DH: DISABLED
7 DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA:

20 DHE Key Exchange With PSK: ???
21 Tickets Per Authentication Context: ???
22
23 ECC Curve: P_224
24
25
26 1) Cipher Name: DEFAULT_BACKEND
27 Description: Default cipher list for Backend SSL session
28 Done
29 <!--NeedCopy-->
```

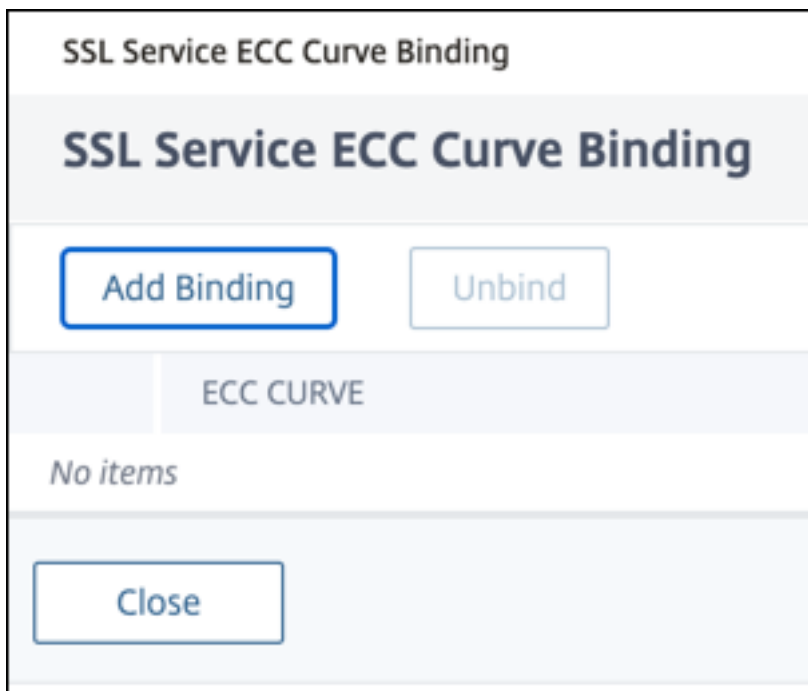

### Bind ECC curves to an SSL service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Select an SSL service and click **Edit**.

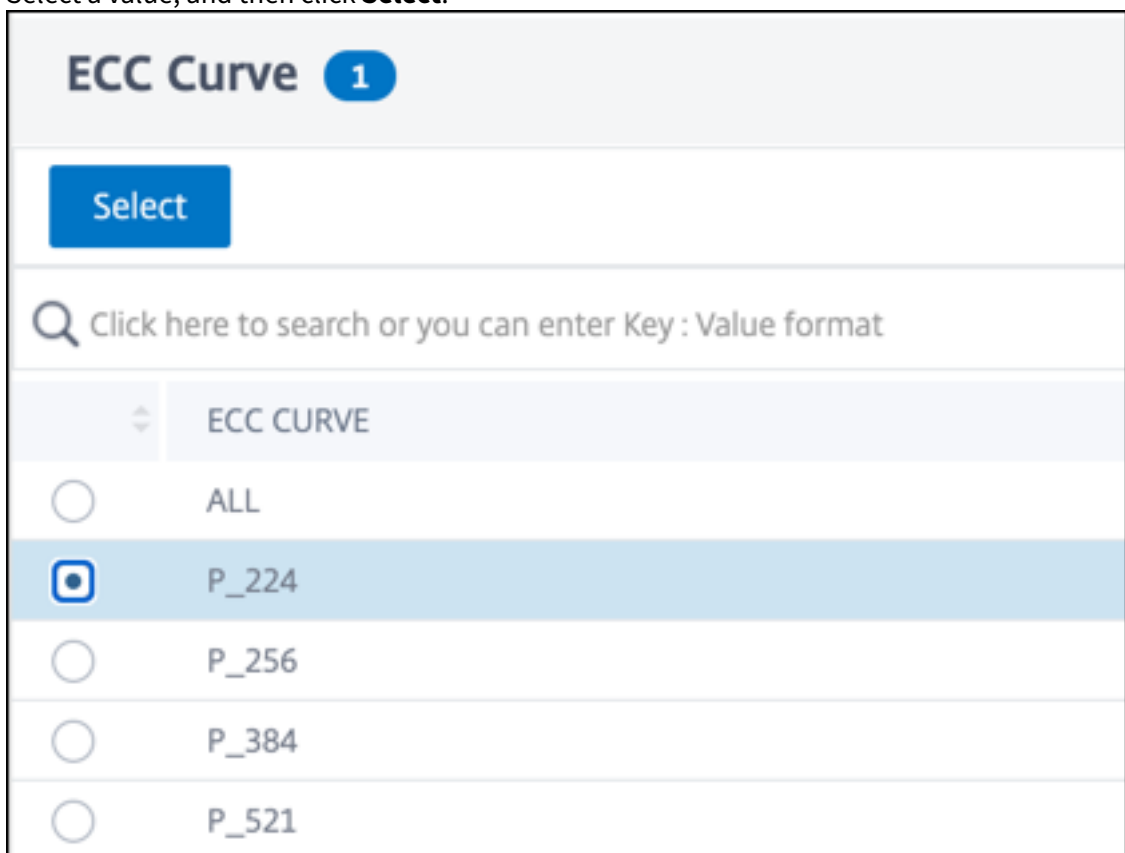

3. In **Advanced Settings**, click **ECC Curve**.

4. Click inside the ECC curve section.
5. In the **SSL Service ECC Curve Binding** page, click **Add Binding**.

6. In **ECC Curve Binding**, click **Select ECC Curve**.
7. Select a value, and then click **Select**.

8. Click **Bind**.

9. Click **Close**.
10. Click **Done**.

## Diffie-Hellman parameters generation and achieving PFS with DHE

May 26, 2023

The Diffie-Hellman (DH) key exchange is a way for two parties involved in an SSL transaction to agree upon a shared secret over an insecure channel. These parties have no prior knowledge about each other. This secret can be converted into cryptographic keying material for symmetric key cipher algorithms that require such a key exchange.

This feature is disabled by default. Configured the feature to support ciphers that use DH as the key exchange algorithm.

**Note:**

Generating 2048-bit DH parameters might take a long time (up to 30 minutes).

### Generate DH parameters by using the CLI

At the command prompt, type the following command:

```
1 create ssl dhparam <dhFile> [<bits>] [-gen (2 | 5)]
2 <!--NeedCopy-->
```

**Example:**

```
1 create ssl dhparam Key-DH-1 512 -gen 2
2 <!--NeedCopy-->
```

### Generate DH parameters by using the GUI

Navigate to **Traffic Management > SSL** and, in the **Tools** group, select **Create Diffie-Hellman (DH) key**, and **Configure SSL DH Param**.

**Note:**

For information about DH parameters, see [Diffie-Hellman parameters](#).

## Achieve perfect forward secrecy with DHE

Generating DH parameters is a CPU-intensive operation. In earlier releases, parameter generation, on a VPX appliance, took a long time because it was done in the software. Parameter generation is optimized by setting the `dhKeyExpSizeLimit` parameter. You can set this parameter for an SSL virtual server or an SSL profile and then bind the profile to a virtual server.

You can maintain perfect forward secrecy (PFS) on NetScaler MPX appliances by setting the DH count equal to zero. As a result, DH parameters are generated for each transaction (minimum `DHcount` is 0) on NetScaler MPX appliances. These parameters are generated without a significant drop in performance, because the operation is optimized. Earlier, the minimum DH count allowed was 500. That is, you cannot regenerate the key for up to 500 transactions.

### Limitation:

On a NetScaler VPX appliance, if you set the DH count to zero, the DH parameters are not regenerated. Therefore, you must set the DH count to 500 to maintain PFS. The DH parameters are regenerated after 500 transactions.

## Optimize DH parameters generation by using the CLI

At the command prompt, type commands 1 and 2, or type command 3:

```
1 1. add ssl profile <name> [-sslProfileType (BackEnd | FrontEnd)] [-dhCount <positive_integer>] [-dh (ENABLED | DISABLED) -dhFile <string>] [-dhKeyExpSizeLimit (ENABLED | DISABLED)]
2 2. set ssl vserver <vServerName> [-sslProfile <string>]
3 <!--NeedCopy-->
```

```
1 3. set ssl vserver <vServerName> [-dh (ENABLED | DISABLED) -dhFile <string>] [-dhCount <positive_integer>] [-dhKeyExpSizeLimit (ENABLED | DISABLED)]
2 <!--NeedCopy-->
```

## Optimize DH parameters generation by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the **SSL Parameters** section, select **Enable DH Key Expire Size Limit**.

## Cipher redirection

December 23, 2020

During the SSL handshake, the SSL client (usually a web browser) announces the suite of ciphers that it supports, in the configured order of cipher preference. From that list, the SSL server then selects a cipher that matches its own list of configured ciphers.

If the ciphers announced by the client does not match the ciphers configured on the SSL server, the SSL handshake fails. The failure is announced by a cryptic error message displayed in the browser. These messages rarely mention the exact cause of the error.

With cipher redirection, you can configure an SSL virtual server to deliver accurate, meaningful error messages when an SSL handshake fails. When an SSL handshake fails, the ADC appliance redirects the user to a previously configured URL or, if no URL is configured, displays an internally generated error page.

### Configure cipher redirection by using the CLI

At the command prompt, type the following commands to configure cipher redirection and verify the configuration:

```
1 - set ssl vserver <vServerName> -cipherRedirect < ENABLED | DISABLED>
 -cipherURL < URL>
2 - show ssl vserver <vServerName>
3 <!--NeedCopy-->
```

#### Example:

```
1 set ssl vserver vs-ssl -cipherRedirect ENABLED -cipherURL http://
 redirectURL
2
3 Done
4
5 show ssl vserver vs-ssl
6
7 Advanced SSL configuration for VServer vs-ssl:
8 DH: DISABLED
9 Ephemeral RSA: ENABLED Refresh Count: 1000
10 Session Reuse: ENABLED Timeout: 600 seconds
11 Cipher Redirect: ENABLED Redirect URL: http://redirectURL
12 SSLv2 Redirect: DISABLED
13 ClearText Port: 0
14 Client Auth: DISABLED
15 SSL Redirect: DISABLED
16 Non FIPS Ciphers: DISABLED
17 SNI: DISABLED
18 OCSP Stapling: DISABLED
19 HSTS: DISABLED
20 HSTS IncludeSubDomains: NO
21 HSTS Max-Age: 0
22 SSLv2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.2: ENABLED
 TLSv1.2: ENABLED
```

```
23 1) CertKey Name: Auth-Cert-1 Server Certificate
24 1) Cipher Name: DEFAULT
25 Description: Predefined Cipher Alias
26 Done
27 <!--NeedCopy-->
```

## Configure cipher redirection by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the **SSL Parameters** section, select **Enable Cipher Redirect**, and specify a redirect URL.

## Use hardware and software to improve ECDHE and ECDSA cipher performance

May 2, 2023

### Note:

This enhancement is applicable only to the following platforms:

- MPX/SDX 11000
- MPX/SDX 14000
- MPX 22000, MPX 24000, and MPX 25000
- MPX/SDX 14000 FIPS

Previously, ECDHE and ECDSA computation on a NetScaler appliance was performed only on the hardware (Cavium chips), which limited the number of SSL sessions at any given time. With this enhancement, some operations are also performed in the software. That is, processing is done both on the Cavium chips and on the CPU cores to improve ECDHE and ECDSA cipher performance.

The processing is first performed in software, up to the configured software crypto threshold. After this threshold is reached, the operations are offloaded to the hardware. Therefore, this hybrid model uses both hardware and software to improve SSL performance. You can enable the hybrid model by setting the “softwareCryptoThreshold” parameter to suit your requirement. To disable the hybrid model, set this parameter to 0.

Benefits are greatest if the current CPU utilization is not too high, because the CPU threshold is not exclusive to ECDHE and ECDSA computation. For example, if the current workload on the appliance consumes 50% of the CPU cycles, and the threshold is set to 80%, ECDHE and ECDSA computation can only use 30%. After the configured software crypto threshold of 80% is reached, further ECDHE

and ECDSA computation is offloaded to the hardware. In that case, actual CPU utilization might exceed 80%, because performing ECDHE and ECDSA computations in hardware consumes some CPU cycles.

### Enable the hybrid model by using the CLI

At the command prompt, type:

```
1 set ssl parameter -softwareCryptoThreshold <positive_integer>
2
3 Synopsis:
4
5 softwareCryptoThreshold:
6
7 NetScaler CPU utilization threshold (as a percentage) beyond which
 crypto operations are not done in software. A value of zero implies
 that CPU is not utilized for doing crypto in software.
8
9 Default = 0
10
11 Min = 0
12
13 Max = 100
14 <!--NeedCopy-->
```

### Example:

```
1 set ssl parameter - softwareCryptoThreshold 80
2 Done
3
4 show ssl parameter
5 Advanced SSL Parameters
6
7 SSL quantum size : 8 KB
8 Max CRL memory size : 256 MB
9 Strict CA checks : NO
10 Encryption trigger timeout : 100 ms
11 Send Close-Notify : YES
12 Encryption trigger packet c : 45
13 Deny SSL Renegotiation : ALL
14 Subject/Issuer Name Insertion Format : Unicode
15 OCSP cache size : 10 MB
16 Push flag : 0x0 (Auto)
17 Strict Host Header check for SNI enabled SSL sessions : NO
18 PUSH encryption trigger timeout : 1 ms
19 Crypto Device Disable Limit : 0
20 Global undef action for control policies : CLIENTAUTH
21 Global undef action for data policies : NOOP
22 Default profile : DISABLED
23 Disable TLS 1.1/1.2 for SSL_BRIDGE secure monitors : NO
24 Disable TLS 1.1/1.2 for dynamic and VPN services : NO
```

```
25 Software Crypto acceleration CPU Threshold : 80
26 Signature and Hash Algorithms supported by TLS1.2 : ALL
27 <!--NeedCopy-->
```

## Enable the hybrid model by using the GUI

1. Navigate to **Traffic Management > SSL > Change advanced SSL settings**.
2. Enter a value for **Software Crypto Threshold (%)**.

## Set an SNMP alarm for ECDHE exchange rate

ECDHE-based key exchange can cause the transactions per second on the appliance to drop. From release 13.0 build 52.x, you can configure an SNMP alarm for ECDHE-based transactions. In this alarm, you can set the threshold and normal limits for the ECDHE exchange rate. A new counter `nssl_tot_sslInfo_ECDHE_Tx` is added. This counter is the sum of all the ECDHE-based transaction counters on the front-end and back-end of the appliance. When the ECDHE-based key exchange crosses the configured limits an SNMP trap is sent. Another trap is sent when the value is back to the configured normal value.

## Set an SNMP alarm for ECDHE exchange rate using the CLI

At the command prompt, type:

```
1 set snmp alarm ECDHE-EXCHANGE-RATE -logging (ENABLED | DISABLED) -
 severity <severity>
2 -state (ENABLED | DISABLED) -thresholdValue <positive_integer> [-
 normalValue <positive_integer>] -time <secs>
3 <!--NeedCopy-->
```

### Example:

```
1 set snmp alarm ECDHE-EXCHANGE-RATE -logging eENABLED -severity critical
 -state eENABLED -thresholdValue 100 -normalValue 50
2 <!--NeedCopy-->
```

## ECDSA cipher suites support

May 2, 2023

ECDSA cipher suites use elliptical curve cryptography (ECC). Because of its smaller size, it is helpful in environments where processing power, storage space, bandwidth, and power consumption are constrained.

When the ECDHE\_ECDSA cipher group is used, the server's certificate must contain an ECDSA-capable public key.

The following table lists the ECDSA ciphers that are supported on the NetScaler MPX and SDX appliances with N3 chips, NetScaler VPX appliances, MPX 5900/26000, and MPX/SDX 8900/15000 appliances.

Cipher Name	Priority	Description	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm	HexCode
TLS1-ECDHE-ECDSA-AES128-SHA	1	SSLv3	ECC-DHE	ECDSA	AES(128)	SHA1	0xc009
TLS1-ECDHE-ECDSA-AES256-SHA	2	SSLv3	ECC-DHE	ECDSA	AES(256)	SHA1	0xc00a
TLS1.2-ECDHE-ECDSA-AES128-SHA256	3	TLSv1.2	ECC-DHE	ECDSA	AES(128)	SHA-256	0xc023
TLS1.2-ECDHE-ECDSA-AES256-SHA384	4	TLSv1.2	ECC-DHE	ECDSA	AES(256)	SHA-384	0xc024

Cipher Name	Priority	Description	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm	HexCode
TLS1.2-ECDHE-ECDSA-AES128-GCM-SHA256	5	TLSv1.2	ECC-DHE	ECDSA	AES-GCM(128)	SHA-256	0xc02b
TLS1.2-ECDHE-ECDSA-AES256-GCM-SHA384	6	TLSv1.2	ECC-DHE	ECDSA	AES-GCM(256)	SHA-384	0xc02c
TLS1-ECDHE-ECDSA-RC4-SHA	7	SSLv3	ECC-DHE	ECDSA	RC4(128)	SHA1	0xc007
TLS1-ECDHE-ECDSA-DES-CBC3-SHA	8	SSLv3	ECC-DHE	ECDSA	3DES(168)	SHA1	0xc008
TLS1.2-ECDHE-ECDSA-CHACHA20-POLY1305	9	TLSv1.2	ECC-DHE	ECDSA	CHACHA20/POLY1305(256)	SHA384	0xc030

### ECDSA/RSA cipher and certificate selection

You can bind both ECDSA and RSA server certificates at the same time to an SSL virtual server. When both ECDSA and RSA certificates are bound to the virtual server, it automatically selects the appropriate server certificate to present to the client. If the client cipher list includes RSA ciphers, but does

not include ECDSA ciphers, the virtual server presents the RSA server certificate. If both ciphers are present in the client's list, then the server certificate presented depends on the cipher priority set on the virtual server. That is, if RSA has a higher priority, the RSA certificate is presented. If ECDSA has a higher priority, the ECDSA certificate is presented to the client.

### **Client authentication by using an ECDSA or an RSA certificate**

For client authentication, the CA certificate bound to the virtual server can be ECDSA or RSA signed. The appliance supports a mixed certificate chain. For example, the following certificate chain is supported.

Client certificate (ECDSA) <-> CA certificate (RSA) <-> Intermediate certificate (RSA) <-> Root certificate (RSA)

The following table shows the elliptical curves supported on the different NetScaler appliances with ECDSA cipher groups and ECDSA certificates:

---

Elliptical curves	Platforms supported
prime256v1	All platforms, including FIPS.
secp384r1	All platforms, including FIPS.
secp521r1	MPX 5900, MPX/SDX 8900, MPX/SDX 15000, MPX/SDX 26000, VPX
secp224r1	MPX 5900, MPX/SDX 8900. MPX/SDX 15000, MPX/SDX 26000, VPX

---

### **Create an ECDSA certificate-key pair**

You can create an ECDSA certificate-key pair directly on a NetScaler appliance by using the CLI or the GUI. Earlier, you were able to install and bind an ECC certificate-key pair on the appliance, but you had to use OpenSSL to create a certificate-key pair.

Only P\_256 and P\_384 curves are supported.

#### **Note**

This support is available on all platforms except MPX 9700/1050/12500/15500.

### **To create an ECDSA certificate-key pair by using the CLI:**

At the command prompt, type:

```
1 create ssl ecdsaKey <keyFile> -curve (P_256 | P_384) [-keyform (DER
 | PEM)] [-des | -des3] {
2 -password }
3 [-pkcs8]
4 <!--NeedCopy-->
```

**Example:**

```
1 create ecdsaKey ec_p256.ky -curve P_256 -pkcs8
2 Done
3 create ecdsaKey ec_p384.ky -curve P_384
4 Done
5 <!--NeedCopy-->
```

**To create an ECDSA certificate-key pair by using the GUI:**

1. Navigate to **Traffic Management > SSL > SSL Files > Keys** and click **Create ECDSA Key**.
2. To create a key in PKCS#8 format, select **PKCS8**.

## Configure user-defined cipher groups on the ADC appliance

May 2, 2023

A cipher group is a set of cipher suites that you bind to an SSL virtual server, service, or service group on the NetScaler appliance. A cipher suite comprises a protocol, a key exchange (**Kx**) algorithm, an authentication (**Au**) algorithm, an encryption (**Enc**) algorithm, and a message authentication code (**Mac**) algorithm. Your appliance ships with a predefined set of cipher groups. When you create an SSL service or SSL service group, the ALL cipher group is automatically bound to it. However, when you create an SSL virtual server or a transparent SSL service, the DEFAULT cipher group is automatically bound to it. In addition, you can create a user-defined cipher group and bind it to an SSL virtual server, service, or service group.

**Note:** If your MPX appliance does not have any licenses, then only the EXPORT cipher is bound to your SSL virtual server, service, or service group.

To create a user-defined cipher group, first you create a cipher group and then you bind ciphers or cipher groups to this group. If you specify a cipher alias or a cipher group, all the ciphers in the cipher alias or group are added to the user-defined cipher group. You can also add individual ciphers (cipher suites) to a user-defined group. However, you cannot modify a predefined cipher group. Before removing a cipher group, unbind all the cipher suites in the group.

Binding a cipher group to an SSL virtual server, service, or service group, appends the ciphers to the existing ciphers that are bound to the entity. To bind a specific cipher group to the entity, you must

first unbind the ciphers or cipher group that is bound to the entity. Then bind the specific cipher group to the entity. For example, to bind only the AES cipher group to an SSL service, you perform the following steps:

1. Unbind the default cipher group ALL that is bound by default to the service when the service is created.

```
1 unbind ssl service <service name> -cipherName ALL
2 <!--NeedCopy-->
```

2. Bind the AES cipher group to the service

```
1 bind ssl service <Service name> -cipherName AE
2 <!--NeedCopy-->
```

If you want to bind the cipher group DES in addition to AES, at the command prompt, type:

```
1 bind ssl service <service name> -cipherName DES
2 <!--NeedCopy-->
```

**Note:** The free NetScaler virtual appliance supports only the DH cipher group.

### Configure a user-defined cipher group by using the CLI

At the command prompt, type the following commands to add a cipher group, or to add ciphers to a previously created group, and verify the settings:

```
1 add ssl cipher <cipherGroupName>
2 bind ssl cipher <cipherGroupName> -cipherName <cipherGroup/cipherName>
3 show ssl cipher <cipherGroupName>
4 <!--NeedCopy-->
```

#### Example:

```
1 add ssl cipher test
2
3 Done
4
5 bind ssl cipher test -cipherName ECDHE
6
7 Done
8
9 sh ssl cipher test
10

 Mac=AEAD HexCode=0xc0a9
47 Done
48
```

```
49 bind ssl cipher test -cipherName TLS1-ECDHE-RSA-DES-CBC3-SHA
50 <!--NeedCopy-->
```

## Unbind ciphers from a cipher group by using the CLI

At the command prompt, type the following commands to unbind ciphers from a user-defined cipher group, and verify the settings:

```
1 show ssl cipher <cipherGroupName>
2
3 unbind ssl cipher <cipherGroupName> -cipherName <string>
4
5 show ssl cipher <cipherGroupName>
6 <!--NeedCopy-->
```

## Remove a cipher group by using the CLI

**Note:** You cannot remove a built-in cipher group. Before removing a user-defined cipher group, make sure that the cipher group is empty.

At the command prompt, type the following commands to remove a user-defined cipher group, and verify the configuration:

```
1 rm ssl cipher <userDefCipherGroupName> [<cipherName> ...]
2 show ssl cipher <cipherGroupName>
3
4 <!--NeedCopy-->
```

### Example:

```
1 rm ssl cipher test Done
2
3 sh ssl cipher test ERROR: No such resource [cipherGroupName, test]
4 <!--NeedCopy-->
```

## Configure a user-defined cipher group by using the GUI

1. Navigate to **Traffic Management > SSL > Cipher Groups**.
2. Click **Add**.
3. Specify a name for the cipher group.
4. Click **Add** to view the available ciphers and cipher groups.
5. Select a cipher or cipher group, and click the arrow button to add them.
6. Click **Create**.
7. Click **Close**.

**To bind a cipher group to an SSL virtual server, service, or service group by using the CLI:**

At the command prompt, type one of the following:

```
1 bind ssl vservice <vServerName> -cipherName <string>
2
3 bind ssl service <serviceName> -cipherName <string>
4
5 bind ssl serviceGroup <serviceGroupName> -cipherName <string>
6
7 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vservice ssl_vserver_test -cipherName test
2 Done
3
4 bind ssl service nshttps -cipherName test
5 Done
6
7 bind ssl servicegroup ssl_svc -cipherName test
8 Done
9 <!--NeedCopy-->
```

**To bind a cipher group to an SSL virtual server, service, or service group by using the GUI:**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.

For service, replace virtual servers with services. For service groups, replace virtual servers with service groups.

Open the virtual server, service, or service group.

2. In **Advanced Settings**, select **SSL Ciphers**.
3. Bind a cipher group to the virtual server, service, or service group.

**Binding individual ciphers to an SSL virtual server or service**

You can also bind individual ciphers, instead of a cipher group, to a virtual server or service.

**To bind a cipher by using the CLI:**

At the command prompt, type:

```
1 bind ssl vservice <vServerName> -cipherName <string>
2 bind ssl service <serviceName> -cipherName <string>
3 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vservice v1 -cipherName TLS1.2-ECDHE-RSA-AES256-GCM-SHA384
2 Done
```

```

3
4 bind ssl service sslsvc -cipherName TLS1.2-ECDHE-RSA-AES256-GCM-SHA384
5 Done
6 <!--NeedCopy-->

```

### To bind a cipher to an SSL virtual server by using the GUI:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Select an SSL virtual server and click **Edit**.
3. In **Advanced Settings**, select **SSL Ciphers**.
4. In **Cipher Suites**, select **Add**.
5. Search for the cipher in the available list and click the arrow to add it to the configured list.
6. Click **OK**.
7. Click **Done**.

To bind a cipher to an SSL service, repeat the preceding steps after replacing virtual server with service.

## Server certificate support matrix on the ADC appliance

August 4, 2023

NetScaler supports server certificate messages that are fragmented into more than one record if the total size is within 32 KB. Earlier, the maximum supported size was 16 KB and fragmentation was not supported.

The NetScaler appliance supports the following server certificates.

Table 1: Support on front-end (FE) and back-end (BE) service

Server certificate/- Platform	MPX/SDX (N2 CHIPS)	MPX/SDX (N2 CHIPS)	MPX/SDX (N3 CHIPS)	MPX/SDX (N3 CHIPS)	VPX FE	VPX BE
	FE	BE	FE	BE		
MD5	Y	Y	Y	Y	Y	Y
SHA1	Y	Y	Y	Y	Y	Y
SHA224	Y	Y	Y	Y	Y	Y
SHA256	Y	Y	Y	Y	Y	Y
SHA384	Y	Y	Y	Y	Y	Y
SHA512	Y	Y	Y	Y	Y	Y

Server certificate/- Platform	MPX/SDX (N2 CHIPS) FE	MPX/SDX (N2 CHIPS) BE	MPX/SDX (N3 CHIPS) FE	MPX/SDX (N3 CHIPS) BE	VPX FE	VPX BE
RSA Key	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits
DH Key	1024 bits and 2048 bits	1024 bits and 2048 bits	1024 bits and 2048 bits	1024 bits and 2048 bits	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits

Server certificate/Platform	MPX/SDX 14030/14060/14080 FIPS FE	MPX/SDX 14030/14060/14080 FIPS BE
MD5	Y	Y
SHA1	Y	Y
SHA224	Y	Y
SHA256	Y	Y
SHA384	Y	Y
SHA512	Y	Y
RSA Key	2048 bits and 3072 bits	2048 bits and 3072 bits
DH Key	N	N

Server certificate/Platform	MPX 5900, MPX/SDX 8900, MPX/SDX 9100, MPX/SDX 15000, MPX/SDX 15000-50G, MPX/SDX 16000, MPX/SDX 26000, MPX/SDX 26000-50G, MPX/SDX 26000-100G (front end)	MPX 5900, MPX/SDX 8900, MPX/SDX 9100 MPX/SDX 15000, MPX/SDX 15000-50G, MPX/SDX 16000, MPX/SDX 26000, MPX/SDX 26000-50G, MPX/SDX 26000-100G (back end)
MD5	Y	Y
SHA1	Y	Y
SHA224	Y	Y
SHA256	Y	Y
SHA384	Y	Y
SHA512	Y	Y

Server certificate/Platform	MPX 5900, MPX/SDX 8900, MPX/SDX 9100, MPX/SDX 15000, MPX/SDX 15000-50G, MPX/SDX 16000, MPX/SDX 26000, MPX/SDX 26000-50G, MPX/SDX 26000-100G (front end)	MPX 5900, MPX/SDX 8900, MPX/SDX 9100 MPX/SDX 15000, MPX/SDX 15000-50G, MPX/SDX 16000, MPX/SDX 26000, MPX/SDX 26000-50G, MPX/SDX 26000-100G (back end)
RSA Key	1024, 2048, 3072, and 4096 bits	1024, 2048, 3072, and 4096 bits
DH Key	1024 bits and 2048 bits	1024 bits and 2048 bits

### Notes

- 4k certificates require higher CPU cycles and might affect the performance of low-end appliances.
- In release 11.1 and earlier, a NetScaler appliance supports the following “signature algorithms” extensions in the back end client hello message: RSA-MD5, RSA-SHA1, and RSA-SHA256.  
The NetScaler appliance does not support SHA 384 and SHA 512 signature algorithms extensions. Therefore some servers, such as Windows IIS servers, reset the connection.
- Starting release 12.0, a NetScaler appliance supports all the signature\_algorithms extensions.

## Client authentication or Mutual TLS (mTLS)

August 4, 2023

In a typical SSL transaction, the client that is connecting to a server over a secure connection checks the validity of the server. To do so, it checks the server’s certificate before initiating the SSL transaction. Sometimes, however, you might want to configure the server to authenticate the client that is connecting to it.

With client authentication enabled on an SSL virtual server, the NetScaler appliance asks for the client certificate during the SSL handshake. The appliance checks the certificate presented by the client for normal constraints, such as the issuer signature and expiration date.

From release 13.1 build 42.x, the NetScaler appliance supports cross-signed certificate validation. That is, if a certificate is signed by multiple issuers, the validation passes if there is at least one valid path to the root certificate. Earlier, if one of the certificates in the certificate chain was cross-signed and had multiple paths to the root certificate, the ADC appliance only checked for one path. And if that path was not valid, the validation failed.

### Note

For the appliance to verify issuer signatures, the certificate of the CA that issued the client certificate must be:

- Installed on the appliance.
- Bound to the virtual server that the client is transacting with.

If the certificate is valid, the appliance allows the client to access all secure resources. But if the certificate is invalid, the appliance drops the client request during the SSL handshake.

The appliance verifies the client certificate by first forming a chain of certificates, starting with the client certificate, and ending with the root CA certificate for the client (for example, Verisign). The root CA certificate might contain one or more intermediate CA certificates (if the root CA does not directly issue the client certificate).

Before you enable client authentication on the NetScaler appliance, make sure that a valid client certificate is installed on the client. Then, enable client authentication for the virtual server that handles the transactions. Finally, bind the certificate of the CA that issued the client certificate to the virtual server on the appliance.

**Note:** A NetScaler MPX appliance supports a certificate-key pair size from 512 bits to 4096 bits. The certificate must be signed by using one of the following hash algorithms:

- MD5
- SHA-1
- SHA-224
- SHA-256
- SHA-384
- SHA-512

On an SDX appliance, if an SSL chip is assigned to a VPX instance, the certificate-key pair size support of an MPX appliance applies. Otherwise, the normal certificate-key pair size support of a VPX instance applies.

A NetScaler virtual appliance (VPX instance) supports certificates of at least 512 bits, up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate
- 4096-bit certificate on the physical server

The following table shows the RSASSA-PSS parameter sets supported by NetScaler. RSASSA-PSS algorithms are supported in the X.509 certificate path validation.

Public Key OID	Mask Generation Function (MGF)	MGF Digest Function	Signature Digest Function	Salt Length
rsaEncryption	MGF1	SHA-256	SHA-256	32 bytes
rsaEncryption	MGF1	SHA-384	SHA-384	48 bytes
rsaEncryption	MGF1	SHA-512	SHA-512	64 bytes

**Notes:**

- For MPX FIPS limitations, see [MPX FIPS limitations](#).
- For SDX FIPS limitations, see [SDX FIPS limitations](#).

**Provide the client certificate**

Before you configure client authentication, a valid client certificate must be installed on the client. A client certificate includes details about the specific client system that creates secure sessions with the NetScaler appliance. Each client certificate is unique and must be used by only one client system.

Whether you obtain the client certificate from a CA, use an existing client certificate, or generate a client certificate on the NetScaler appliance, you must convert the certificate to the correct format. On the NetScaler appliance, certificates are stored in either the PEM or DER format and must be converted to PKCS#12 format before they are installed on the client system. After converting the certificate and transferring it to the client system, ensure that it is installed on that system and configured for the client application. The application, such as a web browser, must be part of the SSL transactions.

For instructions on how to convert a certificate from PEM or DER format to PKCS#12 format, see [Import and convert SSL files](#).

For instructions on how to generate a client certificate, see [Create a certificate](#).

**Enable client-certificate based authentication**

By default, client authentication is disabled on the NetScaler appliance, and all SSL transactions proceed without authenticating the client. You can configure client authentication to be either optional or mandatory as part of the SSL handshake.

If client authentication is optional, the appliance requests the client certificate but proceeds with the SSL transaction even if the client presents an invalid certificate. If client authentication is mandatory, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate.

**Caution:** Citrix recommends that you define proper access control policies before changing the client-certificate-based authentication check to optional.

**Note:** Client authentication is configured for individual SSL virtual servers, not globally.

### Enable client-certificate based authentication by using the CLI

At the command prompt, type the following commands to enable the client-certificate-based authentication and verify the configuration:

```
1 set ssl vserver <vServerName> [-clientAuth (ENABLED | DISABLED)] [-
 clientCert (MANDATORY | OPTIONAL)]
2 show ssl vserver <vServerName>
3 <!--NeedCopy-->
```

### Example:

```
1 set ssl vserver vssl -clientAuth ENABLED -clientCert Mandatory
2 Done
3 show ssl vserver vssl
4
5 Advanced SSL configuration for VServer vssl:
6 DH: DISABLED
7 Ephemeral RSA: ENABLED Refresh Count: 0
8 Session Reuse: ENABLED Timeout: 120 seconds
9 Cipher Redirect: DISABLED
10 SSLv2 Redirect: DISABLED
11 ClearText Port: 0
12 Client Auth: ENABLED Client Cert Required: Mandatory
13 SSL Redirect: DISABLED
14 Non FIPS Ciphers: DISABLED
15 SNI: DISABLED
16 OCSP Stapling: DISABLED
17 HSTS: DISABLED
18 HSTS IncludeSubDomains: NO
19 HSTS Max-Age: 0

 .2: ENABLED
21
22 1) CertKey Name: sslkey Server Certificate
23
24 1) Policy Name: client_cert_policy Priority: 0
25
26 1) Cipher Name: DEFAULT
27 Description: Predefined Cipher Alias
28 Done
29 <!--NeedCopy-->
```

### Enable client-certificate based authentication by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.

2. In the **SSL Parameters** section, select **Client Authentication**, and in the **Client Certificate** list, select **Mandatory**.

**Note:**

If client authentication is set to mandatory and if the client certificate contains policy extensions, certificate validation fails. Set a parameter in the front-end SSL profile to skip this check. The parameter is disabled by default. That is, the check is performed by default.

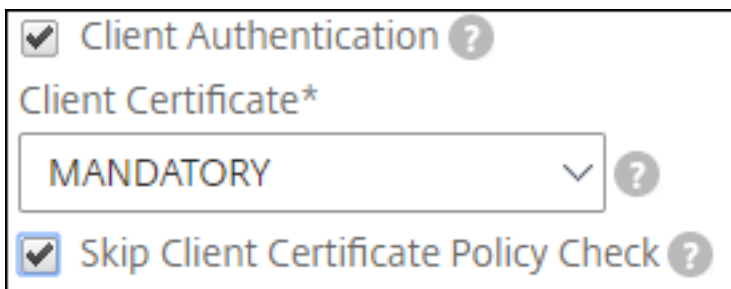

**Skip the policy extension check during client authentication by using the CLI**

At the command prompt, type:

```
1 set ssl profile ns_default_ssl_profile_frontend -clientauth ENABLED -
 skipClientCertPolicyCheck ENABLED
2
3 Parameter
4
5 skipClientCertPolicyCheck
6
7 Control policy extension check, if present inside the
 X509 certificate chain. Applicable only if client
 authentication is enabled and client certificate is
 set to mandatory. Possible values functions as follows
 :
8
9 - ENABLED: Skip the policy check during client authentication.
10
11 - DISABLED: Perform policy check during client authentication.
12
13 Possible values: ENABLED, DISABLED
14
15 Default: DISABLED
16 <!--NeedCopy-->
```

**Skip the policy extension check during client authentication by using the GUI**

1. Navigate to **System > Profiles > SSL Profiles**.
2. Create a new front-end profile or edit an existing front-end profile.
3. Verify that client authentication is enabled and client certificate is set to mandatory.
4. Select **Skip Client Certificate Policy Check**.

The screenshot shows a configuration window for Client Authentication. It includes a checked checkbox for 'Client Authentication', a dropdown menu for 'Client Certificate\*' currently set to 'MANDATORY', and a checked checkbox for 'Skip Client Certificate Policy Check'. Each item has a help icon (question mark) to its right.

### Bind CA certificates to the virtual server

A CA whose certificate is present on the NetScaler appliance must issue the client certificate used for client authentication. Bind this certificate to the NetScaler virtual server that carries out client authentication.

Bind the CA certificate to the SSL virtual server in such a way that the appliance can form a complete certificate chain when it verifies the client certificate. Otherwise, certificate chain formation fails and the client is denied access even if its certificate is valid.

You can bind CA certificates to the SSL virtual server in any order. The appliance forms the proper order during client certificate verification.

For example, if the client presents a certificate issued by **CA\_A**, where **CA\_A** is an intermediate CA whose certificate is issued by **CA\_B**, whose certificate is in turn issued by a trusted root CA, **Root\_CA**, a chain of certificates that contain all three of these certificates must be bound to the virtual server on the NetScaler appliance.

For instructions on binding one or more certificates to the virtual server, see [Bind the certificate-key pair to the SSL virtual server](#).

For instructions on creating a chain of certificates, see [Create a chain of certificates](#).

### Stricter control on client certificate validation

The NetScaler appliance accepts valid Intermediate-CA certificates if issued by a single Root-CA. That is, if only the Root-CA certificate is bound to the virtual server, and that Root-CA validates any intermediate certificate sent with the client certificate, the appliance trusts the certificate chain and the handshake is successful.

However, if a client sends a chain of certificates in the handshake, none of the intermediate certificates can be validated by using a CRL or OCSP responder unless that certificate is bound to the SSL virtual server. Therefore, even if one of the intermediate certificates is revoked, the handshake is successful. As part of the handshake, the SSL virtual server sends the list of CA certificates that are bound to it. For stricter control, you can configure the SSL virtual server to accept only a certificate that is

signed by one of the CA certificates bound to that virtual server. To do so, you must enable the **ClientAuthUseBoundCACChain** setting in the SSL profile bound to the virtual server. The handshake fails if one of the CA certificates bound to the virtual server has not signed the client certificate.

For example, say two client certificates, clientcert1 and clientcert2, are signed by the intermediate certificates Int-CA-A and Int-CA-B, respectively. The intermediate certificates are signed by the root certificate Root-CA. Int-CA-A and Root-CA are bound to the SSL virtual server. In the default case (ClientAuthUseBoundCACChain disabled), both clientcert1 and clientcert2 are accepted. However, if ClientAuthUseBoundCACChain is enabled, the NetScaler appliance only accepts clientcert1.

### Enable stricter control on client certificate validation by using the CLI

At the command prompt, type:

```
1 set ssl profile <name> -ClientAuthUseBoundCACChain Enabled
2 <!--NeedCopy-->
```

### Enable stricter control on client certificate validation by using the GUI

1. Navigate to **System > Profiles**, select the **SSL Profiles** tab, and create an SSL profile, or select an existing profile.
2. Select **Enable Client Authentication using bound CA Chain**.

## Server authentication

August 4, 2023

Since the NetScaler appliance performs SSL offload and acceleration on behalf of a web server, the appliance does not usually authenticate the Web server's certificate. However, you can authenticate the server in deployments that require end-to-end SSL encryption.

In such a situation, the appliance becomes the SSL client and carries out a secure transaction with the SSL server. It verifies that a CA whose certificate is bound to the SSL service has signed the server certificate, and checks the validity of the server certificate.

To authenticate the server, enable server authentication and bind the certificate of the CA that signed the server's certificate to the SSL service on the ADC appliance. When binding the certificate, you must specify the bind as a CA option.

NetScaler supports cross-signed certificate validation. That is, if a certificate is signed by multiple issuers, the validation passes if there is at least one valid path to the root certificate. In release 13.1

build 42.x and earlier, if one of the certificates in the certificate chain was cross-signed and had multiple paths to the root certificate, the appliance only checked for one path. And if that path was not valid, the validation failed.

## Enable (or disable) server certificate authentication

You can use the CLI and the GUI to enable and disable server certificate authentication.

### Enable (or disable) server certificate authentication using the CLI

At the command prompt, type the following commands to enable server certificate authentication and verify the configuration:

```
1 set ssl service <serviceName> -serverAuth (ENABLED | DISABLED)
2 show ssl service <serviceName>
3 <!--NeedCopy-->
```

#### Example:

```
1 set ssl service ssl-service-1 -serverAuth ENABLED
2
3 show ssl service ssl-service-1
4
5 Advanced SSL configuration for Back-end SSL Service ssl-
 service-1:`
6 DH: DISABLED
7 Ephemeral RSA: DISABLED
8 Session Reuse: ENABLED Timeout: 300 seconds
9 Cipher Redirect: DISABLED
10 SSLv2 Redirect: DISABLED
11 Server Auth: ENABLED
12 SSL Redirect: DISABLED
13 Non FIPS Ciphers: DISABLED
14 SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
15 1) Cipher Name: ALL
16 Description: Predefined Cipher Alias
17 Done
18 <!--NeedCopy-->
```

### Enable (or disable) server certificate authentication by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**, and open an SSL service.
2. In the SSL Parameters section, select Enable Server Authentication, and specify a Common Name.
3. In Advanced Settings, select Certificates, and bind a CA certificate to the service.

## Bind the CA certificate to the service by using the CLI

At the command prompt, type the following commands to bind the CA certificate to the service and verify the configuration:

```
1 bind ssl service <serviceName> -certkeyName <string> -CA
2
3 show ssl service <serviceName>
4 <!--NeedCopy-->
```

### Example:

```
1 bind ssl service ssl-service-1 -certkeyName samplecertkey -CA
2
3 show ssl service ssl-service-1
4
5 Advanced SSL configuration for Back-end SSL Service ssl-
6 service-1:
7 DH: DISABLED
8 Ephemeral RSA: DISABLED
9 Session Reuse: ENABLED Timeout: 300 seconds
10 Cipher Redirect: DISABLED
11 SSLv2 Redirect: DISABLED
12 Server Auth: ENABLED
13 SSL Redirect: DISABLED
14 Non FIPS Ciphers: DISABLED
15 SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
16 1) CertKey Name: samplecertkey CA Certificate
17 CRLCheck: Optional
18 1) Cipher Name: ALL
19 Description: Predefined Cipher Alias
20 Done
21 <!--NeedCopy-->
```

## Configure a common name for server certificate authentication

In end-to-end encryption with server authentication enabled, you can include a common name in the configuration of an SSL service or service group. The name that you specify is compared to the common name in the server certificate during an SSL handshake. If the two names match, the handshake is successful.

If the common names do not match, the common name specified for the service or service group is compared to the values in the subject alternative name (SAN) field in the certificate. If it matches one of those values, the handshake is successful. This configuration is especially useful if there are, for example, two servers behind a firewall and one of the servers spoofs the identity of the other. If the common name is not checked, a certificate presented by either server is accepted if the IP address matches.

**Note:** Only domain name, URL, and email ID DNS entries in the SAN field are compared.

## Configure common-name verification for an SSL service or service group by using the CLI

At the command prompt, type the following commands to specify server authentication with common-name verification and verify the configuration:

1. To configure a common name in a service, type:

```
1 set ssl service <serviceName> -commonName <string> -serverAuth
 ENABLED
2 show ssl service <serviceName>
3 <!--NeedCopy-->
```

2. To configure a common name in a service group, type:

```
1 set ssl serviceGroup <serviceName> -commonName <string> -
 serverAuth ENABLED
2 show ssl serviceGroup <serviceName>
3 <!--NeedCopy-->
```

### Example:

```
1 set ssl service svc1 -commonName xyz.com -serverAuth ENABLED
2
3 show ssl service svc
4
5 Advanced SSL configuration for Back-end SSL Service svc1:
6 DH: DISABLED
7 Ephemeral RSA: DISABLED
8 Session Reuse: ENABLED Timeout: 300 seconds
9 Cipher Redirect: DISABLED
10 SSLv2 Redirect: DISABLED
11 Server Auth: ENABLED Common Name: www.xyz.com
12 SSL Redirect: DISABLED
13 Non FIPS Ciphers: DISABLED
14 SNI: DISABLED
15 SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
16 1) CertKey Name: cacert CA Certificate OCSPCheck: Optional
17 1) Cipher Name: ALL
18 Description: Predefined Cipher Alias
19 Done
20 <!--NeedCopy-->
```

## Configure common-name verification for an SSL service or service group by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services** or Navigate to **Traffic Management > Load Balancing > Service Groups**, and open a service or service group.
2. In the **SSL Parameters** section, select **Enable Server Authentication**, and specify a common name.

## SSL actions and policies

May 2, 2023

An SSL policy evaluates incoming traffic and applies a predefined action to requests that match a rule (expression). Configure the actions before creating the policies, so that you can specify an action when you create a policy. To put a policy into effect, do one of the following:

- Bind the policy to a virtual server on the appliance, so that it applies only to traffic flowing through that virtual server.
- Bind the policy globally, so that it applies to all traffic flowing through the appliance.

SSL actions define SSL settings that you can apply to the selected requests. You associate an action with one or more policies. Data in client connection requests or responses is compared to a rule specified in the policy, and the action is applied to connections that match the rule (expression).

You can configure classic policies with classic expressions and Advanced policy policies with Advanced policy expressions for SSL.

**Note:** Users who are not experienced in configuring policies at the CLI usually find using the configuration utility to be considerably easier.

You can associate a user-defined action or a built-in action to a Advanced policy. Classic policies allow only user-defined actions. In Advanced policy, you can also group policies under a policy label, in which case they are applied only when invoked from another policy.

Common uses of SSL actions and policies include per-directory client authentication, support for Outlook web access, and SSL-based header insertions. SSL-based header insertions contain SSL settings required by a server whose SSL processing has been offloaded to the NetScaler appliance.

## SSL policies

May 2, 2023

Policies on the NetScaler appliance help identify specific connections that you want to process. The processing is based on the actions that are configured for that particular policy. Once you create the policy and configure an action for it, you must do one of the following:

- Bind the policy to a virtual server on the appliance, so that it applies only to traffic flowing through that virtual server.
- Bind the policy globally, so that it applies to all traffic flowing through any virtual server configured on the NetScaler appliance.

The NetScaler appliance SSL feature supports Advanced policy (advanced) policies. For a complete description of Advanced policy expressions, how they work, and how to configure them manually, see [Policies and Expressions](#). For more information about SSL expressions, see [Advanced policy expressions: parsing SSL](#).

**Note:**

Users who are not experienced in configuring policies at the CLI usually find using the configuration utility considerably easier.

SSL policies require that you create an action before creating a policy, so that you can specify the actions when you create the policies.

In SSL Advanced policies, you can also use the built-in actions. For more information about built-in actions, see [SSL built-in actions and user-defined actions](#).

## SSL Advanced policies

An SSL Advanced policy, also known as an advanced policy, defines a control or a data action to be performed on requests. SSL policies can therefore be categorized as control policies and data policies:

- **Control policy.** A control policy uses a control action, such as forcing client authentication.  
Note: In release 10.5 or later, deny SSL renegotiation (`denySSLReneg`) is set, by default, to ALL. However, control policies, such as CLIENTAUTH, trigger a renegotiation handshake. If you use such policies, you must set `denySSLReneg` to NO.
- **Data policy.** A data policy uses a data action, such as inserting some data into the request.

The essential components of a policy are an expression and an action. The expression identifies the requests on which the action is to be performed.

You can configure an Advanced policy with a built-in action or a user-defined action. You can configure a policy with a built-in action without creating a separate action. However, to configure a policy with a user-defined action, first configure the action and then configure the policy.

You can specify an extra action, called an UNDEF action, to be performed when applying the expression to a request has an undefined result.

## SSL policy configuration

You can configure an SSL Advanced policy by using the CLI and the GUI.

## Configure an SSL policy by using the CLI

At the command prompt, type:

```
1 add ssl policy <name> -rule <expression> -Action <string> [-undefAction
 <string>] [-comment <string>]
2 <!--NeedCopy-->
```

## Configure an SSL policy by using the GUI

Navigate to **Traffic Management > SSL > Policies** and, on the **Policies** tab, click *Add*.

## Support for SSL policies with TLS1.3 protocol

From release 13.0 build 71.x and later, support is added for SSL policies with the TLS1.3 protocol. When the TLSv1.3 protocol is negotiated for a connection, policy rules that inspect TLS data received from the client now trigger the configured action.

For example, if the following policy rule returns true, the traffic is forwarded to the virtual server defined in the action.

```
1 add ssl action action1 -forward vserver2
2 add ssl policy pol1 -rule client.ssl.client_hello.sni.contains(" xyz ")
 -action action1
3 <!--NeedCopy-->
```

## Limitations

- Control policies are not supported.
- The following actions are not supported:
  - DOCLIENTAUTH
  - NOCLIENTAUTH
  - caCertGrpName
  - clientCertVerification
  - ssllogProfile

## SSL built-in actions and user-defined actions

May 2, 2023

Unless you need only the built-in actions in your policies, you have to create the actions before creating the policies. Then, you can specify the actions when you create the policies. The built-in actions are of two types, control actions and data actions. You use control actions in control policies, and data actions in data policies.

The built-in control actions are:

- DOCLIENTAUTH—Perform client certificate authentication. (Not supported for TLS1.3)
- NOCLIENTAUTH—Do not perform client certificate authentication. (Not supported for TLS1.3)

The built-in data actions are:

- RESET—Close the connection by sending an RST packet to the client.
- DROP—Drop all packets from the client. The connection remains open until the client closes it.
- NOOP—Forward the packet without performing any operation on it.

**Note:** Any dependent actions to client authentication, such as clientCertVerification and ssllogProfile, are not supported with the TLS 1.3 protocol.

You can create user-defined data actions. If you enable client authentication, you can create an SSL action to insert client-certificate data into the request header before forwarding the request to the web server.

If a policy evaluation results in an undefined state, an UNDEF action is performed. For either a data policy or a control policy, you can specify RESET, DROP, or NOOP as the UNDEF action. For a control policy, you also have the option of specifying DOCLIENTAUTH or NOCLIENTAUTH.

### Examples of built-in actions in a policy

In the following example, if the client sends a cipher other than an EXPORT category cipher, the NetScaler appliance requests client authentication. The client has to provide a valid certificate for a successful transaction.

```
1 add ssl policy pol1 -rule CLIENT.SSL.CIPHER_EXPORTABLE.NOT -reqAction
 DOCLIENTAUTH
2 <!--NeedCopy-->
```

The following examples assume that client authentication is enabled.

If the version in the certificate provided by the user matches the version in the policy, no action is taken and the packet is forwarded:

```
1 add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -
 reqAction NOOP
2 <!--NeedCopy-->
```

If the version in the certificate provided by the user matches the version in the policy, the connection is dropped:

```
1 add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -
 reqAction DROP
2 <!--NeedCopy-->
```

If the version in the certificate provided by the user matches the version in the policy, the connection is reset:

```
1 add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -
 reqAction RESET
2 <!--NeedCopy-->
```

## Client certificate verification with policy based client authentication

You can set client certificate verification to mandatory or option when you have configured policy based client authentication. Default is mandatory.

### Set client certificate verification to optional using the CLI

At the command prompt, type:

```
1 add ssl action <name> ((-clientAuth (DOCLIENTAUTH | NOCLIENTAUTH) [-
 clientCertVerification (Mandatory | Optional)])
2 <!--NeedCopy-->
```

#### Example:

```
1 add ssl action sslact -clientauth DOCLIENTAUTH -clientcertverification
 OPTIONAL
2 <!--NeedCopy-->
```

### Set client certificate verification to optional using the GUI

1. Navigate to **Traffic Management > SSL > Policies**.
2. On the **SSL Actions** tab, click **Add**.
3. Specify a name and in the **Client Certificate Verification** list, select **Optional**.

## User-defined SSL actions

In addition to built-in actions, you can also configure other SSL actions depending on your deployment. These actions are called user-defined actions.

## Configure a user-defined SSL action by using the CLI

At the command prompt, type the following commands to configure an action and verify the configuration:

```
1 add SSL action <name> -clientAuth(DOCLIENTAUTH | NOCLIENTAUTH) -
 clientCert (ENABLED | DISABLED) certHeader <string> -clientHeader <
 string> -clientCertSerialNumber (ENABLED | DISABLED) -
 certSerialHeader <string> -clientCertSubject (ENABLED | DISABLED) -
 certSubjectHeader <string> -clientCertHash (ENABLED | DISABLED) -
 certHashHeader <string> -clientCertIssuer (ENABLED | DISABLED) -
 certIssuerHeader <string> -sessionID (ENABLED | DISABLED) -
 sessionIDheader <string> -cipher (ENABLED | DISABLED) -cipherHeader
 <string> -clientCertNotBefore (ENABLED | DISABLED) -
 certNotBeforeHeader <string> -clientCertNotAfter (ENABLED | DISABLED
) -certNotAfterHeader <string> -OWASupport (ENABLED | DISABLED)
2 <!--NeedCopy-->
```

```
1 show ssl action [<name>]
2 <!--NeedCopy-->
```

### Example:

```
1 add ssl action Action-SSL-ClientCert -clientCert ENABLED -certHeader "X
 -Client-Cert"
2 <!--NeedCopy-->
```

```
1 show ssl action Action-SSL-ClientCert
2
3 1) Name: Action-SSL-ClientCert
4 Data Insertion Action:
5 Cert Header: ENABLED Cert Tag: X-Client-Cert
6 Done
7 <!--NeedCopy-->
```

## Configure a user-defined SSL action by using the GUI

Navigate to **Traffic Management > SSL > Policies** and, on the **Actions** tab, click **Add**.

### Configure an SSL action to forward client traffic to another virtual server

Admins can configure an SSL action to forward the client traffic received on an SSL virtual server to another virtual server to avoid SSL offloading. Or for terminating the connection on the ADC appliance. This virtual server can be of the type: SSL, TCP, or SSL\_BRIDGE. For example, admins can choose to forward the request to another virtual server for further action instead of terminating the connection if any of the following cases:

- The appliance does not have a certificate.
- The appliance does not support a specific cipher.

To achieve the above, a new bind point 'CLIENTHELLO\_REQ' is added to evaluate client traffic when a client hello is received. If the policy bound to the virtual server receiving client traffic evaluates to true after parsing the client hello, the traffic is forwarded to another virtual server. If this virtual server is of type SSL, it performs the handshake. If this virtual server is of type TCP or SSL\_BRIDGE, the back-end server performs the handshake.

In release 12.1-49.x, only the forward and reset actions are supported for the CLIENTHELLO\_REQ bind point. The following expression prefixes are available:

- CLIENT.SSL.CLIENT\_HELLO.CIPHERS.HAS\_HEXCODE
- CLIENT.SSL.CLIENT\_HELLO.CLIENT\_VERSION
- CLIENT.SSL.CLIENT\_HELLO.IS\_RENEGOTIATE
- CLIENT.SSL.CLIENT\_HELLO.IS\_REUSE
- CLIENT.SSL.CLIENT\_HELLO.IS\_SCSV
- CLIENT.SSL.CLIENT\_HELLO.IS\_SESSION\_TICKET
- CLIENT.SSL.CLIENT\_HELLO.LENGTH
- CLIENT.SSL.CLIENT\_HELLO.SNI
- CLIENT.SSL.CLIENT\_HELLO.ALPN.HAS\_NEXTPROTOCOL (from release 13.0 build 61.x)

For a description of these prefixes, see [Advanced policy expressions: parsing SSL](#).

A parameter `forward` is added to the `add SSL action` command and a new bind point `CLIENTHELLO_REQ` is added to the `bind ssl vserver` command.

### Configuration using the CLI

At the command prompt, type:

```
1 add ssl action <name> -forward <virtual server name>
2
3 add ssl policy <name> -rule <expression> -action <string>
4
5 bind ssl vserver <vServerName> -policyName <string> -priority <
 positive_integer> -type <type>
6 <!--NeedCopy-->
```

#### EXAMPLE:

```
1 add ssl action act1 -forward v2
2
3 add ssl policy pol1 -rule client.ssl.client_hello.ciphers.has_hexcode(0
 x002f) -action act1
4
```

```
5 bind ssl vserver v1 -policyName pol1 -priority 1 -type CLIENTHELLO_REQ
6 <!--NeedCopy-->
```

## Configuration using the GUI

Navigate to **Traffic Management > SSL > Policies**.

### Create SSL action:

1. In **SSL Actions**, click **Add**.
2. In **Create SSL Action**, specify a name for the action.
3. In **Forward Action Virtual Server**, select an existing virtual server or add a new virtual server to forward the traffic to.
4. Optionally, set other parameters.
5. Click **Create**.

### Create SSL policy:

1. In **SSL Policies**, click **Add**.
2. In **Create SSL Policy**, specify a name for the policy.
3. In **Action**, select the action that you created earlier.
4. In **Expression Editor**, enter the rule to evaluate.
5. Click **Create**.

### Create or add a virtual server and bind policy:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Add or select a virtual server.
3. In **Advanced Settings**, click **SSL Policies**.
4. Click in the SSL Policy section.
5. In **Select Policy**, select the policy that you created earlier.
6. In **Policy Binding**, specify a priority for the policy.
7. In **Type**, select **CLIENTHELLO\_REQ**.
8. Click **Bind**.
9. Click **Done**.

For the end-to-end configuration for the most popular use cases, see the following topics:

- [Configure SSL action to forward client traffic if the appliance does not have a domain specific \(SNI\) certificate.](#)
- [Configure an SSL action to forward client traffic based on the protocol in the ALPN extension of the client hello message.](#)
- [Configure SSL action to forward client traffic if a cipher is not supported on the ADC.](#)

## SSL action to selectively pick CAs based on SNI for client authentication

You can send only the list of CAs based on SNI (domain) in the client certificate request rather than the list of all the CAs bound to an SSL virtual server. For example, when a client hello is received, only the CA certificates based on the SSL policy expression (for example, SNI) are sent. To send a specific set of certificates, you must create a CA certificates group. Then, bind this group to an SSL action, and bind the action to an SSL policy. If the policy bound to the virtual server receiving client traffic evaluates to true after parsing the client hello, only a specific CA certificates group is sent in the client request certificate.

Earlier, you had to bind CA certificates to an SSL virtual server. With this enhancement, you can simply add CA certificate groups and associate them to an SSL action.

**Note:** Enable client authentication and SNI on the SSL virtual server. Bind the correct SNI certificates to the virtual server.

Perform the following steps:

1. Add a CA certificate group.
2. Add certificate-key pairs.
3. Bind the certificate-key pairs to this group.
4. Add an SSL action.
5. Add an SSL policy. Specify the action in the policy.
6. Bind the policy to an SSL virtual server. Specify the bind point as CLIENTHELLO\_REQ.

### Configuration using the CLI

At the command prompt, type the following commands in a sequence:

```
1 add ssl caCertGroup <caCertGroupName>
2 add ssl certkey <certkey_name> -cert <cert> -key <key>
3 bind ssl caCertGroup <caCertGroupName> <certkey_name>
4 add ssl action <name> -caCertGrpName <string>
5 add ssl policy <name> -rule <expression> -action <string>
6 bind ssl vserver <vServerName> -policyName <string> -priority <
 positive_integer> -type CLIENTHELLO_REQ
7 <!--NeedCopy-->
```

### Example:

```
1 add ssl cacertGroup ca_cert_group
2
3 add ssl certkey ca_certkey1 -cert cacert1 -key cakey1
4 add ssl certkey ca_certkey2 -cert cacert2 -key cakey2
5 add ssl certkey snicert -cert snicert -key snikey
```

```
6
7 bind ssl cacertGroup ca_cert_group ca_certkey1
8 bind ssl caCertGroup ca_cert_group ca_certkey2
9 <!--NeedCopy-->
```

```
1 sh ssl caCertGroup ca_cert_group
2
3 CA GROUP NAME: ca_cert_group
4 ACTIONS REFERRING: 1
5
6 1) CertKey Name: ca_certkey1 CA Certificate CRLCheck: Optional
 CA_Name Sent
7 2) CertKey Name: ca_certkey2 CA Certificate CRLCheck: Optional
 CA_Name Sent
8 <!--NeedCopy-->
```

```
1 add ssl action pick_ca_group -cacertGrpName ca_cert_group
2 <!--NeedCopy-->
```

```
1 sh ssl action pick_ca_group
2 1) Name: pick_ca_group
3 Type: Data Insertion
4 PickCaCertGroup: ca_cert_group
5 Hits: 0
6 Undef Hits: 0
7 Action Reference Count: 1
8 <!--NeedCopy-->
```

```
1 add ssl policy snipolicy -rule client.ssl.client_hello.sni.contains("
 abc") -action pick_ca_group
2 bind ssl vserver v_SSL -policyName snipolicy -type CLIENTHELLO_REQ -
 priority 10
3 <!--NeedCopy-->
```

```
1 sh ssl policy snipolicy
2 Name: snipolicy
3 Rule: client.ssl.client_hello.sni.contains("abc")
4 Action: pick_ca_group
5 UndefAction: Use Global
6 Hits: 0
7 Undef Hits: 0
8
9
10 Policy is bound to following entities
11 1) Bound to: CLIENTHELLO_REQ VSERVER v_SSL
12 Priority: 10
13 <!--NeedCopy-->
```

```
1 set ssl vserver v_SSL -clientauth ENABLED -SNIEnable ENABLED
2 bind ssl vserver v_SSL -certkeyName snicert -sniCert
3 <!--NeedCopy-->
```

```
1 sh ssl vserver v_SSL
2
3 Advanced SSL configuration for VServer v_SSL:

```

## Configuration using the GUI

### Create CA certificates group and bind certificates to the group:

1. Navigate to **Traffic Management > SSL > CA Certificates Group**.
2. Click **Add** and specify a name for the group.
3. Click **Create**.
4. Select the **CA certificate group** and then click **Show Bindings**.

5. Click **Bind**.
6. In the **CA Certificate Binding** page, select an existing certificate or click **Add** to add a new certificate.
7. Click **Select** and then click **Bind**.
8. To bind another certificate, repeat steps 5 through 7.
9. Click **Close**.

Navigate to **Traffic Management > SSL > Policies**.

**Create SSL action:**

1. In **SSL Actions**, click **Add**.
2. In **Create SSL Action**, specify a name for the action.
3. In **Forward Action Virtual Server**, select an existing virtual server or add a virtual server to forward the traffic to.
4. Optionally, set other parameters.
5. Click **Create**.

**Create SSL policy:**

1. In **SSL Policies**, click **Add**.
2. In **Create SSL Policy**, specify a name for the policy.
3. In **Action**, select the action created earlier.
4. In **Expression Editor**, enter the rule to evaluate.
5. Click **Create**.

**Create or add a virtual server and bind policy:**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Add or select a virtual server.
3. In **Advanced Settings**, click **SSL Policies**.
4. Click in the SSL Policy section.
5. In **Select Policy**, select the policy that you created earlier.
6. In **Policy Binding**, specify a priority for the policy.
7. In **Type**, select **CLIENTHELLO\_REQ**.
8. Click **Bind**.
9. Click **Done**.

**Unbind a CA certificate group by using the GUI**

1. Navigate to **Traffic Management > SSL > CA Certificates Group**.
2. Select a certificate group and click **Show Bindings**.
3. Select the certificate to remove from the group and click **Unbind**.

4. If prompted for confirmation, click **\*\*Yes\*\***.
5. Click **Close**.

### Remove a CA certificate group by using the GUI

1. Navigate to **Traffic Management > SSL > CA Certificates Group**.
2. Select a certificate group and click **Delete**.
3. If prompted for confirmation, click **Yes**.

## SSL policy binding

May 2, 2023

You can bind SSL policies globally or to an SSL type virtual server only. Globally bound policies are evaluated after all policies bound to services, virtual servers, or other NetScaler bind points are evaluated. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered, and the action associated with it is carried out.

When binding an SSL policy to a virtual server, you must select from one of the following bind points:

- REQUEST (Default bind point. Policy evaluation is done in the HTTP layer after the SSL handshake is completed.)
- INTERCEPT\_REQ (This option applies to a Citrix Secure Web Gateway setup. For more information, see [SSL policy infrastructure for SSL interception](#)).
- CLIENTHELLO\_REQ

Similarly, when unbinding a policy from a virtual server, you must specify the bind point.

If you specify CLIENTHELLO\_REQ as the bind point, the policy is evaluated when a client hello message is received. The allowed actions are RESET, FORWARD, and `caCertGrpName`. The reset action terminates the connection. The forward action forwards the request to a load balancing virtual server for processing. The `caCertGrpName` action selectively picks CAs based on SNI for client authentication. For more information about SSL actions, see [SSL built-in actions and user-defined actions](#).

**Note:** The action `caCertGrpName` is not supported with the TLS 1.3 protocol.

### Bind an SSL policy globally by using the CLI

At the command prompt, type the following command to bind a global SSL policy and verify the configuration:

```

1 bind ssl global - policyName <string> [- priority <positive_integer>]
2 show ssl global
3 <!--NeedCopy-->

```

**Example:**

```

1 bind ssl global -policyName Policy-SSL-2 -priority 90
2 Done
3
4 sh ssl global
5
6 1) Name: Policy-SSL-2 Priority: 90
7 2) Name: Policy-SSL-1 Priority: 100
8 Done
9 <!--NeedCopy-->

```

**Bind an SSL policy globally by using the GUI**

1. Navigate to **Traffic Management > SSL > Policies**.
2. In the details pane, click **Global Bindings**.
3. In the **Bind/Unbind SSL Policies to Global** dialog box, click **Insert Policy**.
4. In the **Policy Name** list, select a policy.
5. Optionally, drag the entry to a new position in the policy bank to automatically update the priority level.
6. Click **OK**. A message appears in the status bar, stating that the policy has been bound successfully.

**Bind or unbind an SSL policy to a virtual server by using the CLI**

At the command prompt, type the following command to bind an SSL policy to a virtual server and verify the configuration:

```

1 bind ssl vserver <vServerName> -policyName <string> -priority <
 positive_integer> -type <type>
2
3 unbind ssl vserver <vServerName> -policyName <string> -priority <
 positive_integer> -type <type>
4
5 <!--NeedCopy-->

```

**Example:**

```

1 bind ssl vserver v1 -policyName pol1 -priority 1 -type CLIENTHELLO_REQ
2 <!--NeedCopy-->

```

```
1 unbind ssl vsrver v1 -policyName pol1 -priority 1 -type
 CLIENTHELLO_REQ
2 <!--NeedCopy-->
```

```
1 show ssl vsrver vs-server
2
3 Advanced SSL configuration for VServer vs-server:
4
5 DH: DISABLED
6
7 Ephemeral RSA: ENABLED Refresh Count: 1000
8
9 Session Reuse: ENABLED Timeout: 120 seconds
10
11 Cipher Redirect: DISABLED
12
13 SSLv2 Redirect: DISABLED
14
15 ClearText Port: 80
16
17 Client Auth: DISABLED
18
19 SSL Redirect: ENABLED
20
21 SSL-REDIRECT Port Rewrite: ENABLED
22
23 Non FIPS Ciphers: DISABLED
24
25 SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
26
27 1) Policy Name: ssl-policy-1 Priority: 10
28
29 1) Cipher Name: DEFAULT
30
31 Description: Predefined Cipher Alias
32
33 Done
34 <!--NeedCopy-->
```

## Bind an SSL policy to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open an SSL virtual server.
2. In **Advanced Settings**, select **SSL Policy**. Click in the **SSL policy** section to bind a policy to the virtual server.
3. In the **Policy Binding** page, select an existing policy or add a new policy.
4. Specify priority and type (bind point) for the policy.
5. Select **Bind**.

6. Select **Done**.

## SSL policy labels

May 24, 2023

Policy labels are holders for policies. A policy label helps in managing a group of policies, called a policy bank, which can be invoked from another policy. SSL policy labels can be control labels or data labels, depending on the type of policies that are included in the policy label. You can add only data policies in a data policy label and only control policies in a control policy label. To create the policy bank, bind policies to the label and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. At the CLI, you enter two commands to create a policy label and bind policies to the policy label. In the configuration utility, you select options from a dialog box.

**Note:** Policy labels of type control are not supported with the TLS 1.3 protocol.

### Create an SSL policy label and bind policies to the label by using the CLI

At the command prompt, type:

```
1 add ssl policylabel <labelName> -type (CONTROL | DATA)
2
3 bind ssl policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]
4 <!--NeedCopy-->
```

#### Example:

```
1 add ssl policylabel cpl1 -type CONTROL
2 add ssl policylabel dpl1 -type DATA
3
4 add ssl action act1 -clientauth DOCLIENTAUTH
5 add ssl policy ctrlpol -rule HTTP.REQ.METHOD.EQ("GET") -action act1
6
7 add ssl action act2 -clientCert ENABLED -certHeader "X-Client-Cert"
8 add ssl policy datapol -rule CLIENT.SSL.CLIENT_CERT.EXISTS -action act2
9
10 bind ssl policylabel cpl1 ctrlpol 1
11 bind ssl policylabel dpl1 datapol 1
12
13 > sh ssl policylabel
14 Control policylabels
15 1) Label Name: cpl1
16 Type: CONTROL
```

```
17 Number of bound policies: 1
18 Number of times invoked: 0
19
20 Data policylabels
21 1) Label Name: dpl1
22 Type: DATA
23 Number of bound policies: 1
24 Number of times invoked: 0
25 Done
26 >
27 <!--NeedCopy-->
```

## Configure an SSL policy label and bind policies to the label by using the GUI

Navigate to **Traffic Management > SSL > Policy Labels**, and configure an SSL policy label.

## Selective SSL logging

September 22, 2022

In a large deployment comprising thousands of virtual servers, all SSL-related information is logged. Earlier, filtering the client authentication and SSL handshake successes and failures for a few critical virtual servers was not easy. Perusing through the entire log to get this information was a time-consuming and tedious task because the infrastructure did not offer the control to filter the logs. Now, you can log SSL-related information for a specific virtual server or for a group of virtual servers in the `ns.log`. This information is especially helpful in debugging failures.

With the DEBUG setting, all SSL related information is logged in `ns.log`. However, when you configure an SSL log profile, only information related to client authentication and SSL handshake is logged. To log this information, perform the following steps:

1. Set DEBUG on syslog parameters.
2. Configure an SSL log profile. Enable logging of client authentication and SSL handshake failure/success and failures only. All four are logged when you attach the SSL log profile with the SSL profile. Only client authentication failure/success and failures only are logged when you attach the SSL log profile with the SSL action.
3. Attach the SSL log profile to an SSL profile or to an SSL action.

See sample `ns.log` output for successful client authentication at the end of this page.

## Set DEBUG level

Set the syslog log level to DEBUG. At the command prompt, type:

```
set audit syslogParams -logLevel DEBUG
```

When debug is set, SSL logs for both front end (virtual servers) and back end (services and service groups) are included. However, selective SSL logging offers control only over the front end.

## SSL log profile

An SSL log profile provides control over logging the following events for a virtual server or a group of virtual servers:

- Client authentication success and failures, or failures only.
- SSL handshake success and failures, or failures only.

By default, all the parameters are disabled.

An SSL log profile can be set on an SSL profile, or on an SSL action. If set to an SSL profile, you can log both client authentication and SSL handshake success and failure information. If set to an SSL action, you can only log client authentication success and failure information because the handshake is complete before the policy is evaluated.

Client authentication and SSL handshake success and failures are logged even if you do not configure an SSL log profile. However, selective logging is possible only if an SSL log profile is used.

**Note:**

SSL log profile is supported in high availability and cluster setups.

## Add an SSL log profile by using the CLI

At the command prompt, type:

```
1 add ssl logprofile <name> [-sslLogClAuth (ENABLED | DISABLED)] [-
 ssllogClAuthFailures (ENABLED | DISABLED)] [-sslLogHS (ENABLED |
 DISABLED)] [-sslLogHSfailures (ENABLED | DISABLED)]
2 <!--NeedCopy-->
```

**Parameters:****Name:**

Name for the SSL log profile. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created.

Name is a mandatory argument. Maximum Length: 127

**sslLogClAuth:**

Log all client authentication events. Includes both success and failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**ssllogClAuthFailures:**

Log all client authentication failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**sslLogHS:**

Log all SSL handshake related events. Includes both success and failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**sslLogHSfailures:**

Log all SSL handshake related failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**Example:**

```
1 > add ssl logprofile ssllog10 -sslLogClAuth ENABLED -sslLogHS ENABLED
2
3 Done
4
5 sh ssllogprofile ssllog10
6
7 1) Name: ssllog10
8
9 SSL log ClientAuth [Success/Failures] : ENABLED
10
11 SSL log ClientAuth [Failures] : DISABLED
12
13 SSL log Handshake [Success/Failures] : ENABLED
14
15 SSL log Handshake [Failures] : DISABLED
16
17 Done
18 <!--NeedCopy-->
```

## Add an SSL log profile by using the GUI

Navigate to **System > Profiles > SSL Log Profile** and add a profile.

## Modify an SSL log profile by using the CLI

At the command prompt type:

```
1 set ssl logprofile <name> [-sslLogClAuth (ENABLED | DISABLED)][-
 ssllogClAuthFailures (ENABLED | DISABLED)] [-sslLogHS (ENABLED |
 DISABLED)] [-sslLogHSfailures (ENABLED | DISABLED)]
2 <!--NeedCopy-->
```

### Example:

```
1 set ssllogprofile ssllog10 -ssllogClAuth en -ssllogClAuthFailures en -
 ssllogHS en -ssllogHSfailures en
2
3 Done
4
5 sh ssllogprofile ssllog10
6
7 1) Name: ssllog10
8
9 SSL log ClientAuth [Success/Failures] : ENABLED
10 SSL log ClientAuth [Failures] : ENABLED
11 SSL log Handshake [Success/Failures] : ENABLED
12 SSL log Handshake [Failures] : ENABLED
13 Done
14 <!--NeedCopy-->
```

## Modify an SSL log profile by using the GUI

1. Navigate to **System > Profiles > SSL Log Profile**, select a profile, and click **Edit**.
2. Make changes and click **OK**.

## View all the SSL log profiles by using the CLI

At the command prompt, type:

```
1 sh ssl logprofile
2 <!--NeedCopy-->
```

### Example:

```
1 sh ssl logprofile
2
```

```

3 1) Name: ssllogp1
4 SSL log ClientAuth [Success/Failures] : ENABLED
5 SSL log ClientAuth [Failures] : ENABLED
6 SSL log Handshake [Success/Failures] : DISABLED
7 SSL log Handshake [Failures] : ENABLED
8
9 2) Name: ssllogp2
10 SSL log ClientAuth [Success/Failures] : DISABLED
11 SSL log ClientAuth [Failures] : DISABLED
12 SSL log Handshake [Success/Failures] : DISABLED
13 SSL log Handshake [Failures] : DISABLED
14
15 3) Name: ssllogp3
16 SSL log ClientAuth [Success/Failures] : DISABLED
17 SSL log ClientAuth [Failures] : DISABLED
18 SSL log Handshake [Success/Failures] : DISABLED
19 SSL log Handshake [Failures] : DISABLED
20
21 4) Name: ssllog10
22 SSL log ClientAuth [Success/Failures] : ENABLED
23 SSL log ClientAuth [Failures] : ENABLED
24 SSL log Handshake [Success/Failures] : ENABLED
25 SSL log Handshake [Failures] : ENABLED
26 Done
27 <!--NeedCopy-->

```

### View all the SSL log profiles by using the GUI

Navigate to **System > Profiles > SSL Log Profile**. All the profiles are listed.

### Attach an SSL log profile to an SSL profile

You can attach (set) an SSL log profile on an SSL profile when you are creating an SSL profile, or later by editing the SSL profile. You can log both client authentication and handshake successes and failures.

#### Important:

The default SSL profile must be enabled before you can attach an SSL log profile. For more information about enabling the default SSL profile, see [Enable the default profile](#).

### Attach an SSL log profile on an SSL profile by using the CLI

At the command prompt, type:

```

1 set ssl profile <name> [-ssllogProfile <string>]
2 <!--NeedCopy-->

```

**Example:**

```
1 set ssl profile fron_1 -ssllogProfile ssllog10
2 <!--NeedCopy-->
```

**Attach an SSL log profile to an SSL profile by using the GUI**

1. Navigate to **System > Profiles > SSL Profile**.
2. Click **Edit** and in **SSL Log Profile**, specify a profile.

**Attach an SSL log profile to an SSL action**

You can set an SSL log profile only while creating an SSL action. You cannot modify an SSL action to set the log profile. Associate the action to a policy. You can only log client authentication successes and failures.

**Attach an SSL log profile to an SSL action by using the CLI**

At the command prompt, type:

```
1 add ssl action <name> -clientAuth (DOCLIENTAUTH | NOCLIENTAUTH) -
 ssllogProfile <string>
2 <!--NeedCopy-->
```

**Example:**

```
1 > add ssl action act1 -clientAuth DoCLIENTAUTH -ssllogProfile ssllog10
2
3 Done
4
5 > sh ssl action act1
6
7 1) Name: act1
8 Type: Client Authentication (DOCLIENTAUTH)
9 Hits: 0
10 Undef Hits: 0
11 Action Reference Count: 0
12 SSLlogProfile: ssllog10
13 Done
14 <!--NeedCopy-->
```

**Attach an SSL log profile to an SSL action by using the GUI**

1. Navigate to **Traffic Management > SSL > Policies** and click **SSL Actions**.

2. Click **Add**.
3. In Client Authentication, select **ENABLED**.
4. In SSL Log Profile, select a profile from the list, or click “+” to create a profile.
5. Click **Create**.

### Sample output from the log file

The following is a sample log output from `ns.log` for successful client authentication.

```

1 Jan 24 16:24:25 <local0.debug> 10.102.57.80 01/24/2019:10:54:25 GMT 0-

## Support for DTLS protocol

February 1, 2024

### Notes

- DTLS 1.2 protocol is supported on the following appliances:

- NetScaler MPX/SDX (N2 and N3 based) and VPX appliances. It is not supported on external HSMs.
  - NetScaler appliances containing Intel Coletto and Intel Lewisburg SSL chips.
  - Front-end of NetScaler VPX appliances.
  - Front-end of NetScaler appliances containing Intel Coletto SSL chips. For more information about the platforms containing Intel Coletto SSL chips, see [Support for Intel Coletto SSL chip-based platforms](#).
  - Front-end of NetScaler MPX (N3 based) appliances except the MPX 14000 FIPS appliances.
- Service groups of type DTLS are not supported.
  - For information about Enlightened Data Transport (EDT) support for NetScaler Gateway, see [HDX enlightened data transport support](#).
  - For information about the platforms and builds supported, see [NetScaler MPX hardware-software compatibility matrix](#)

The SSL and TLS protocols have traditionally been used to secure streaming traffic. Both of these protocols are based on TCP, which is slow. Also, TLS cannot handle lost or reordered packets.

UDP is the preferred protocol for audio and video applications, such as Lync, Skype, iTunes, YouTube, training videos, and flash. However, UDP is not secure or reliable. The DTLS protocol is designed to secure data over UDP and is used for applications such as media streaming, VOIP, and online gaming for communication. In DTLS, each handshake message is assigned a specific sequence number within that handshake. When a peer receives a handshake message, it can quickly determine whether that message is the next one expected. If it is, the peer processes the message. If not, the message is queued for handling after all the previous messages have been received.

Create a DTLS virtual server and a service of type UDP. By default, a DTLS profile (nsdtls\_default\_profile) is bound to the virtual server. Optionally, you can create and bind a user-defined DTLS profile to the virtual server.

Note: RC4 ciphers are not supported on a DTLS virtual server.

### DTLS configuration

You can use the command line (CLI) or the configuration utility (GUI) to configure DTLS on your ADC appliance.

**Note:** The DTLS 1.2 protocol is supported on the front end of a NetScaler VPX appliance. While configuring a DTLS 1.2 virtual server, specify DTLS12. Default is DTLS1.

At the command prompt, type:

```
set ssl vservice DTLS [-dtls1 (ENABLED | DISABLED)] [-dtls12 (
ENABLED | DISABLED)]
```

### Create a DTLS configuration by using the CLI

At the command prompt, type:

```
1 add lb vservice <vservice_name> DTLS <IPAddress> <port>
2 add service <service_name> <IPAddress> UDP 443
3 bind lb vservice <vservice_name> <udp_service_name>
4 <!--NeedCopy-->
```

The following steps are optional:

```
1 add dtlsProfile dtls-profile -maxretryTime <positive_integer>
2 set ssl vservice <vservice_name> -dtlsProfileName <dtls_profile_name>
3 <!--NeedCopy-->
```

### Create a DTLS configuration by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Create a virtual server of type DTLS, and bind a UDP service to the virtual server.
3. A default DTLS profile is bound to the DTLS virtual server. To bind a different profile, in SSL Parameters, select a different DTLS profile. To create a profile, click the plus (+) next to DTLS Profile.

### Support for SNI on a DTLS virtual server

For information about SNI, see [Configure an SNI virtual server for secure hosting of multiple sites](#).

### Configure SNI on a DTLS virtual server by using the CLI

At the command prompt, type:

```
1 set ssl vservice <vServiceName> -SNIEnable ENABLED
2 bind ssl vservice <vServiceName> -certkeyName <string> -SNIcert
3 show ssl vservice <vServiceName>
4 <!--NeedCopy-->
```

### Example:

```
1 set ssl vservice v1 -sniEnable ENABLED
2 bind ssl vservice v1 -certkeyName san2 -sniCert
3 bind ssl vservice v1 -certkeyName san13 -sniCert
```

```
4 bind ssl vserver v1 -certkeyName san17 -sniCert
5 <!--NeedCopy-->
```

```
1 sh ssl vserver v1
2
3 Advanced SSL configuration for VServer v1:
4 DH: DISABLED
5 DH Private-Key Exponent Size Limit: DISABLED
6 Ephemeral RSA: ENABLED
7 Refresh Count: 0
8 Session Reuse: ENABLED
9 Timeout: 1800 seconds
10 Cipher Redirect: DISABLED
11
12 ClearText Port: 0
13 Client Auth: DISABLED
14 SSL Redirect: DISABLED
15 Non FIPS Ciphers: DISABLED
16 SNI: ENABLED
17 OCSP Stapling: DISABLED
18 HSTS: DISABLED
19 HSTS IncludeSubDomains: NO
20 HSTS Max-Age: 0
21 DTLSv1: ENABLED
22 Send Close-Notify: YES
23 Strict Sig-Digest Check: DISABLED
24 Zero RTT Early Data: DISABLED
25 DHE Key Exchange With PSK: NO
26 Tickets Per Authentication Context: 1
27
28 DTLS profile name: nsdtls_default_profile
29
30 ECC Curve: P_256, P_384, P_224, P_521
31
32 1) CertKey Name: ca
33 CA Certificate OCSPCheck: OptionalCA_Name Sent
34 2) CertKey Name: san2 Server Certificate for SNI
35 3) CertKey Name: san17 Server Certificate for SNI
36 4) CertKey Name: san13 Server Certificate for SNI
37
38
39 1) Cipher Name: DEFAULT
40 Description: Default cipher list with encryption strength >= 128bit
41 Done
42 <!--NeedCopy-->
```

### Configure SNI on a DTLS virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open a DTLS virtual server and, in Certificates, click **Server Certificate**.

3. Add a certificate or select a certificate from the list and select **Server Certificate for SNI**.
4. In **Advanced Settings**, click **SSL Parameters**.
5. Select **SNI Enable**.

### Features not supported by a DTLS virtual server

The following options cannot be enabled on a DTLS virtual server:

- SSLv2
- SSLv3
- TLS 1.0
- TLS 1.1
- TLS 1.2
- Push encrypt trigger
- SSLv2Redirect
- SSLv2URL

### Parameters not used by a DTLS virtual server

A DTLS virtual server ignores the following SSL parameters, even if set:

- Encryption trigger packet count
- PUSH encryption trigger timeout
- SSL quantum size
- Encryption trigger timeout
- Subject/Issuer Name Insertion Format

### Configure renegotiation on a DTLS service

Non-secure renegotiation is supported on a DTLS service. You can use the CLI or the GUI to configure this setting.

#### Configure renegotiation on a DTLS service by using the CLI

At the command prompt, type:

```
1 set ssl parameter -denysslreneg NONSECURE
2 <!--NeedCopy-->
```

#### Example:

```

1 set ssl parameter -denysslreneg NONSECURE
2
3
4 sh ssl parameter
5 Advanced SSL Parameters
6 -----
7 SSL quantum size : 8 KB
8 Max CRL memory size : 256 MB
9 Strict CA checks : NO
10 Encryption trigger timeout : 100 ms
11 Send Close-Notify : YES
12 Encryption trigger packet count : 45
13 Deny SSL Renegotiation : NONSECURE
14 Subject/Issuer Name Insertion Format : Unicode
15 OCSP cache size : 10 MB
16 Push flag : 0x0 (Auto)
17 Strict Host Header check for SNI enabled SSL sessions : NO
18 PUSH encryption trigger timeout : 1 ms
19 Crypto Device Disable Limit : 0
20 Global undef action for control policies : CLIENTAUTH
21 Global undef action for data policies : NOOP
22 Default profile : DISABLED
23 SSL Insert Space in Certificate Header : YES
24 Disable TLS 1.1/1.2 for SSL_BRIDGE secure monitors : NO
25 Disable TLS 1.1/1.2 for dynamic and VPN services : NO
26 Software Crypto acceleration CPU Threshold : 0
27 Hybrid FIPS Mode : DISABLED
28 Signature and Hash Algorithms supported by TLS1.2 : ALL
29 SSL Interception Error Learning and Caching : DISABLED
30 SSL Interception Maximum Error Cache Memory : 0 Bytes
31 Done
32 <!--NeedCopy-->

```

### Configure renegotiation on a DTLS service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Select a DTLS service and click **Edit**.
3. Navigate to **SSL > Advanced Settings**.
4. Select **Deny SSL Renegotiation**.

### Features not supported by a DTLS service

The following options cannot be enabled on a DTLS service:

- SSLv2
- SSLv3
- TLS 1.0

- TLS 1.1
- TLS 1.2
- Push encrypt trigger
- SSLv2Redirect
- SSLv2URL
- SNI
- Secure renegotiation

### Parameters not used by a DTLS service

A DTLS service ignores the following SSL parameters, even if set:

- Encryption trigger packet count
- PUSH encryption trigger timeout
- SSL quantum size
- Encryption trigger timeout
- Subject/Issuer Name Insertion Format

**Note:**

SSL session reuse handshake fails on a DTLS service because session reuse is not currently supported on DTLS services.

**Workaround:** Manually disable session reuse on a DTLS service. At the CLI, type:

```
set ssl service <dtls-service-name> -sessReuse DISABLED
```

### DTLS profile

A DTLS profile with the default settings is automatically bound to a DTLS virtual server. However, you can create a DTLS profile with specific settings to suit your requirement.

Use a DTLS profile with a DTLS virtual server or a VPN DTLS virtual server. You cannot use an SSL profile with a DTLS virtual server.

**Note:**

Change the maximum record size setting in the DTLS profile based on the changes in the MTU and packet size. For example, the default max record size of 1459 bytes is calculated based on an IPv4 address header size. With IPv6 records, the header size is larger and therefore the maximum record size must be reduced to meet the following criteria.

```
max record size + UDP header(8bytes) + IP header size < MTU
```

**Example:**

```

1 Default DTLS profile
2 1) Name: nsdtls_default_profile
3 PMTU Discovery: DISABLED
4 Max Record Size: 1459 bytes
5 Max Retry Time: 3 sec
6 Hello Verify Request: ENABLED
7 Terminate Session: DISABLED
8 Max Packet Count: 120 bytes
9
10 Custom DTLS profile
11 1) Name: ns_dtls_profile_ipv6_1
12 PMTU Discovery: DISABLED
13 Max Record Size: 1450 bytes
14 Max Retry Time: 3 sec
15 Hello Verify Request: ENABLED
16 Terminate Session: DISABLED
17 Max Packet Count: 120 bytes
18 <!--NeedCopy-->

```

## Create a DTLS profile by using the CLI

### Notes:

- The `helloverifyrequest` parameter is enabled by default. Enabling this parameter helps mitigate the risk of an attacker or bots overwhelming the network throughput, potentially leading to outbound bandwidth exhaustion. That is, it helps mitigate the DTLS DDoS amplification attack.
- The `maxHoldQLen` parameter is added. This parameter defines the number of datagrams that can be queued at the DTLS layer for processing. A high value of the `maxHoldQLen` parameter can cause memory buildup at the DTLS layer if UDP multiplexing is transmitting high UDP traffic. Therefore, configuring a lower value is recommended. The minimum value is 32, maximum value is 65535, and the default value is 32.

A new parameter `maxBadmacIgnorecount` is introduced in the DTLS profile to ignore bad MAC records received in a DTLS session. Using this parameter, bad records up to the value set in the parameter are ignored. The appliance terminates the session only after the limit is reached and sends an alert.

This parameter setting is effective only when the `terminateSession` parameter is enabled.

```

1 add ssl dtlsProfile <name> -maxRetryTime <positive_integer> -
 helloVerifyRequest (ENABLED | DISABLED) -terminateSession (ENABLED
 | DISABLED) -maxHoldQLen <positive_integer> -maxBadmacIgnorecount
 <positive_integer>
2
3 helloVerifyRequest
4 Send a Hello Verify request to validate the client.

```

```

5 Possible values: ENABLED, DISABLED
6 Default value: ENABLED
7
8 terminateSession
9 Terminate the session if the message authentication code
 (MAC)
10 of the client and server do not match.
11 Possible values: ENABLED, DISABLED
12 Default value: DISABLED
13
14 maxHoldQLen
15 Maximum number of datagrams that can be queued at DTLS
 layer for
16 processing
17 Default value: 32
18 Minimum value: 32
19 Maximum value: 65535
20
21 maxBadmacIgnorecount
22 Maximum number of bad MAC errors to ignore for a
 connection prior disconnect. Disabling parameter
 terminateSession
23 terminates session immediately when bad MAC is detected in the
 connection.
24 Default value: 100
25 Minimum value: 1
26 Maximum value: 65535
27 <!--NeedCopy-->

```

**Example:**

```

1 > add ssl dtlsprofile dtls_profile -maxRetryTime 4 -helloVerifyRequest
 ENABLED -terminateSession ENABLED -maxHoldQLen 40 -
 maxBadmacIgnorecount 150
2 Done
3 > sh dtlsprofile dtls_profile
4 1) Name: dtls_profile
5 PMTU Discovery: DISABLED
6 Max Record Size: 1459 bytes
7 Max Retry Time: 4 sec
8 Hello Verify Request: ENABLED
9 Terminate Session: ENABLED
10 Max Packet Count: 120 bytes
11 Max HoldQ Size: 40 datagrams
12 Max bad-MAC Ignore Count: 150
13
14 Done
15 <!--NeedCopy-->

```

**Configure DTLS time-out to retransmit the last packet from NetScaler**

**Note:**

This feature is available in build 17.x and later.

In a DTLS deployment, you can configure the initial time-out value to retransmit the last packet from NetScaler. You can select between one second to three seconds with the default value set to three seconds. The initial timeout value cannot be greater than the max retry value.

Earlier, three seconds was hardcoded while the RFC recommended one second.

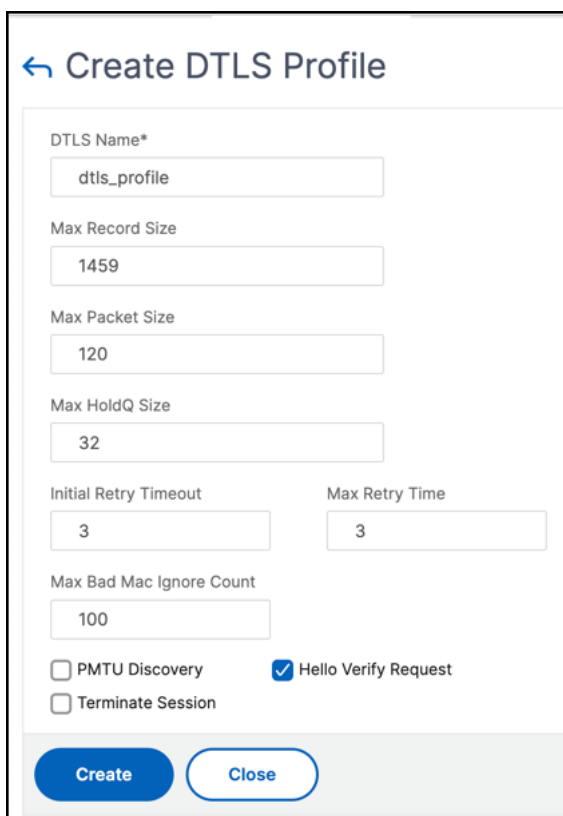

```
1 set ssl dtlsProfile <name> -initialRetryTimeout <positive_integer> -
 maxRetryTime <positive_integer>
2 <!--NeedCopy-->
```

**Examples:**

```
1 > set dtlsProfile nsdtls_default_profile -initialRetryTimeout 2 -
 maxretryTime 3
2 Done
3 > set dtlsProfile nsdtls_default_profile -initialRetryTimeout 1 -
 maxretryTime 3
4 Done
5 > set dtlsProfile nsdtls_default_profile -initialRetryTimeout 2 -
 maxretryTime 1
6 ERROR: Invalid value [The initial timeout value for retransmission
 cannot be greater than max retry value]
7 >
8 <!--NeedCopy-->
```

**Create a DTLS profile by using the GUI**

1. Navigate to **System > Profiles > DTLS Profiles** and click **Add**.
2. In the **Create DTLS Profile** page, type the values for the different parameters.

← Create DTLS Profile

DTLS Name\*  
dtls\_profile

Max Record Size  
1459

Max Packet Size  
120

Max HoldQ Size  
32

Initial Retry Timeout  
3

Max Retry Time  
3

Max Bad Mac Ignore Count  
100

PMTU Discovery  Hello Verify Request  
 Terminate Session

Create Close

3. Click **Create**.

### Example for an end-to-end DTLS configuration

```
1 enable ns feature SSL LB
2
3 add server s1 198.51.100.2

## DTLS support for IPv6 address

DTLS is supported with IPv6 addresses also. However, to use DTLS with IPv6 addresses the maximum record size must be adjusted in the DTLS profile.

If the default value is used for the maximum record size, the initial DTLS connection might fail. Adjust the maximum record size using a DTLS profile.

## DTLS cipher support

By default, a DTLS cipher group is bound when you create a DTLS virtual server or service. `DEFAULT_DTLS` contains the ciphers that a front-end DTLS entity supports. This group is bound by default when you create a DTLS virtual server. `DEFAULT_DTLS_BACKEND` contains the ciphers that are supported to a back-end DTLS entity. This group is bound by default to a DTLS back-end service. `DTLS_FIPS` contains the ciphers that are supported on the NetScaler FIPS platform. This group is bound by default to a DTLS virtual server or service created on a FIPS platform.

## DTLS cipher support on NetScaler VPX, MPX/SDX (N2 and N3 based) appliances

### How to read the tables:

Unless a build number is specified, a cipher suite is supported for all builds in a release.

### Example:

- **11.1, 12.1, 13.0, 13.1, 14.1:** All builds of 11.1, 12.1, 13.0, 13.1, 14.1 releases.
- **-NA-:** not applicable.

## DTLS cipher support on NetScaler VPX, MPX/SDX (N2, N3 and Coletto based) appliances

Cipher Suite Name	Hex Code	Wireshark Cipher Suite Name	Builds Supported (front end)	Builds Supported (back end)
TLS1-AES-256-CBC-SHA	0x0035	TLS_RSA_WITH_AES_256_GCM_SHA384	12.1, 13.0, 13.1, 13.1, 14.1	12.1, 13.0, 13.1, 14.1
TLS1-AES-128-CBC-SHA	0x002f	TLS_RSA_WITH_AES_128_GCM_SHA256	12.1, 13.0, 13.1, 13.1, 14.1	12.1, 13.0, 13.1, 14.1

```

## DTLS cipher support on the NetScaler MPX 14000 FIPS platform

**Note:** Enlightened Data Support (EDT) is supported on the FIPS platform if the following conditions are met:

- The UDT MSS value set on StoreFront is 900.
- Windows client version is 4.12 or later.

- DTLS enabled VDA version is 7.17 or later.
- Non-DTLS VDA version is 7.15 LTSR CU3 or later.

**How to read the tables:**

Unless a build number is specified, a cipher suite is supported for all builds in a release.

**Example:**

- **11.1, 12.1, 13.0, 13.1, 14.1:** All builds of 11.1, 12.1, 13.0, 13.1, 14.1 releases.
- **-NA-:** not applicable.

Cipher suite Name	Hex Code	Wireshark Cipher suite Name	Builds Supported (front end)	Builds Supported (back end)
TLS1-AES-256-CBC-SHA	0x0035	TLS_RSA_WITH_AES_256_CBC_SHA	12.1-14.1	12.1-49.x, 13.0, 13.1, 14.1
TLS1-AES-128-CBC-SHA	0x002f	TLS_RSA_WITH_AES_128_CBC_SHA	12.1-14.1	12.1-49.x, 13.0, 13.1, 14.1

**DTLS 1.2 cipher support on the front-end VPX appliances, MPX/SDX (Coletto and N3 based) appliances**

The following table lists the additional ciphers supported for the DTLS 1.2 protocol.

Cipher suite Name	Hex Code	Wireshark Cipher suite Name	Builds	
			Supported (VPX front end)	Builds Supported (Coletto based)
TLS1.2-AES256-GCM-SHA384	0x009d	TLS_RSA_WITH_AES_256_GCM_SHA384	13.1, 14.1	13.1, 14.1
TLS1.2-AES128-GCM-SHA256	0x009c	TLS_RSA_WITH_AES_128_GCM_SHA256	13.1, 14.1	13.1, 14.1
TLS1.2-ECDHE-RSA-AES256-GCM-SHA384	0xc030	TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	13.1, 14.1	13.1, 14.1
TLS1.2-ECDHE-RSA-AES128-GCM-SHA256	0xc02f	TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256	13.1, 14.1	13.1, 14.1
TLS1.2-DHE-RSA-AES256-GCM-SHA384	0x009f	TLS_DHE_RSA_WITH_AES_256_GCM_SHA384	13.1, 14.1	13.1, 14.1
TLS1.2-DHE-RSA-AES128-GCM-SHA256	0x009e	TLS_DHE_RSA_WITH_AES_128_GCM_SHA256	13.1, 14.1	13.1, 14.1
TLS1.2-AES-256-SHA256	0x003d	TLS_RSA_WITH_AES_256_CBC_SHA256	13.1, 14.1	13.1, 14.1
TLS1.2-AES-128-SHA256	0x003c	TLS_RSA_WITH_AES_128_CBC_SHA256	13.1, 14.1	13.1, 14.1
TLS1.2-ECDHE-RSA-AES-256-SHA384	0xc028	TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	13.1, 14.1	13.1, 14.1
TLS1.2-ECDHE-RSA-AES-128-SHA256	0xc027	TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256	13.1, 14.1	13.1, 14.1
TLS1.2-DHE-RSA-AES-256-SHA256	0x006b	TLS_DHE_RSA_WITH_AES_256_CBC_SHA256	13.1, 14.1	13.1, 14.1

Cipher suite Name	Hex Code	Wireshark Cipher suite Name	Builds		
			Supported (VPX front end)	Builds Supported (Coletto based)	Builds Supported (N3 based)
TLS1.2-DHE-RSA-AES-128-SHA256	0x0067	TLS_DHE_RSA_WITH_AES_128_CBC_SHA256	13.1, 14.1	13.1, 14.1	13.0–58.x, 13.1, 14.1
TLS1-ECDHE-ECDSA-AES128-SHA	0xc009	TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA	14.1		13.1-21.x, 14.1
TLS1-ECDHE-ECDSA-AES256-SHA	0xc00a	TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	14.1		13.1-21.x, 14.1
TLS1-ECDHE-ECDSA-DES-CBC3-SHA	0xc008	TLS_ECDHE_ECDSA_WITH_3DES_CBC_SHA	14.1	14.1	13.1-21.x, 14.1
TLS1.2-ECDHE-ECDSA-AES128-GCM-SHA256	0xc02b	TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256	14.1		13.1-21.x, 14.1
TLS1.2-ECDHE-ECDSA-AES256-GCM-SHA384	0xc02c	TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	14.1		13.1-21.x, 14.1
TLS1.2-ECDHE-ECDSA-AES128-SHA256	0xc023	TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256	14.1		13.1-21.x, 14.1
TLS1.2-ECDHE-ECDSA-AES256-SHA384	0xc024	TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	14.1		13.1-21.x, 14.1

## Support for Intel Coletto and Intel Lewisburg SSL chip-based platforms

January 29, 2024

The following appliances ship with Intel Coletto chips:

- MPX 5900
- MPX/SDX 8900
- MPX/SDX 15000
- MPX/SDX 15000-50G
- MPX/SDX 26000
- MPX/SDX 26000-50S
- MPX/SDX 26000-100G

The following appliances ships with Intel Lewisburg chips:

- MPX/SDX 9100
- MPX/SDX 16000

Use the 'show hardware' command to identify whether your appliance has Coletto (COL) or Lewisburg (LBG) chips.

```
1 > sh hardware
2
3 Platform: NSMPX-8900 8*CPU+4*F1X+6*E1K+1*E1K+1*COL 8955 30010
4 Manufactured on: 10/18/2016
5 CPU: 2100MHZ
6 Host Id: 0
7 Serial no: CRAC5CR8UA
8 Encoded serial no: CRAC5CR8UA
9 Done
10 <!--NeedCopy-->
```

```
1 > sh hardware
2 Platform: NSMPX-9100 10*CPU+64GB+8*F2X+E1K+1*LBG C627 35000
3 Manufactured on: 10/1/2021
4 CPU: 2300MHZ
5 Host Id: 161644678
6 Serial no: N2Z3ZD9S21
7 Encoded serial no: N2Z3ZD9S21
8 Netscaler UUID: 41a26261-227e-11ec-b4db-3cecef56f86b
9 BMC Revision: 1.00
10 Done
11 <!--NeedCopy-->
```

## Limitations

The following ciphers, protocols, and features are not supported:

- DH 512 cipher
- SSLv3 protocol
- Azure Key Vault
- GnuTLS
- ECDSA certificates with ECC curves P\_224 and P521
- DNSSEC offload

### Note

Support for the Thales Luna Network hardware security module (HSM) is available in release 13.1 build 33.x and later.

## View the software-based SSL chip utilization on NetScaler MPX and SDX platforms

You can view more details about the software-based SSL chip utilization on the following platforms:

- MPX and SDX platforms that ship with Intel Coletto chips.
- MPX platforms that ship with Intel Lewisburg chips.

### Note

This feature is not supported on the following platforms:

- SDX 9100
- MPX/SDX 16000

At the command prompt, type:

```
1 > stat ssl
2
3 SSL Summary
4

#### Notes

- Admin partition is supported, but the utilization for all partitions is shown in the default partition. On non-default partitions, these values display as 0.
- In a cluster setup, the CLIP address displays the average utilization for all the nodes in the cluster. For node-specific utilization, run the command on the CLI of each node. This data might be incorrect for an SDX platform if the nodes of the cluster are hosted on the same hardware.
- For VPX instances on the SDX platform, the utilization of each VPX instance is displayed.

## SNMP OID and trap for SSL symmetric and asymmetric crypto utilization

#### Note:

This feature is available in NetScaler release 14.1 build 17.x and later.

SNMP OIDs are used for monitoring and SNMP alarms are sent when the crypto utilization reaches the configured limit and when it returns to normal. From release 14.1 build 17.x, NetScaler can send traps for software-based symmetric and asymmetric crypto utilization when the configured thresholds are crossed. It also provides an SNMP OID to read these crypto utilization absolute values.

Earlier, NetScaler only had CLIs to read these crypto utilization values.

### Configure SNMP alarms for crypto utilization using the CLI

At the command line, type:

```

1 > set snmp alarm SSL-ASYM-CRYPTO-UTILIZATION
2 -logging (ENABLED | DISABLED)
3 -severity <severity>
4 -state (ENABLED | DISABLED)
5 -thresholdValue <positive_integer> [-normalValue <
6 positive_integer>]
6 -time <secs>
7
8 > set snmp alarm SSL-SYM-CRYPTO-UTILIZATION
9 -logging (ENABLED | DISABLED)
10 -severity <severity>
11 -state (ENABLED | DISABLED)
12 -thresholdValue <positive_integer> [-normalValue <
 positive_integer>]

```

```
13 -time <secs>
14
15 <!--NeedCopy-->
```

Example:

```
1 set snmp alarm SSL-ASYM-CRYPTO-UTILIZATION -thresholdValue 37 -
 normalValue 17
2
3 set snmp alarm SSL-SYM-CRYPTO-UTILIZATION -thresholdValue 25 -
 normalValue 15
4 <!--NeedCopy-->
```

### Configure SNMP alarms for crypto utilization using the GUI

1. Navigate to **System > SNMP > Alarms**.
2. Do one of the following:
  - To configure an asymmetric crypto utilization, search for SSL-ASYM-CRYPTO-UTILIZATION and click it.
  - To configure a symmetric crypto utilization, search for SSL-SYM-CRYPTO-UTILIZATION and click it.
3. In the **Configure SNMP Alarm** page, enter the values for the different parameters and click **OK**.

### Crypto utilization on NetScaler SDX

SNMP OID and trap implementation are based on software-based crypto utilization. The maximum crypto is fixed for MPX, and the software uses that to derive the values.

For SDX, each VPX can have a predefined number of crypto units allocated. The allocated crypto units are the minimum guaranteed resources for the VPX, but it can also use the free crypto units available at the SDX level. The software-based crypto utilization provided for VPX on SDX is at the SDX level.

Therefore, when thresholds are configured for symmetric or asymmetric SNMP alarms on SDX, admins must take into account the percentage of crypto units allocated for each VPX and derive a threshold to be configured for these alarms.

For example, if the total crypto units on SDX are 100 K and three VPX instances are provisioned on SDX. The crypto units allocated to VPX1, VPX2, and VPX3 are 50 K, 25 K, and 25 K respectively. The threshold is set at 80%.

	Actual utilization on VPX1	Actual utilization on VPX2	Actual utilization on VPX3	Comments
Scenario 1	80%	0%	0%	When utilization hits 80% on VPX1, it generates a trap. Since there is no traffic to the other VPX, the trap from VPX1 indicates the actual utilization at SDX as well.
Scenario 2	40%	25%	15%	None of the VPX generate a trap although overall utilization is 80%.

**Problem:**

In scenario 2, the trap is not sent even though the overall utilization at the SDX level has crossed the threshold.

**Solution:**

Admins must manually intervene and derive the equivalent percentage based on the allocation. In scenario 2, calculate the corresponding percentage for each VPX by multiplying the % of crypto units allocated and the threshold % set.

	VPX1	VPX2	VPX3	Comments
Crypto units = 100k	50K	25K	25K	

	VPX1	VPX2	VPX3	Comments
Derived threshold = % crypto units allocated * % threshold (Overall threshold = 80%)	40%	20%	20%	For example, VPX 1 has 50% of crypto units allocated. Therefore the derived threshold is 50% of the overall threshold. VPX2 and VPX3 each have 25% of the crypto units allocated. Therefore, the derived threshold is 25% of the overall threshold.

An SNMP alarm will now be sent out when the threshold for VPX1 crosses 40% instead of when it crosses 80%. Even if the threshold for SDX might not have crossed the configured percentage, the alarm is an indication to the admin to monitor.

## MPX 14000 FIPS appliances

August 4, 2023

### Important:

- The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.
- Configuration steps for NetScaler MPX 14000 FIPS and NetScaler MPX 9700/10500/12500/15500 FIPS appliances are different. MPX 14000 FIPS appliances do not use firmware v2.2. A FIPS key created on the Hardware Security Module (HSM) of the MPX 9700 platform cannot be transferred to the HSM of the MPX 14000 platform. The other way round is also not supported. However, if you have imported an RSA key as a FIPS key, you can copy the RSA key to the MPX 14000 platform. Then import it as a FIPS key. Only 2048-bit and 3072-bit keys are supported.

- The firmware versions listed under “NetScaler Release 12.1-FIPS” and “NetScaler Release 12.1-NDcPP” in the NetScaler downloads page are not supported on the MPX 14000 FIPS or SDX 14000 FIPS platforms. These platforms can use other latest NetScaler firmware versions available on the downloads page.

A FIPS appliance is equipped with a tamper-proof (tamper-evident) cryptographic module—a Cavium CNN3560-NFBE-G—designed to comply with the FIPS 140-2 Level-3 specifications. The Critical Security Parameters (CSPs), primarily the server’s private-key, are securely stored and generated inside the cryptographic module, also referred to as the HSM. The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (`nsroot`) can perform operations on the keys stored inside the HSM.

Before configuring a FIPS appliance, you must check the state of the FIPS card and then initialize the card. Create a FIPS key and server certificate, and add any additional SSL configuration.

For information about the FIPS ciphers supported, see [FIPS Approved Algorithms and Ciphers](#).

For information about configuring FIPS appliances in an HA setup, see [Configure FIPS on appliances in an HA setup](#).

### Limitations

1. SSL renegotiation using the SSLv3 protocol is not supported on the back end of an MPX FIPS appliance.
2. 1024-bit and 4096-bit keys and exponent value of 3 aren’t supported.
3. 4096-bit server certificate isn’t supported.
4. 4096-bit client certificate isn’t supported (if client authentication is enabled on the back-end server).

### Configure the HSM

Before configuring the HSM on an MPX 14000 FIPS appliance, check the state of your FIPS card to verify that the driver loaded correctly. Then initialize the card.

At the command prompt, type:

```
1 show fips
2
3 FIPS Card is not configured
4 <!--NeedCopy-->
```

The message “ERROR: Operation not permitted - no FIPS card present in the system” appears if the driver is not loaded correctly.

## Initialize the FIPS card

The appliance must be restarted three times for proper initialization of the FIPS card.

### Important

- Verify that the `/nsconfig/fips` directory has been successfully created on the appliance.
- Do not save the configuration before you restart the appliance for the third time.

Perform the following steps to initialize the FIPS card:

1. Reset the FIPS card (`reset fips`).
2. Restart the appliance (`reboot`).
3. Set the security officer password for partitions 0 and 1, and the user password for partition (`set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -hsmLabel NSFIPS`).

Note: The set or reset command takes more than 60 seconds to run.

4. Save the configuration (`saveconfig`).
5. Verify that the password-encrypted key for the main partition (`master_pek.key`) has been created in the `/nsconfig/fips/` directory.
6. Restart the appliance (`reboot`).
7. Verify that the password-encrypted key for the default partition (`default_pek.key`) has been created in the `/nsconfig/fips/` directory.
8. Restart the appliance (`reboot`).
9. Verify that the FIPS card is UP (`show fips`).

**Initialize the FIPS card by using the CLI** The `set fips` command initializes the Hardware Security Module (HSM) on the FIPS card and sets a new security officer password and user password.

**Caution:** This command erases all data on the FIPS card. You are prompted before proceeding with the command execution. A restart is required before and after running this command for the changes to apply. Save the configuration after running this command and before restarting the appliance.

At the command prompt, type the following commands:

```
1 reset fips
2
3 reboot
4
5 set fips -initHSM Level-2 so12345 so12345 user123 -hsmLabel NSFIPS
```

```

6
7 This command will erase all data on the FIPS card. You must save the
 configuration (saveconfig) after executing this command. Do you want
 to continue?(Y/N)y
8
9 <!--NeedCopy-->

```

**Note:** The following message appears when you run the `set fips` command:

```

1 This command will erase all data on the FIPS card. You must save the
 configuration (saveconfig) after executing this command. [Note: On
 MPX/SDX 14xxx FIPS platform, the FIPS security is at Level-3 by
 default, and the -initHSM Level-2 option is internally converted to
 Level-3] Do you want to continue?(Y/N)y
2
3 saveconfig
4
5 reboot
6
7 reboot
8
9 show fips
10
11 FIPS HSM Info:
12 HSM Label : NetScaler FIPS
13 Initialization : FIPS-140-2 Level-3
14 HSM Serial Number : 3.1G1836-ICM000136
15 HSM State : 2
16 HSM Model : NITROX-III CNN35XX-NFBE
17 Hardware Version : 0.0-G
18 Firmware Version : 1.0
19 Firmware Build : NFBE-FW-1.0-48
20 Max FIPS Key Memory : 102235

23 Free SRAM Memory : 262780
24 Total Crypto Cores : 63
25 Enabled Crypto Cores : 63
26
27 <!--NeedCopy-->

```

## Create a FIPS key

You can create a FIPS key on your MPX 14000 FIPS appliance or import an existing FIPS key to the appliance. The MPX 14000 FIPS appliance supports only 2048-bit and 3072-bit keys and an exponent value of F4 (whose value is 65537). For PEM keys, an exponent is not required. Verify that the FIPS key is created correctly. Create a certificate signing request and a server certificate. Finally, add the certificate-key pair to your appliance.

Specify the key type (RSA or ECDSA). For ECDSA keys, specify only the curve. ECDSA key creation with

curve P\_256 and P\_384 are supported.

**Note:**

1024-bit and 4096-bit keys and an exponent value of 3 are not supported.

**Create a FIPS key by using the CLI**

At the command prompt, type:

```
1 create ssl fipsKey <fipsKeyName> -keytype (RSA | ECDSA) [-exponent (
 3 | F4)] [-modulus <positive_integer>] [-curve (P_256 | P_384)]
2 <!--NeedCopy-->
```

**Example1:**

```
1 create fipsKey f1 -keytype RSA -modulus 2048 -exponent F4
2
3
4 show ssl fipskey f1
5
6 FIPS Key Name: f1 Key Type: RSA Modulus: 2048 Public Exponent: F4 (
 Hex: 0x10001)
7
8 <!--NeedCopy-->
```

**Example2:**

```
1 > create fipskey f2 -keytype ECDSA -curve P_256
2
3
4 > sh fipskey f2
5 FIPS Key Name: f2 Key Type: ECDSA Curve: P_256
6
7 <!--NeedCopy-->
```

**Create a FIPS key by using the GUI**

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Add**.
3. In the Create FIPS Key dialog box, specify values for the following parameters:
  - FIPS Key Name\*—fipsKeyName
  - Modulus\*—modulus
  - Exponent\*—exponent

\*A required parameter

4. Click **Create**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you created are correct.

## Import a FIPS key

To use an existing FIPS key with your FIPS appliance, you need to transfer the FIPS key from the hard disk of the appliance into its HSM.

**Note:** To avoid errors when importing a FIPS key, ensure that the name of the key imported is the same as the original key name when it was created.

## Import a FIPS key by using the CLI

At the command prompt, type:

```
1 import ssl fipsKey <fipsKeyName> -key <string> [-inform <inform>] [-
 wrapKeyName <string>] [-iv<string>] -exponent F4]
2 <!--NeedCopy-->
```

### Example:

```
1 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4
2
3
4 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform PEM
5
6 <!--NeedCopy-->
```

Verify that the FIPS key is created or imported correctly by running the `show fipskey` command.

```
1 show fipskey
2 1) FIPS Key Name: Key-FIPS-2
3
4 <!--NeedCopy-->
```

## Import a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Import**.
3. In the Import as a FIPS Key dialog box, select FIPS key file and set values for the following parameters:
  - FIPS Key Name\*

- Key File Name\* —To put the file in a location other than the default, specify the complete path or click **Browse** and navigate to a location.
- Exponent\*

\*A required parameter

4. Click **Import**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

## Export a FIPS key

Citrix recommends that you create a backup of any key created in the FIPS HSM. If a key in the HSM is deleted, you cannot create the same key again, and all the certificates associated with it are rendered useless.

In addition to exporting a key as a backup, you might need to export a key for transfer to another appliance.

The following procedure provides instructions on exporting a FIPS key to the `/nsconfig/ssl` folder on the appliance's CompactFlash and securing the exported key by using a strong asymmetric key encryption method.

## Export a FIPS key by using the CLI

At the command prompt, type:

```
1 export ssl fipsKey <fipsKeyName> -key <string>
2 <!--NeedCopy-->
```

### Example:

```
1 export fipskey Key-FIPS-1 -key Key-FIPS-1.key
2 <!--NeedCopy-->
```

## Export a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Export**.
3. In the Export FIPS key to a file dialog box, specify values for the following parameters:
  - FIPS Key Name\*—fipsKeyName

- File Name\*—key (To put the file in a location other than the default, you can either specify the complete path or click the Browse button and navigate to a location.)

\*A required parameter

4. Click **Export**, and then click **Close**.

### Import an external key

You can transfer FIPS keys that are created within the NetScaler appliance's HSM. You can also transfer external private keys (such as keys created on a standard NetScaler, Apache, or IIS) to a NetScaler FIPS appliance. External keys are created outside the HSM, by using a tool such as OpenSSL. Before importing an external key into the HSM, copy it to the appliance's flash drive under `/nsconfig/ssl`.

On the MPX 14000 FIPS appliances, the `-exponent` parameter in the `import ssl fipskey` command is not required while importing an external key. The correct public exponent is detected automatically when the key is imported, and the value of the `-exponent` parameter is ignored.

The NetScaler FIPS appliance does not support external keys with a public exponent other than 3 or F4.

You do not need a wrap key on the MPX 14000 FIPS appliances.

You cannot import an external, encrypted FIPS key directly to an MPX 14000 FIPS appliance. To import the key you need to first decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

```
1 openssl rsa -in <EncryptedKey.key> > <DecryptedKey.out>
2 <!--NeedCopy-->
```

**Note:** If you import an RSA key as a FIPS key, Citrix recommends that you delete the RSA key from the appliance for security purposes.

### Import an external key as a FIPS key by using the CLI

1. Copy the external key to the appliance's flash drive.
2. If the key is in .pfx format, you must first convert it to PEM format. At the command prompt, type:

```
1 convert ssl pkcs12 <output file> -import -pkcs12File <input .pfx
 file name> -password <password>
2 <!--NeedCopy-->
```

3. At the command prompt, type the following commands to import the external key as a FIPS key and verify the settings:

```
1 import ssl fipsKey <fipsKeyName> -key <string> -informPEM
2 show ssl fipskey<fipsKeyName>
3 <!--NeedCopy-->
```

**Example:**

```
1 convert ssl pkcs12 iis.pem -password 123456 -import -pkcs12File iis.pfx
2
3 import fipskey Key-FIPS-2 -key iis.pem -inform PEM
4
5 show ssl fipskey key-FIPS-2
6
7 FIPS Key Name: Key-FIPS-2 Modulus: 0 Public Exponent: F4 (Hex value 0
 x10001)
8 <!--NeedCopy-->
```

**Import an external key as a FIPS key by using the GUI**

1. If the key is in .pfx format, you must first convert it to PEM format.
  - a) Navigate to **Traffic Management > SSL**.
  - b) In the details pane, under Tools, click **Import PKCS#12**.
  - c) In the Import PKCS12 File dialog box, set the following parameters:
    - Output File Name\*
    - PKCS12 File Name\*—Specify the .pfx file name.
    - Import Password\*
    - Encoding Format\*A required parameter
2. Navigate to **Traffic Management > SSL > FIPS**.
3. In the details pane, on the FIPS Keys tab, click **Import**.
4. In the Import as a FIPS Key dialog box, select PEM file, and set values for the following parameters:
  - FIPS Key Name\*
  - Key File Name\*—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.\*A required parameter
5. Click **Import**, and then click **Close**.
6. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

## Configure FIPS on appliances in an HA setup

You can configure two appliances in an HA pair as FIPS appliances.

### Prerequisites

- The Hardware Security Module (HSM) must be configured on both the appliances. For more information, see [Configure the HSM](#).
- When using the GUI, ensure that the appliances are already in an HA setup. For more information about configuring an HA setup, see [High availability](#).

#### Note:

Citrix recommends that you use the configuration utility (GUI) for this procedure. If you use the command line (CLI), make sure that you carefully follow the steps as listed in the procedure. Changing the order of steps or specifying an incorrect input file might cause an inconsistency that requires an appliance restart. In addition, if you use the CLI, the `create ssl fipskey` command is not propagated to the secondary node. When you run the command with the same input values for modulus size and exponent on two different FIPS appliances, the keys generated are not the same. Create the FIPS key on one of the nodes and then transfer it to the other node. But if you use the configuration utility to configure FIPS appliances in an HA setup, the FIPS key that you create is automatically transferred to the secondary node. The process of managing and transferring the FIPS keys is known as secure information management (SIM).

**Important:** The HA setup must be completed within six minutes. If the procedure fails at any step, do the following:

1. Restart the appliance or wait for 10 minutes.
2. Remove all the files created by the procedure.
3. Repeat the HA setup procedure.

Do not reuse existing file names.

In the following procedure, appliance A is the primary node and appliance B is the secondary node.

### Configure FIPS on appliances in an HA setup by using the CLI

The following diagram summarizes the transfer process on the CLI.

Figure 1. Transfer the FIPS key-summary

1. **On appliance A**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance, using the administrator credentials.
3. Initialize appliance A as the source appliance. At the command prompt, type:

```
1 init ssl fipsSIMsource <certFile>
2 <!--NeedCopy-->
```

**Example:**

```
init fipsSIMsource /nsconfig/ssl/nodeA.cert
```

4. Copy this <certFile> file to appliance B, in the /nconfig/ssl folder.

**Example:**

```
scp /nsconfig/ssl/nodeA.cert nsroot@198.51.100.10:/nsconfig/ssl
```

5. **On appliance B**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
6. Log on to the appliance, using the administrator credentials.
7. Initialize appliance B as the target appliance. At the command prompt, type:

```
1 init ssl fipsSIMtarget <certFile> <keyVector> <targetSecret>
2 <!--NeedCopy-->
```

**Example:**

```
init fipsSIMtarget /nsconfig/ssl/nodeA.cert /nsconfig/ssl/nodeB.key /nsconfig/ssl/nodeB.secret
```

- Copy this `<targetSecret>` file to appliance A.

**Example:**

```
scp /nsconfig/ssl/fipslbdal0801b.secret nsroot@198.51.100.20:/nsconfig/ssl
```

- On appliance A**, enable appliance A as the source appliance. At the command prompt, type:

```
1 enable ssl fipsSIMSource <targetSecret> <sourceSecret>
2 <!--NeedCopy-->
```

**Example:**

```
enable fipsSIMsource /nsconfig/ssl/nodeB.secret /nsconfig/ssl/nodeA.secret
```

- Copy this `<sourceSecret>` file to appliance B.

**Example:**

```
scp /nsconfig/ssl/fipslbdal0801b.secret nsroot@198.51.100.10:/nsconfig/ssl
```

- On appliance B**, enable appliance B as the target appliance. At the command prompt, type:

```
1 enable ssl fipsSIMtarget <keyVector> <sourceSecret>
2 <!--NeedCopy-->
```

**Example:**

```
enable fipsSIMtarget /nsconfig/ssl/nodeB.key /nsconfig/ssl/nodeA.secret
```

- On appliance A**, create a FIPS key, as described in Create a FIPS key.
- Export the FIPS key to the appliance's hard disk, as described in Export a FIPS key.
- Copy the FIPS key to the hard disk of the secondary appliance by using a secure file transfer utility, such as SCP.
- On appliance B**, import the FIPS key from the hard disk into the HSM of the appliance, as described in Import a FIPS key.

**Configure FIPS on appliances in an HA setup by using the GUI**

- On the appliance to be configured as the source (primary) appliance, navigate to **Traffic Management > SSL > FIPS**.
- In the details pane, on the FIPS Info tab, click **Enable SIM**.
- In the **Enable SIM for HA Pair** dialog box, in the **Certificate File Name** text box, type the file name. The file name must contain the path to the location at which the FIPS certificate must be stored on the source appliance.

4. In the **Key Vector File Name** text box, type the file name. The file name must contain the path to the location at which the FIPS key vector must be stored on the source appliance.
5. In the **Target Secret File Name** text box, type the location for storing the secret data on the target appliance.
6. In the **Source Secret File Name** text box, type the location for storing the secret data on the source appliance.
7. Under **Secondary System Login Credential**, enter the values for **User Name** and **Password**.
8. Click **OK**. The FIPS appliances are now configured in HA mode.

**Note:** After configuring the appliances in HA, create a FIPS key, as described in [Create a FIPS key](#). The FIPS key is automatically transferred from the primary to the secondary appliance.

### Create a certificate signing request by using the CLI

At the command prompt, type:

```

1 create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
 <string>) [-keyform (DER | PEM) {
2 -PEMPassPhrase }
3] -countryName <string> -stateName <string> -organizationName<string>
 [-organizationUnitName <string>] [-localityName <string>] [-
 commonName <string>] [-emailAddress <string>] {
4 -challengePassword }
5 [-companyName <string>] [-digestMethod (SHA1 | SHA256)]
6 <!--NeedCopy-->
```

#### Example:

```

1 >create certreq f1.req - fipsKeyName f1 -countryName US -stateName CA
 -organizationName Citrix -companyName Citrix -commonName ctx -
 emailAddress test@example.com
2 Done
3 <!--NeedCopy-->
```

### Create a server certificate by using the CLI

At the command prompt, type:

```

1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
 input_filename>] [-keyform (DER | PEM) {
2 -PEMPassPhrase }
3] [-days <positive_integer>] [-certForm (DER | PEM)] [-CAcert <
 input_filename>] [-CAcertForm (DER | PEM)] [-CAkey <
 input_filename>] [-CAkeyForm (DER | PEM)] [-CAserial <
 output_filename>]
4 <!--NeedCopy-->
```

**Example:**

```

1 create cert f1.cert f1.req SRVR_CERT -CAcert ns-root.cert -CAkey ns-
 root.key -CAserial ns-root.srl -days 1000
2 Done
3 <!--NeedCopy-->

```

The preceding example creates a server certificate using a local root CA on the appliance.

**Add a certificate-key pair by using the CLI**

At the command prompt, type:

```

1 add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <
 string> | -fipsKey <string> | -hsmKey <string>] [-inform <inform>][
 -expiryMonitor (ENABLED | DISABLED) [-notificationPeriod <
 positive_integer>]] [-bundle (YES | NO)]
2 <!--NeedCopy-->

```

**Example:**

```

1 add certkey cert1 -cert f1.cert -fipsKey f1
2
3 <!--NeedCopy-->

```

After creating the FIPS key and server certificate, you can add the generic SSL configuration. Enable the features that are required for your deployment. Add servers, services, and SSL virtual servers. Bind the certificate-key pair and the service to the SSL virtual server. Save the configuration.

```

1 enable ns feature SSL LB
2
3 add server s1 10.217.2.5
4
5 add service sr1 s1 HTTP 80
6
7 add lb vserver v1 SSL 10.217.2.172 443
8
9 bind ssl vserver v1 -certkeyName cert1
10
11 bind lb vserver v1 sr1
12
13 saveconfig
14
15 <!--NeedCopy-->

```

The basic configuration of your MPX 14000 FIPS appliance is now complete.

For information about configuring secure HTTPS, click [Configure FIPS](#).

For information about configuring secure RPC, click [Configure FIPS for the first time](#).

## Update the license on an MPX 14000 FIPS appliance

Any update to the license on this platform requires two reboots.

1. Update the license in the `/nsconfig/license` folder.
2. Restart the appliance.
3. Log on to the appliance.
4. Restart the appliance again.

**Note:** Do not add new commands, save the config, or check the system state before the second reboot.

5. Log on to the appliance and ensure that FIPS is initialized by running the `show ssl fips` command.

## Support for hybrid FIPS mode on the MPX 14000 FIPS and SDX 14000 FIPS platforms

### Note:

This feature is supported only on the new MPX/SDX 14000 FIPS platform containing one primary FIPS card and one or more secondary cards. It is not supported on a VPX platform or a platform containing only one type of hardware card.

On a FIPS platform, the asymmetric and symmetric encryption and decryption are performed on the FIPS card for security reasons. However, you can perform part of this activity (asymmetric) on a FIPS card and offload the bulk encryption and decryption (symmetric) to another card without compromising the security of your keys.

The new MPX/SDX 14000 FIPS platform contains one primary card and one or more secondary cards. If you enable the hybrid FIPS mode, the pre-master secret decryption commands are run on the primary card because the private key is stored on this card. However, the bulk encryption and decryption is offloaded to the secondary card. This offload significantly increases the bulk encryption throughput on an MPX/SDX 14000 FIPS platform as compared to non-hybrid FIPS mode and the existing MPX 9700/10500/12500/15000 FIPS platform. Enabling the hybrid FIPS mode also improves the SSL transaction per second on this platform.

### Notes:

- The hybrid FIPS mode is disabled by default to meet the strict certification requirements where all the crypto computation must be done inside a FIPS certified module. Enable the hybrid mode to offload the bulk encryption and decryption to the secondary card.
- On an SDX 14000 FIPS platform, you must first assign an SSL chip to the VPX instance before you enable the hybrid mode.

## Enable hybrid FIPS mode by using the CLI

At the command prompt, type:

```

1 set SSL parameter -hybridFIPSMODE {
2 ENABLED|DISABLED }
3
4
5 Arguments
6
7 hybridFIPSMODE
8
9 When this mode is enabled, system will use additional crypto hardware
 to accelerate symmetric crypto operations.
10
11 Possible values: ENABLED, DISABLED
12
13 Default value: DISABLED
14 <!--NeedCopy-->
```

### Example:

```

1 set SSL parameter -hybridFIPSMODE ENABLED
2 show SSL parameter
3 Advanced SSL Parameters
4 -----
5
6 Hybrid FIPS Mode : ENABLED
7
8
9 <!--NeedCopy-->
```

## Enable hybrid FIPS mode by using the GUI

1. Navigate to **Traffic Management > SSL**.
2. In the details pane, under **Settings**, click **Change advanced SSL settings**.
3. In the **Change Advanced SSL Settings** dialog box, select **Hybrid FIPS Mode**.

### Limitations:

1. Renegotiation is not supported.
2. The `stat ssl parameter` command on an SDX 14000 platform does not display the correct secondary card utilization percentage. It always displays 0.00% utilization.

```

1 stat ssl
2
3 SSL Summary
4 # SSL cards present 1
5 # SSL cards UP 1
```

```
6 # Secondary SSL cards present 4
7 # Secondary SSL cards UP 4
8 SSL engine status 1
9 SSL sessions (Rate) 963
10 Secondary card utilization (%) 0.00
11 <!--NeedCopy-->
```

## SDX 14000 FIPS appliances

August 4, 2023

### Note

The firmware versions listed under “NetScaler Release 12.1-FIPS” and “NetScaler Release 12.1-NDcPP” in the NetScaler downloads page are not supported on the MPX 14000 FIPS or SDX 14000 FIPS platforms. These platforms can use other latest NetScaler firmware versions available on the downloads page.

A NetScaler SDX appliance is a multitenant platform on which you can provision and manage multiple virtual NetScaler instances. The SDX appliance addresses cloud computing and multitenancy requirements by allowing a single administrator to configure and manage the appliance and delegate the administration of each hosted instance to tenants.

A NetScaler SDX 14030/14060/14080 FIPS appliance provides the capabilities of an SDX appliance with FIPS functionality. It is equipped with a tamper-proof (tamper-evident) cryptographic module—a Cavium CNN3560-NFBE-G—designed to comply with the FIPS 140-2 Level-3 specifications. The Critical Security Parameters (CSPs), primarily the server’s private-key, are securely stored and generated inside the cryptographic module. This module is also referred to as the Hardware Security Module (HSM). The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (`nsroot`) can perform operations on the keys stored inside the HSM.

A NetScaler SDX 14030/14060/14080 FIPS appliance contains one FIPS HSM module with 63 cores. The FIPS HSM module can be partitioned up to a maximum of 32 partitions. The SDX administrator can assign dedicated key storage, cryptographic resources, and number of crypto SSL FIPS cores to each partition. Keys and resources allocated to a partition are dedicated and secure and any other partition cannot access or share them.

The FIPS HSM partition that you create can be assigned or attached to a VPX instance at the time of provisioning the instance, or later by editing the instance. The FIPS partition created and attached to an instance acts like a virtual HSM module for that instance.

The VPX instances on an SDX 14030/14060/14080 FIPS appliance are assigned a FIPS virtual function (VF) partition, which is treated as an isolated FIPS virtual card or HSM. Therefore, the steps to config-

ure a FIPS partition inside a VPX instance are similar to the steps to configure an MPX FIPS appliance. For compliance details, see the security policy details on the U.S. National Institute of Standards and Technology (NIST) website.

For information about configuring FIPS appliances in a high availability setup, see [Configure FIPS appliances in an HA setup](#).

### Important

Each key includes a private and a public key. As a result, it occupies two key spaces. Therefore, the maximum number of keys is limited to one less than half the key store size.

The SDX 14000 FIPS platform supports a hybrid FIPS mode. This mode allows you to offload part of the encryption and decryption activity to a non-FIPS card. For more information, see [Hybrid FIPS mode](#).

## Limitations

September 21, 2020

1. SSL renegotiation using the SSLv3 protocol is not supported on the back end of an SDX FIPS appliance.
2. 1024-bit and 4096-bit keys and an exponent value of 3 are not supported.
3. Backup and restore are not supported.
4. Cluster and administrative domains are not supported.
5. You can attach only one FIPS partition to an instance.
6. An instance with a FIPS partition can be assigned only one CPU core.
7. You can assign either a FIPS partition or an SSL core to an instance, but not both.
8. 4096-bit server certificate is not supported.
9. 4096-bit client certificate is not supported (if client authentication is enabled on the back-end server).

## Terminology

May 2, 2023

**Zeroize:** Reset the HSM. All the data on the HSM is deleted. This step is mandatory before the HSM is initialized.

**Initialize:** Set the HSM capabilities. The NetScaler SDX FIPS appliance complies with FIPS-140-2 level 2. You can create partitions after you initialize the chip.

**Key store size:** Number of keys that can be stored on a partition. A maximum of 102235 keys can be specified. The maximum number of keys that can be stored is one less than half the number specified. For example, if you specify 100, you can create only 49 keys because one of the keys is the RSA key pair that consumes 2 key stores.

**Crypto Core Capacity:** Number of crypto cores assigned to a partition. A maximum of 63 cores are available.

**SSL Context:** Number of concurrent SSL connections that can be created on a partition.

## Initialize the HSM

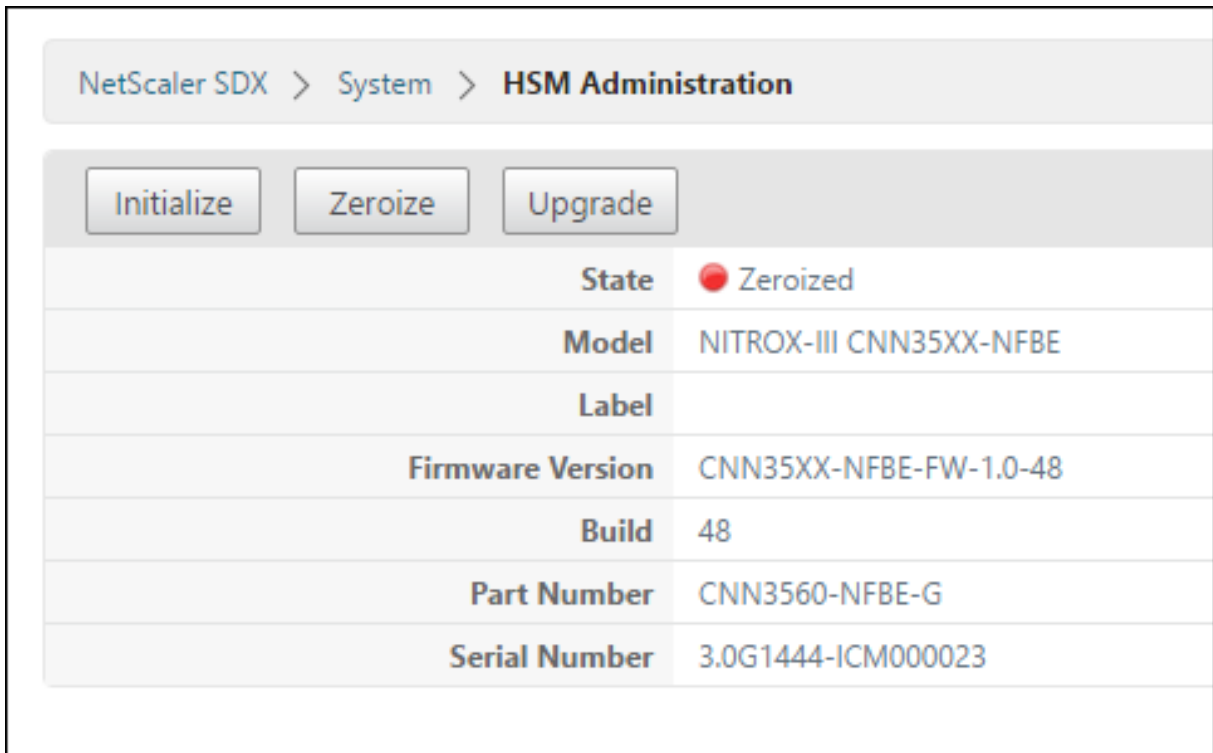

September 21, 2020

Before initializing the HSM, you must first zeroize it.

### Zeroize the HSM by using the Management Service

1. Open a browser and log on to the appliance.
2. On the **Configuration** tab, navigate to **System > HSM Administration**, and in the details plane, click **Zeroize**.

All data is wiped from the FIPS chip, and the state appears as “Zeroized.” Any HSM partitions created earlier are deleted.

### Initialize the HSM by using the Management Service

1. On the **Configuration** tab, navigate to **System > HSM Administration**, and in the details plane, click **Initialize**.
2. Type a new user name, specify a password, and click **OK**.

The card state appears as “Initialized.”

NetScaler SDX > System > **HSM Administration**

Initialize Zeroize Upgrade

<b>State</b>	● Initialized
<b>Model</b>	NITROX-III CNN35XX-NFBE
<b>Label</b>	cavium
<b>Firmware Version</b>	CNN35XX-NFBE-FW-1.0-48
<b>Build</b>	48
<b>Part Number</b>	CNN3560-NFBE-G
<b>Serial Number</b>	3.0G1444-ICM000023

## Create partitions

January 2, 2024

Create partitions for different tenants and specify the cryptographic resources for each partition. Each instance is assigned one partition, and a partition can be assigned to only one instance. Deleting an instance deletes the partition assigned to the instance. As a result, the partition data is also deleted and not left unsecured or accessible later. Number of keys and SSL context assignment depends on your application. For information about the number of cores to assign, see the NetScaler data sheet.

### Important

After you assign a key store size and cores to an HSM partition, you cannot change them at run time. First detach the partition from the instance.

### Create a partition by using the Management Service

1. On the Configuration tab, navigate to **System > HSM Administration > Partitions**, and in the details plane, click **Add**.

2. Specify a name for the partition, and the resources to be assigned to this partition.
3. Click **OK**.

The summary page displays all the partitions that were created. Some partitions are assigned an instance while some are free partitions.

NetScaler SDX > System > HSM Administration > Partitions ↻

Total Keys	Available Keys	Total Crypto Cores	Available Crypto Cores	Total SSL Contexts	Available SSL Contexts
102,235	97,035	63	23	1,000,000	610,000

Name	Key Store Size	Crypto Core Capacity	SSL Core Contexts	Instance Name
Part-3	2000	8	10000	
Part-4	200	2	10000	
Partition-1234	100	4	20000	
Partition-12345	300	4	20000	
Partition-5	300	8	100000	
Part-6	200	8	200000	
Part-1	100	2	10000	NSVPX-1-10.217.202.35
Part-2	2000	4	20000	NSVPX-2-10.217.202.36

## Provision a new instance or modify an existing instance and assign a partition

January 2, 2024

After creating the partitions, you must assign them to instances.

### Important:

- You can attach only one FIPS partition to an instance.
- An instance with a FIPS partition can be assigned only one CPU core.

### Provision a new instance or modify an existing instance

1. On the Configuration tab, navigate to **NetScaler > Instances**, and add or modify an instance.
2. Select **Enable FIPS**, and from the **Partitions** list, select a partition to attach to this instance.

You can verify that the partition is attached to an instance by using either the GUI or the CLI.

In the GUI, navigate to **System > HSM Administration > Partitions**. The instance name attached to the partition is displayed.

To unassign a FIPS partition, navigate to **NetScaler > Instances**. Edit the instance and clear the **Enable FIPS** check box.

In the CLI, at the command prompt, type the following commands:

```
1 show fips
2
3 FIPS Card is not configured
4 Done
5 <!--NeedCopy-->
```

If you see the following output, see the troubleshooting section for debugging.

ERROR: Operation not permitted - no FIPS card present in the system

#### Note

When a partition is detached from any of the existing VPX instances, the data on the partition is cleared. As a result, any current configuration (for example FIPS keys) is lost. After a partition is detached or reattached to a new or previously bound VPX instance, it must be initialized as per the instructions in [Configure the HSM](#) before you can use the partition for any secure connections.

During this time (after the partition is detached or reattached), the corresponding VPX instance can be accessed through the GUI using HTTP and through the CLI using SSH.

## Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance

October 20, 2021

First check the state of your FIPS card to verify that the driver loaded correctly, and then initialize the card.

At the command prompt, type:

```
1 show fips
2
3 FIPS Card is not configured
4
5 Done
6 <!--NeedCopy-->
```

If the driver is not loaded correctly, the message “ERROR: Operation not permitted - no FIPS card present in the system” appears.

## Initialize the FIPS card

### Important:

Verify that the `/nsconfig/fips` directory has successfully been created on the appliance.

Do not save the configuration before you restart the appliance for the third time.

Perform the following steps to initialize the FIPS card:

1. Reset the FIPS card (`reset fips`).
2. Restart the appliance (`reboot`).
3. Set the security officer password for partitions 0 and 1, and the user password for partition (`set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -hsmLabel NSFIPS`).

Note: The set or reset command takes more than 60 seconds to run.

4. Save the configuration (`saveconfig`).
5. Verify that the password encrypted key for the main partition (`master_pek.key`) has been created in the `/nsconfig/fips/` directory.
6. Restart the appliance (`reboot`).
7. Verify that the FIPS card is UP (`show fips`).

## Initialize the FIPS card by using the CLI

At the command prompt, type the following commands:

```
1 reset fips
2
3 reboot
4
5 set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -
 hsmLabel <string>
6 <!--NeedCopy-->
```

**Note:** The following message appears when you run the `set fips` command:

```
1 This command will erase all data on the FIPS card. You must save the
 configuration (saveconfig) after executing this command. [Note: On
 MPX/SDX 14xxx FIPS platform, the FIPS security is at Level-3 by
 default, and the -initHSM Level-2 option is internally converted to
 Level-3] Do you want to continue?(Y/N)y
2
3 saveconfig
```

```
4
5 reboot
6
7 show fips
8 <!--NeedCopy-->
```

**Example:**

```
1 reset fips
2
3 Done
4
5 reboot
6
7 set fips -initHSM Level-2 so12345 so12345 user123 -hsmLabel NSFIPS
8
9 This command will erase all data on the FIPS card. You must save the
 configuration (saveconfig) after executing this command. [Note: On
 MPX/SDX 14xxx FIPS platform, the FIPS security is at Level-3 by
 default, and the -initHSM Level-2 option is internally converted to
 Level-3] Do you want to continue?(Y/N)y
10
11 Done
12
13 saveconfig
14
15 Done
16
17 reboot
18
19 show fips
20
21 FIPS HSM Info:
22 HSM Label : NSFIPS
23 Initialization : FIPS-140-2 Level-2
24 HSM Serial Number : 3.0G1532-ICM000228
25 HSM State : 2
26 HSM Model : NITROX-III CNN35XX-NFBE
27 Hardware Version : 0.0-G
28 Firmware Version : 1.0
29 Firmware Build : NFBE-FW-1.0-48
30 Max FIPS Key Memory : 1000
31 Free FIPS Key Memory : 1000
32 Total SRAM Memory : 557396
33 Free SRAM Memory : 238088
34 Total Crypto Cores : 4
35 Enabled Crypto Cores : 4
36 Done
37 <!--NeedCopy-->
```

## Create a FIPS key for an instance on an SDX 14030/14060/14080 FIPS appliance

February 1, 2021

You can create a FIPS key on your instance or import an existing FIPS key into the instance. An SDX 14030/14060/14080 FIPS appliance supports only 2048-bit and 3072-bit keys and an exponent value of F4. For PEM keys, an exponent is not required. Verify that the FIPS key is created correctly. Create a certificate signing request and a server certificate. Finally, add the certificate-key pair to your instance.

### Note:

1024-bit and 4096-bit keys and an exponent value of 3 are not supported.

### Create a FIPS key by using the CLI

At the command prompt, type:

```
1 create ssl fipsKey <fipsKeyName> -keytype (RSA | ECDSA) [-exponent (3
 | F4)] [-modulus <positive_integer>] [-curve (P_256 | P_384)]
2 <!--NeedCopy-->
```

### Example:

```
1 create fipsKey f1 -keytype RSA -modulus 2048 -exponent F4
2
3 Done
4
5 show ssl fipskey ddvws
6
7 FIPS Key Name: f1 Key Type: RSA Modulus: 2048 Public Exponent: F4 (
 Hex: 0x10001)
8
9 Done
10 <!--NeedCopy-->
```

### Import a FIPS key by using the CLI

At the command prompt, type:

```
1 import ssl fipsKey <fipsKeyName> -key <string> [-inform <inform>] [-
 wrapKeyName <string>] [-iv<string>] [-exponent F4]
2 <!--NeedCopy-->
```

### Example:

```

1 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4
2 Done
3 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform PEM
4 Done
5 <!--NeedCopy-->

```

Verify that the FIPS key is created or imported correctly by running the **show fipskey** command.

```

1 show fipskey
2 1) FIPS Key Name: Key-FIPS-2
3 Done
4 <!--NeedCopy-->

```

## Create a certificate signing request by using the CLI

At the command prompt, type:

```

1 create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
 <string>) [-keyform (DER | PEM) {
2 -PEMPassPhrase }
3] -countryName <string> -stateName <string> -organizationName<string>
 [-organizationUnitName <string>] [-localityName <string>] [-
 commonName <string>] [-emailAddress <string>] {
4 -challengePassword }
5 [-companyName <string>] [-digestMethod (SHA1 | SHA256)]
6 <!--NeedCopy-->

```

### Example:

```

1 create certreq f1.req - fipsKeyName f1 -countryName US -stateName CA -
 organizationName Citrix -companyName Citrix -commonName ctx -
 emailAddress test@example.com`
2 `Done
3 <!--NeedCopy-->

```

## Create a server certificate by using the CLI

At the command prompt, type:

```

1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
 input_filename>] [-keyform (DER | PEM) {
2 -PEMPassPhrase }
3] [-days <positive_integer>] [-certForm (DER | PEM)] [-CAcert <
 input_filename>] [-CAcertForm (DER | PEM)] [-CAkey <
 input_filename>] [-CAkeyForm (DER | PEM)] [-CASerial <
 output_filename>]
4 <!--NeedCopy-->

```

**Example:**

```
1 create cert f1.cert f1.req SRVR_CERT -CAcert ns-root.cert -CAkey ns-
 root.key -CAserial ns-root.srl -days 1000
2 Done
3 <!--NeedCopy-->
```

The preceding example creates a server certificate using a local root CA on the appliance.

**Add a certificate-key pair by using the CLI**

At the command prompt, type:

```
1 add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <
 string> | -fipsKey <string> | -hsmKey <string>] [-inform <inform>]
 [-expiryMonitor (ENABLED | DISABLED) [-notificationPeriod <
 positive_integer>]] [-bundle (YES | NO)]
2 <!--NeedCopy-->
```

**Example:**

```
1 add certkey cert1 -cert f1.cert -fipsKey f1
2 Done
3 <!--NeedCopy-->
```

After creating the FIPS key and server certificate, you can add the generic SSL configuration. Enable the features that are required for your deployment. Add servers, services, and SSL virtual servers. Bind the certificate-key pair and the service to the SSL virtual server, and save the configuration.

```
1 enable ns feature SSL LB
2 Done
3 add server s1 10.217.2.5
4 Done
5 add service sr1 s1 HTTP 80
6 Done
7 add lb vserver v1 SSL 10.217.2.172 443
8 Done
9 bind ssl vserver v1 -certkeyName cert1
10 Done
11 bind lb vserver v1 sr1
12 Done
13 saveconfig
14 Done
15 <!--NeedCopy-->
```

For information about configuring secure HTTPS and secure RPC, click [here](#).

## Upgrade the FIPS HSM firmware on a VPX instance

December 29, 2023

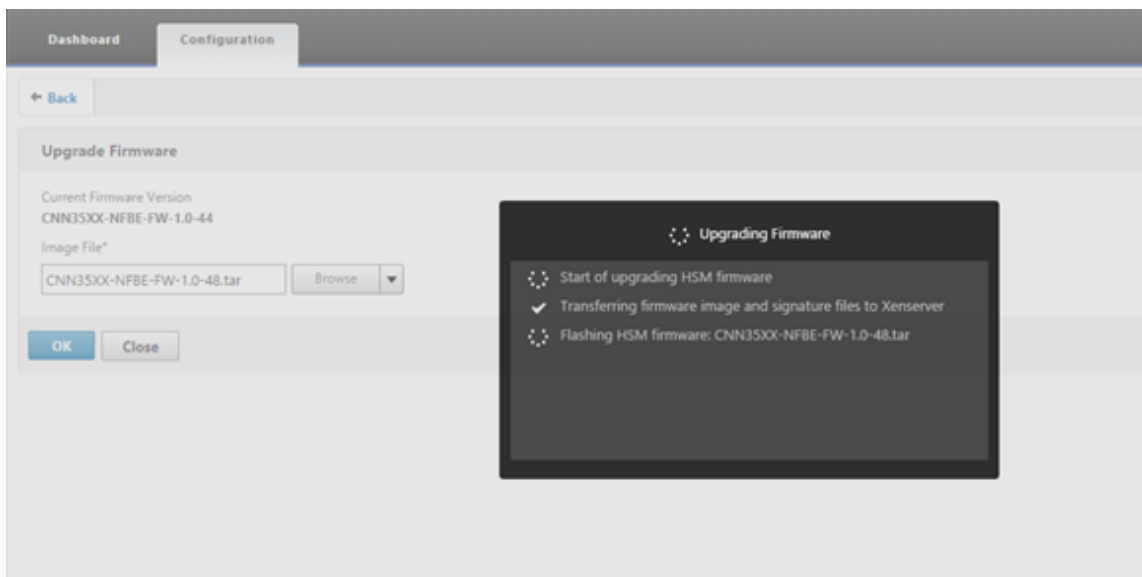

### Note

This upgrade applies to the FIPS card on the SDX 14000 appliance.

FIPS HSM firmware updates are released from time to time. Download the latest firmware from the NetScaler download page and upload it to the appliance. The upgrade process might take up to 10 minutes to complete. The instance is restarted after the upgrade.

### Upgrade the FIPS HSM firmware

1. Navigate to **System > HSM Administration > Firmware Images**.
2. Select **Upload**.
3. Navigate to the folder that contains the firmware image and select the file.
4. Navigate to **System > HSM Administration**, and select **Upgrade Firmware**.
5. Select the firmware image to upgrade to, and click **OK**.

## Support for Thales Luna Network hardware security module

May 2, 2023

A non-FIPS NetScaler appliance stores the server's private key on the hard disk. On a FIPS appliance, the key is stored in a cryptographic module known as a hardware security module (HSM). Storing a key in the HSM protects it from physical and software attacks. In addition, the keys are encrypted with special FIPS approved ciphers.

Only the NetScaler MPX/SDX 14000 FIPS appliances support a FIPS card. Support for FIPS is not available on other MPX/SDX appliances, or on the NetScaler VPX appliances. This limitation is addressed by supporting a Thales Luna network HSM on all NetScaler MPX, SDX, and VPX appliances except the MPX/SDX 14000 FIPS appliances.

**Note**

Support for the appliances listed in [Support for Intel Coletto and Intel Lewisburg SSL chip-based platforms](#) is available in release 13.1 build 33.x and later.

A Thales Luna network HSM is designed to protect critical cryptographic keys and to accelerate sensitive cryptographic operations across a wide range of security applications.

**Supported versions matrix**

---

NetScaler Version	Software Appliance		
	Version	Firmware Version	Client Version
11.1, 12.0, 12.1	5.2.3-1	6.2.1	6.0.0
11.1, 12.0, 12.1	6.2.2-5	6.10.9	6.2.2
13.0	7.2.0-220	7.0.3	7.2.2 (7.2.0-220)
13.1	7.2.0-220	7.0.3	10.3.0

---

**Prerequisites**

May 2, 2023

Before you can use a Thales Luna network HSM with a NetScaler, make sure that the following prerequisites are met:

- A Thales Luna network HSM is installed in the network, ready to use, and accessible to the NetScaler. That is, the NSIP address or the SNIP address is added as an authorized client on the HSM.

- Licenses are available to support the required number of partitions on the HSM.
- The Thales Luna network HSM and the NetScaler can initiate connections with each other through port 1792.
- You are using NetScaler release 11.1 or later.
- The NetScaler appliance does not contain a FIPS Cavium card.

**Important**

Thales Luna network HSMs are not supported on the MPX 9700/10500/12500/15500 FIPS appliances.

## Configure a Thales Luna client on the ADC

August 3, 2023

After you have configured the Thales Luna HSM and created the required partitions, you must create clients and assign them to partitions. Begin by configuring the Thales Luna clients on the NetScaler and setting up the network trust links (NTLs) between the Thales Luna clients and the Thales Luna HSM. A sample configuration is given in the [Appendix](#).

**Note**

If you upgrade to software version 14.1, you must install the Thales Luna client version 10.3.0 and perform the following steps.

1. Change the directory to `/var/safenet` and install the Thales Luna client. At the shell prompt, type:

```
1 cd /var/safenet
2 <!--NeedCopy-->
```

To install Thales Luna client version 6.0.0, type:

```
1 install_client.sh -v 600
2 <!--NeedCopy-->
```

To install Thales Luna client version 6.2.2, type:

```
1 install_client.sh -v 622
2 <!--NeedCopy-->
```

To install Thales Luna client version 7.2.2, type:

```
1 install_client.sh -v 722
2 <!--NeedCopy-->
```

To install Thales Luna client version 10.3.0, type:

```
1 install_client.sh -v 1030
2 <!--NeedCopy-->
```

## 2. Configure the NTLs between Thales Luna client (ADC) and HSM.

After the ‘/var/safenet/’ directory is created, perform the following tasks on the ADC.

a) Change the directory to ‘/var/safenet/config/’ and run the ‘safenet\_config’ script. At the shell prompt, type:

```
1 cd /var/safenet/config
2
3 sh safenet_config
4 <!--NeedCopy-->
```

This script copies the “Chrystoki.conf” file into the /etc/ directory. It also generates a symbolic link ‘libCryptoki2\_64.so’ in the ‘/usr/lib/’ directory.

b) Create and transfer a certificate and key between the ADC and the Thales Luna HSM.

To communicate securely, the ADC and the HSM must exchange certificates. Create a certificate and key on the ADC and then transfer it to the HSM. Copy the HSM certificate to the ADC.

i) Change directory to /var/safenet/safenet/lunaclient/bin.

ii) Create a certificate on the ADC. At the shell prompt, type:

```
1 ./vtl createCert -n <ip address of NetScaler>
2 <!--NeedCopy-->
```

This command also adds the certificate and key path to the “/etc/Chrystoki.conf” file.

iii) Copy this certificate to the HSM. At the shell prompt, type:

```
1 scp /var/safenet/safenet/lunaclient/cert/client/<ip address of NS
 >.pem <LunaSA_HSM account>@<IP address of Luna SA>
2 <!--NeedCopy-->
```

iv) Copy the HSM certificate to the NetScaler. At the shell prompt, type:

```
1 scp <HSM account>@<HSM IP>:server.pem /var/safenet/safenet/
 lunaclient/server_<HSM ip>.pem
2 <!--NeedCopy-->
```

## 3. Register the NetScaler as a client and assign it a partition on the Thales Luna HSM.

Log on to the HSM and create a client. Enter the NSIP as the client IP. This address must be the IP address of the ADC from which you transferred the certificate to the HSM. After the client is successfully registered, assign a partition to it. Run the following commands on the HSM.

a) Use SSH to connect to the Thales Luna HSM and enter the password.

b) Register the NetScaler on the Thales Luna HSM. The client is created on the HSM. The IP address is the client's IP address. That is, the NSIP address.

At the prompt, type:

```
1 client register -client <client name> -ip <NetScaler ip>
2 <!--NeedCopy-->
```

c) Assign the client a partition from the partition list. To view the available partitions, type:

```
1 <luna_sh> partition list
2 <!--NeedCopy-->
```

Assign a partition from this list. Type:

```
1 <lunash:> client assignPartition -client <Client Name> -par <
 Partition Name>
2 <!--NeedCopy-->
```

#### 4. Register the HSM with its certificate on the NetScaler.

On the ADC, change the directory to “/var/safenet/safenet/lunaclient/bin” and, at the shell prompt, type:

```
1 ./vtl addserver -n <IP addr of HSM> -c /var/safenet/safenet/
 lunaclient/server_<HSM_IP>.pem
2 <!--NeedCopy-->
```

To remove the HSM that is enrolled on the ADC, type:

```
1 ./vtl deleteServer -n <HSM IP> -c <cert path>
2 <!--NeedCopy-->
```

To list the HSM servers configured on the ADC, type:

```
1 ./vtl listServer
2 <!--NeedCopy-->
```

#### Note:

Before removing the HSM by using `vtl`, make sure all the keys for that HSM are manually removed from the appliance. HSM keys cannot be deleted after the HSM server is removed.

#### 5. Verify the network trust links (NTLs) connectivity between the ADC and HSM. At the shell prompt, type:

```
1 ./vtl verify
2 <!--NeedCopy-->
```

If verification fails, review all the steps. Errors are due to an incorrect IP address in the client certificates.

## 6. Save the configuration.

The preceding steps update the “/etc/Chrystoki.conf” configuration file. This file is deleted when the ADC is started. Copy the configuration to the default configuration file, which is used when an ADC is restarted.

At the shell prompt, type:

```
1 root@ns# cp /etc/Chrystoki.conf /var/safenet/config/
2 <!--NeedCopy-->
```

Recommended practice is to run this command every time there is a change to the Thales Luna related configuration.

## 7. Start the Thales Luna gateway process.

At the shell prompt, type:

```
1 sh /var/safenet/gateway/start_safenet_gw
2 <!--NeedCopy-->
```

## 8. Configure automatic start of the gateway daemon at boot time.

Create the “safenet\_is\_enrolled” file, which indicates that Thales Luna HSM is configured on this ADC. Whenever the ADC restarts and this file is found, the gateway is automatically started.

At the shell prompt, type:

```
1 touch /var/safenet/safenet_is_enrolled
2 <!--NeedCopy-->
```

## 9. Restart the NetScaler appliance. At the command prompt, type:

```
1 reboot
2 <!--NeedCopy-->
```

# Configure Thales Luna HSMs in a high availability setup on the ADC

May 2, 2023

Configuring Thales Luna HSMs in a high availability (HA) ensures uninterrupted service even if all, but one of the devices, are unavailable. In an HA setup, each HSM joins an HA group in active-active mode. Thales Luna HSMs in an HA setup provide load balancing of all the group members to increase performance and response time while providing the assurance of high availability service. For more information, contact Thales Luna Sales and Support.

### Prerequisites:

- Minimum two Thales Luna HSM devices. All the devices in an HA group must have either PED (trusted path) authentication or password authentication. A combination of trusted path authentication and password authentication in an HA group is not supported.
- Partitions on each HSM device must have the same password even if the label (name) is different.
- All partitions in HA must be assigned to the client (NetScaler appliance).

After configuring a Thales Luna client on the ADC as described in [Configure a Thales Luna client on the ADC](#), perform the following steps to configure Thales Luna HSMs in HA:

1. On the NetScaler shell prompt, launch `lunacm (/usr/safenet/lunaclient/bin)`

**Example:**

```
1 root@ns# cd /var/safenet/safenet/lunaclient/bin/
2
3 root@ns# ./lunacm
4 <!--NeedCopy-->
```

2. Identify the slot IDs of the partitions. To list the available slots (partitions), type:

```
1 lunacm:> slot list
2 <!--NeedCopy-->
```

**Example:**

```
1 Slot Id -> 0
2 HSM Label -> trinity-p1
3 HSM Serial Number -> 481681014
4 HSM Model -> LunaSA 6.2.1
5 HSM Firmware Version -> 6.10.9
6 HSM Configuration -> Luna SA Slot (PED) Signing With
 Cloning Mode
7 HSM Status -> OK
8
9 Slot Id -> 1
10 HSM Label -> trinity-p2
11 HSM Serial Number -> 481681018
12 HSM Model -> LunaSA 6.2.1
13 HSM Firmware Version -> 6.10.9
14 HSM Configuration -> Luna SA Slot (PED) Signing With
 Cloning Mode
15 HSM Status -> OK
16
17 Slot Id -> 2
18 HSM Label -> neo-p1
19 HSM Serial Number -> 487298014
20 HSM Model -> LunaSA 6.2.1
21 HSM Firmware Version -> 6.10.9
22 HSM Configuration -> Luna SA Slot (PED) Signing With
 Cloning Mode
```

```

23 HSM Status -> OK
24
25 Slot Id -> 3
26 HSM Label -> neo-p2
27 HSM Serial Number -> 487298018
28 HSM Model -> LunaSA 6.2.1
29 HSM Firmware Version -> 6.10.9
30 HSM Configuration -> Luna SA Slot (PED) Signing With
 Cloning Mode
31 HSM Status -> OK
32
33 Slot Id -> 7
34 HSM Label -> hsmha
35 HSM Serial Number -> 1481681014
36 HSM Model -> LunaVirtual
37 HSM Firmware Version -> 6.10.9
38 HSM Configuration -> Luna Virtual HSM (PED) Signing With
 Cloning Mode
39 HSM Status -> N/A - HA Group
40
41 Slot Id -> 8
42 HSM Label -> newha
43 HSM Serial Number -> 1481681018
44 HSM Model -> LunaVirtual
45 HSM Firmware Version -> 6.10.9
46 HSM Configuration -> Luna Virtual HSM (PED) Signing With
 Cloning Mode
47 HSM Status -> N/A - HA Group
48
49 Current Slot Id: 0
50 <!--NeedCopy-->

```

3. Create the HA group. The first partition is called the primary partition. You can add more than one secondary partitions.

```

1 lunacm:> hagroup createGroup -slot <slot number of primary
 partition> -label <group name> -password <partition password >
2
3 lunacm:> hagroup createGroup -slot 1 -label gp12 -password *****
4 <!--NeedCopy-->

```

4. Add the secondary members (HSM partitions). Repeat this step for all partitions to be added to the HA group.

```

1 lunacm:> hagroup addMember -slot <slot number of secondary
 partition to be added> -group <group name> -password <partition
 password>
2 <!--NeedCopy-->

```

**Code:**

```

1 lunacm:> hagroup addMember -slot 2 -group gp12 -password *****
2 <!--NeedCopy-->

```

5. Enable HA only mode.

```
1 lunacm:> hgroup HAonly - enable
2 <!--NeedCopy-->
```

6. Enable active recovery mode.

```
1 lunacm:.>hgroup recoveryMode -mode active
2 <!--NeedCopy-->
```

7. Set auto recovery interval time (in seconds). Default is 60 seconds.

```
1 lunacm:.>hgroup interval -interval <value in seconds>
2 <!--NeedCopy-->
```

**Example:**

```
1 lunacm:.>hgroup interval -interval 120
2 <!--NeedCopy-->
```

8. Set recovery retry count. A value of -1 allows an infinite number of retries.

```
1 lunacm:> hgroup retry -count <xxx>
2 <!--NeedCopy-->
```

**Example:**

```
1 lunacm:> hgroup retry -count 2
2 <!--NeedCopy-->
```

9. Copy the configuration from `Chrystoki.conf` to the SafeNet configuration directory.

```
1 cp /etc/Chrystoki.conf /var/safenet/config/
2 <!--NeedCopy-->
```

10. Restart the ADC appliance.

```
1 reboot
2 <!--NeedCopy-->
```

After configuring Thales Luna HSM in HA, see [Other ADC configuration](#) for further configuration on the ADC.

## Other ADC configuration

March 23, 2021

1. Generate a key on the HSM.

Use third party tools to create keys on the HSM.

2. Add an HSM key on the ADC.

**Important!** The # character is not supported in a key name. If the key name includes this character, the load key operation fails.

**To add a Thales Luna HSM key by using the CLI:**

At the command prompt, type:

```
1 add ssl hsmkey <KeyName> -hsmType SAFENET -serialNum <serial #> -
password
2 <!--NeedCopy-->
```

where:

-keyName is the key created on the HSM by using third party tools.

-serialNum is the serial number of the partition on the HSM on which the keys are generated.

**Note:** For HSM in a high availability setup, use the serial number of the high availability group.

-password is the password of the partition on which the keys are present.

**To add a Thales Luna HSM key by using the GUI:**

Navigate to **Traffic Management > SSL > HSM** and add an HSM key. You must specify the HSM Type as **SAFENET**.

3. Add a certificate-key pair on the ADC. First use a third party tool to generate a certificate associated with the key. Then, copy the certificate to the /nsconfig/ssl/ directory on the ADC.

**Note:** The key must be an HSM key.

**To add a certkey pair on the ADC by using the CLI:**

At the command prompt, type:

```
1 add ssl certkey <CertkeyName> -cert <cert name> -hsmkey <KeyName>
2 <!--NeedCopy-->
```

**To add a certkey pair on the ADC by using the GUI:**

- a) Navigate to **Traffic Management > SSL**.
- b) In **Getting Started**, select **Install Certificate (HSM)** and create a certificate-key pair using an HSM key.

4. Create a virtual server and bind the certificate-key pair to this virtual server.

For information about creating a virtual server, click [SSL virtual server configuration](#).

For information about adding a certificate-key pair, click [Add or update a certificate-key pair](#).

For information about binding a certificate-key pair to an SSL virtual server, click [Bind the certificate-key pair to the SSL virtual server](#).

## NetScaler appliances in a high availability setup

May 2, 2023

You can configure a high availability (HA) setup on the NetScaler appliances with a Thales Luna HSM configuration in either of the following two ways:

- First, configure a Thales Luna HSM on the two nodes, using the same HSM and partition. Then create an HA pair. Finally, add the NetScaler configuration, such as keys, certificate-key pairs, and virtual servers, on the primary node.
- If a Thales Luna HSM is already configured on one node with the NetScaler configuration, add a similar configuration on the other node. Copy “/var/safenet/sfgw\_ident\_file” from the first node to the other and restart the safenet\_gw binary. After the gateway is up and running, add the nodes in an HA setup.

## Limitations

May 2, 2023

1. For any changes to the HSM-related configuration in an existing setup, such as adding or removing an HSM, or creating an HA setup, copy ‘/etc/Chrystoki.conf’ to ‘/var/safenet/config’.
2. After adding, removing, or restarting an HSM, you must restart the ‘/var/safenet/gateway/safenet\_gw’ binary. If you don’t restart the gateway binary, the HSM will not serve any traffic after it is added back or after it restarts.
3. To reboot or stop the current ‘/var/safenet/gateway/safenet\_gw’ binary, use

```
1 kill -SIGTERM <PID>
2 kill -SIGINT <PID>
3 <!--NeedCopy-->
```

**Important!** Do not use `kill -9 <PID>` or `kill -6 <PID>`

4. Before removing an existing HSM from the ADC, remove, from the ADC, all the keys and certificate-key pairs that are associated with that HSM. You can’t delete these files from the ADC after you remove the HSM.

5. On a standalone NetScaler appliance, Thales Luna HSMs in HA are supported for Luna version 6.2 and later.
6. EXPORT ciphers are not supported.
7. Update certificate-key pair operation is not supported.
8. When you generate an HSM key on a third-party tool, the private and public key names must be the same. When you add the HSM key on the appliance, provide this name as the key name.
9. The # character is not supported in a key name and partition password.
10. Cluster and admin partitions are not supported.

## Appendix

May 2, 2023

Sample commands with their outputs:

### Run the script

```
1 root@ns# pwd
2 /var/safenet/config
3 root@ns# sh safenet_config
4 <!--NeedCopy-->
```

### Create a certificate

```
1 root@ns# cd /var/safenet/safenet/lunaclient/bin
2 root@ns# ./vtl createcert -n 10.102.59.175
3 Private Key created and written to: /var/safenet/safenet/lunaclient
 /cert/client/10.102.59.175Key.pem
4 Certificate created and written to: /var/safenet/safenet/lunaclient
 /cert/client/10.102.59.175.pem
5 <!--NeedCopy-->
```

### Copy the certificate to the HSM

```
1 root@ns# scp /var/safenet/safenet/lunaclient/cert/client
 /10.102.59.175.pem admin@10.217.2.7:
2 admin@10.217.2.7's password:
3
```

```
4 10.102.59.175.pem 100% 818 0.8KB/s 00:00
5 <!--NeedCopy-->
```

### Copy the certificate and key from the HSM to the NetScaler appliance

```
1 root@ns# scp admin@10.217.2.7:server.pem /var/Thales Luna/safenet/
 lunaclient/server.2.7.pem
2 admin@10.217.2.7's password:
3
4 server.pem 100% 1164 1.1KB/s 00:01
5 <!--NeedCopy-->
```

### Use SSH to connect to the Thales Luna HSM

```
1 ssh admin@10.217.2.7
2 Connecting to 10.217.2.7:22...
3 Connection established.
4 To escape to local shell, press 'Ctrl+Alt+]'.

2
3 The following Luna SA Slots/Partitions were found:
4
5 Slot Serial # Label
6 ==== ===== =====
7 0 477877010 p2
8 <!--NeedCopy-->
```

## Save the configuration

```
1 root@ns# cp /etc/Chrystoki.conf /var/safenet/config/
2 <!--NeedCopy-->
```

## Configure automatic start of the gateway daemon at boot time

```
1 touch /var/safenet/safenet_is_enrolled
2 <!--NeedCopy-->
```

## FAQ

May 2, 2023

- **How do I check that the Thales Luna process is running?**

At the NetScaler shell prompt, type:

```
1 ps -aux | grep safenet_gw
2 <!--NeedCopy-->
```

- **How do I verify the network trust links (NTLs) connectivity between the ADC and HSM?**

After configuring Thales Luna, change the directory to “/var/safenet/safenet/lunaclient/bin” and type:

```
1 ./vtl verify
2 <!--NeedCopy-->
```

## Support for Azure Key Vault

December 29, 2023

The NetScaler appliance integrates with external HSMs (SafeNet and Thales) for on-premises deployments. For cloud deployments, the ADC appliance integrates with Azure Key Vault. The appliance stores its private keys in the Key Vault for ease of management and security of the private key in the public cloud domain. You no longer have to store and manage keys in different locations for ADC appliances deployed across multiple data centers and cloud providers.

Using ADC with the Azure Key Vault Premium pricing tier, which provided HSM backed keys, provides FIPS 140-2 level 2 compliance.

Azure Key Vault is a standard offering from Microsoft. For more information about Azure Key Vault, see the Microsoft Azure documentation.

**Note:**

The NetScaler integration with Azure Key Vault is supported with the TLS 1.3 protocol.

### Architecture overview

Azure Key Vault is a service for storing secrets securely in the Azure cloud. By storing your keys in the Azure Key Vault, you reduce the chances of keys being stolen. Once the Key Vault is set up, you can

store your keys in it. Configure virtual servers on the ADC appliance to perform private key operations in the Key Vault. The ADC appliance accesses the key for each SSL handshake.

The following diagram illustrates the process to get an access token from the Azure Active Directory after authentication. This token is used with REST API calls for crypto operations using private keys.

The following diagram shows a typical RSA handshake. The client key exchange (CKE) message that is encrypted using the public key is decrypted using the private key stored in the Key Vault.

In an ECDHE handshake, the server key exchange (SKE) message sent by the NetScaler appliance is signed by using the private key stored in the Key Vault.

## Prerequisites

1. You must have an Azure subscription.
2. (Optional) Install Azure CLI on a Linux machine. For instructions, see the Azure documentation <https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-apt?view=azure-cli-latest>.
3. Complete the configuration on the Azure portal before configuring entities on the ADC appliance.

## Configure the ADC Azure Key Vault integration

First perform the configuration on the Azure portal followed by the configuration on the ADC appliance.

### Perform the following steps on the Azure portal

The following flowchart shows the high-level flow for configuration required on the Azure portal.

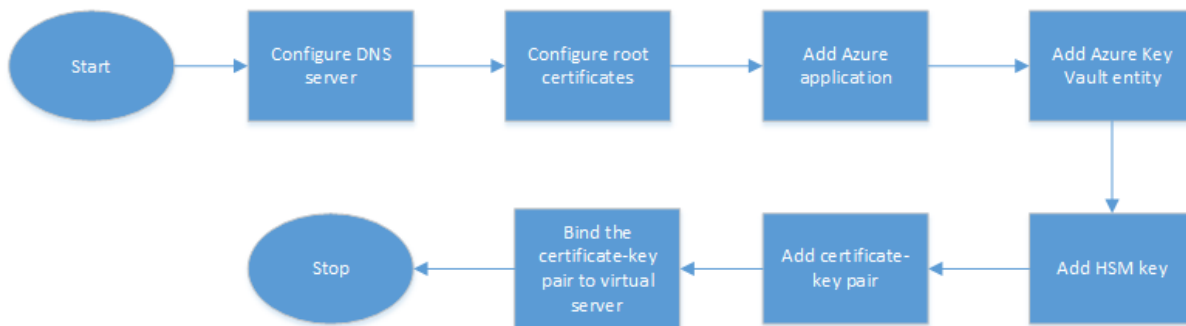

1. Create app and service principal in Azure Active Directory.
2. Create Key Vault in a resource group.
3. Configure the app and service principal to perform sign and decrypt operations on the Key Vault.
4. Create keys in the Key Vault using one of the following ways:
  - a) By importing a key file.
  - b) By generating a certificate.

For information about the commands to configure the preceding steps, see the Azure documentation at <https://docs.microsoft.com/en-us/azure/active-directory/develop/app-objects-and-service-principals>.

### Perform the following steps on the ADC appliance

The following flowchart shows the high-level flow for configuration required on the ADC appliance.

1. Configure a DNS server.
2. Configure root certificates to verify the certificates presented by Azure.
3. Create an Azure application.
4. Create an Azure Key Vault entity.
5. Create an HSM key.
6. Create a certificate-key pair.
7. Bind the certificate-key pair to a virtual server.

**Configure a DNS server** A DNS server is required for the name resolution of Key Vault host and Azure Active Directory end point.

To configure a DNS server by using the CLI

At the command prompt, type:

```

1 add dns nameserver <IP address>
2 <!--NeedCopy-->

```

**Example:**

```

1 add dns nameserver 192.0.2.150
2 <!--NeedCopy-->

```

To configure a DNS server by using the GUI

1. Navigate to **Traffic Management > DNS > Name Servers**. Click **Add**.
2. Enter values for the following parameters:
  - IP Address - IP address of an external name server or, if the Local parameter is set, IP address of a local DNS server (LDNS).
  - Protocol - Protocol used by the name server. UDP\_TCP is not valid if the name server is a DNS virtual server configured on the appliance.
3. Click **Create**.

**Add and bind a root certificate** Download the root certificates of the certificate presented by Azure Key Vault [https://<vault\\_name>.vault.azure.net](https://<vault_name>.vault.azure.net) and Azure Active Directory (AAD) <https://login.microsoftonline.com> and load it on the ADC appliance. These certificates are required to validate the certificate presented by Azure Key Vault and AAD. Bind one or more certificates to the CA certificate group `ns_callout_certs`.

To add a root certificate by using the CLI

At the command prompt, type:

```
1 add ssl certkey <certkeyname> -cert <certname>
2 bind ssl caCertGroup <caCertGroupName> <certkeyName>
3 <!--NeedCopy-->
```

**Example:**

In the following example, the root certificate presented by Azure Key Vault and AAD is the same.

```
1 add ssl certKey rootcert -cert RootCyberTrustRoot.crt
2 bind ssl cacertGroup ns_callout_certs rootcert
3 <!--NeedCopy-->
```

To add a root certificate by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. Enter values for the following parameters:
  - Certificate-key pair name
  - Certificate file name

← Install CA Certificate

Certificate-Key Pair Name\*  
 ⓘ

Certificate File Name\*  
  ⓘ

Notify When Expires

No SNMP Trap destination found. Notification will not be sent until a trap destination is configured.

Notification Period

3. Click **Install**.
4. Navigate to **Traffic Management > SSL > CA Certificates Group**.

5. Select **ns\_callout\_certs** and click **Show Bindings**.
6. Click **Bind**.
7. Select the CA certificate created earlier and click **Select**.
8. Click **Bind**, and then click **Close**.

### Configure an Azure application

The Azure application entity contains the credentials required to authenticate to Azure Active Directory and obtain the access token. That is, to get authorization access to Key Vault resources and APIs, add the Azure Application ID, secret (password) and tenant ID on the ADC appliance.

When configuring the Azure Application entity using the CLI, you must enter the password. If you use the GUI, the Azure application entity contains the credentials required to authenticate to Azure Active Directory and obtain the access token.

To configure an Azure application by using the CLI

Use the parameter, `vaultResource`, in the `add azure application` command to get the domain of the resource group before the access token is granted to the application. This parameter is added because the domain name might be different for different regions. For example, the domain might be `vault.azure.net` or `vault.usgov.net`.

At the command prompt, type:

```
1 add azure application <name> -clientID <string> -clientSecret <string> -tenantID <string> -vaultResource <string> [-tokenEndpoint <URL>]
2 show azure application
3 <!--NeedCopy-->
```

### Example:

```
1 add azure application app10 -clientid 12345t23aaa5 -clientsecret csHz0oEzmuY= -vaultResource example.vault.azure.net -tenantID 33583ee9ca5b
2 Done
3 > sh azure application app10
4 1) Name: app10 ClientID: 12345t23aaa5
5 TokenEndpoint: "https://login.microsoftonline.com/33583ee9ca5b/"
6 TenantID: 33583ee9ca5b VaultResource: example.vault.azure.net
7 Done
8
9 <!--NeedCopy-->
```

To configure an Azure application by using the GUI

1. Navigate to **Traffic Management > SSL > Azure > Application**.
2. In the details pane, click **Add**.

## 3. Enter values for the following parameters:

- Name –Name for the application object on the NetScaler appliance.
- Client ID –Application ID that is generated when an application is created in Azure Active Directory using either the Azure CLI or the Azure portal (GUI).
- Client Secret –Password for the application configured in Azure Active Directory. The password is specified in the Azure CLI or generated in the Azure portal (GUI).
- Tenant ID –ID of the directory inside Azure Active Directory in which the application was created.
- Vault Resource - Vault resource for which access token is granted. Example `vault.azure.net`.
- Token End point –URL from where the access token can be obtained. If the token end point is not specified, the default value is `https://login.microsoftonline.com/<tenant id>`.

← Create Azure Application

Name\*  
app10

Client ID\*  
12345t23aaa5

Client Secret\*  
csHzOoEzmuY=

Create Close

**Configure Azure Key Vault** Create an Azure Key Vault object on the ADC appliance.

To configure Azure Key Vault by using the CLI

At the command prompt, type:

```
1 add azure keyVault <name> -azureVaultName <string> -azureApplication
2 <string>
3 show azure keyvault
```

```
4 <!--NeedCopy-->
```

**Example:**

```
1 add azure keyvault kv1 -azureapplication app10 -azurevaultName pctest.vault.azure.net
2 > sh azure keyVault
3 1) Name: kv1 AzureVaultName: pctest.vault.azure.net
4 AzureApplication: app10 State: "Access token obtained"
5 Done
6 <!--NeedCopy-->
```

The following table lists the different values that the state of the Azure Key Vault can take along with a brief description about each state.

State	Description
Created	Initial state of the Key Vault object. Authentication has not been attempted.
Could not reach token end point	Indicates one of the following: DNS server not configured, issuer certificate not bound to a CA certificate group, or network issues.
Authorization failed	Incorrect application credentials.
Token parse error	Response from Azure Active Directory is not in the expected format.
Access token obtained	Successfully authenticated by Azure Active Directory.

To configure the Azure Key Vault by using the GUI

1. Navigate to **Traffic Management > SSL > Azure > Key Vault**.
2. Enter values for the following parameters:
  - Name - Name for the Key Vault.
  - Azure Key Vault Name - Name of the Key Vault configured in Azure cloud using either the Azure CLI or the Azure portal (GUI) with domain name.
  - Azure Application Name - Name of the Azure Application object created on the ADC appliance. The Azure Application object with this name is used for authentication with Azure Active Directory.

**Create Azure KeyVault**

Name\*

Azure Vault Name

 ▼

**Add HSM key** Storing your private key in the HSM provides FIPS 140-2 level 2 compliance.

To add an HSM key by using the CLI

At the command prompt, type:

```

1 add ssl hsmKey <hsmKeyName> [-hsmType <hsmType>] [-key <string> |
2 -serialNum <string>] {
3 -password }
4 [-keystore <string>]
5 <!--NeedCopy-->

```

**Example:**

```

1 add ssl hsmKey h1 -keystore kv1 -key san15key -hsmType KEYVAULT
2
3
4 > sh ssl hsmKey h1
5 HSM Key Name: h1 Type: KEYVAULT
6 Key: san15key
7 Key store: kv1
8 State: " Created "
9 Done
10 <!--NeedCopy-->

```

The following table lists the different values that the state of an HSM key can take along with a brief description about each state.

---

State	Description
Created	The HSM key is added on the ADC appliance. A key operation is not yet attempted.
Access token unavailable	Access token not available when key operation was attempted.
Unauthorized	Configured Azure application does not have permission to perform the key operation.
Does not exist	The key does not exist in the Azure Key Vault.
Unreachable	The Key Vault host is not reachable on the network.
Marked down	The HSM key is marked DOWN on the ADC appliance due to threshold errors during key operation.
Key operations successful	Success response received from the Key Vault for key operation.
Key operations failed	Failure response received from Key Vault for key operation.
Key operation throttled	The key operation request is throttled by the Key Vault.

---

To add an HSM key by using the GUI

1. Navigate to **Traffic Management > SSL > HSM**.
2. Enter values for the following parameters.
  - HSM key name - Name of the key.
  - HSM type - Type of HSM.
  - Key store - Name of key store object representing HSM where the key is stored. For example, name of Key Vault object or Azure Key Vault authentication object. Applies only to **KEYVAULT** type HSM.

### 3. Click **Add**

**Add a certificate-key pair** Add a certificate-key pair using the HSM key created earlier.

To add a certificate-key pair by using the CLI

At the command prompt, type:

```
1 add ssl certKey <certkeyName> (-cert <string> [-password]) -hsmKey <
 string>]
2 show ssl certkey
3 <!--NeedCopy-->
```

### Example:

```
1 add ssl certKey serverrsa_2048 -cert /nsconfig/ssl/san_certs/san15.pem
 -hsmKey h1
2 > sh ssl certkey serverrsa_2048
3 Name: serverrsa_2048 Status: Valid, Days to expiration
 :9483
4 Version: 3
5 Serial Number: F5CFF9EF1E246022
6 Signature Algorithm: sha256WithRSAEncryption
7 Issuer: C=in,O=citrix,CN=ca
8 Validity
9 Not Before: Mar 20 05:42:57 2015 GMT
10 Not After : Mar 12 05:42:57 2045 GMT
11 Certificate Type: "Server Certificate"
12 Subject: C=in,O=citrix
```

```
13 Public Key Algorithm: rsaEncryption
14 Public Key size: 2048
15 Ocspl Response Status: NONE
16 Done
17 <!--NeedCopy-->
```

To add a certificate-key pair by using the GUI

1. Navigate to **Traffic Management > SSL > Install Certificate (HSM)**.
2. Enter values for the following parameters:
  - Certificate-Key Pair Name
  - Certificate File Name
  - HSM Key

The screenshot shows the 'Install Certificate' GUI. It has several sections: 'Certificate-Key Pair Name\*' with a text box containing 'serverrsa\_2048'; 'Certificate File Name\*' with a 'Choose File' dropdown, a text box containing 'san15.pem', and an 'Add' button; 'HSM Key\*' with a dropdown menu containing 'hi' and an 'Add' button; 'Certificate Format' with radio buttons for 'PEM' (selected) and 'DER'; 'Password' with an empty text box; 'Certificate Bundle' with an unchecked checkbox; 'Notify When Expires' with a checked checkbox; and 'Notification Period' with a text box containing '30'.

3. Click **Install**.

**Bind the certificate-key pair to a virtual server** The certificate used for processing SSL transactions must be bound to the virtual server that receives the SSL data.

To bind the SSL certificate-key pair to a virtual server by using the CLI

At the command prompt, type:

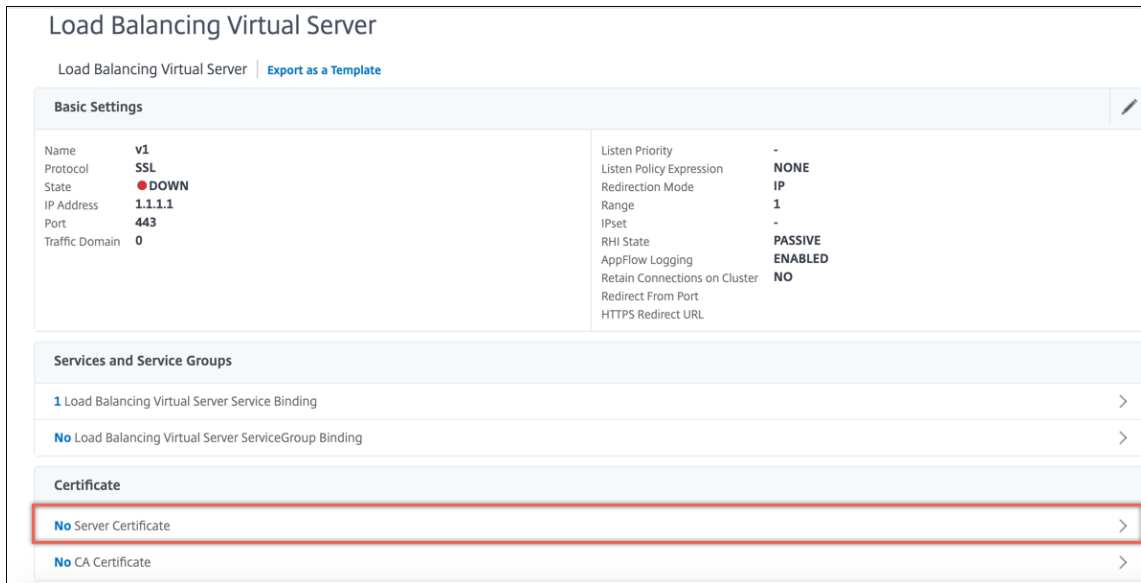

```
1 bind ssl vsrver <vServerName> -certkeyName <certificate-KeyPairName>
2 show ssl vsrver <vServerName>
3 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vserver v1 -certkeyName serverrsa_2048
2
3 sh ssl vserver v1
4
5 Advanced SSL configuration for VServer v1:
6 DH: DISABLED
7 DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA:
8 ENABLED Refresh Count: 0
9 Session Reuse: ENABLED Timeout: 120 seconds
10 Cipher Redirect: DISABLED
11 ClearText Port: 0
12 Client Auth: DISABLED
13 SSL Redirect: DISABLED
14 Non FIPS Ciphers: DISABLED
15 SNI: DISABLED
16 OCSP Stapling: DISABLED

31
32
33
34 1) CertKey Name: serverrsa_2048 Server Certificate
35
36
37 1) Cipher Name: DEFAULT
38 Description: Default cipher list with encryption strength >= 128bit
39 Done
40 <!--NeedCopy-->
```

To bind an SSL certificate-key pair to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and open an SSL virtual server. Click inside the Certificate section.

2. Click the arrow to select the certificate-key pair.
3. Select the certificate-key pair from the list.
4. Bind the certificate-key pair to the virtual server.

## Limitations

- The number of concurrent calls to the Azure Key Vault for key operations is limited. Performance of the ADC appliance depends on the Key Vault limits. For more information see, [Microsoft Azure Key Vault documentation](#).
- EC keys are not supported.
- EDT and DTLS protocols are not supported.
- ADC appliances with Intel Coletto SSL chips are not supported.
- Clustering and admin partitions are not supported.
- You cannot update the Azure Application entity, the Azure Key Vault object, and the HSM certificate-key pair after you have added them to the ADC appliance.
- A certificate bundle with HSM keys is not supported.
- An error does not appear if the HSM key and certificate do not match. While adding a certificate-key pair, ensure that the HSM key and certificate match.
- You cannot bind an HSM key to a DTLS virtual server.
- You cannot sign OCSP requests using a certificate-key pair that is created using an HSM key.
- You cannot bind a certificate-key pair to an SSL service if the certificate-key pair is created using an HSM key.

## FAQ

### When integrated with Azure Key Vault, are private keys stored in the ADC appliance memory?

No, private keys are not be stored in ADC appliance memory. For each SSL transaction, the appliance sends a request to Key Vault.

### Is the integration FIPS 140-2 level 2 compliant?

Yes, the integrated solution provides FIPS 140-2 Level 2 support.

### Which key types are supported?

Only RSA key types are supported.

### What key sizes are supported?

1024-bit, 2048-bit, and 4096-bit RSA keys are supported.

### Which ciphers are supported?

All ciphers supported on the ADC appliance, including TLSv1.3 ciphers with ECDHE and SHA256 are supported.

### Are transactions logged?

The ADC appliance logs each transaction it makes with the Key Vault. Details such as, time, vault IP address, port, success or failure of connection, and errors are logged.

The following is a sample SSL log output.

```
1 Apr 9 16:35:30 <local0.debug> 10.102.57.30 04/09/2019:16:35:30 GMT

## Troubleshooting

September 12, 2023

If the SSL feature does not work as expected after configuration, you can use some common tools to access NetScaler resources and diagnose the problem.

### Resources for troubleshooting

For best results, use the following resources to troubleshoot an SSL issue on a NetScaler appliance:

- The relevant ns.log file
- The latest ns.conf file
- The message file
- The relevant `newslog` file
- Trace files
- A copy of the certificate files, if possible
- A copy of the key file, if possible
- The error message, if any

In addition to these resources, you can use the Wireshark application customized for the NetScaler trace files to speed up troubleshooting.

### Troubleshooting SSL issues

To troubleshoot an SSL issue, continue as follows:

- Verify that the NetScaler appliance is licensed for SSL Offloading and load balancing.
- Verify that SSL Offloading and load balancing features are enabled on the appliance.
- Verify that the status of the SSL virtual server is not displayed as DOWN.
- Verify that the status of the service bound to the virtual server is not displayed as DOWN.
- Verify that a valid certificate is bound to the virtual server.
- Verify that the service is using an appropriate port, preferably port 443.

## Decrypting TLS1.3 traffic from packet trace

To troubleshoot protocols that run over TLS1.3, you must first decrypt the TLS1.3 traffic. To decrypt TLS 1.3 in Wireshark, the secrets must be exported in the [NSS key log format](#). For more information about the key log format, see [NSS Key Log Format](#).

For information about how to capture a packet trace, see [Capturing SSL Session Keys During a Trace](#).

**Note:** NetScaler automatically logs each connection's secrets in the appropriate format for the TLS/SSL protocol version in use.

## CRL refresh does not happen on the secondary node in an HA setup

The refresh does not happen because the CRL server is accessible only to the primary node through a private network.

**Workaround:** Add a service on the primary node with the IP address of the CRL server. This service acts as a proxy for the CRL server. When the configuration is synchronized between the nodes, CRL refresh works for both primary and secondary nodes through the service configured on the primary node.

## SSL FAQs

August 4, 2023

### Basic questions

#### HTTPS access to the GUI fails on a VPX instance. How do I gain access?

A certificate-key pair is required for HTTPS access to the GUI. On a NetScaler appliance, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes and bind it to the internal service for HTTPS access to the configuration utility. Alternately, update the `ns-server-certificate` to 1024 bytes. You can use HTTP access to the configuration utility or the CLI to install the certificate.

**If I add a license to an MPX appliance, the certificate-key pair binding is lost. How do I resolve this problem?**

If a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding. Reinstall the certificate and bind it to the internal service

Citrix recommends that you install an appropriate license before starting the appliance.

**What are the various steps involved in setting up a secure channel for an SSL transaction?**

Setting up a secure channel for an SSL transaction involves the following steps:

1. The client sends an HTTPS request for a secure channel to the server.
2. After selecting the protocol and cipher, the server sends its certificate to the client.
3. The client checks the authenticity of the server certificate.
4. If any of the checks fail, the client displays the corresponding feedback.
5. If the checks pass or the client decides to continue even if a check fails, the client creates a temporary, disposable key. This key is called the *pre-master secret* and the client encrypts this key by using the public key of the server certificate.
6. The server, upon receiving the pre-master secret, decrypts it by using the server's private key and generates the session keys. The client also generates the session keys from the pre-master secret. Thus both client and server now have a common session key, which is used for encryption and decryption of application data.

**I understand that SSL is a CPU-intensive process. What is the CPU cost associated with the SSL process?**

The following two stages are associated with the SSL process:

- The initial handshake and secure channel setup by using the public and private key technology.
- Bulk data encryption by using the symmetric key technology.

Both of the preceding stages can affect server performance, and they require intensive CPU processing for of the following reasons:

1. The initial handshake involves public-private key cryptography, which is very CPU intensive because of large key sizes (1024 bit, 2048 bit, 4096 bit).
2. Encryption/decryption of data is also computationally expensive, depending on the amount of data that must be encrypted or decrypted.

### **What are the various entities of an SSL configuration?**

An SSL configuration has the following entities:

- Server certificate
- Certificate Authority (CA) certificate
- Cipher suite that specifies the protocols for the following tasks:
  - Initial key exchange
  - Server and client authentication
  - Bulk encryption algorithm
  - Message authentication
- Client authentication
- CRL
- SSL Certificate Key Generation Tool that enables you to create the following files:
  - Certificate request
  - Self-signed certificate
  - RSA keys
  - DH parameters

### **I want to use the SSL offloading feature of the NetScaler appliance. What are the various options for receiving an SSL certificate?**

You must receive an SSL certificate before you can configure the SSL setup on the NetScaler appliance. You can use any of the following methods to receive an SSL certificate:

- Request a certificate from an authorized certificate authority (CA).
- Use the existing server certificate.
- Create a certificate-key pair on the NetScaler appliance.

**Note:** This certificate is a test certificate signed by the test Root-CA generated by the NetScaler appliance. Test certificates signed by the test Root-CA are not accepted by browsers. The browser throws a warning message stating that the server's certificate cannot be authenticated.

- For anything other than test purposes, you must provide a valid CA certificate and CA key to sign the server certificate.

### **What are the minimum requirements for an SSL setup?**

The minimum requirements for configuring an SSL setup are as follows:

- Obtain the certificates and keys.
- Create a load balancing SSL virtual server.
- Bind HTTP or SSL services to the SSL virtual server.
- Bind a certificate-key pair to the SSL virtual server.

### **What are the limits for the various components of SSL?**

SSL components have the following limits:

- Bit size of SSL certificates: 4096.
- Number of SSL certificates: Depends on the available memory on the appliance.
- Maximum linked intermediate CA SSL certificates: 9 per chain.
- CRL revocations: Depends on the available memory on the appliance.

### **What are the various steps involved in the end-to-end data encryption on a NetScaler appliance?**

The steps involved in the server-side encryption process on a NetScaler appliance are as follows:

1. The client connects to the SSL VIP configured on the NetScaler appliance at the secure site.
2. After receiving the secure request, the appliance decrypts the request and applies layer 4–7 content switching techniques and load balancing policies. Then, it selects the best available back-end web server for the request.
3. The NetScaler appliance creates an SSL session with the selected server.
4. After establishing the SSL session, the appliance encrypts the client request and sends it to the Web server by using the secure SSL session.
5. When the appliance receives the encrypted response from the server, it decrypts and re-encrypts the data. Then, it sends the data to the client by using the client side SSL session.

The multiplexing technique of the NetScaler appliance enables the appliance to reuse SSL sessions that have been established with the Web servers. Therefore, the appliance avoids the CPU intensive key exchange, known as *full handshake*. This process reduces the overall number of SSL sessions on the server and maintains end-to-end security.

## Certificates and Keys

### **Can I place the certificate and key files at any location? Is there any recommended location to store these files?**

You can store the certificate and key files on the NetScaler appliance or a local computer. However, Citrix recommends that you store the certificate and key files in the `/nsconfig/ssl` directory of the NetScaler appliance. The `/etc` directory exists in the flash memory of the NetScaler appliance. This action provides portability and facilitates backup and restoration of the certificate files on the appliance.

**Note:** Make sure that the certificate and the key files are stored in the same directory.

### **What is the maximum size of the certificate key supported on the NetScaler appliance?**

A NetScaler appliance running a software release earlier than release 9.0 supports a maximum certificate key size of 2048 bits. Release 9.0 and later support a maximum certificate key size of 4096 bits. This limit is applicable to RSA certificates.

An MPX appliance supports certificates from 512 bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A virtual appliance supports certificates from 512 bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

### **What is the maximum size of the DH parameter supported on the NetScaler appliance?**

The NetScaler appliance supports a DH parameter of maximum 2048 bits.

**What is the maximum certificate-chain length, that is, the maximum number of certificates in a chain, supported on a NetScaler appliance?**

A NetScaler appliance can send a maximum of 10 certificates in a chain when sending a server certificate message. A chain of the maximum length includes the server certificate and nine intermediate CA certificates.

**What are the various certificate and key formats supported on the NetScaler appliance?**

The NetScaler appliance supports the following certificate and key formats:

- Privacy Enhanced Mail (PEM)
- Distinguished Encoding Rule (DER)

**Is there a limit for the number of certificates and keys that I can install on the NetScaler appliance?**

No. The number of certificates and keys that can be installed is limited only by the available memory on the NetScaler appliance.

**I have saved the certificate and key files on the local computer. I want to transfer these files to the NetScaler appliance by using the FTP protocol. Is there any preferred mode for transferring these files to the NetScaler appliance?**

Yes. If using the FTP protocol, you must use binary mode to transfer the certificate and key files to the NetScaler appliance.

**Note:** By default, FTP is disabled. Citrix recommends using the SCP protocol for transferring certificate and key files. The configuration utility implicitly uses SCP to connect to the appliance.

**What is the default directory path for the certificate and key?**

The default directory path for the certificate and key is `/nsconfig/ssl`.

**When adding a certificate and key pair, what happens if I do not specify an absolute path to the certificate and key files?**

When adding a certificate-key pair, specify an absolute path to the certificate and key files. If you do not specify, the ADC appliance searches the default directory for these files and attempts to load them to the kernel. The default directory is `/nsconfig/ssl`. For example, if the `cert1024.pem`

and `rsa1024.pem` files are available in the `/nsconfig/ssl` directory of the appliance, both of the following commands are successful:

```
1 add ssl certKey cert1 -cert cert1204.pem -key rsa1024.pem
2 <!--NeedCopy-->
```

```
1 add ssl certKey cert1 -cert /nsconfig/ssl/cert1204.pem -key /nsconfig/
 ssl/rsa1024.pem
2 <!--NeedCopy-->
```

**I have configured a high availability setup. I want to implement the SSL feature on the setup. How must I handle the certificate and key files in a high availability setup?**

In a high availability setup, you must store the certificate and key files on both the primary and the secondary NetScaler appliance. The directory path for the certificate and key files must be the same on both appliances before you add an SSL certificate-key pair on the primary appliance.

### **nCipher nShield® HSM**

**When integrating with nCipher nShield® HSM, do we have to keep in mind any specific configuration when adding the NetScaler appliance to HA?**

Configure the same nCipher devices on both the nodes in HA. nCipher configuration commands don't synchronize in HA. For information about the prerequisites for nCipher nShield® HSM, see [Prerequisites](#).

**Do we have to individually integrate both the appliances with nCipher nShield® HSM and RFS? Do we need to complete this action before or after the HA setup?**

You can complete the integration before or after the HA setup. If the integration is done after the HA setup, the keys imported on the primary node before configuring the secondary node are not synced to the secondary node. Therefore, Citrix recommends nCipher integration before the HA setup.

**Do we need to import the key into both the primary and secondary NetScaler appliances, or are the keys synchronized from the primary node to the secondary node?**

If nCipher is integrated on both devices before forming the HA, the keys are automatically synchronized from RFS in the process of integration.

**Given that the HSM is not on the NetScaler appliance, but on nCipher, what happens to the keys and certificates when a node fails and is replaced?**

If a node fails, you can synchronize the keys and certificates to the new node, by integrating nCipher on the new node. Then, run the following commands:

```
1 sync ha files ssl
2 force ha sync
3 <!--NeedCopy-->
```

The certificates are synchronized and added if the keys are synchronized in the process of integrating nCipher.

**Ciphers****What is a NULL-Cipher?**

Ciphers with no encryption are known as NULL-Ciphers. For example, NULL-MD5 is a NULL-Cipher.

**Are the NULL-Ciphers enabled by default for an SSL VIP or an SSL service?**

No. NULL-Ciphers are not enabled by default for an SSL VIP or an SSL service.

**What is the procedure to remove NULL-Ciphers?**

To remove the NULL-Ciphers from an SSL VIP, run the following command:

```
1 bind ssl cipher <SSL_VIP> REM NULL
2 <!--NeedCopy-->
```

To remove the NULL-Ciphers from an SSL Service, run the following command:

```
1 bind ssl cipher <SSL_Service> REM NULL -service
2 <!--NeedCopy-->
```

**What are the various cipher aliases supported on the NetScaler appliance?**

To list the cipher aliases supported on the appliance, at the command prompt, type:

```
1 sh cipher
2 <!--NeedCopy-->
```

**What is the command to display all the predefined ciphers of the NetScaler appliance?**

To display all the predefined ciphers of the NetScaler appliance, at the CLI, type:

```
1 show ssl cipher
2 <!--NeedCopy-->
```

**What is the command to display the details of an individual cipher of the NetScaler appliance?**

To display the details of an individual cipher of the NetScaler appliance, at the CLI, type:

```
1 show ssl cipher <Cipher_Name/Cipher_Alias_Name/Cipher_Group_Name>
2 <!--NeedCopy-->
```

**Example:**

```
1 show cipher SSL3-RC4-SHA
2 1) Cipher Name: SSL3-RC4-SHA
3 Description: SSLv3 Kx=RSA Au=RSA Enc=RC4(128)
4 Mac=SHA1
5 Done
6 <!--NeedCopy-->
```

**What is the significance of adding the predefined ciphers of the NetScaler appliance?**

Adding the predefined ciphers of the NetScaler appliance causes the NULL-Ciphers to get added to an SSL VIP or an SSL service.

**Is it possible to change the cipher's order without unbinding them from a cipher group on a NetScaler appliance?**

Yes. It is possible to change the cipher's order without unbinding the ciphers from a custom cipher group. However, you cannot change the priority in inbuilt cipher groups. To change the priority of a cipher bound to an SSL entity, first unbind the cipher from the virtual server, service, or service group.

**Note:** If the cipher group bound to an SSL entity is empty, the SSL handshake fails because there is no negotiated cipher. The cipher group must contain at least one cipher.

**Is ECDSA supported on the NetScaler appliance?**

ECDSA is supported on the following NetScaler platforms. For details of supported builds, see Table 1 and Table 2 in [Ciphers available on the NetScaler appliances](#).

- NetScaler MPX and SDX appliances with N3 chips
- NetScaler MPX 5900/8900/15000/26000
- NetScaler SDX 8900/15000
- NetScaler VPX appliances

### **Does the NetScaler VPX appliance support AES-GCM/SHA2 ciphers on the front-end?**

Yes, AES-GCM/SHA2 ciphers are supported on the NetScaler VPX appliance. For details about the supported builds, see [Ciphers available on the NetScaler appliances](#).

## **Certificates**

### **Is the distinguished name in a client certificate available for the length of the user session?**

Yes. You can access the distinguished name of the client certificate in subsequent requests during the length of the user session. That is, even after the SSL handshake is complete and the certificate is not sent again by the browser. Use a variable and an assignment as detailed in the following sample configuration:

#### **Example:**

```
1 add ns variable v2 -type "text(100)"
2
3 add ns assignment a1 -variable "$v2" -set "CLIENT.SSL.CLIENT_CERT
4 .SUBJECT.TYPECAST_NVLIST_T('=', '/').VALUE("CN")"
5 add rewrite action act1 insert_http_header subject "$v2" // example:
6 to insert the distinguished name in the header
7 add rewrite policy pol1 true a1
8
9 add rewrite policy pol2 true act1
10
11 bind rewrite global pol1 1 next -type RES_DEFAULT
12
13 bind rewrite global pol2 2 next -type RES_DEFAULT
14
15 set rewrite param -undefAction RESET
16 <!--NeedCopy-->
```

### **Why do I need to bind the server certificate?**

Binding the server certificates is the basic requirement for enabling the SSL configuration to process SSL transactions.

To bind the server certificate to an SSL VIP, at the CLI, type:

```
1 bind ssl vserver <vServerName> -certkeyName <cert_name>
2 <!--NeedCopy-->
```

To bind the server certificate to an SSL service, at the CLI, type:

```
1 bind ssl service <serviceName> -certkeyName <cert_name>
2 <!--NeedCopy-->
```

### **How many certificates can I bind to an SSL VIP or an SSL service?**

On a NetScaler VPX, MPX/SDX (N3), and MPX/SDX 14000 FIPS appliance, you can bind two certificates to an SSL virtual server or an SSL service if SNI is disabled. The certificates must be one each of type RSA and ECDSA. If SNI is enabled, you can bind multiple server certificates of type RSA or ECDSA. On a NetScaler MPX (N2) or MPX 9700 FIPS appliance, if SNI is disabled, you can bind only one certificate of type RSA. If SNI is enabled, you can bind multiple server certificates of type RSA only.

### **What happens if I unbind or overwrite a server certificate?**

When you unbind or overwrite a server certificate, all the connections and SSL sessions created by using the existing certificate are terminated. When you overwrite an existing certificate, the following message appears:

```
1 ERROR:
2
3 Warning: Current certificate replaces the previous binding.
4 <!--NeedCopy-->
```

### **How do I install an intermediate certificate on a NetScaler appliance and link to a server certificate?**

See the article at <http://support.citrix.com/article/ctx114146> for information about installing an intermediate certificate.

### **Why am I getting a “resource already exists” error when I try to install a certificate on the NetScaler?**

See the article at <http://support.citrix.com/article/CTX117284> for instructions for resolving the “resource already exists” error.

**I want to create a server certificate on a NetScaler appliance to test and evaluate the product. What is the procedure to create a server certificate?**

Perform the following procedure to create a test certificate.

**Note:** A certificate created with this procedure cannot be used to authenticate all the users and browsers. After using the certificate for testing, you must obtain a server certificate signed by an authorized Root certificate authority.

To create a self-signed server certificate:

1. To create a Root CA certificate, at the CLI, type:

```
1 create ssl rsakey /nsconfig/ssl/test-ca.key 1024
2
3 create ssl certreq /nsconfig/ssl/test-ca.csr -keyfile /nsconfig/
 ssl/test-ca.key
4
5 Enter the required information when prompted, and then type the
 following command:
6
7 create ssl cert /nsconfig/ssl/test-ca.cer /nsconfig/ssl/test-ca.
 csr ROOT_CERT -keyfile /nsconfig/ssl/test-ca.key
8 <!--NeedCopy-->
```

2. Perform the following procedure to create a server certificate and sign it with the root CA certificate that you just created

- a) To create the request and the key, at the CLI, type:

```
1 create ssl rsakey /nsconfig/ssl/test-server.key 1024
2
3 create ssl certreq /nsconfig/ssl/test-server.csr -keyfile
 /nsconfig/ssl/test-server.key
4 <!--NeedCopy-->
```

- b) Enter the required information when prompted.

- c) To create a serial-number file, at the CLI, type:

```
1 shell
2 # echo '01' >
3 /nsconfig/ssl/serial.txt
4 # exit
5 <!--NeedCopy-->
```

- d) To create a server certificate signed by the root CA certificate created in step 1, at the CLI, type:

```
1 create ssl cert /nsconfig/ssl/test-server.cer /nsconfig/ssl/
 test-server.csr SRVR_CERT -CAcert /nsconfig/ssl/test-ca.cer
```

```
-CAkey /nsconfig/ssl/test-ca.key -CAserial /nsconfig/ssl/serial.txt
2 <!--NeedCopy-->
```

- e) To create a NetScaler cert-key pair, which is the in-memory object that holds the server certificate information for SSL handshakes and bulk encryption, at the CLI, type:

```
1 add ssl certkey test-certkey -cert /nsconfig/ssl/test-server.cer -key /nsconfig/ssl/test-server.key
2 <!--NeedCopy-->
```

- f) To bind the cert-key pair to the SSL virtual server, at the CLI, type:

```
1 bind ssl vserver <vServerName> -certkeyName <cert_name>
2 <!--NeedCopy-->
```

**I have received a NetScaler appliance on which NetScaler software release 9.0 is installed. I have noticed an extra license file on the appliance. Is there any change in the licensing policy starting with NetScaler software release 9.0?**

Yes. Starting with NetScaler software release 9.0, the appliance might not have a single license file. The number of license files depends on the NetScaler software release edition. For example, if you have installed the Advanced edition, you might need extra license files for the full functionality of the various features. However, if you have installed the Premium edition, the appliance has only one license file.

**How do I export the certificate from the Internet Information Service (IIS)?**

There are many ways, but by using the following method the appropriate certificate and private key for the website are exported. This procedure must be performed on the actual IIS server.

1. Open the Internet Information Services (IIS) Manager administration tool.
2. Expand the websites node and locate the SSL-enabled website that you want to serve through the NetScaler appliance.
3. Right-click this website and click Properties.
4. Click the Directory Security tab and, in the Secure Communications section of the window, select the View Certificate box.
5. Click the Details tab, and then click Copy to File.
6. On the Welcome to the Certificate Export Wizard page, click Next.
7. Select Yes, export the private key, and click Next.

**Note:** The private key MUST be exported for SSL Offload to work on the NetScaler.

8. Make sure that the Personal Information Exchange -PKCS #12 radio button is selected, and select *only* the Include all certificates in the certification path if possible check box. Click Next.
9. Enter a password and click Next.
10. Enter a file name and location, and then click Next. Give the file an extension of .PFX.
11. Click Finish.

### How do I convert the PKCS#12 certificate and install it on the NetScaler?

1. Move the exported .PFX certificate file to a location from where it can be copied to the NetScaler appliance. That is, to a machine that permits SSH access to the management interface of a NetScaler appliance. Copy the certificate to the appliance by using a secure copy utility such as SCP.
2. Access the BSD shell and convert the certificate (for example, cert.PFX) to .PEM format:

```
1 root@ns# openssl pkcs12 -in cert.PFX -out cert.PEM
2 <!--NeedCopy-->
```

3. To make sure that the converted certificate is in the correct x509 format, verify that the following command produces no error:

```
1 root@ns# openssl x509 -in cert.PEM -text
2 <!--NeedCopy-->
```

4. Verify that the certificate file contains a private key. Begin by issuing the following command:

```
1 root@ns# cat cert.PEM
2
3 Verify that the output file includes an RSA PRIVATE KEY section.
4
5 -----BEGIN RSA PRIVATE KEY-----
6 Mkm^s9KMs9023pz/s...
7 -----END RSA PRIVATE KEY-----
8 <!--NeedCopy-->
```

The following is another example of an RSA PRIVATE KEY section:

```
1 Bag Attributes
2 1.3.6.1.4.1.311.17.2: <No Values>
3 localKeyID: 01 00 00 00
4 Microsoft CSP Name: Microsoft RSA SChannel Cryptographic
5 Provider
6 friendlyName:
7 4b9cef4cc8c9b849ff5c662fd3e0ef7e_76267e3e-6183-4d45-886e-6
 e067297b38f
8
9 Key Attributes
```

```

10 X509v3 Key Usage: 10
11 -----BEGIN RSA PRIVATE KEY-----
12 Proc-Type: 4, ENCRYPTED

14 pZJ2SfsSVqMbRRf6ug37Clua5gY0Wld4frPIxFXyJquUhr31diW5ta3hbIaQ+
 Rg
15
16 ... (more random characters)
17 v8dMugeRplkaH2Uwt/mWBk4t71Yv7GeHmcmjafK8H8iW80ooPO3D/ENV8X4U/
 tLh
18
19 5eU6ky3WYZ1BTy6thxxLlwAuLlynVXZEFNLxq1oX+ZYl6djgjE3qg==
20 -----END RSA PRIVATE KEY-----
21 <!--NeedCopy-->

```

The following is a SERVER CERTIFICATE section:

```

1 Bag Attributes
2 localKeyID: 01 00 00 00
3 friendlyName: AG Certificate
4 subject=/C=AU/ST=NSW/L=Wanniassa/O=Dave Mother
5 Asiapacific/OU=Support/CN=davemother.food.lan
6 issuer=/DC=lan/DC=food/CN=hotdog
7 -----BEGIN CERTIFICATE-----
8 MIIFiTCCBHGgAwIBAgIKGryDgAAAAAAHzANBgkqhkiG9w0BAQUFADA8MRMwEQYK
9
10 ... (more random characters) 5
 pLDWYVHhLkA1pSxvFjNJHRSIydWHc5ltGyKqIUcBezVaXyel94pNSUYx07NpPV
 /
11
12 MY2ovQyQZM8gGe3+lGFum0VHbv/y/gB9HhFesog=
13 -----END CERTIFICATE-----
14 <!--NeedCopy-->

```

The following is an INTERMEDIATE CA CERTIFICATE section:

```

1 Bag Attributes: <Empty Attributes>
2 subject=/DC=lan/DC=food/CN=hotdog
3 issuer=/DC=lan/DC=food/CN=hotdog
4 -----BEGIN CERTIFICATE-----
5 MIIESDCCAzCgAwIBAgIQah20fCRYTY9LRXYMIRaKGjANBgkqhkiG9w0BAQUFADA8
6
7 ... (more random characters)
 Nt0nksawDnbKo86rQcNnY5xUs7c7pj2zxj/I0sgNHUp5W6dDI9pQoqFFaDk
 =
8
9 -----END CERTIFICATE-----
10 <!--NeedCopy-->

```

Further Intermediate CA certificates might follow, depending on the certification path of the exported certificate.

5. Open the .PEM file in a text editor
6. Locate the first line of the .PEM file and the first instance of the following line, and copy those two lines and all the lines between them:

```
1 -----END CERTIFICATE-----
2
3 Note: Make sure that last copied line is the first
4 -----END CERTIFICATE----- line in the .PEM file.
5
6 <!--NeedCopy-->
```

7. Paste the copied lines into a new file. Call the new file something intuitive, such as cert-key.pem. This certificate-key pair is for the server hosting the HTTPS service. This file must contain both the section labeled RSA PRIVATE KEY and the section labeled SERVER CERTIFICATE in the preceding example.

**Note:** The certificate-key pair file contains the private key and must be kept secure.

8. Locate any subsequent sections beginning with —BEGIN CERTIFICATE— and ending with —END CERTIFICATE—, and copy each such section to a separate new file.

These sections correspond to certificates of trusted CAs that have been included in the certification path. These sections must be copied and pasted into new individual files for these certificates. For example, the INTERMEDIATE CA CERTIFICATE section of the preceding example must be copied and pasted into a new file).

For multiple intermediate CA certificates in the original file, create files for each intermediate CA certificate in the order in which they appear in the file. Keep track (using appropriate file names) of the order in which the certificates appear, as they must be linked together in the correct order in a later step.

9. Copy the certificate-key file (cert-key.pem) and any additional CA certificate files into the /nsconfig/ssl directory on the NetScaler appliance.
10. Exit the BSD shell and access the NetScaler prompt.
11. Follow the steps in “Install the certificate-key files on the appliance” to install the key/certificate once uploaded on the device.

### How do I convert the PKCS#7 certificate and install it on the NetScaler appliance?

You can use OpenSSL to convert a PKCS #7 Certificate to a format recognizable by the NetScaler appliance. The procedure is identical to the procedure for PKCS #12 certificates, except that you invoke OpenSSL with different parameters. The steps for converting PKCS #7 certificates are as follows:

1. Copy the certificate to the appliance by using a secure copy utility, such as SCP.

2. Convert the certificate (for example, cert.P7B) to PEM format:

```
1 openssl pkcs7 -inform DER -in cert.p7b -print_certs -text -out
 cert.pem
2 <!--NeedCopy-->
```

3. Follow steps 3 through 7 as described in the answer for PKCS #12 certificates.

Note: Before loading the converted PKCS #7 certificate to the appliance, verify that it contains a private key, exactly as described in step 3 for the PKCS #12 procedure. PKCS #7 certificates, particularly the certificates exported from IIS, do not typically contain a private key.

### **When I bind a cipher to a virtual server or service by using the bind cipher command, I see the error message “Command deprecated.”?**

The command for binding a cipher to a virtual server or service has changed.

Use the `bind ssl vservice <vserviceName> -ciphername <ciphername>` command to bind an SSL cipher to an SSL virtual server.

Use the `bind ssl service <serviceName> -ciphername <ciphername>` command to bind an SSL cipher to an SSL service.

**Note:** New ciphers and cipher groups are added to the existing list and not replaced.

### **Why can't I create a cipher group and bind ciphers to it by using the add cipher command?**

The add cipher command functionality has changed in release 10. The command only creates a cipher group. To add ciphers to the group, use the bind cipher command.

## **OpenSSL**

### **How do I use OpenSSL to convert certificates between PEM and DER?**

To use OpenSSL, you must have a working installation of the OpenSSL software and be able to run OpenSSL from the command line.

x509 certificates and RSA keys can be stored in several different formats.

Two common formats are:

- DER (a binary format used primarily by Java and Macintosh platforms)
- PEM (a base64 representation of DER with header and footer information, which is used primarily by UNIX and Linux platforms).

A key and the corresponding certificate, in addition to the root and any intermediate certificates, can also be stored in a single PKCS#12 (.P12, .PFX) file.

### Procedure

Use the **OpenSSL** command to convert between formats as follows:

1. To convert a certificate from PEM to DER:

```
1 x509 -in input.crt -inform PEM -out output.crt -outform DER
2 <!--NeedCopy-->
```

2. To convert a certificate from DER to PEM:

```
1 x509 -in input.crt -inform DER -out output.crt -outform PEM
2 <!--NeedCopy-->
```

3. To convert a key from PEM to DER:

```
1 rsa -in input.key -inform PEM -out output.key -outform DER
2 <!--NeedCopy-->
```

4. To convert a key from DER to PEM:

```
1 rsa -in input.key -inform DER -out output.key -outform PEM
2 <!--NeedCopy-->
```

**Note:** If the key you are importing is encrypted with a supported symmetric cipher, you are prompted to enter the pass phrase.

**Note:** To convert a key to or from the obsolete NET (Netscape server) format, substitute NET for PEM or DER as appropriate. The stored key is encrypted in a weak unsalted RC4 symmetric cipher, so a pass phrase is requested. A blank pass phrase is acceptable.

## System Limits

### What are the important numbers to remember?

1. Create Certificate Request:
  - Request File Name: Maximum 63 characters
  - Key File Name: Maximum 63 characters
  - PEM Passphrase (For Encrypted Key): Maximum 31 characters
  - Common Name: Maximum 63 characters
  - City: Maximum 127 characters
  - Organization Name: Maximum 63 characters
  - State/Province Name: Maximum 63 characters

- Email Address: Maximum 255 Characters
- Organization Unit: Maximum 63 characters
- Challenge Password: Maximum 20 characters
- Company Name: Maximum 127 characters

2. Create Certificate:

- Certificate File Name: Maximum 63 characters
- Certificate Request File Name: Maximum 63 characters
- Key File Name: Maximum 63 characters
- PEM Passphrase: Maximum 31 characters
- Validity Period: Maximum 3650 days
- CA Certificate File Name: Maximum 63 characters
- CA Key File Name: Maximum 63 characters
- PEM Passphrase: Maximum 31 characters
- CA Serial Number File: Maximum 63 characters

3. Create and Install a Server Test Certificate:

- Certificate File Name: Maximum 31 characters
- Fully Qualified Domain Name: Maximum 63 characters

4. Create Diffie-Hellman (DH) key:

- DH File Name (with path): Maximum 63 characters
- DH Parameter Size: Maximum 2048 bits

5. Import PKCS12 key:

- Output File Name: Maximum 63 characters
- PKCS12 File Name: Maximum 63 characters
- Import Password: Maximum 31 characters
- PEM Passphrase: Maximum 31 characters
- Verify PEM Passphrase: Maximum 31 characters

6. Export PKCS12

- PKCS12 File Name: Maximum 63 characters
- Certificate File Name: Maximum 63 characters
- Key File Name: Maximum 63 characters
- Export Password: Maximum 31 characters
- PEM Passphrase: Maximum 31 characters

7. CRL Management:

- CA Certificate File Name: Maximum 63 characters
- CA Key File Name: Maximum 63 characters
- CA Key File Password: Maximum 31 characters
- Index File Name: Maximum 63 characters
- Certificate File Name: Maximum 63 characters

8. Create RSA Key:

- Key File Name: Maximum 63 characters
- Key Size: Maximum 4096 bits
- PEM Passphrase: Maximum 31 characters
- Verify Passphrase: Maximum 31 characters

9. Change advanced SSL settings:

- Maximum CRL memory size: Maximum 1024 Mbytes
- Encryption trigger timeout (10 mS ticks): Maximum 200
- Encryption trigger packet count: Maximum 50
- OCSP cache size: Maximum 512 Mbytes

10. Install Certificate:

- Certificate-Key pair Name: Maximum 31 characters
- Certificate File Name: Maximum 63 characters
- Private Key File Name: Maximum 63 characters
- Password: Maximum 31 characters
- Notification Period: Maximum 100

11. Create Cipher Group:

- Cipher Group Name: Maximum 39 characters

12. Create CRL:

- CRL Name: Maximum 31 characters
- CRL File: Maximum 63 characters
- URL: Maximum 127 characters
- Base DN: Maximum 127 characters
- Bind DN: Maximum 127 characters
- Password: Maximum 31 characters
- Days: Maximum 31

13. Create SSL Policy:

- Name: Maximum 127 characters

14. Create SSL Action:

- Name: Maximum 127 characters

15. Create OCSP Responder:

- Name: Maximum 32 characters
- URL: Maximum 128 characters
- Batching Depth: Maximum 8
- Batching Delay: Maximum 10000
- Produced At Time Skew: Maximum 86400
- Request Time-out: Maximum 120000

16. Create Virtual Server:

- Name: Maximum 127 characters
- Redirect URL: Maximum 127 characters
- Client Time-out: Maximum 31536000 secs

17. Create Service:

- Name: Maximum 127 characters
- Idle Time-out (secs):  
Client: Maximum 31536000  
Server: Maximum 31536000

18. Create Service Group:

- Service Group Name: Maximum 127 characters
- Server ID: Maximum 4294967295
- Idle Time-out (secs):  
Client: Maximum value 31536000  
Server: Maximum 31536000

19. Create Monitor:

- Name: Maximum 31 characters

20. Create Server:

- Server Name: Maximum 127 characters
- Domain Name: Maximum 255 characters
- Resolve Retry: Maximum 20939 secs

## Content inspection

May 2, 2023

In recent times, there is an expansion of device types to display various multimedia content. The device types can be of mobile handsets to tablets, and to desktops. Intermediate infrastructure providers need to transform the original content from a web server to a format suitable for the device that asks for the content. The external devices inspect the content that transcodes and send it back to the client. Commonly used protocol to achieve this is ICAP. ICAP enables the NetScaler appliance to be put in various deployments. ICAP uses the content inspection technique that inspects data for malware and security issues.

### Note

HTTP/2 is not compatible with content inspection. The applications using the HTTP/2 might not function properly if the traffic is sent through the content inspection.

## ICAP for remote content inspection

May 2, 2023

The Internet Content Adaptation Protocol (ICAP) is a simple lightweight protocol for running the value-added transformation service on HTTP messages. In a typical scenario, an ICAP client forwards HTTP requests and responses to one or more ICAP servers for processing. The ICAP servers perform content transformation on the requests and send back responses with appropriate action to take on the request or response.

### ICAP on a NetScaler appliance

In a NetScaler setup, the appliance acts as an ICAP client interoperating with third-party ICAP servers (such as antimalware and Data Loss Protection (DLP)). When the appliance receives an incoming web traffic, the appliance intercepts the traffic and uses a Content Inspection policy to evaluate if the HTTP request needs an ICAP processing. If yes, the appliance decrypts and sends the message as a plain text to the ICAP servers. The ICAP servers run the content transformation service on the request message and send back a response to the appliance. The adapted messages can either be an HTTP request or an HTTP response. If the appliance interoperates with multiple ICAP servers, the appliance performs load balancing of ICAP servers. This scenario happens when one ICAP server is not sufficient to handle all the traffic load. Once the ICAP servers return a modified message, the appliance forwards the modified message to the back-end origin server.

The NetScaler appliance also provides a secured ICAP service if the incoming traffic is an HTTPS type. The appliance uses an SSL based TCP service to establish a secured connection between the appliance and ICAP servers.

### **How ICAP request modification (REQMOD) works**

In the request modification (REQMOD) mode, the NetScaler appliance forwards the HTTP request received from the client to the ICAP server. The ICAP server then performs one of the following:

1. Sends back a modified version of the request and the appliance in turn sends the modified request to the back-end origin server or it pipelines the modified request to another ICAP server.
2. Responds with a message indicating no adaptation is required.
3. Returns an error and the appliance in turn sends the error message back to the user.

### **How ICAP response modification (RESPMOD) works**

In the response modification (RESPMOD) mode, the NetScaler appliance sends an HTTP response to the ICAP server (the response sent by the appliance is typically the response sent by the origin server). The ICAP server then performs one of the following:

1. Sends a modified version of the response and the appliance in turn sends the response to the user or pipelines the response to another ICAP server.
2. Responds with a message indicating no adaptation is required.
3. Returns an error and the appliance in turn sends the error message to the user.

### **ICAP license**

The ICAP feature works on a NetScaler standalone or high availability setup with NetScaler Premium or Advanced license edition.

### **Configure ICAP for content transformation service**

To use ICAP for content transformation service, you must begin by enabling the Content inspection and load balancing features. Once you enable the features, you can complete the following tasks

#### **To enable content inspection**

If you want the NetScaler appliance to act as an ICAP client, you must first enable the Content Inspection and load balancing features.

At the command prompt, type:

```
1 enable ns feature contentInspection LoadBalancing
2 <!--NeedCopy-->
```

### Add ICAP profile

ICAP configurations for a NetScaler appliance are specified in an entity called the ICAP profile. The profile has a collection of the ICAP settings. The settings include parameters to dynamically generate an ICAP request, receive the ICAP response, and log content inspection data.

To dynamically generate an ICAP request to the ICAP server, a new parameter, “insertHTTPRequest” is added to the ICAP profile. If this parameter is configured, the appliance takes the configured value as a policy expression and evaluates the expression and includes the result as an encapsulated HTTP request or response and then sent it to the ICAP server. Also, a new parameter “insertICAPHeaders” is configurable to dynamically evaluate and include the ICAP headers.

When the appliance sends an ICAP request and does not receive a response the ICAP server, the connection becomes unresponsive. It occurs until the ICAP server sends a response or a session gets freed. The behavior can be handled by configuring the ICAP response time-out option. You can set a request time-out parameter for action if there is delayed ICAP response. If the NetScaler appliance does not receive a response within the configured request time-out, the request timeout action is performed.

ReqTimeoutAction: Possible values are BYPASS, RESET, DROP.

BYPASS: This ignores the remote ICAP server’s response and sends the request/response to Client/Server.

RESET (default): Reset the client connection by closing it.

DROP: Drop the request without sending a response to the user

To evaluate an ICAP response, a new policy expression `ICAP.RES` is used in the content inspection callout return expression. This expression evaluates the ICAP response similar to the `HTTP.RES` expression in a `HTTP_CALLOUT`.

For example, when a NetScaler appliance receives an HTTP request for a service hosted behind the NetScaler virtual IP address, the appliance might have to check the client’s authentication with an external server and take an action.

At the command prompt, type:

```
add ns icapProfile <name> [-preview (ENABLED | DISABLED)][-previewLength
<positive_integer>] -uri <string> [-hostHeader <string>] [-userAgent
<string>] -Mode (REQMOD | RESPMOD)[-queryParams <string>] [-
connectionKeepAlive (ENABLED | DISABLED)][-allow204 (ENABLED
```

```
| DISABLED)] [-insertICAPHeaders <string>][-insertHTTPRequest
<string>] [-reqTimeout <positive_integer>][-reqTimeoutAction <
reqTimeoutAction>] [-logAction <string>]
```

**Example:**

```
add icaprofile reqmod-profile -mode RESPMOD -uri "/req_scan" -hostHeader
"Webroot.req sca" -useragent "NS_SWG-Proxy"
```

```
add ns icapProfile icap_prof1 -uri "/example"-Mode REQMOD -reqtimeout
4 -reqtimeoutaction BYPASS
```

```
> add icapProfile reqmode-profile -uri '/example'-mode REQMOD -
insertHTTPRequest q{ HTTP.REQ.METHOD + ""+ HTTP.REQ.URL + "HTTP/1.1\r
\n"+ "Host: "+ HTTP.REQ.HOSTNAME + "\r\n\r\n"}
```

**Log ICAP content inspection action** To dynamically generate content inspection log stream records or SYSLOG logs, you can use the ICAP.RES based policy expression on the ICAP response. This parameter is configurable in the ICAP profile to configure the policy expression to generate the dynamic log records.

At the command prompt, type:

```
add audit messageaction icap_log_expr INFORMATIONAL icap.res.full_header
```

```
set icapProfile reqmode-profile -logAction messageaction
```

**Add ICAP service as a TCP or SSL\_TCP service**

After you enable the Content Inspection feature, you must add an ICAP service for the ICAP servers that will be part of the load balancing setup. The service that you add provides the ICAP connection between the NetScaler appliance and load balancing virtual servers.

**Note:** As an administrator, you can add an ICAP service and directly configure the ICAP server IP address in the Content Inspection action.

At the command prompt, type the following:

```
1 add service <name> <IP> <serviceType> <port>
2 <!--NeedCopy-->
```

**Example:**

```
add service icapsv1 10.10.10.10 SSL_TCP 1345
```

```
add service icapsv2 10.10.10.11 SSL_TCP 1345
```

## Add a TCP or SSL\_TCP based load balancing virtual server

After creating an ICAP service, you must create a virtual server to accept ICAP traffic and load balance the ICAP servers.

**Note:**

You can also use an SSL based TCP service over a secured channel. You use a SSL\_TCP service and bind to the Content Inspection action.

At the command prompt, type the following:

```
1 add lb vsrver <name> <serviceType> <port>
2 <!--NeedCopy-->
```

**Example:**

```
1 add lb vsrver vicap TCP 0.0.0.0.0 -persistenceType NONE -cltTimeout
 9000
2
3 add lb vsrver vicap SSL_TCP 0.0.0.0 0 -persistenceType NONE -
 cltTimeout 9000
4 <!--NeedCopy-->
```

## Bind ICAP service to the load balancing virtual server

After you create an ICAP service and virtual server, you must bind the ICAP service to the virtual server.

At the command prompt, type the following:

```
1 bind lb vsrver <name> <serviceName>
2 <!--NeedCopy-->
```

**Example:**

```
1 bind lb vsrver vicap icapsv1
2 <!--NeedCopy-->
```

## Add content inspection action

After you enable the Content Inspection feature, you must add an ICAP action for handling the ICAP request information. The ICAP profile and services, or load balancing virtual server that are created are bound to the ICAP action. If the ICAP server is down, you can configure the `ifserverdown` parameter for the appliance to perform any one of the following actions.

CONTINUE: If the User wants to bypass the content inspection when the remote server is down, you can choose the “CONTINUE” action, as default.

RESET (default): This action responds to the client by closing the connection with RST.

DROP: This action silently drops the packets without sending a response to the user.

At the command prompt, type the following:

```
1 add contentInspection action <name> -type ICAP -serverName <string> -
 icapProfileName <string>
2
3 add ContentInspection action <name> -type ICAP -serverip <ip> -
 serverport <port> -icapProfileName <string>
4 <!--NeedCopy-->
```

**Note:**

If you can configure the ICAP service instead of a load balancing virtual server, you can mention the service name in the \<-serverip> option. When adding the Content Inspection action, the TCP service is automatically created for the given IP address with port 1344 and it is used for ICAP communication.

**Example:**

```
1 add ContentInspection action ci_act_lb -type ICAP -serverName vicap -
 icapProfileName icap_reqmod
2
3 add ContentInspection action ci_act_svc -type ICAP -serverName icapsv1
 -icapProfileName icap_reqmod
4
5 add ContentInspection action ci_act_svc -type ICAP -serverip 1.1.1.1 -
 serverport 1344 -icapProfileName icap_reqmod
6 <!--NeedCopy-->
```

**Add content inspection policies**

After you create a Content Inspection action, you must create content inspection policies to evaluate requests for ICAP processing and audit logging. The policy is based on a rule which consists of one or more expressions. The rule is associated to the content inspection action that is associated if a request matches the rule.

At the command prompt, type the following:

```
1 add contentInspection policy <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

**Example:**

---

```
1 add ContentInspection policy ci_pol_basic -rule true -action
 ci_act_svc
2
3 add ContentInspection policy ci_pol_HTTP -rule HTTP.REQ.URL.CONTAINS(
 "html") -action ci_act_svc
4 <!--NeedCopy-->
```

### **Bind content inspection policies to the content switching or load balancing virtual server**

To put an ICAP policy into effect, you must bind it globally or bind it to a Content Switching or load balancing virtual server, which front end the application. When you bind the policy, you must assign a priority to it. The priority determines the order in which the policies you define are evaluated.

**Note:**

The application virtual server must be of type - HTTP/SSL/CS-PROXY.

For information about configuring a load balancing setup for forwarding the traffic to the back-end origin server after content transformation, see [Load Balancing](#).

### **Configure secured ICAP service**

To establish a secured connection between the NetScaler appliance and the ICAP web servers, the appliance uses an SSL-based TCP service or load balancing virtual server bound to an ICAP action.

To establish a secured ICAP connection, complete the following tasks:

1. Add SSL-based TCP service.
2. Bind SSL-based TCP service to load balancing virtual server of type TCP or SSL\_TCP.
3. Bind SSL-based TCP service or load balancing virtual server to Content Inspection action.

### **Add SSL-based TCP service to load balancing virtual server**

To establish a secured connection between the NetScaler appliance and the ICAP web servers, the appliance uses an SSL-based TCP service or load balancing virtual server bound to an ICAP action.

To establish a secured ICAP connection, complete the following tasks:

1. Add SSL-based TCP service.
2. Bind SSL-based TCP service to load balancing virtual server of type TCP or SSL\_TCP.

Bind SSL-based TCP service or load balancing virtual server to Content Inspection action

### Add SSL-based TCP service to load balancing virtual server

After you enable the Content Inspection feature, you must add a secured ICAP service that will be part of the load balancing setup. The service that you add provides a secured ICAP connection between the NetScaler appliance and load balancing virtual servers.

At the command prompt, type the following:

```
1 add service <name> <IP> <serviceType> <port>
2 <!--NeedCopy-->
```

#### Example:

```
1 add service icapsv2 10.102.29.200 SSL_TCP 1344 - gslb NONE - maxclient
 0 - maxReq 0 - cip DISABLED - usip NO - useproxport YES - sp ON -
 cltTimeout 9000 - svrTimeout 9000 - CKA NO - TCPB NO - CMP NO
2 <!--NeedCopy-->
```

### Bind SSL-based TCP service to SSL\_TCP or TCP load balancing virtual server

After you create a secured ICAP service, you must bind the service to the load balancing virtual server. It is required if you are using a load balancing virtual server to load balance the ICAP servers.

At the command prompt, type the following:

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

#### Example:

```
1 bind lb vserver vicap icapsv2
2 <!--NeedCopy-->
```

### Bind SSL-based TCP service or load balancing virtual server to the Content Inspection action

You add an ICAP action for handling the ICAP request information and also bind the SSL-based TCP service to the action.

At the command prompt, type the following:

```
1 add contentInspection action <name> -type ICAP -serverName <string> -
 icapProfileName <string>
2 <!--NeedCopy-->
```

#### Example:

```
1 add ContentInspection action ci_act_svc -type ICAP -serverName icapsv2
 -icapProfileName icap_reqmod
```

```
2
3 add ContentInspection action ci_act_svc -type ICAP -serverName vicap -
 icapProfileName icap_reqmod
4 <!--NeedCopy-->
```

### Configure ICAP protocol by using the GUI

1. Navigate to **Load Balancing > Services** and click **Add**.
2. In the **Services** page, enter the service details.
3. Navigate to **Load Balancing > Virtual Servers**. Add a load balancing virtual server of type HTTP/SSL. Or, you can select a virtual server and click **Edit**.
4. After entering the server basic details, click **Continue**.
5. In the **Advanced Settings** section, click **Policies**.
6. Go the **Policies** section and click the **Pencil** icon to configure the Content Inspection policy.
7. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
8. In the **Policy Binding** section, click **+** to add a Content Inspection policy.
9. In the **Create ICAP Policy** page, enter a name for the policy.
10. In the **Action** field, click the “+” sign to add an ICAP action.
11. In the **Create ICAP Action** page, enter a name for the action.
12. Enter a name for the action.
13. In the **Server Name** field, enter the name of the TCP service already created.
14. In **ICAP Profile** field, click the “+” sign to add an ICAP profile.
15. In the **Create ICAP Profile** page, enter a profile name, URI, and MODE.
16. Click **Create**.
17. In the **Create ICAP Action** page, click **Create**.
18. In the **Create ICAP Policy** page, enter “true” in the **Expression Editor** and then click **Create**.
19. Click **Bind**.
20. When prompted to enable the Content Inspection feature, click **Yes**.
21. Click **Done**.

For information about the NetScaler GUI configuration for load balancing and forwarding the traffic to the back-end origin server after content transformation, see [Load Balancing](#).

### Configure secured ICAP protocol by using the GUI

1. Navigate to **Load Balancing > Services** and click **Add**.
2. In the **Services** page, enter the service details.
3. Navigate to **Load Balancing > Virtual Servers**. Add a virtual server of type HTTP/SSL. Or, you can select a virtual server and click **Edit**.
4. After entering the server basic details, click **Continue**.

5. In the **Advanced Settings** section, click **Policies**.
6. Go the **Policies** section and click the **Pencil** icon to configure the Content Inspection policy.
7. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
8. In the **Policy Binding** section, click **+** to add a Content Inspection policy.
9. In the **Create ICAP Policy** page, enter a name for the policy.
10. In the **Action** field, click the “+” sign to add an ICAP action.
11. In the **Create ICAP Action** page, enter a name for the action.
12. Enter a name for the action.
13. In the **Server Name** field, enter the name of the TCP\_SSL service already created.
14. In **ICAP Profile** field, click the “+” sign to add an ICAP profile.
15. In the **Create ICAP Profile** page, enter a profile name, URI, and MODE.
16. Click **Create**.
17. In the **Create ICAP Action** page, click **Create**.
18. In the **Create ICAP Policy** page, enter “true” in the **Expression Editor** and then click **Create**.
19. Click **Bind**.
20. When prompted to enable the Content Inspection feature, click **Yes**.
21. Click **Done**.

## Audit log support for remote content inspection

If an incoming request or outgoing response is content inspected, the NetScaler appliance logs the ICAP details. The appliance stores the details as a log message in the ns.log file.

Each log message typically contains the following details:

```
1 <Source IP> <Destination IP> <Domain> <ICAP server IP><ICAP Mode> <
 Service URI> <ICAP response> <Policy action>
2 <!--NeedCopy-->
```

**Limitation:** Streaming mode of App Firewall is not supported with the content inspection feature.

### Example for content inspected request log message:

```
1 Apr 18 14:45:41 <local0.info> 10.106.97.104 04/18/2018:14:45:41 GMT 0-
 PPE-0 : default CI ICAP_LOG 788 0 : Source 10.102.1.98:39048 -
 Destination 10.106.97.89:8011 - Domain 10.106.97.89 - Content-Type
 application/x-www-form-urlencoded - ICAP Server 10.106.97.99:1344 -
 Mode REQMOD - Service /example - Response 204 - Action FORWARD
2 <!--NeedCopy-->
```

### Example for content inspected response log message:

```
1 Apr 18 12:34:08 <local0.info> 10.106.97.104 04/18/2018:12:34:08 GMT 0-
 PPE-0 : default CI ICAP_LOG 71 0 : Source 10.106.97.105:18552 -
 Destination 10.106.97.99:80 - Domain NA - Content-Type NA - ICAP
```

```
Server 10.106.97.99:1344 - Mode RESPMOD - Service /example -
Response 400 - Action Internal Error
2 <!--NeedCopy-->
```

## Inline device integration with NetScaler

October 16, 2023

Security devices such as Intrusion Prevention System (IPS) and Next Generation Firewall (NGFW) protect servers from network attacks. These devices are deployed in layer 2 inline mode and their primary function is to protect servers from network attacks and report security threats on the network.

To prevent vulnerable threats and provide advanced security protection, a NetScaler appliance is integrated with one or more inline devices. The inline devices can be any security device such as IPS, NGFW.

Following are some of the use cases that benefit in using the inline device integration with the NetScaler appliance:

- **Inspecting encrypted traffic.** Most IPS and NGFW appliances bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A NetScaler appliance can decrypt traffic and send it to inline devices for inspection. It enhances the customer's network security.
- **Offloading inline devices from TLS/SSL processing.** TLS/SSL processing is expensive and the issue can result in high system CPU in IPS or NGFW appliances if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. NetScaler helps in offloading inline devices from TLS/SSL processing. It results in the inline device supporting a high volume of traffic inspection.
- **Loading balancing inline devices.** The NetScaler appliance load balances multiple inline devices when there is a high volume of traffic.
- **Smart selection of traffic.** Every packet flowing into the appliance might be content inspected, for example download of text files. User can configure the NetScaler appliance to select specific traffic (for example .exe files) for inspection and send the traffic to inline devices for processing the data

## How the NetScaler is integrated with inline devices

The following diagram shows how a NetScaler is integrated with inline security devices.

When you integrate inline devices with the NetScaler appliance, the component interacts as per the following:

1. A client sends a request to NetScaler appliance.
2. The appliance receives the request and sends it to an inline device based on policy evaluation.  
**Note:** If there are two or more inline devices, the appliance load balances the devices and sends the traffic.  
 If the incoming traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text to the inline device for content inspection.
3. The inline device inspects the data for threats and decides whether to drop, reset, or send the data back to the appliance.
4. If there are security threats, the device modifies the data and sends it to the appliance.
5. The NetScaler in turn re-encrypts the data and forwards the request to the back-end server.
6. The back-end server sends the response to the NetScaler appliance.
7. The appliance again decrypts the data and sends it to the inline device for inspection.
8. Appliance re-encrypts the data and sends the response to the client

## Software licensing

To deploy the inline device integration, your NetScaler appliance must be provisioned with one of the following licenses:

1. ADC Premium
2. ADC Advanced

3. Telco Advanced
4. Telco Premium
5. SWG license

## Configuring inline device integration

You can configure a NetScaler appliance with an inline device in three different ways. The configuration scenarios are as follows.

### Scenario 1 for using a single inline device

If you want to integrate a security device (IPS or NGFW) in inline mode, you must begin by first enabling the Content Inspection feature and enabling the NetScaler in MBF (MAC-based forwarding) in global mode. Once you have enabled the features, you must add the Content Inspection profile, add the Content Inspection action for inline devices to reset, block, or drop the traffic based on inspection. Then, add the Content Inspection policy for the appliance to decide what subset of traffic to send to the inline devices. Then, configure the load balancing virtual server with layer 2 connection enabled on the server. Finally, bind the content inspection policy to the load balancing virtual server.

**Enable MBF (MAC-based forwarding) mode** If you want the NetScaler appliance to be integrated to inline devices such as IPS, or firewalls, you must enable this mode. For more information about MBF, see [Configure MAC-based Forwarding](#) topic.

At the command prompt, type:

```
enable ns mode mbf
```

**Enable Content Inspection** If you want the NetScaler appliance to decrypt and then send the content for inspection to the inline devices, you must enable the Content Inspection and load balancing features.

```
enable ns feature contentInspection LoadBalancing
```

**Add Layer 2 connection method** To handle response generated by inline devices, the appliance uses the VLAN channel as a layer 2 method (L2ConnMethod) of communication with inline devices.

At the command prompt, type:

```
set l4param -l2ConnMethod <l2ConnMethod>
```

**Example**

```
set l4param -l2ConnMethod VlanChannel
```

**Add Content Inspection profile for service** Inline device configuration for a NetScaler appliance can be specified in an entity called the Content Inspection profile. The profile has a collection of settings that explains how to integrate with an inline device.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile1 -type InlineInspection
-ingressinterface "1/2" -egressInterface "1/3"
```

**Add IPS-TCP monitor** If you want to configure monitors, you add a user defined monitor.

**Note:** If you want to configure monitors, you must use a custom monitor. When adding a monitor, you must enable the transparent parameter.

At the command prompt, type:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr>] [-
destPort <port>] [-transparent (YES | NO)]
```

**Example:**

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
YES
```

**Add a service** Add a service. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address` (USIP) to YES. Set `useproxyport` to NO. By default, health monitoring is ON, bind the service to a health monitor, and also set the TRANSPARENT option in the monitor ON. At the command prompt, type:

```
add service <Service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor YES -usip ON -useproxyport OFF
```

**Example:**

```
add service ips_service 192.168.10.2 TCP * -healthMonitor YES -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof
```

**Add a health monitor** By default the health monitor is turned on and you also have the option to disable it, if necessary. At the command prompt, type:

```
add lb monitor <name> TCP -destIP <ip address> -destPort 80 -transparent
<YES, NO>
```

**Example:**

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
YES
```

**Bind the service to the health monitor** After configuring the health monitor, you must bind the service to the health monitor. At the command prompt, type:

```
bind service <name> -monitorName <name>
```

**Example:**

```
bind service ips_svc -monitorName ips_tcp
```

**Add content inspection action for service** After you enable the Content Inspection feature and then after you add the inline profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the inline device can drop, reset, or block action after it has inspected the data.

If the Inline server or service is down, you can configure the `ifserverdown` parameter in the appliance to perform any one of the following actions.

CONTINUE: If the User wants to bypass the content inspection when the remote server is down, you can choose the “CONTINUE” action, as default.

RESET (default): This action responds to the client by closing the connection with RST.

DROP: This action silently drops the packets without sending a response to the user.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string>
> [-ifserverdown <ifserverdown>] [-reqTimeout <positive_integer>] [-
reqTimeoutAction <reqTimeoutAction>]
```

```
add ContentInspection action <action_name> -type InlineINSPECTION -
serverName Service_name/Vserver_name>
```

**Example:**

```
add ContentInspection action <Inline_action> -type InlineSPECTION -
serverName Inline_service1
```

**Add content inspection policy for inspection** After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> -rule <Rule> -action <
action_name>
```

**Example**

```
add contentInspection policy Inline_pol1 -rule true -action Inline_action
```

**Add content switching or load balancing virtual server of type HTTP/SSL** To receive the web traffic, you must add a load balancing virtual server. Also you must enable the layer2 connection on the virtual server.

At the command prompt, type:

```
add lb vserver <name> <vserver name> -l2Conn ON
```

**Example:**

```
add lb vserver HTTP_vserver HTTP 10.102.29.200 8080 -l2Conn ON
```

**Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL** You bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
< priority > -type <REQUEST>
```

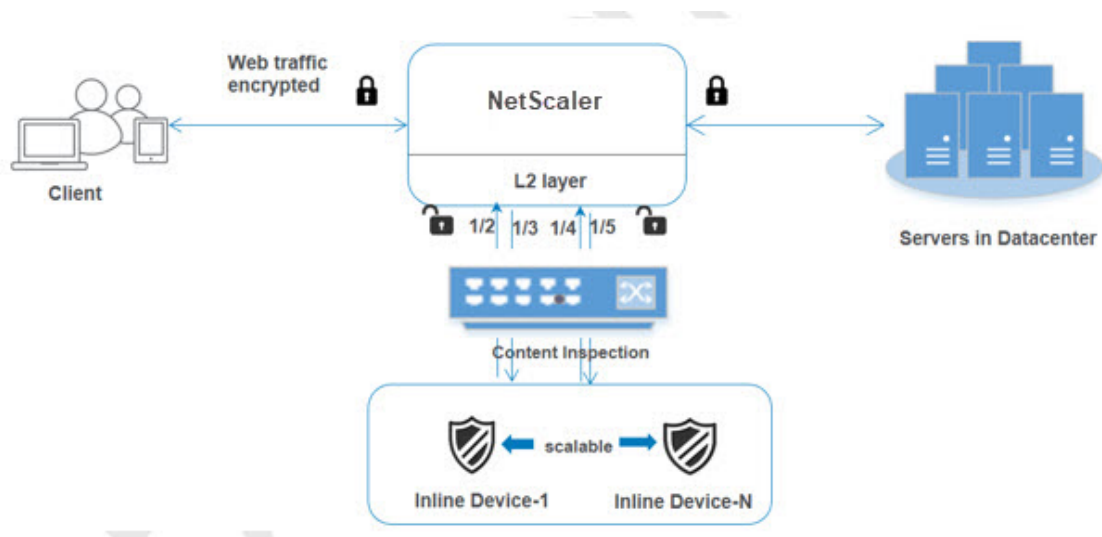

**Example:**

```
bind lb vserver HTTP_vserver -policyName Inline_pol1 -priority 100 -
type REQUEST
```

**Scenario 2: Load balancing multiple inline devices using dedicated interfaces**

If you are using two or more inline devices, you must load balance the devices using different content inspection services in a dedicated VLAN setup. In this case, the NetScaler appliance load balances the devices on top of sending a subset of traffic to each device through a dedicated interface.

For basic configuration steps, refer to scenario 1.

**Add content inspection profile1 for service1** Inline configurations for a NetScaler appliance can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for inline service 1 and the communication is through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile1 -type InlineInspection
-ingressinterface "1/2" -egressInterface "1/3"
```

**Add content inspection profile2 for service2** The Content Inspection profile2 is added for service2 and the inline device communicates with the appliance through 1/4 and 1/5 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface <interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile2 -type InlineInspection -ingressinterface "1/4" -egressInterface "1/5"
```

**Add service 1 for inline device 1** After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> TCP * -contentInspectionProfileName <Inline_Profile_1> -healthmonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service Inline_service1 10.102.29.200 TCP 80 -contentInspectionProfileName Inline_profile1 -healthmonitor OFF -usip ON -useproxyport OFF
```

**Add service 2 for inline device 2** After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> TCP * -contentInspectionProfileName <Inline_Profile_2> -healthmonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service Inline_service1 10.29.20.205 TCP 80 -contentInspectionProfileName Inline_profile2 -healthmonitor OFF -usip ON -useproxyport OFF
```

**Add load balancing virtual server** After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> TCP <Pvt_IP3> <port>
```

**Example:**

```
add lb vserver lb-Inline_vserver TCP *
```

**Bind service 1 to the load balancing virtual server** After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-Inline_vserver Inline_service1
```

**Bind service 2 to the load balancing virtual server** After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-Inline_vserver Inline_service2
```

**Add content inspection action for the service** After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the inline device drops, resets, or blocks after it has examined the given subset of traffic.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string> [-ifserverdown <ifserverdown>] [-reqTimeout <positive_integer>] [-reqTimeoutAction <reqTimeoutAction>])
```

```
add ContentInspection action < action_name > -type InlineINSPECTION -serverName Service_name/Vserver_name>
```

**Example:**

```
add ContentInspection action Inline_action -type InlineINSPECTION -serverName lb-Inline_vserver
```

**Add content inspection policy for inspection** After you create a Content Inspection action, you must add the Content Inspection policy to evaluate requests for service. The policy is based on a rule which consists of one or more expressions. The rule is associated to the Content Inspection action that is associated if a request matches the rule.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> -rule <Rule> -action <
action_name>
```

**Example:**

```
add contentInspection policy Inline_pol1 -rule true -action Inline_action
```

**Add content switching or load balancing virtual server of type HTTP/SSL** Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.

For more information about load balancing, see [How load balancing works](#) topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name> -l2Conn ON
```

**Example:**

```
add lb vserver http_vserver HTTP 10.102.29.200 8080 -l2Conn ON
```

**Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL** You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
<> -type <L7InlineREQUEST | L4Inline-REQUEST>
```

**Example:**

```
bind lb vserver http_vserver -policyName Inline_pol1 -priority 100 -
type REQUEST
```

### Scenario 3: Load balancing multiple inline devices using shared interfaces

You can refer to this configuration, if you are using multiple inline devices and if you want to load balance the devices using different services in a shared VLAN interface. This configuration using shared VLAN interfaces is similar to use case 2. For basic configuration, refer to scenario 2.

**Bind VLAN A with sharing option enabled** At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
bind vlan 100 -ifnum 1/2 tagged
```

**Bind VLAN B with sharing option enabled** At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
bind vlan 200 -ifnum 1/3 tagged
```

**Bind VLAN C with sharing option enabled** At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
bind vlan 300 -ifnum 1/2 tagged
```

**Bind VLAN D with sharing option enabled** At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
bind vlan 400 -ifnum 1/3 tagged
```

**Add content inspection profile1 for service1** Inline configurations for a NetScaler appliance can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile is created for inline service 1 and the communication is through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface <interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile1 -type InlineInspection -ingressinterface "1/2" -egressInterface "1/3" -egressVlan 100 -ingressVlan 300
```

**Add content inspection profile2 for service2** The Content Inspection profile2 is added for service2 and the inline device communicates with the appliance through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface <interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile2 -type InlineInspection -ingressinterface "1/2" -egressInterface "1/3" -egressVlan 200 -ingressVlan 400
```

### **Configure inline service integration using the NetScaler GUI**

1. Log on to the NetScaler appliance and navigate to **Configuration** tab page.
2. Navigate to **System > Settings > Configure Modes**.
3. In the **Configure Modes** page, select **Mac Based Forwarding**.
4. Click **OK** and **Close**.
5. Navigate to **System > Settings > Configure Advanced Features**.
6. In the **Configure Advanced Feature** page, select **Content Inspection**.
7. Click **OK** and **Close**.
8. Navigate to **Security > Content Inspection > ContentInspection Profiles**.

9. In the **ContentInspection Profiles** page, click **Add**.
10. In the **Create ContentInspection Profiles** page, set the following parameters.
  - a) Profile Name. Name of the content inspection profile.
  - b) Type. Select the profile type as inlineInspection.
  - c) Egress Interface. Interface through which the appliance sends traffic from the NetScaler to the Inline device.
  - d) Ingress Interface. Interface through which the appliance receives traffic from the Inline device to the NetScaler.
  - e) Egress VLAN. Interface VLAN ID through which the traffic is sent to the Inline device.
  - f) Ingress VLAN. Interface VLAN ID through which the appliance receives traffic from Inline to NetScaler (if it is configured).
11. Click **Create** and **Close**.
12. Navigate to **Traffic Management > Load Balancing > Services** and click **Add**.
13. In the **Services** page, set the following parameters:
  - a) Service name. Name of the load balancing service.
  - b) IP address. Use a dummy IP address. Note: No device must own the IP address.
  - c) Protocol. Select protocol type as TCP.
  - d) Port. Enter \*
  - e) Health Monitoring. Clear this option and enable it only if you want to bind the service to the TCP type monitor. If you want to bind a monitor to service then the **TRANSPARENT** option in the monitor must be ON. See step 14 on how to add monitor and how to bind it to service.
  - f) Click **OK**.
14. In the **Settings** section, edit the following and click **OK**.
  - a) Use Proxy Port: Turn it OFF
  - b) Use Source IP Address: Turn it ON
15. In the **Advanced Settings** section, click **Profiles**.
16. Go to **Profiles** section, and add the inline content inspection profile and click **OK**.
17. Go to **Monitors** section, **Add Bindings > Select Monitor > Add**.
  - a) Name: Name of monitor
  - b) Type: Select TCP type
  - c) Destination IP, PORT: Destination IP address and Port.
  - d) Transparent: Turn ON

**Note:** Monitor packets must flow through the inline device to monitor inline device status.

18. Click **Create**.
19. Click **Done**.
20. Navigate to **Traffic Management > Load Balancing > Virtual Servers**. Add a virtual server of type HTTP or SSL.
21. After entering the server details, click **OK** and again **OK**.
22. In the **Traffic Settings** section of Load Balancing Virtual Server, turn Layer 2 Parameters ON.
23. In the **Advanced Settings** section, click **Policies**.
24. Go the **Policies** section and click the “+” icon to configure the content inspection policy.
25. On the **Choose Policy** page, select Content Inspection. Click **Continue**.
26. In the **Policy Binding** section, click **Add** to add a Content Inspection policy.
27. In the **Create ContentInspection Policy** page, enter a name for the Inline content inspection policy.
28. In the **Action** field, click **Add** to create an Inline content inspection action.
29. In the **Create CI Action** page, set the following parameters:
  - a) Name. Name of the content inspection Inline policy.
  - b) Type. Select the type as inlineInspection.
  - c) Server. Select the server/service as Inline devices.
  - d) If Server Down. Select an operation if the server goes down.
  - e) Request Time-out. Select a time-out value. You can use default values.
  - f) Request Time-out Action. Select a time-out action. You can use default values.
30. Click **Create**.
31. In the **Create CI Policy** page, enter other details:
32. Click **OK** and **Close**.

## Integration with IPS or NGFW as inline devices using SSL forward proxy

November 2, 2023

Security devices such as Intrusion Prevention System (IPS) and Next Generation Firewall (NGFW) protect servers from network attacks. These devices can inspect live traffic and are typically deployed in layer 2 inline mode. The SSL forward proxy appliance provides security of users and the enterprise network when accessing resources on the internet.

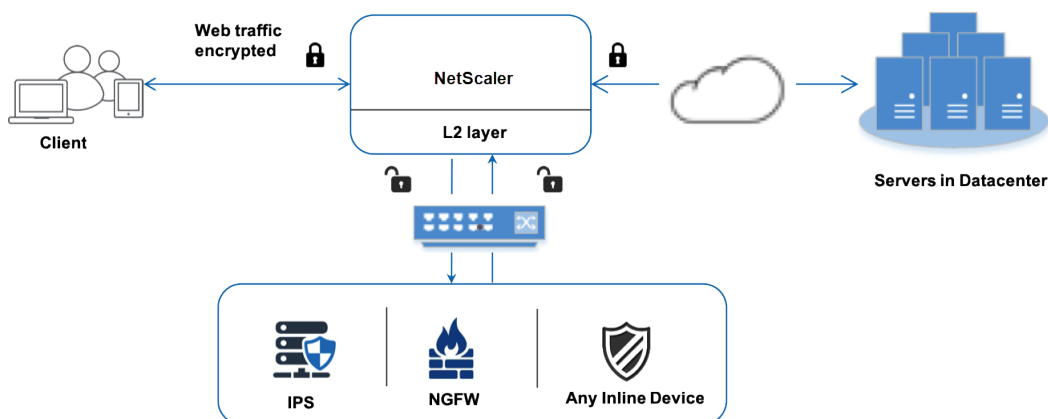

An SSL forward proxy appliance can be integrated with one or more inline devices to prevent threats and provide advanced security protection. The inline devices can be any security device, such as IPS and NGFW.

Some use cases where you can benefit by using the SSL forward proxy appliance and inline device integration are:

- **Inspecting encrypted traffic:** Most IPS and NGFW appliances bypass encrypted traffic, which can leave servers vulnerable to attacks. An SSL forward proxy appliance can decrypt traffic and send it to the inline devices for inspection. This integration enhances the customer’s network security.
- **Offloading inline devices from TLS/SSL processing:** TLS/SSL processing is expensive, which can result in high CPU utilization in IPS or NGFW appliances if they also decrypt the traffic. An SSL forward proxy appliance helps in offloading TLS/SSL processing from inline devices. As a result, inline devices can inspect a higher volume of traffic.
- **Loading balancing inline devices:** If you have configured multiple inline devices to manage heavy traffic, an SSL forward proxy appliance can load balance and distribute traffic evenly to these devices.
- **Smart selection of traffic:** Instead of sending all the traffic to the inline device for inspection, the appliance does a smart selection of traffic. For example, it skips sending text files for inspection to the inline devices.

### SSL forward proxy integration with inline devices

The following diagram shows how an SSL forward proxy is integrated with inline security devices.

When you integrate inline devices with the SSL forward proxy appliance, the components interact as follows:

1. A client sends a request to an SSL forward proxy appliance.

2. The appliance sends the data to the inline device for content inspection based on the policy evaluation. For HTTPS traffic, the appliance decrypts the data and sends it in plain text to the inline device for content inspection.

**Note**

If there are two or more inline devices, the appliance load balances the devices and sends the traffic.

3. Add a content switching or an HTTP/HTTPS load balancing virtual server.
4. The inline device inspects the data for threats and decides whether to drop, reset, or send the data back to the appliance.
5. If there are security threats, the device modifies the data and sends it to the appliance.
6. For HTTPS traffic, the appliance re-encrypts the data and forwards the request to the back-end server.
7. The back-end server sends the response to the appliance.
8. The appliance again decrypts the data and sends it to the inline device for inspection.
9. The inline device inspects the data. If there are security threats, the device modifies the data and sends it to the appliance.
10. The appliance re-encrypts the data and sends the response to the client.

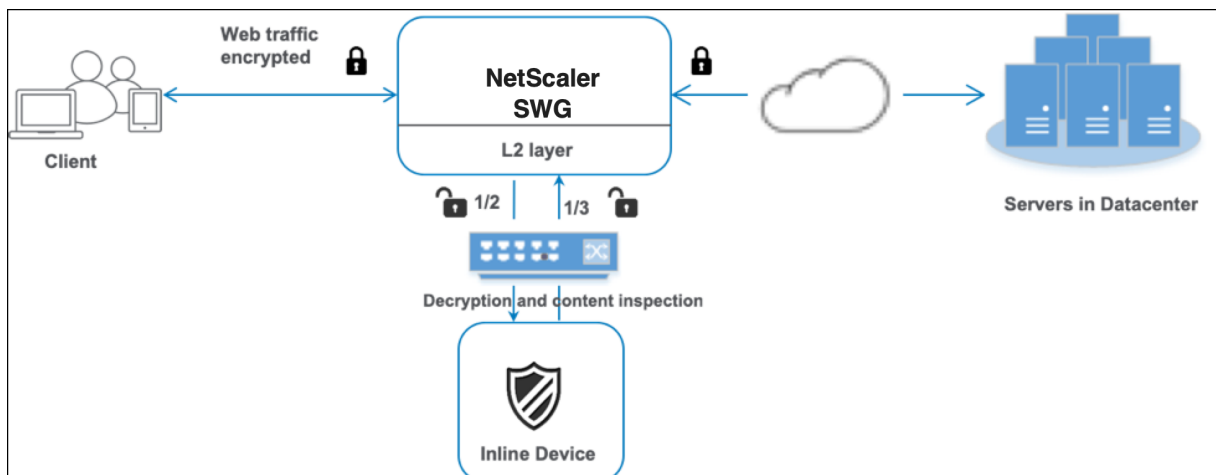

## **Configuring inline device integration**

You can configure an SSL forward proxy appliance with an inline device in three different ways as follows:

### **Scenario 1: Using a single inline device**

To integrate a security device (IPS or NGFW) in inline mode, you must enable content inspection and MAC-based forwarding (MBF) in global mode on the SSL forward proxy appliance. Then, add a content inspection profile, a TCP service, a content inspection action for inline devices to reset, block, or drop the traffic based on inspection. Also add a content inspection policy that the appliance uses to decide the subset of traffic to send to the inline devices. Finally, configure the proxy virtual server with layer 2 connection enabled on the server and bind the content inspection policy to this proxy virtual server.

Perform the following steps:

1. Enable MAC-based forwarding (MPF) mode.
2. Enable the content inspection feature.
3. Add a content inspection profile for the service. The content inspection profile contains the inline device settings that integrate the SSL forward proxy appliance with an inline device.
4. (Optional) Add a TCP monitor.

**Note:**

Transparent devices do not have an IP address. Therefore, to perform health checks, you must explicitly bind a monitor.

5. Add a service. A service represents an inline device.
6. (Optional) Bind the service to the TCP monitor.
7. Add a content inspection action for the service.
8. Add a content inspection policy and specify the action.
9. Add an HTTP or HTTPS proxy (content switching) virtual server.
10. Bind the content inspection policy to the virtual server.

**Configure using the CLI** Type the following commands at the command prompt. Examples are given after most commands.

1. Enable MBF.

```
enable ns mode mbf
```

1. Enable the feature.

```
enable ns feature contentInspection
```

1. Add a content inspection profile.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile ipsprof -type InlineInspection -ingressinterface
"1/2" -egressInterface "1/3"
```

1. Add a service. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address (USIP)` to YES. Set `useproxyport` to NO. By default, health monitoring is ON, bind the service to a health monitor, and also set the TRANS-PARENT option in the monitor ON.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor YES -usip YES -useproxyport NO
```

**Example:**

```
add service ips_service 198.51.100.2 TCP * -healthMonitor YES -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof
```

1. Add a health monitor. By default the health monitor is turned on and you also have the option to disable it, if necessary. At the command prompt, type:

```
add lb monitor <name> TCP -destIP <ip address> -destPort 80 -
transparent <YES, NO>
```

**Example:**

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
YES
```

1. Bind the service to the health monitor

After configuring the health monitor, you must bind the service to the health monitor. At the command prompt, type:

```
bind service <name> -monitorName <name>
```

**Example:**

```
bind service ips_svc -monitorName ips_tcp
```

1. Add a content inspection action.

```
add contentInspection action <name> -type INLINEINSPECTION -serverName <string>
```

**Example:**

```
add contentInspection action ips_action -type INLINEINSPECTION -serverName ips_service
```

1. Add a content inspection policy.

```
add contentInspection policy <name> -rule <expression> -action <string>
```

**Example:**

```
add contentInspection policy ips_pol -rule "HTTP.REQ.METHOD.NE(\\"CONNECT\\")"-action ips_action
```

1. Add a proxy virtual server.

```
add cs vserver <name> PROXY <IPAddress> <port> -cltTimeout <secs> -Listenpolicy <expression> -authn401 (ON | OFF)-authnVsName <string> -l2Conn ON
```

**Note:**

Load balancing virtual servers of type HTTP/SSL are also supported.

**Example:**

```
add cs vserver transparentcs PROXY * * -cltTimeout 180 -Listenpolicy exp1 -authn401 on -authnVsName swg-auth-vs-trans-http -l2Conn ON
```

1. Bind the policy to the virtual server.

```
bind cs vserver <name> -policyName <string> -priority <positive_integer> -gotoPriorityExpression <expression> -type REQUEST
```

**Example:**

```
bind cs vserver explicitcs -policyName ips_pol -priority 1 -gotoPriorityExpression END -type REQUEST
```

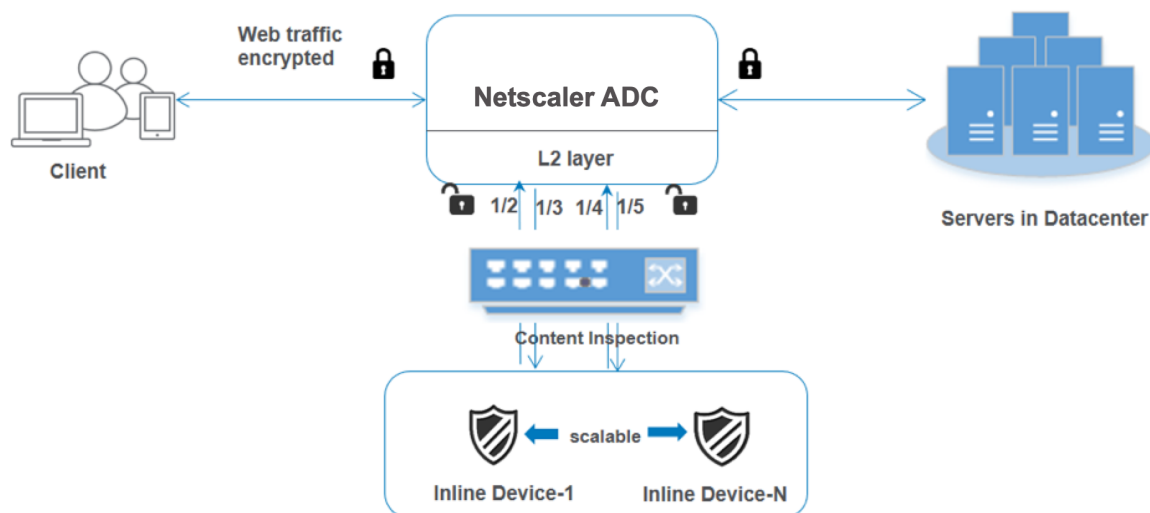

**Configure using the GUI**

1. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Modes**.
2. In the **Configure Modes** page, select the **MAC based forwarding** option.
3. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Advanced Features**.

4. In the **Configure Advanced Features** page, select the **Content Inspection** option.
5. Navigate to **Security > Content Inspection > Content Inspection Profiles**. Click **Add**.
6. Navigate to **Load Balancing > Services > Add** and add a service.
  - a) In **Advanced Settings**, click **Profiles**. In the **CI Profile Name** list, select the content inspection profile created earlier.
  - b) In **Service Settings**, set **Use Source IP Address** to YES and **Use Proxy Port** to No. In **Basic Settings**, set **Health Monitoring** to NO.
  - c) Turn on health monitoring only if you bind this service to a TCP monitor. If you bind a monitor to a service, then set the TRANSPARENT option in the monitor to ON.
7. Navigate to **Security > Proxy Virtual Servers > Add**. Specify a name, IP address, and port. In **Advanced Settings**, select **Policies**. Click the “+” sign.
8. In **Choose Policy** select **Content Inspection**. Click **Continue**.
9. Click **Add**. Specify a name. In **Action**, click **Add**.
10. Specify a name. In **Type**, select **INLINEINSPECTION**. In **Server Name**, select the TCP service created earlier.
11. Click **Create**. Specify the rule and click **Create**.
12. Click **Bind**.
13. Click **Done**.

### **Scenario 2: Load balance multiple inline devices with dedicated interfaces**

If you are using two or more inline devices, you can load balance the devices using different content inspection services with dedicated interfaces. In this case, the SSL forward proxy appliance load balances the subset of traffic sent to each device through a dedicated interface. The subset is decided based on the policies configured. For example, TXT or image files might not be sent for inspection to the inline devices.

The basic configuration remains the same as in scenario 1. However, you must create a content inspection profile for each inline device and specify the ingress and egress interface in each profile. Add a service for each inline device. Add a load balancing virtual server and specify it in the content inspection action. Perform the following extra steps:

1. Add content inspection profiles for each service.
2. Add a service for each device.
3. Add a load balancing virtual server.
4. Specify the load balancing virtual server in the content inspection action.

**Configure using the CLI** Type the following commands at the command prompt. Examples are given after each command.

1. Enable MBF.

```
enable ns mode mbf
```

1. Enable the feature.

```
enable ns feature contentInspection
```

1. Add profile 1 for service 1.

```
add contentInspection profile <name> -type InlineInspection -egressInterface <interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile ipsprof1 -type InlineInspection -ingressInterface "1/2"-egressInterface "1/3"
```

1. Add profile 2 for service 2.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile ipsprof2 -type InlineInspection -
ingressInterface "1/4"-egressInterface "1/5"
```

1. Add service 1. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address (USIP)` to YES. Set `useproxyport` to NO. Turn on health monitoring with TCP monitor with TRANSPARENT option set ON.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES -useproxyport NO
```

**Example:**

```
add service ips_service1 192.168.10.2 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof1
```

1. Add service 2. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address (USIP)` to YES. Set `useproxyport` to NO. Turn on health monitoring with TRANSPARENT option set ON.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES -useproxyport NO
```

**Example:**

```
add service ips_service2 192.168.10.3 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof2
```

1. Add a load balancing virtual server.

```
add lb vserver <LB_VSERVER_NAME> TCP <IP> <port>
```

**Example:**

```
add lb vserver lb_inline_vserver TCP 192.0.2.100 *
```

1. Bind the services to the load balancing virtual server.

```
bind lb vserver <LB_VSERVER_NAME> <service_name>
bind lb vserver <LB_VSERVER_NAME> <service_name>
```

**Example:**

```
bind lb vserver lb_inline_vserver ips_service1
bind lb vserver lb_inline_vserver ips_service2
```

1. Specify the load balancing virtual server in the content inspection action.

```
add contentInspection action <name> -type INLINEINSPECTION -serverName
<string>
```

**Example:**

```
add contentInspection action ips_action -type INLINEINSPECTION -
serverName lb_inline_vserver
```

1. Add a content inspection policy. Specify the content inspection action in the policy.

```
add contentInspection policy <name> -rule <expression> -action <
string>
```

**Example:**

```
add contentInspection policy ips_pol -rule "HTTP.REQ.METHOD.NE(\
CONNECT\)"-action ips_action
```

1. Add a proxy virtual server.

```
add cs vserver <name> PROXY <IPAddress> <port> -l2Conn ON
```

**Example:**

```
add cs vserver transparentcs PROXY * * -l2Conn ON
```

1. Bind the content inspection policy to the virtual server.

```
bind cs vserver <name> -policyName <string> -priority <positive_integer
> -gotoPriorityExpression <expression> -type REQUEST
```

**Example:**

```
bind cs vserver explicitcs -policyName ips_pol -priority 1 -gotoPriorityExpres
END -type REQUEST
```

**Configuration using the GUI**

1. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Modes**.
2. In the **Configure Modes** page, select the **MAC based forwarding** option.
3. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Advanced Features**.
4. In the **Configure Advanced Features** page, select the **Content Inspection** option.

5. Navigate to **Security > Content Inspection > Content Inspection Profiles**. Click **Add**.
6. Specify the ingress and egress interfaces.
7. Create two profiles. Specify a different ingress and egress interface in the second profile.
8. Navigate to **Load Balancing > Services > Add** and add a service.
  - a) In **Advanced Settings**, click **Profiles**. In the **CI Profile Name** list, select the content inspection profile created earlier.
  - b) In **Service Settings**, set **Use Source IP Address** to YES and **Use Proxy Port** to No. In **Basic Settings**, set **Health Monitoring** to NO.
  - c) Turn on health monitoring only if you bind this service to a TCP monitor. If you bind a monitor to a service, then set the TRANSPARENT option in the monitor to ON.

Create two services. Specify dummy IP addresses that are not owned by any of the devices, including the inline devices.

9. Navigate to **Load Balancing > Virtual Servers > Add**. Create a TCP load balancing virtual server and Click **OK**.
10. Click the **Load Balancing Virtual Server Service Binding** section. In **Service Binding**, click the arrow in **Select Service**. Select the two services created earlier, and click **Select**. Click **Bind**.
11. Navigate to **Security > Proxy Virtual Servers > Add**. Specify a name, IP address, and port. In **Advanced Settings**, select **Policies**. Click the “+” sign.
12. In **Choose Policy** select **Content Inspection**. Click **Continue**.
13. Click **Add**. Specify a name. In **Action**, click **Add**.
14. Specify a name. In **Type**, select **INLINEINSPECTION**. In **Server Name**, select the load balancing virtual server created earlier.
15. Click **Create**. Specify the rule and click **Create**.
16. Click **Bind**.
17. Click **Done**.

### Scenario 3: Load balance multiple inline devices with shared interfaces

If you are using two or more inline devices, you can load balance the devices using different content inspection services with shared interfaces. In this case, the SSL forward proxy appliance load balances the subset of traffic sent to each device through a shared interface. The subset is decided based on the policies configured. For example, TXT or image files might not be sent for inspection to the inline devices.

The basic configuration remains the same as in scenario 2. For this scenario, bind the interfaces to different VLANs to segregate the traffic for each inline device. Specify the VLANs in the content inspection profiles. Perform the following extra steps:

1. Bind the shared interfaces to different VLANs.
2. Specify the ingress and egress VLANs in the content inspection profiles.

**Configuration using the CLI** Type the following commands at the command prompt. Examples are given after each command.

1. Enable MBF.

```
enable ns mode mbf
```

1. Enable the feature.

```
enable ns feature contentInspection
```

1. Bind the shared interfaces to different VLANs.

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
1 bind vlan 100 -ifnum 1/2 tagged
2 bind vlan 200 -ifnum 1/3 tagged
3 bind vlan 300 -ifnum 1/2 tagged
4 bind vlan 400 -ifnum 1/3 tagged
5 <!--NeedCopy-->
```

1. Add profile 1 for service 1. Specify the ingress and egress VLANs in the profile.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile ipsprof1 -type InlineInspection -
egressInterface "1/3" -ingressinterface "1/2" -egressVlan 100 -ingressVlan
300
```

1. Add profile 2 for service 2. Specify the ingress and egress VLANs in the profile.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile ipsprof2 -type InlineInspection -
egressInterface "1/3" -ingressinterface "1/2" -egressVlan 200 -ingressVlan
400
```

1. Add service 1.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES -useproxyport NO
```

**Example:**

```
add service ips_service1 192.168.10.2 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof1
```

1. Add service 2.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES -useproxyport NO
```

**Example:**

```
add service ips_service2 192.168.10.3 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof2
```

1. Add a load balancing virtual server.

```
add lb vserver <LB_VSERVER_NAME> TCP <IP> <port>
```

**Example:**

```
add lb vserver lb_inline_vserver TCP 192.0.2.100 *
```

1. Bind the services to the load balancing virtual server.

```
bind lb vserver <LB_VSERVER_NAME> <service_name>
bind lb vserver <LB_VSERVER_NAME> <service_name>
```

**Example:**

```
bind lb vserver lb_inline_vserver ips_service1
bind lb vserver lb_inline_vserver ips_service2
```

1. Specify the load balancing virtual server in the content inspection action.

```
add contentInspection action <name> -type INLINEINSPECTION -serverName
<string>
```

**Example:**

```
add contentInspection action ips_action -type INLINEINSPECTION -
serverName lb_inline_vserver
```

1. Add a content inspection policy. Specify the content inspection action in the policy.

```
add contentInspection policy <name> -rule <expression> -action <
string>
```

**Example:**

```
add contentInspection policy ips_pol -rule "HTTP.REQ.METHOD.NE(\\"
CONNECT\\")"-action ips_action
```

1. Add a proxy virtual server.

```
add cs vserver <name> PROXY <IPAddress> <port> -l2Conn ON
```

**Example:**

```
add cs vserver transparentcs PROXY * * -l2Conn ON
```

1. Bind the content inspection policy to the virtual server.

```
bind cs vserver <name> -policyName <string> -priority <positive_integer>
> -gotoPriorityExpression <expression> -type REQUEST
```

**Example:**

```
bind cs vserver explicitcs -policyName ips_pol -priority 1 -gotoPriorityExpres
END -type REQUEST
```

## Configuration using the GUI

1. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Modes**.
  2. In the **Configure Modes** page, select the **MAC based forwarding** option.
  3. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Advanced Features**.
  4. In the **Configure Advanced Features** page, select the **Content Inspection** option.
  5. Navigate to **System > Network > VLANs > Add**. Add four VLANs and tag them to the interfaces.
  6. Navigate to **Security > Content Inspection > Content Inspection Profiles**. Click **Add**.
  7. Specify the ingress and egress VLANs.
  8. Create another profiles. Specify a different ingress and egress VLAN in the second profile.
  9. Navigate to **Load Balancing > Services > Add** and add a service.
    - a) In **Advanced Settings**, click **Profiles**. In the **CI Profile Name** list, select the content inspection profile created earlier.
    - b) In **Service Settings**, set **Use Source IP Address** to YES and **Use Proxy Port** to No. In **Basic Settings**, set **Health Monitoring** to NO.
    - c) Turn on health monitoring only if you bind this service to a TCP monitor. If you bind a monitor to a service, then set the TRANSPARENT option in the monitor to ON.
- Create two services. Specify dummy IP addresses that are not owned by any of the devices, including the inline devices. Specify profile 1 in service 1, and profile 2 in service 2.
10. Navigate to **Load Balancing > Virtual Servers > Add**. Create a TCP load balancing virtual server and Click **OK**.
  11. Click the **Load Balancing Virtual Server Service Binding** section. In **Service Binding**, click the arrow in **Select Service**. Select the two services created earlier, and click **Select**. Click **Bind**.
  12. Navigate to **Security > Proxy Virtual Servers > Add**. Specify a name, IP address, and port. In **Advanced Settings**, select **Policies**. Click the “+” sign.
  13. In **Choose Policy** select **Content Inspection**. Click **Continue**.
  14. Click **Add**. Specify a name. In **Action**, click **Add**.
  15. Specify a name. In **Type**, select **INLINEINSPECTION**. In **Server Name**, select the load balancing virtual server created earlier.
  16. Click **Create**. Specify the rule and click **Create**.
  17. Click **Bind**.
  18. Click **Done**.

## Integrating NetScaler with passive security devices (Intrusion Detection System)

October 25, 2023

A NetScaler appliance is now integrated with passive security devices such as the Intrusion Detection System (IDS). These passive devices store logs and trigger alerts when it detects a bad or non-compliant traffic. It also generates reports for the compliance purpose. If the NetScaler appliance is integrated with two or more IDS devices and when there is a high volume of traffic, the appliance can load balance the devices by cloning traffic at the virtual server level.

For advanced security protection, a NetScaler appliance is integrated with passive security devices such as IDS deployed in detection-only mode. These devices store log and trigger alerts when it sees a bad or non-compliant traffic. It also generates reports for the compliance purpose. Following are some of the benefits of integrating the NetScaler with an IDS device.

- **Inspecting encrypted traffic.** Most security devices bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A NetScaler appliance can decrypt traffic and send it to IDS devices for enhancing the customer's network security.
- **Offloading inline devices from TLS/SSL processing.** TLS/SSL processing is expensive and it results in high system CPU in intrusion detection devices if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. NetScaler helps in offloading traffic to IDS devices from TLS/SSL processing. This way of offloading data results in an IDS device supporting a high volume of traffic inspection.
- **Loading balancing IDS devices.** The NetScaler appliance load balances multiple IDS devices when there is a high volume of traffic by cloning traffic at the virtual server level.
- **Replicating traffic to passive devices.** The traffic flowing into the appliance can be replicated to other passive devices for generating compliance reports. For example, few government agencies mandate every transaction to be logged in some passive devices.
- **Fanning traffic to multiple passive devices.** Some customers prefer to fan out or replicate incoming traffic into multiple passive devices.
- **Smart selection of traffic.** Every packet flowing into the appliance might not be must be content inspected, for example download of text files. User can configure the NetScaler appliance to select specific traffic (for example .exe files) for inspection and send the traffic to IDS devices for processing data.

### How NetScaler is integrated with IDS device with L2 connectivity

The following diagram shows how IDS is integrated with a NetScaler appliance.

The component interaction is given as follows:

1. A client sends an HTTP/HTTPS request to the NetScaler appliance.
2. The appliance intercepts the traffic and replicates it to an IDS device based on content inspection policy evaluation.
3. If the traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text.
4. Based on policy evaluation, the appliance applies a “MIRROR” type content inspection action.
5. The action has the IDS service or load balancing service (for multiple IDS device integrations) configured in it.
6. The IDS device is configured as content inspection service type “Any” on the appliance. The content inspection service is then associated to the content inspection profile of type “MIRROR” which specifies the egress interface through which the data has to be forwarded to the IDS device. Optionally, you can also configure a VLAN tag in the content inspection profile.

**Note:**

- The IP-address used for the IDS service or server is a dummy address.
- NetScaler appliance does not support LA-Channel for the egress interface.

7. The appliance then, replicates the data through the egress interface to one or more IDS devices.
8. Similarly, when the back-end server sends a response to the NetScaler, the appliance replicates the data and forwards it to the IDS device.
9. If your appliance is integrated to one or more IDS devices and if you prefer to load balance the devices, then you can use the load balancing virtual server.

## Software licensing

To deploy the inline device integration, your NetScaler appliance must be provisioned with one of the following licenses:

1. ADC Premium
2. ADC Advanced
3. Telco Advanced
4. Telco Premium

## Configuring intrusion detection system integration

You can integrate the IDS device with the NetScaler in two different ways.

### Scenario 1: Integration with a single IDS device

Following are the steps you must configure using the command line interface.

1. Enable content inspection
2. Add content inspection profile of type MIRROR for service representing IDS device.
3. Add IDS service of type “ANY”
4. Add content inspection action of type “MIRROR”
5. Add content inspection policy for IDS inspection
6. Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL

**Enable Content Inspection** If you want the NetScaler appliance to send the content for inspection to the IDS devices, you must enable the Content Inspection and load balancing features irrespective of performing decryption.

At the command prompt, type:

```
enable ns feature contentInspection LoadBalancing
```

**Add Content Inspection profile of type “MIRROR** The Content Inspection profile of type “MIRROR” explains how you can connect to the IDS device.

At the command prompt, type.

```
add contentInspection profile <name> -type MIRROR -egressInterface <interface_name> [-egressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile IDS_profile1 -type MIRROR -egressInterface
1/1 -egressVLAN 10
```

**Add IDS service** You must configure a service of type “ANY” for each IDS device that is integrated with the appliance. The service has the IDS device configuration details. The service represents the IDS device.

At the command prompt, type:

```
add service <Service_name> <IP> ANY <Port> - contentinspectionProfileName
<Name> -healthMonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service IDS_service 1.1.1.1 ANY 8080 -contentInspectionProfileName
IDS_profile1 -healthMonitor OFF
```

**Add content inspection action of type MIRROR for IDS service** After you enable the Content Inspection feature and then add the IDS profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the appliance can drop, reset, block, or send data to the IDS device.

At the command prompt, type:

```
add ContentInspection action < action_name > -type MIRROR -serverName
Service_name/Vserver_name>
```

**Example:**

```
add ContentInspection action IDS_action -type MIRROR -serverName
IDS_service
```

**Add content inspection policy for IDS inspection** After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy < policy_name > -rule <Rule> -action <
action_name>
```

**Example:**

```
add contentInspection policy IDS_pol1 -rule true -action IDS_action
```

**Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL** To receive the web traffic, you must add a load balancing virtual server.

At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

**Example:**

```
add lb vserver HTTP_vserver HTTP 1.1.1.3 8080
```

**Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL** You must bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority < priority > -type <REQUEST>
```

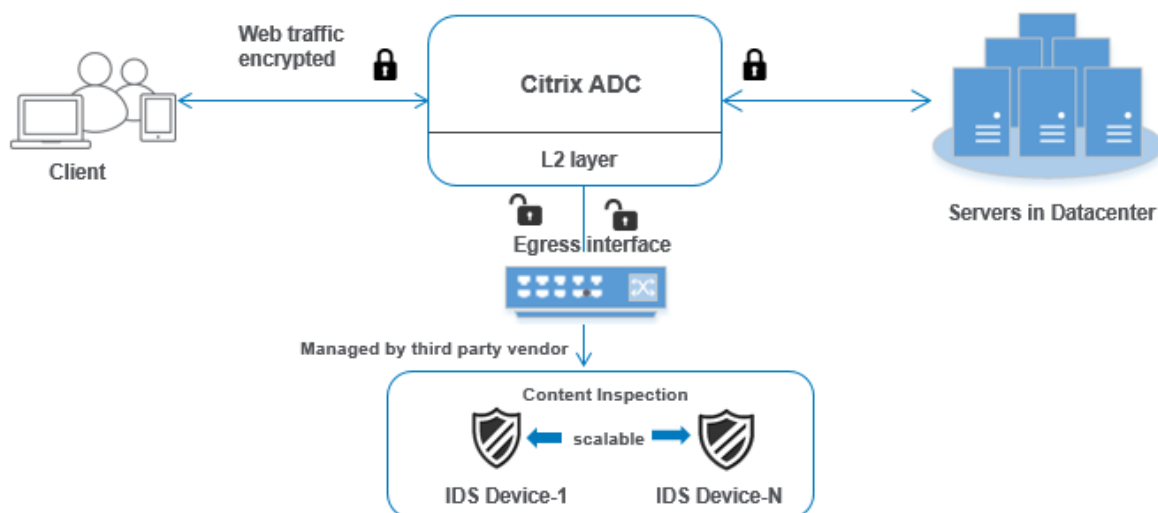

**Example:**

```
bind lb vserver HTTP_vserver -policyName IDS_pol1 -priority 100 -type REQUEST
```

## Scenario 2: Load balancing multiple IDS devices

If you are using two or more IDS devices, you must load balance the devices using different content inspection services. In this case, the NetScaler appliance load balances the devices on top of sending a subset of traffic to each device.

For basic configuration steps, refer to scenario 1.

Following are the steps you must configure using the command line interface.

1. Add content inspection profile 1 of type MIRROR for IDS service 1
2. Add content inspection profile 2 of type MIRROR for IDS service 2
3. Add IDS service 1 of type ANY for IDS device 1
4. Add IDS service 2 of type ANY for IDS device 2
5. Add load balancing virtual server of type ANY
6. Bind IDS service 1 to load balancing virtual server
7. Bind IDS service 2 to load balancing virtual server
8. Add content inspection action for the load balancing of IDS devices.
9. Add content inspection policy for inspection
10. Add content switching or load balancing virtual server of type HTTP/SSL
11. Bind content inspection policy to load balancing virtual server of type HTTP/SSL

**Add content inspection profile1 of type MIRROR for IDS service 1** IDS configuration can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for IDS service 1.

At the command prompt, type:

```
add contentInspection profile <name> -type ANY -egressInterface <
interface_name> [-egressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile IDS_profile1 -type MIRROR -egressInterface
1/1 -egressVLAN 1
```

**Add content inspection profile 2 for type MIRROR for IDS service 2** The Content Inspection profile 2 is added for service 2 and the inline device communicates with the appliance through the egress 1/1 interface.

At the command prompt, type:

```
add contentInspection profile <name> -type MIRROR -egressInterface -
egressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile IDS_profile1 -type MIRROR -egressInterface
1/1 -egressVLAN 1
```

**Add IDS service 1 of type ANY for IDS device 1** After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY <Port> -contentInspectionProfileName
<IDS_Profile_1> -usip ON -useproxyport OFF
```

**Example:**

```
add service IDS_service1 1.1.1.1 ANY 80 -contentInspectionProfileName
IDS_profile1 -usip ON -useproxyport OFF
```

**Note**

The IP address mentioned in the example is a dummy one.

**Add IDS service 2 of type ANY for IDS device 2** After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY -contentInspectionProfileName
<Inline_Profile_2> -healthmonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service IDS_service 1 1.1.2 ANY 80 -contentInspectionProfileName
IDS_profile2
```

**Note**

The IP address mentioned in the example is a dummy one.

**Add load balancing virtual server** After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> ANY <Pvt_IP3> <port>
```

**Example:**

```
add lb vserver lb-IDS_vserver ANY 1.1.1.2
```

**Bind IDS service 1 to load balancing virtual server** After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-IDS_vserver IDS_service1
```

**Bind IDS service 2 to load balancing virtual server** After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-IDS_vserver IDS_service2
```

**Add content inspection action for the IDS service** After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the appliance drops, resets, blocks, or sends traffic to the IDS device.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string> [-ifserverdown <ifserverdown>])
```

**Example:**

```
add ContentInspection action IDS_action -type MIRROR -serverName lb-IDS_vserver
```

**Add content inspection policy for inspection** After you create a Content Inspection action, you must add a Content Inspection policy to evaluate requests for service.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> -rule <Rule> -action <action_name>
```

**Example:**

```
add contentInspection policy IDS_pol1 -rule true -action IDS_action
```

**Add content switching or load balancing virtual server of type HTTP/SSL** Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.

For more information about load balancing, refer to **How load balancing works** topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

**Example:**

```
add lb vserver http_vserver HTTP 1.1.1.1 8080
```

**Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL** You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
<> -type <REQUEST>
```

**Example:**

```
bind lb vserver http_vserver -policyName IDS_pol1 -priority 100 -type
REQUEST
```

### Configure inline service integration using the NetScaler GUI

1. Navigate to **Security > Content Inspection > Content Inspection Profiles**.
2. In the **Content Inspection Profile** page, click **Add**.
3. In the **Create Content Inspection Profile** page, set the following parameters.
  - a) Profile Name. Name of the content inspection profile for IDS.
  - b) Type. Select the profile types as MIRROR.
  - c) Egress Interface. The interface through which the traffic is sent from the NetScaler to the IDS device.
  - d) Egress VLAN (optional). The interface VLAN ID through which the traffic is sent to the IDS device.
4. Click **Create**.
5. Navigate to **Traffic Management > Load Balancing > Services** and click **Add**.
6. In the **Load Balancing Service** page, enter the content inspection service details.
7. In the **Advanced Settings** section, click **Profiles**.
8. Go to the **Profiles** section and click the **Pencil** icon to add the content inspection profile.
9. Click **OK**.
10. Navigate to **Load Balancing > Servers**. Add a virtual server of type HTTP or SSL.
11. After entering the server details, click **OK** and again **OK**.

12. In the **Advanced Settings** section, click **Policies**.
13. Go the **Policies** section and click the **Pencil** icon to configure the content inspection policy.
14. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
15. In the **Policy Binding** section, click “+” to add a Content Inspection policy.
16. In the **Create CI Policy** page, enter a name for the Inline content inspection policy.
17. In the **Action** field, click the “+” sign to create an IDS content inspection action of type MIRROR.
18. In the **Create CI Action** page, set the following parameters.
  - a) Name. Name of the content inspection Inline policy.
  - b) Type. Select the type as MIRROR.
  - c) Server Name. Select the server/service name as Inline devices.
  - d) If Server Down. Select an operation if the server goes down.
  - e) Request Time-out. Select a time-out value. Default values can be used.
  - f) Request Time-out Action. Select a time-out action. Default values can be used.
19. Click **Create**.
20. In the **Create CI Policy** page, enter other details.
21. Click **OK** and **Close**.

For information about the NetScaler GUI configuration for load balancing and replicating the traffic to IDS devices, see Load Balancing.

For information about the NetScaler GUI configuration for load balancing and forwarding the traffic to the back-end origin server after content transformation, see [Load Balancing](#) topic.

## **Integrating NetScaler layer 3 with passive security devices (Intrusion Detection System)**

October 25, 2023

A NetScaler appliance is now integrated with passive security devices such as the Intrusion Detection System (IDS). In this setup, the appliance sends a copy of the original traffic securely to remote IDS devices. These passive devices store logs and trigger alerts when it detects a bad or non-compliant traffic. It also generates reports for the compliance purpose. If a NetScaler appliance is integrated with two or more IDS devices and when there is a high volume of traffic, the appliance can load balance the devices by cloning traffic at the virtual server level.

For advanced security protection, a NetScaler appliance is integrated with passive security devices such as IDS deployed in detection-only mode. These devices store log and trigger alerts when it sees a bad or non-compliant traffic. It also generates reports for the compliance purpose. Following are some of the benefits of integrating the NetScaler with an IDS device.

- **Inspecting encrypted traffic.** Most security devices bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A NetScaler appliance can decrypt traffic and send it to IDS devices for enhancing the customer's network security.
- **Offloading inline devices from TLS/SSL processing.** TLS/SSL processing is expensive and it results in high system CPU in intrusion detection devices if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. NetScaler helps in offloading traffic to IDS devices from TLS/SSL processing. This way of offloading data results in an IDS device supporting a high volume of traffic inspection.
- **Loading balancing IDS devices.** The NetScaler appliance load balances multiple IDS devices when there is a high volume of traffic by cloning traffic at the virtual server level.
- **Replicating traffic to passive devices.** The traffic flowing into the appliance can be replicated to other passive devices for generating compliance reports. For example, few government agencies mandate every transaction to be logged in some passive devices.
- **Fanning traffic to multiple passive devices.** Some customers prefer to fan out or replicate incoming traffic into multiple passive devices.
- **Smart selection of traffic.** Every packet flowing into the appliance might not be must be content inspected, for example download of text files. User can configure the NetScaler appliance to select specific traffic (for example .exe files) for inspection and send the traffic to IDS devices for processing data.

### **How NetScaler is integrated with IDS device with L3 connectivity**

The following diagram shows how the IDS is integrated with a NetScaler appliance.

The component interaction is given as follows:

1. A client sends an HTTP/HTTPS request to the NetScaler appliance.
2. The appliance intercepts the traffic and sends the data to remote IDS devices across different data centers or even in a cloud. This integration is done through IP tunneled layer 3. For more information about IP tunneling in a NetScaler appliance, see IP tunnels topic.
3. If the traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text.
4. Based on policy evaluation, the appliance applies a “MIRROR” type content inspection action.
5. The action has an IDS service or load balancing service (for multiple IDS device integrations) configured in it.
6. The IDS device is configured as content inspection service type “Any” on the appliance. The content inspection service is then associated to the content inspection profile of type “MIRROR” and the tunnel parameter which specifies the IP tunneled layer 3 interface through which the data is forwarded to the IDS device.

**Note:**

Optionally, you can also configure a VLAN tag in the content inspection profile.

7. Similarly, when the back-end server sends a response to the NetScaler, the appliance replicates the data and forwards it to the IDS device.
8. If your appliance is integrated to one or more IDS devices and if you prefer to load balance the devices, then you can use the load balancing virtual server.

## Software licensing

To deploy the IDS integration, your NetScaler appliance must be provisioned with one of the following licenses:

1. ADC Premium
2. ADC Advanced

## Configuring intrusion detection system integration

You can integrate IDS device with a NetScaler in two different ways.

### Scenario 1: Integration with a single IDS device

Following are the steps you must configure using the command line interface.

1. Enable content inspection
2. Add content inspection profile of type MIRROR for service representing IDS device.
3. Add IDS service of type “ANY”
4. Add content inspection action of type “MIRROR”
5. Add content inspection policy for IDS inspection
6. Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL

**Enable Content Inspection** If you want the NetScaler appliance to send the content for inspection to the IDS devices, you must enable the Content Inspection and load balancing features irrespective of performing decryption.

At the command prompt, type:

```
enable ns feature contentInspection LoadBalancing
```

**Add Content Inspection profile of type “MIRROR”** The Content Inspection profile of type “MIRROR” explains how you can connect to the IDS device.

At the command prompt, type.

#### Note:

The IP tunnel parameter must be used only for layer 3 IDS topology. Otherwise, you must use the egress interface with the egress VLAN option. GRE/IPIP tunnel types are supported with the layer 3 IDS topology.

```
add contentInspection profile <name> -type MIRROR -ipTunnel <iptunnel_name>
>
```

**Example:**

```
add contentInspection profile IDS_profile1 -type MIRROR -ipTunnel
ipsect-tunnel1
```

**Add IDS service** You must configure a service of type “ANY” for each IDS device that is integrated with the appliance. The service has the IDS device configuration details. The service represents the IDS device.

At the command prompt, type:

```
add service <Service_name> <IP> ANY <Port> - contentInspectionProfileName
<Name> -healthMonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service IDS_service 1.1.1.1 ANY 8080 -contentInspectionProfileName
IDS_profile1 -healthMonitor OFF
```

**Add content inspection action of type MIRROR for IDS service** After you enable the Content Inspection feature and then add the IDS profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the appliance can drop, reset, block, or send data to the IDS device.

At the command prompt, type:

```
add ContentInspection action < action_name > -type MIRROR -serverName
Service_name/Vserver_name>
```

**Example:**

```
add ContentInspection action IDS_action -type MIRROR -serverName
IDS_service
```

**Add content inspection policy for IDS inspection** After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy < policy_name > -rule <Rule> -action <
action_name>
```

**Example:**

```
add contentInspection policy IDS_pol1 -rule true -action IDS_action
```

**Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL** To receive the web traffic, you must add a load balancing virtual server.

At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

**Example:**

```
add lb vserver HTTP_vserver HTTP 1.1.1.3 8080
```

**Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL** You must bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
< priority > -type <REQUEST>
```

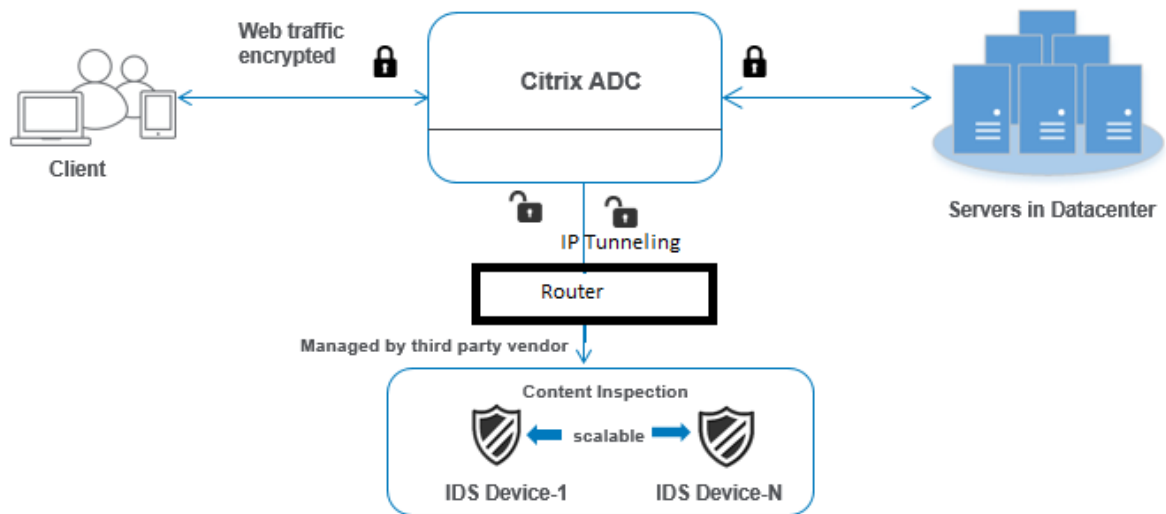

**Example:**

```
bind lb vserver HTTP_vserver -policyName IDS_pol1 -priority 100 -type
REQUEST
```

**Scenario 2: Load balancing multiple IDS devices**

If you are using two or more IDS devices, you must load balance the IDS devices using different content inspection services. In this case, the NetScaler appliance load balances the devices on top of sending a subset of traffic to each device.

For basic configuration steps, refer to scenario 1.

Following are the steps you must configure using the command line interface.

1. Add content inspection profile 1 of type MIRROR for IDS service 1
2. Add content inspection profile 2 of type MIRROR for IDS service 2
3. Add IDS service 1 of type ANY for IDS device 1
4. Add IDS service 2 of type ANY for IDS device 2
5. Add load balancing virtual server of type ANY
6. Bind IDS service 1 to load balancing virtual server
7. Bind IDS service 2 to load balancing virtual server
8. Add content inspection action for the load balancing of IDS devices.
9. Add content inspection policy for inspection
10. Add content switching or load balancing virtual server of type HTTP/SSL
11. Bind content inspection policy to load balancing virtual server of type HTTP/SSL

**Add content inspection profile1 of type MIRROR for IDS service 1** IDS configuration can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for IDS service 1.

**Note:**

IP tunnel parameter must be used only for layer 3 IDS topology. Otherwise, you must use the egress interface with the egress VLAN option. GRE/IPIP tunnel types are supported with the layer 3 IDS topology.

At the command prompt, type:

```
add contentInspection profile <name> -type ANY - ipTunnel <iptunnel_name>
>
```

**Example:**

```
add contentInspection profile IDS_profile1 -type MIRROR - ipTunnel
ipsect_tunnel1
```

**Add content inspection profile 2 for type MIRROR for IDS service 2** The Content Inspection profile 2 is added for service 2 and the inline device communicates with the appliance through the egress 1/1 interface.

At the command prompt, type:

```
add contentInspection profile <name> -type ANY - ipTunnel <iptunnel_name>
>
```

**Example:**

```
add contentInspection profile IDS_profile2 -type ANY - ipTunnel
ipsect_tunnel2
```

**Add IDS service 1 of type ANY for IDS device 1** After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for the inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY <Port> -contentInspectionProfileName
<IDS_Profile_1> -usip ON -useproxyport OFF
```

**Example:**

```
add service IDS_service1 1.1.1.1 ANY 80 -contentInspectionProfileName
IDS_profile1 -usip ON -useproxyport OFF
```

**Note:**

The IP address mentioned in the example is a dummy one.

**Add IDS service 2 of type ANY for IDS device 2** After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY -contentInspectionProfileName
<Inline_Profile_2> -healthmonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service IDS_service 1 1.1.2 ANY 80 -contentInspectionProfileName
IDS_profile2
```

**Note:**

The IP address mentioned in the example is a dummy one.

**Add load balancing virtual server** After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> ANY <Pvt_IP3> <port>
```

**Example:**

```
add lb vserver lb-IDS_vserver ANY 1.1.1.2
```

**Bind IDS service 1 to load balancing virtual server** After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-IDS_vserver IDS_service1
```

**Bind IDS service 2 to load balancing virtual server** After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-IDS_vserver IDS_service2
```

**Add content inspection action for the IDS service** After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the appliance drops, resets, blocks, or sends traffic to the IDS device.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string
> [-ifserverdown <ifserverdown>])
```

**Example:**

```
add ContentInspection action IDS_action -type MIRROR -serverName lb-IDS_vserver
```

**Add content inspection policy for inspection** After you create a Content Inspection action, you must add the Content Inspection policy to evaluate requests for service.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> -rule <Rule> -action <action_name>
```

**Example:**

```
add contentInspection policy IDS_pol1 -rule true -action IDS_action
```

**Add content switching or load balancing virtual server of type HTTP/SSL** Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.

For more information about load balancing, refer to [How load balancing works](#) topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

**Example:**

```
add lb vserver http_vserver HTTP 1.1.1.1 8080
```

**Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL** You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority <> -type <REQUEST>
```

**Example:**

```
bind lb vserver http_vserver -policyName IDS_pol1 -priority 100 -type REQUEST
```

**Configure inline service integration using the NetScaler GUI**

1. Navigate to **Security > Content Inspection > ContentInspection Profiles**.
2. In the **ContentInspection Profile** page, click **Add**.
3. In the **Create ContentInspectionProfile** page, set the following parameters.
  - a) Profile Name. Name of the content inspection profile for IDS.
  - b) Type. Select the profile types as MIRROR.
  - c) Connectivity. Layer 2 or Layer 3 interface.
  - d) IP Tunnel. Select the network communication channel between the two networks.
4. Click **Create**.
5. Navigate to **Traffic Management > Load Balancing > Services** and click **Add**.
6. In the **Load Balancing Service** page, enter the content inspection service details.
7. In the **Advanced Settings** section, click **Profiles**.
8. Go to the **Profiles** section and click the **Pencil** icon to add the content inspection profile.
9. Click **OK**.
10. Navigate to **Load Balancing > Servers**. Add a virtual server of type HTTP or SSL.
11. After entering the server details, click **OK** and again **OK**.
12. In the **Advanced Settings** section, click **Policies**.
13. Go the **Policies** section and click the **Pencil** icon to configure the content inspection policy.
14. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
15. In the **Policy Binding** section, click "+" to add a Content Inspection policy.
16. In the **Create CI Policy** page, enter a name for the Inline content inspection policy.
17. In the **Action** field, click the "+" sign to create an IDS content inspection action of type MIRROR.
18. In the **Create CI Action** page, set the following parameters.
  - a) Name. Name of the content inspection Inline policy.
  - b) Type. Select the type as MIRROR.
  - c) Server Name. Select the server/service name as Inline devices.
  - d) If Server Down. Select an operation if the server goes down.
  - e) Request Time-out. Select a time-out value. Default values can be used.
  - f) Request Time-out Action. Select a time-out action. Default values can be used.
19. Click **Create**.
20. In the **Create CI Policy** page, enter other details.
21. Click **OK** and **Close**.

For information about the NetScaler GUI configuration for load balancing and replicating the traffic to IDS devices, see [Load Balancing](#).

For information about the NetScaler GUI configuration for load balancing and forwarding the traffic to the back-end origin server after content transformation, see [Load Balancing](#).

## Content inspection statistics for ICAP, IPS, and IDS

January 7, 2021

The content inspection statistics for ICAP, inline device integration (IDS), and Intrusion Prevention System (IPS) devices is a detailed output (summary) of request, response, and server action details.

The content inspection statistics is a collection of statistical data that includes the HTTP/HTTPS request sent for content inspection. HTTP/HTTPS response received from IPS, IDS, and ICAP devices and back-end server action.

To display Content inspection statistics by using the CLI:

At the command prompt, type:

```
> stat contentInspection
```

```

## SSL forward proxy

May 2, 2023

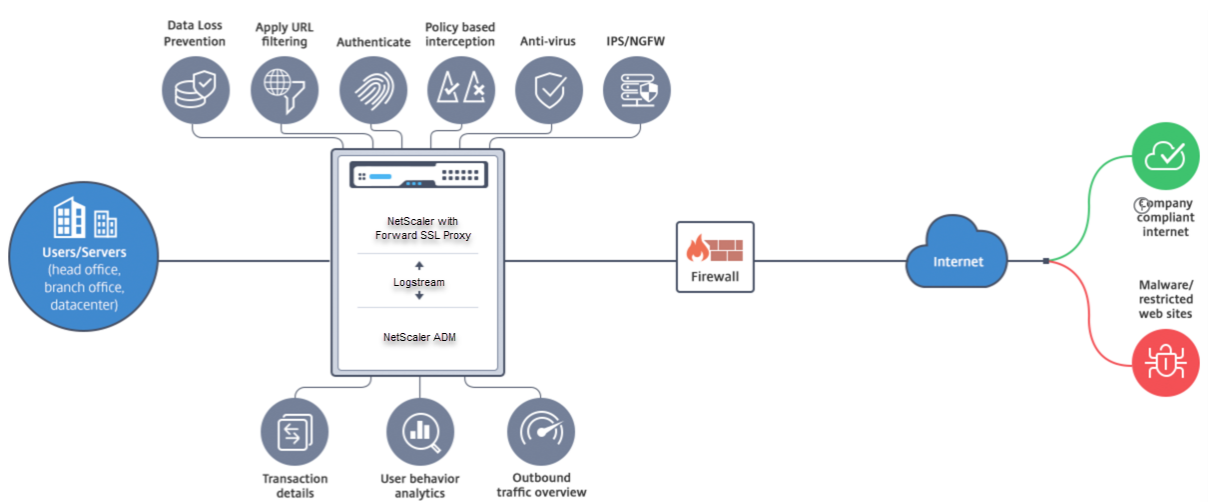

**Note:** SSL forward proxy feature is available with the ADC Premium license.

Web traffic has increased exponentially in recent years, and corporations are increasingly relying on the internet for their day to day operations. That, combined with the emergence of more diverse endpoints, mobility, and BYOD, along with a growing attacker base, is making users easy targets of modern malware. They are increasingly vulnerable to identity theft and having their data compromised. Traditionally, enterprises have inspected HTTP traffic for malware and viruses. They bypassed HTTP-S/TLS traffic, because it was not as prominent. It was used sparingly for content that was sensitive and trusted. But that has changed rapidly as most public internet websites now prefer to use HTTPS to protect user privacy. As a result, the inability to inspect encrypted packets allows malware or intrusions into the enterprise network. The SSL forward proxy solution offers tools that enterprises can use to protect against internet threats.

A proxy is a server that controls all the traffic between users and the Internet or SaaS applications. Since all the traffic passes through this proxy, it performs security-related functions, such as user authentication and URL categorization.

The following figure is an overview of the SSL forward proxy implementation. Traffic flows through the enterprise network from the head office, branch offices, data center, and remote employees. A NetScaler appliance at the edge of the network acts a proxy. The appliance can operate in transparent proxy mode or explicit proxy mode and offers controls to intercept internet traffic, including HTTPS. Policies configured on the appliance determine whether it intercepts, bypasses, or blocks a particular request. Access to restricted sites can be blocked by using URL filtering. A user is authenticated before logging on to the enterprise network. All requests and responses are tagged to identify the user, and internet-site access is categorized. User activity is logged and used to generate reports. If a breach occurs, administrators can isolate the infected system, determine whether the devices of any other users who visited that website are compromised, and take appropriate action. When you integrate

NetScaler Application Delivery Management (ADM) with SSL forward proxy, the logged user activity and the subsequent records in the appliance are exported to NetScaler Console by using [logstream](#). NetScaler Console collates and presents information about the activities of users, from websites visited to the time spent online. It also provides information about bandwidth use and detected threats, such as malware and phishing sites. You can use these key metrics to monitor your network, and use the SSL forward proxy feature to take corrective actions.

SSL forward proxy enables IT directors to do the following:

- Gain visibility into the otherwise bypassed secure traffic.
- Block access to malicious or unknown sites and avoid infecting users within the enterprise.
- Control access to some websites, such as personal mail, social networking, and job search websites, from the enterprise network.
- Apply intelligent content control policies to ensure maximum user productivity.

## Getting started with the SSL forward proxy feature

May 2, 2023

### Important:

- OCSP check requires an internet connection to check the validity of certificates. If your appliance is not accessible from the internet by using the NSIP address, add access control lists (ACLs) to perform NAT from the NSIP address to the subnet IP (SNIP) address. The SNIP must be able to access the internet. For example,

```

1 add ns acl a1 ALLOW -srcIP = <NSIP> -destIP " != "
 10.0.0.0-10.255.255.255
2

```

```
3 add rnat RNAT-1 a1
4
5 bind rnat RNAT-1 <SNIP>
6
7 apply acls
8 <!--NeedCopy-->
```

- Specify a DNS name server to resolve domain names.
- Make sure that the date on the appliance is synchronized with the NTP servers. If the date is not synchronized, the appliance cannot effectively verify whether an origin server certificate is an expired one.

To use the SSL forward proxy feature, you must perform the following tasks:

- Add a proxy server in explicit or transparent mode.
- Enable SSL interception.
  - Configure an SSL profile.
  - Add and bind SSL policies to the proxy server.
  - Add and bind a CA certificate-key pair for SSL interception.

**Note:**

An ADC appliance configured in transparent proxy mode can intercept only HTTP and HTTPS protocols. To bypass any other protocol, such as telnet, you must add the following listen policy on the proxy virtual server.

The virtual server now accepts only HTTP and HTTPS incoming traffic.

```
1 set cs vserver transparent-pxy1 PROXY * * -cltTimeout 180 -Listenpolicy
 "CLIENT.TCP.DSTPORT.EQ(80) || CLIENT.TCP.DSTPORT.EQ(443)"`
2 <!--NeedCopy-->
```

You might need to configure the following features, depending on your deployment:

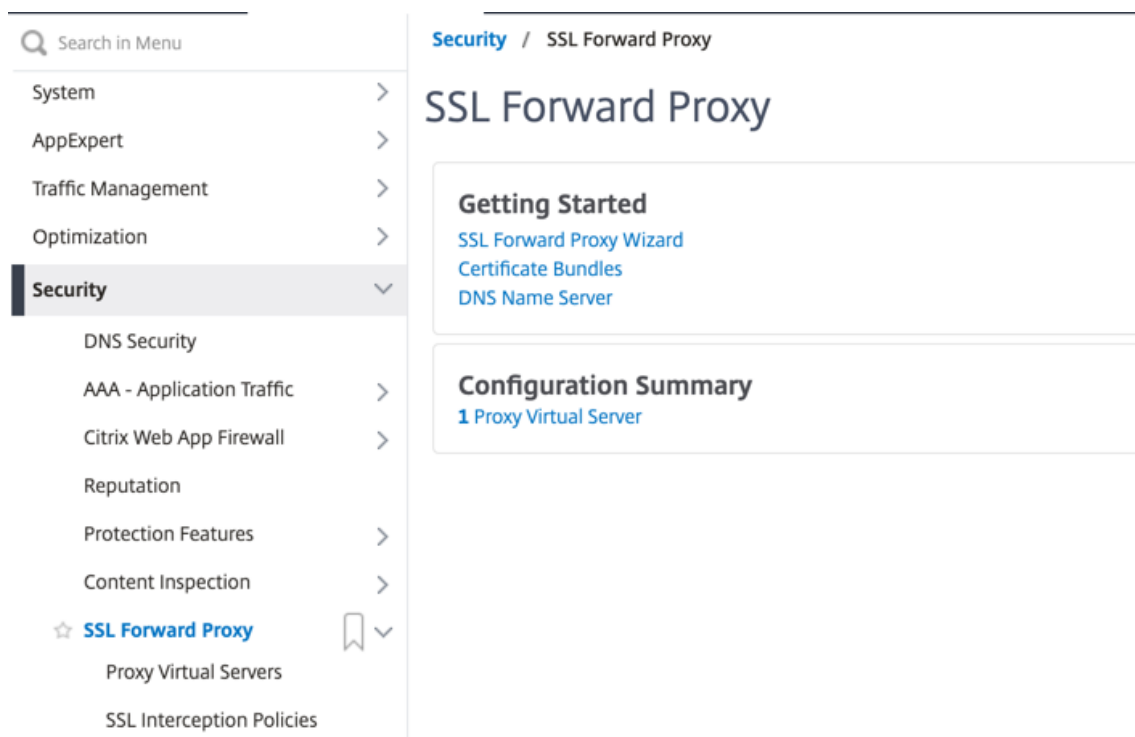

- Authentication Service (recommended) –to authenticate users. Without the Authentication Service, user activity is based on client IP address.
- URL Filtering –to filter URLs by categories, reputation score, and URL lists.
- Analytics –to view user activity, user risk indicators, bandwidth consumption, and transactions break down in NetScaler Application Delivery Management (ADM).

**Note:** SSL Forward Proxy implements most typical HTTP and HTTPS standards followed by similar products. This implementation is done with no specific browser in mind and is compatible with most common browsers. SSL Forward Proxy has been tested with common browsers and recent versions of Google Chrome, Internet Explorer, and Mozilla Firefox.

## SSL forward proxy wizard

The SSL forward proxy wizard provides administrators with a tool for managing the entire SSL forward proxy deployment by using a web browser. It helps guide the customers to bring up an SSL forward proxy service quickly and helps simplify the configuration by following a sequence of well-defined steps.

1. Navigate to **Security > SSL Forward Proxy**. In **Getting Started**, click **SSL Forward Proxy Wizard**.

2. Follow the steps in the wizard to configure your deployment.

## Add a listen policy to the transparent proxy server

1. Navigate to **Security > SSL Forward Proxy > Proxy Virtual Servers**. Select the transparent proxy server and click **Edit**.
2. Edit **Basic Settings**, and click **More**.
3. In **Listen priority**, enter 1.
4. In **Listen Policy Expression**, enter the following expression:

```
1 (CLIENT.TCP.DSTPORT.EQ(80) || CLIENT.TCP.DSTPORT.EQ(443))
2 <!--NeedCopy-->
```

This expression assumes standard ports for HTTP and HTTPS traffic. If you have configured different ports, for example 8080 for HTTP or 8443 for HTTPS, modify the expression to reflect those ports.

## Limitations

SSL forward proxy is not supported in a cluster setup, in admin partitions, and on a NetScaler FIPS appliance.

## Proxy modes

February 5, 2024

The NetScaler appliance acts as a client's proxy to connect to the internet and SaaS applications. As a proxy, it accepts all the traffic and determines the traffic's protocol. Unless the traffic is HTTP or SSL, it is forwarded to the destination as is. When the appliance receives a request from a client, it intercepts the request and performs some actions, such as user authentication, site categorization, and redirection. It uses policies to determine which traffic to allow and which traffic to block.

The appliance maintains two different sessions, one between the client and the proxy and the other between the proxy and the origin server. The proxy relies on customer-defined policies to allow or block HTTP and HTTPS traffic. Therefore, it is important that you define policies to bypass sensitive data, such as financial information. The appliance offers a rich set of Layer 4 to Layer 7 traffic attributes and user-identity attributes to create traffic management policies.

For SSL traffic, the proxy verifies the origin server's certificate and establishes a legitimate connection with the server. It then emulates the server certificate, signs it using a CA certificate installed on NetScaler, and presents the created server certificate to the client. You must add the CA certificate as a trusted certificate to the client's browser for the SSL session to be successfully established.

The appliance supports transparent and explicit proxy modes. In explicit proxy mode, the client must specify an IP address in their browser, unless the organization pushes the setting onto the client's device. This address is the IP address of a proxy server that is configured on the ADC appliance. All client requests are sent to this IP address. For explicit proxy, you must configure a content switching virtual server of type PROXY and specify an IP address and a valid port number. Also, when the `markconnReqInval` parameter is set to ON globally on the default HTTP profile, then you must bind another HTTP profile with `markconnReqInval` set to OFF to the content switching virtual server.

**Example to bind a custom HTTP profile to the proxy content switching virtual server:**

```
1 add ns httpprofile custom_http_profile1 -markconnReqInval OFF
2 set cs vserver swgVS -httpprofileName custom_http_profile1
3 <!--NeedCopy-->
```

A transparent proxy, as the name implies, is transparent to the client. That is, the clients might not be aware that a proxy server is mediating their requests. The ADC appliance is configured in an inline deployment, and transparently accepts all HTTP and HTTPS traffic. For transparent proxy, you must configure a content switching virtual server of type PROXY, with asterisks (\* \*) as the IP address and port. When using the **SSL Forward Proxy Wizard** in the GUI, you do not have to specify an IP address and port.

**Note**

To intercept protocols other than HTTP and HTTPS in transparent proxy mode, you must add a listen policy and bind it to the proxy server.

## Configure an SSL forward proxy by using the CLI

At the command prompt, type:

```
1 add cs vserver <name> PROXY <ipaddress> <port>
2 <!--NeedCopy-->
```

**Arguments:****Name:**

Name for the proxy server. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CS virtual server is created.

The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my server" or 'my server').

This argument is mandatory. Maximum Length: 127

**IPAddress:**

IP address of the proxy server.

**Port:**

Port number for the proxy server. Minimum value: 1

**Example for explicit proxy:**

```
1 add cs vserver swgVS PROXY 192.0.2.100 80
2 <!--NeedCopy-->
```

**Example for transparent proxy:**

```
1 add cs vserver swgVS PROXY * *
2 <!--NeedCopy-->
```

**Add a listen policy to the transparent proxy server by using the GUI**

1. Navigate to **Security > SSL Forward Proxy > Proxy Virtual Servers**. Select the transparent proxy server and click **Edit**.
2. Edit **Basic Settings**, and click **More**.
3. In **Listen priority**, enter 1.
4. In **Listen Policy Expression**, enter the following expression:

```
1 (CLIENT.TCP.DSTPORT.EQ(80) || CLIENT.TCP.DSTPORT.EQ(443))
2 <!--NeedCopy-->
```

**Note**

This expression assumes standard ports for HTTP and HTTPS traffic. If you have configured different ports, for example 8080 for HTTP or 8443 for HTTPS, modify the preceding expression to specify those ports.

**Block privileged upstream ports**

To block privileged upstream ports (<1024) access except ports 80 and 443 using forward proxy, bind the following responder policy to the forward proxy content switching virtual server in explicit mode.

**Using the CLI**

At the command prompt, type:

```
1 add responder policy web_only "(HTTP.REQ.METHOD.EQ(CONNECT) && (HTTP.
 REQ.HOSTNAME.PORT.LT(1024) && HTTP.REQ.HOSTNAME.PORT.NE(\":80\") &&
 HTTP.REQ.HOSTNAME.PORT.NE(\":443\") && HTTP.REQ.HOSTNAME.PORT.LENGTH
 .NE(0)) || (HTTP.REQ.URL.AFTER_STR(\":\").TYPECAST_NUM_AT.NE(80) &&
2 HTTP.REQ.URL.AFTER_STR(\":\").TYPECAST_NUM_AT.NE(443) && HTTP.REQ.URL.
 AFTER_STR(\":\").TYPECAST_NUM_AT.LE(1024)))" RESET
3 bind cs vserver <proxy_vs_name> -policyName web_only -priority 9 -
 gotoPriorityExpression END -type REQUEST
4 <!--NeedCopy-->
```

## Using the GUI

1. Navigate to **Security > SSL Forward Proxy > Proxy Virtual Servers**.
2. Add a proxy virtual server or select a virtual server and click **Edit**.
3. In **Advanced Settings**, click **Policies**.
4. In **Choose Policy**, select **Responder**. Click **Continue**.
5. Click **Add Binding**.
6. In **Policy Binding**, click **Click to select**.
7. Click **Add** to add a new policy.
8. Give the policy name, select the action as RESET, and update the expression accordingly for the GUI.
9. Click **Create**.
10. Click **Select**.
11. Under **Policy Binding**, assign a priority and click **Bind**.
12. Click **Close**.
13. Click **Done**.

## SSL interception

May 2, 2023

A NetScaler appliance configured for SSL interception acts as a proxy. It can intercept and decrypt SSL/TLS traffic, inspect the unencrypted request, and enable an admin to enforce compliance rules and security checks. SSL interception uses a policy that specifies which traffic to intercept, block, or allow. For example, traffic to and from financial websites, such as banks, must not be intercepted, but other traffic can be intercepted, and blacklisted sites can be identified and blocked. Citrix recommends that you configure one generic policy to intercept traffic and more specific policies to bypass some traffic.

The client and the proxy establish an HTTPS/TLS handshake. The proxy establishes another HTTPS/TLS handshake with the server and receives the server certificate. The proxy verifies the server certificate on behalf of the client, and also checks the validity of the server certificate by using the Online Certificate Status Protocol (OCSP). It regenerates the server certificate, signs it by using the key of the CA certificate installed on the appliance, and presents it to the client. Therefore, one certificate is used between the client and the NetScaler appliance, and another certificate between the appliance and the back-end server.

### Important

The CA certificate that is used to sign the server certificate must be preinstalled on all the client

devices, so that the regenerated server certificate is trusted by the client.

For intercepted HTTPS traffic, the proxy server decrypts the outbound traffic, accesses the clear text HTTP request, and can use any Layer 7 application to process the traffic, such as by looking into the plain text URL and allowing or blocking access based on the corporate policy and URL reputation. If the policy decision is to allow access to the origin server, the proxy server forwards the re-encrypted request to the destination service (on the origin server). The proxy decrypts the response from the origin server, accesses the clear text HTTP response, and optionally applies any policies to the response. The proxy then reencrypts the response and forwards it to the client. If the policy decision is to block the request to the origin server, the proxy can send an error response, such as HTTP 403, to the client.

To perform SSL interception, in addition to the proxy server configured earlier, you must configure the following on the ADC appliance:

- SSL profile
- SSL policy
- CA certificate store
- SSL-error autolearning and caching

**Note:**

HTTP/2 traffic is not intercepted by the SSL Interception feature.

### **SSL interception certificate store**

An SSL certificate, which is a part of any SSL transaction, is a digital data form (X509) that identifies a company (domain) or an individual. An SSL certificate is issued by a certificate authority (CA). A CA can be private or public. Certificates issued by public CAs, such as Verisign, are trusted by applications that conduct SSL transactions. These applications maintain a list of CAs that they trust.

As a forward proxy, the ADC appliance performs encryption and decryption of traffic between a client and a server. It acts as a server to the client (user) and as a client to the server. Before an appliance can process HTTPS traffic, it must validate the identity of a server to prevent any fraudulent transactions. Therefore, as a client to the origin server, the appliance must verify the origin server certificate before accepting it. To verify a server certificate, all the certificates (for example, root and intermediate certificates) that are used to sign and issue the server certificate must be present on the appliance. A default set of CA certificates is preinstalled on an appliance. The appliance can use these certificates to verify almost all the common origin-server certificates. This default set cannot be modified. However, if your deployment requires more CA certificates, you can create a bundle of such certificates and import the bundle to the appliance. A bundle can also contain a single certificate.

When you import a certificate bundle to the appliance, the appliance downloads the bundle from the remote location and, after verifying that the bundle contains only certificates, installs it on the appliance. You must apply a certificate bundle before you can use it to validate a server certificate. You can also export a certificate bundle for editing or to store it in an offline location as a backup.

### Import and apply a CA certificate bundle on the appliance by using the CLI

At the command prompt, type:

```
1 import ssl certBundle <name> <src>
2 apply ssl certBundle <name>
3 <!--NeedCopy-->
```

```
1 show ssl certBundle
2 <!--NeedCopy-->
```

#### ARGUMENTS:

##### Name:

Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file').

Maximum Length: 31

##### src:

URL specifying the protocol, host, and path, including file name, to the certificate bundle to be imported or exported. For example, [http://www.example.com/cert\\_bundle\\_file](http://www.example.com/cert_bundle_file).

**NOTE:** The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

Maximum Length: 2047

##### Example:

```
1 import ssl certbundle swg-certbundle http://www.example.com/cert_bundle
2 apply ssl certBundle swg-certbundle
3 <!--NeedCopy-->
```

```
1 show ssl certbundle
2
3 Name : swg-certbundle(Inuse)
```

```
4
5 URL : http://www.example.com/cert_bundle
6
7 Done
8 <!--NeedCopy-->
```

### Import and apply a CA certificate bundle on the appliance by using the GUI

1. Navigate to **Security > SSL Forward Proxy > Getting Started > Certificate Bundles**.
2. Do one of the following:
  - Select a certificate bundle from the list.
  - To add a certificate bundle, click “+” and specify a name and source URL. Click **OK**.
3. Click **OK**.

### Remove a CA certificate bundle from the appliance by using the CLI

At the command prompt, type:

```
1 remove certBundle <cert bundle name>
2 <!--NeedCopy-->
```

#### Example:

```
1 remove certBundle mytest-cacert
2 <!--NeedCopy-->
```

### Export a CA certificate bundle from the appliance by using the CLI

At the command prompt, type:

```
1 export certBundle <cert bundle name> <Path to export>
2 <!--NeedCopy-->
```

#### ARGUMENTS:

##### Name:

Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my file” or ‘my file’).

Maximum Length: 31

**src:**

URL specifying the protocol, host, and path, including file name, to the certificate bundle to be imported or exported. For example, [http://www.example.com/cert\\_bundle\\_file](http://www.example.com/cert_bundle_file).

**NOTE:** The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

Maximum Length: 2047

**Example:**

```
1 export certBundle mytest-cacert http://192.0.2.20/
2 <!--NeedCopy-->
```

**Import, apply, and verify a CA certificate bundle from the Mozilla CA certificate store**

At the command prompt, type:

```
1 > import certbundle mozilla_public_ca https://curl.haxx.se/ca/cacert.
 pem
2 Done
3 <!--NeedCopy-->
```

To apply the bundle, type:

```
1 > apply certbundle mozilla_public_ca
2 Done
3 <!--NeedCopy-->
```

To verify the certificate bundle in use, type:

```
1 > sh certbundle | grep mozilla
2 Name : mozilla_public_ca (Inuse)
3 <!--NeedCopy-->
```

**Limitations**

- Certificate bundles are not supported in a cluster setup, or on a partitioned appliance.
- TLSv1.3 protocol is not supported with SSL Forward Proxy.

**SSL policy infrastructure for SSL interception**

A policy acts like a filter on incoming traffic. Policies on the ADC appliance help define how to manage proxied connections and requests. The processing is based on the actions that are configured for

that policy. That is, data in connection requests is compared to a rule specified in the policy, and the action is applied to connections that match the rule (expression). After defining an action to assign to the policy and create the policy, you must bind it to a proxy server, so that it applies to traffic flowing through that proxy server.

An SSL policy for SSL interception evaluates incoming traffic and applies a predefined action to requests that match a rule (expression). A decision to intercept, bypass, or reset a connection is made based on the defined SSL policy. You can configure one of three actions for a policy—INTERCEPT, BYPASS, or RESET. You must specify an action when you create a policy. To put a policy into effect, you must bind it to a proxy server on the appliance. To specify that a policy is intended for SSL interception, you must specify the type (bind point) as INTERCEPT\_REQ when you bind the policy to a proxy server. When unbinding a policy, you must specify the type as INTERCEPT\_REQ.

**Note:**

The proxy server cannot make a decision to intercept unless you specify a policy.

Traffic interception can be based on any SSL handshake attribute. The most commonly used is the SSL domain. The SSL domain is usually indicated by the attributes of the SSL handshake. It can be the Server Name Indicator value extracted from the SSL Client Hello message, if present, or the Server Alternate Name (SAN) value extracted from the origin server certificate. The SSL interception policy presents a special attribute, DETECTED\_DOMAIN. This attribute makes it easier for the customers to author interception policies based on the SSL domain from the origin server certificate. The customer can match the domain name against a string, URL list (URL set or [patset](#)), or a URL category derived from the domain.

### Create an SSL policy by using the CLI

At the command prompt, type:

```
1 add ssl policy <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

**Examples:**

The following examples are for policies with expressions that use the `detected_domain` attribute to check for a domain name.

Do not intercept traffic to a financial institution, such as XYZBANK

```
1 add ssl policy pol1 -rule client.ssl.detected_domain.contains("XYZBANK"
) -action BYPASS
2 <!--NeedCopy-->
```

Do not allow a user to connect to YouTube from the corporate network

```

1 add ssl policy pol2 -rule client.ssl.client.ssl.detected_domain.
 url_categorize(0,0).category.eq("YouTube") -action RESET
2 <!--NeedCopy-->

```

Intercept all user traffic

```

1 add ssl policy pol3 -rule true -action INTERCEPT
2 <!--NeedCopy-->

```

If the customer doesn't want to use the detected\_domain, they can use any of the SSL handshake attributes to extract and infer the domain.

For example, a domain name is not found in the SNI extension of the client hello message. The domain name must be taken from the origin server certificate. The following examples are for policies with expressions that check for a domain name in the subject name of the origin server certificate.

Intercept all user traffic to any Yahoo domain

```

1 add ssl policy pol4 -rule client.ssl.origin_server_cert.subject.
 contains("yahoo") -action INTERCEPT
2 <!--NeedCopy-->

```

Intercept all user traffic for the category "Shopping/Retail"

```

1 add ssl policy pol_url_category -rule client.ssl.origin_server_cert.
 subject.URL_CATEGORIZE(0,0).CATEGORY.eq("Shopping/Retail") -action
 INTERCEPT
2 <!--NeedCopy-->

```

Intercept all user traffic to an uncategorized URL

```

1 add ssl policy pol_url_category -rule client.ssl.origin_server_cert.
 subject.url_categorize(0,0).category.eq("Uncategorized") -action
 INTERCEPT
2 <!--NeedCopy-->

```

The following examples are for policies that match the domain against an entry in a URL set.

Intercept all user traffic if the domain name in SNI matches an entry in the URL set "top100"

```

1 add ssl policy pol_url_set -rule client.ssl.client_hello.SNI.
 URLSET_MATCHES_ANY("top100") -action INTERCEPT
2 <!--NeedCopy-->

```

Intercept all user traffic of the domain name if the origin server certificate matches an entry in the URL set "top100"

```

1 add ssl policy pol_url_set -rule client.ssl.origin_server_cert.subject.
 URLSET_MATCHES_ANY("top100") -action INTERCEPT
2 <!--NeedCopy-->

```

### Create an SSL policy to a proxy server by using the GUI

1. Navigate to **Traffic Management > SSL > Policies**.
2. On the **SSL Policies** tab, click **Add** and specify the following parameters:
  - Policy name
  - Policy action –Select from intercept, bypass, or reset.
  - Expression
3. Click **Create**.

### Bind an SSL policy to a proxy server by using the CLI

At the command prompt, type:

```
1 bind ssl vserver <vServerName> -policyName <string> -priority <
 positive_integer> -type INTERCEPT_REQ
2 <!--NeedCopy-->
```

#### Example:

```
1 bind ssl vserver <name> -policyName pol1 -priority 10 -type
 INTERCEPT_REQ
2 <!--NeedCopy-->
```

### Bind an SSL policy to a proxy server by using the GUI

1. Navigate to **Security > SSL Forward Proxy > Proxy Virtual Servers**.
2. Select a virtual server and click **Edit**.
3. In **Advanced Settings**, click **SSL Policies**.
4. Click inside the **SSL Policy** box.
5. In **Select Policy**, select a policy to bind.
6. In **Type**, select **INTERCEPT\_REQ**.
7. Click **Bind** and then click **OK**.

### Unbind an SSL policy to a proxy server by using the CLI

At the command prompt, type:

```
1 unbind ssl vserver <vServerName> -policyName <string> -type
 INTERCEPT_REQ
2 <!--NeedCopy-->
```

**SSL expressions used in SSL policies**

---

Expression	Description
<code>CLIENT.SSL.CLIENT_HELLO.SNI.*</code>	Returns the SNI extension in a string format. Evaluate the string to see if it contains the specified text. Example: <code>client.ssl.client_hello.sni.contains( "xyz.com" )</code>
<code>CLIENT.SSL.ORIGIN_SERVER_CERT.*</code>	Returns a certificate, received from a back-end server, in a string format. Evaluate the string to see if it contains the specified text. Example: <code>client.ssl.origin_server_cert.subject.contains( "xyz.com"</code>
<code>CLIENT.SSL.DETECTED_DOMAIN.*</code>	Returns a domain, either from the SNI extension or from the origin server certificate, in a string format. Evaluate the string to see if it contains the specified text. Example: <code>client.ssl.detected_domain.contains( "xyz.com"</code>

---

**SSL error autolearning**

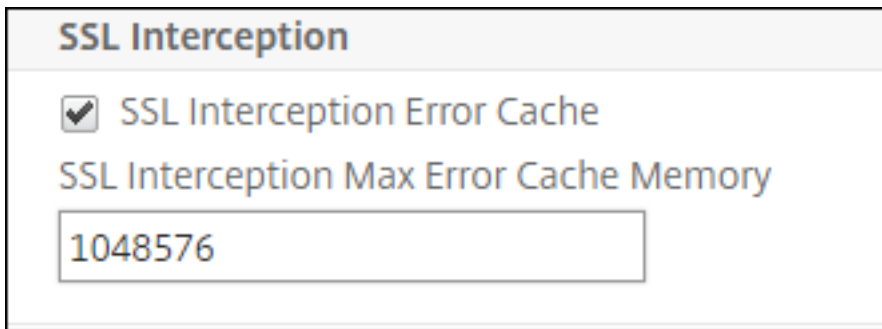

The appliance adds a domain to the SSL bypass list if learning mode is on. The learning mode is based on the SSL alert message received from either a client or an origin server. That is, learning depends the client or server sending an alert message. There is no learning if an alert message is not sent. The appliance learns if any of the following conditions are met:

1. A request for a client certificate is received from the server.
2. Any one of the following alerts is received as part of the handshake:
  - BAD\_CERTIFICATE
  - UNSUPPORTED\_CERTIFICATE
  - CERTIFICATE\_REVOKED
  - CERTIFICATE\_EXPIRED
  - CERTIFICATE\_UNKNOWN
  - UNKNOWN\_CA (If a client uses pinning, it sends this alert message if it receives a server certificate.)
  - HANDSHAKE\_FAILURE

To enable learning, you must enable the error cache and specify the memory reserved for learning.

### Enable learning by using the GUI

1. Navigate to **Traffic Management > SSL**.
2. In **Settings**, click **Change advanced SSL settings**.
3. In **SSL Interception**, select **SSL Interception Error Cache**.
4. In **SSL Interception Max Error Cache Memory**, specify the memory (in bytes) to reserve.

The screenshot shows the 'SSL Interception' settings page. The 'SSL Interception Error Cache' checkbox is checked. Below it, the 'SSL Interception Max Error Cache Memory' field is set to 1048576.

5. Click **OK**.

### Enable learning by using the CLI

At the command prompt type:

```
1 set ssl parameter -ssliErrorCache (ENABLED | DISABLED) -
 ssliMaxErrorCacheMem <positive_integer>
2 <!--NeedCopy-->
```

#### Arguments:

##### **ssliErrorCache:**

Enable or disable dynamic learning, and cache the learned information to make subsequent decisions to intercept or bypass requests. When enabled, the appliance performs a cache lookup to decide whether to bypass the request.

Possible values: ENABLED, DISABLED

Default value: DISABLED

##### **ssliMaxErrorCacheMem:**

Specify the maximum memory, in bytes, that can be used to cache the learned data. This memory is used as an LRU cache so that the old entries are replaced with new entries after the set memory limit is exhausted. A value of 0 decides the limit automatically.

Default value: 0

Minimum value: 0

Maximum value: 4294967294

## SSL profile

An SSL profile is a collection of SSL settings, such as ciphers and protocols. A profile is helpful if you have common settings for different servers. Instead of specifying the same settings for each server, you can create a profile, specify the settings in the profile, and then bind the profile to different servers. If a custom front-end SSL profile is not created, the default front-end profile is bound to client-side entities. This profile enables you to configure settings for managing the client-side connections.

For SSL interception, you must create an SSL profile and enable SSL interception in the profile. A default cipher group is bound to this profile, but you can configure more ciphers to suit your deployment. Bind an SSL interception CA certificate to this profile and then bind the profile to a proxy server. For SSL interception, the essential parameters in a profile are the ones used for the following actions:

- Check the OCSP status of the origin server certificate.
- Trigger client renegotiation if the origin server requests renegotiation.
- Verify the origin server certificate before reusing the front-end SSL session.

Use the default back-end profile when communicating with the origin servers. Set any server-side parameters, such as cipher suites, in the default back-end profile. A custom back-end profile is not supported.

For examples of the most commonly used SSL settings, see “Sample Profile” at the end of this section.

Cipher/protocol support differs on the internal and external network. In the following tables, the connection between the users and an ADC appliance is the internal network. The external network is between the appliance and the internet.

Table 1: Cipher/protocol support matrix for the internal network

See Table 1-Support on virtual server/frontend service/internal service in [Ciphers available on the NetScaler appliances](#).

Table 2: Cipher/protocol support matrix for the external network

See Table 2-Support on back-end services in [Ciphers available on the NetScaler appliances](#).

### **Add an SSL profile and enable SSL interception by using the CLI**

At the command prompt, type:

```
add ssl profile <name> -sslinterception ENABLED -ssliReneg (ENABLED
| DISABLED)-ssliOCSPCheck (ENABLED | DISABLED)-ssliMaxSessPerServer
<positive_integer>
```

#### **Arguments:**

##### **sslInterception:**

Enable or disable interception of SSL sessions.

Possible values: ENABLED, DISABLED

Default value: DISABLED

##### **ssliReneg:**

Enable or disable triggering client renegotiation when a renegotiation request is received from the origin server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

##### **ssliOCSPCheck:**

Enable or disable OCSP check for an origin-server certificate.

Possible values: ENABLED, DISABLED

Default value: ENABLED

##### **ssliMaxSessPerServer:**

Maximum number of SSL sessions to be cached per dynamic origin server. A unique SSL session is created for each SNI extension received from the client in a client hello message. The matching session is used for server-session reuse.

Default value: 10

Minimum value: 1

Maximum value: 1000

#### **Example:**

```
1 add ssl profile swg_ssl_profile -sslinterception ENABLED
2
3 Done
4
5 sh ssl profile swg_ssl_profile
6
7 1) Name: swg_ssl_profile (Front-End)

### Bind an SSL interception CA certificate to an SSL profile by using the GUI

1. Navigate to **System > Profiles > SSL Profile**.
2. Click **Add**.
3. Specify a name for the profile.
4. Enable **SSL Sessions Interception**.
5. Click **OK**.
6. In **Advanced Settings**, click **Certificate Key**.
7. Specify an SSL interception CA certificate key to bind to the profile.
8. Click **Select** and then click **Bind**.
9. Optionally, configure ciphers to suit your deployment.
  - Click the edit icon, and then click **Add**.
  - Select one or more cipher groups, and click the right arrow.

- Click **OK**.

10. Click **Done**.

### Bind an SSL profile to a proxy server by using the GUI

1. Navigate to **Security > SSL Forward Proxy > Proxy Virtual Servers**, and add a server or select a server to modify.
2. In **SSL Profile**, click the edit icon.
3. In the **SSL Profile** list, select the SSL profile that you created earlier.
4. Click **OK**.
5. Click **Done**.

### Sample Profile:

```
1 Name: swg_ssl_profile (Front-End)
2
3 SSLv3: DISABLED TLSv1.0: ENABLED TLSv1
 .1: ENABLED TLSv1.2: ENABLED
4
5 Client Auth: DISABLED
6
7 Use only bound CA certificates: DISABLED
8
9 Strict CA checks: NO
10
11 Session Reuse: ENABLED
 Timeout: 120 seconds
12
13 DH: DISABLED
14
15 DH Private-Key Exponent Size Limit: DISABLED
 Ephemeral RSA: ENABLED
 Refresh Count: 0
16
17 Deny SSL Renegotiation
 ALL
18
19 Non FIPS Ciphers: DISABLED
20
21 Cipher Redirect: DISABLED
22
23 SSL Redirect: DISABLED
24
25 Send Close-Notify: YES
26
27 Strict Sig-Digest Check: DISABLED
28
29 Push Encryption Trigger: Always
30
```

```

31 PUSH encryption trigger timeout: 1 ms
32
33 SNI: DISABLED
34
35 OCSP Stapling: DISABLED
36
37 Strict Host Header check for SNI enabled SSL sessions:
38 NO
39
39 Push flag: 0x0 (Auto)
40
41 SSL quantum size: 8 kB
42
43 Encryption trigger timeout 100 mS
44
45 Encryption trigger packet count: 45
46
47 Subject/Issuer Name Insertion Format: Unicode
48
49 SSL Interception: ENABLED
50
51 SSL Interception OCSP Check: ENABLED
52
53 SSL Interception End to End Renegotiation: ENABLED
54
55 SSL Interception Maximum Reuse Sessions per Server: 10
56
57 Session Ticket: DISABLED Session Ticket
58 Lifetime: 300 (secs)
59
59 HSTS: DISABLED
60
61 HSTS IncludeSubDomains: NO
62
63 HSTS Max-Age: 0
64

71 1) SSL Interception CA CertKey Name: swg_ca_cert
72 <!--NeedCopy-->

```

## User identity management

May 2, 2023

An increasing number of security breaches and the growing popularity of mobile devices has emphasized the need to ensure that use of the external internet is compliant with the corporate policies. Only authorized users must be allowed access to external resources provisioned by the corporate personnel. Identity Management makes it possible by verifying the identity of a person or a device. It does not determine what tasks the individual can take or what files the individual can see.

An SSL forward proxy deployment identifies the user before allowing access to the internet. All requests and responses from the user are inspected. User activity is logged, and records are exported to the NetScaler Application Delivery Management (ADM) for reporting. In NetScaler Console, you can view the statistics about the user activities, transactions, and bandwidth consumption.

By default, only the user's IP address is saved, but you can configure the feature to record more details about the user. You can use this identity information to create richer internet usage policies for specific users.

The NetScaler appliance supports the following authentication modes for an explicit-proxy configuration.

- **Lightweight Directory Access Protocol (LDAP).** Authenticates the user through an external LDAP authentication server. For more information, see [LDAP authentication Policies](#).
- **RADIUS.** Authenticates the user through an external RADIUS server. For more information, see [RADIUS Authentication](#).
- **TACACS+.** Authenticates the user through an external Terminal Access Controller Access-Control System (TACACS) authentication server. For more information, see [TACACS authentication Policies](#).
- **Negotiate.** Authenticates the user through a Kerberos authentication server. If there is an error in Kerberos authentication, the appliance uses NTLM authentication. For more information, see [Negotiate authentication Policies](#).

For transparent proxy, only IP-based LDAP authentication is supported. When a client request is received, the proxy authenticates the user by checking an entry for the client IP address in the active directory. It then creates a session based on the user IP address. However, if you configure the `ssoNameAttribute` in an LDAP action, a session is created by using the user name instead of the IP address. Classic policies are not supported for authentication in a transparent proxy setup.

#### Note

For explicit proxy, you must set the LDAP login name to **sAMAccountName**. For transparent proxy, you must set the LDAP login name to **networkAddress** and `attribute1` to **sAMAccountName**.

#### Example for explicit proxy:

```
1 add authentication ldapAction swg-auth-action-explicit -serverIP
 10.105.157.116 -ldapBase "CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDn "
```

```

1 CN=Administrator,CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDnPassword
 freebds123$ -ldapLoginName sAMAccountName
2 <!--NeedCopy-->

```

**Example for transparent proxy:**

```

1 add authentication ldapAction swg-auth-action-explicit -serverIP
 10.105.157.116 -ldapBase "CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDn "
 CN=Administrator,CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDnPassword
 freebds123$ -ldapLoginName networkAddress -authentication disable -
 Attribute1 sAMAccountName
2 <!--NeedCopy-->

```

**Set up user authentication by using the CLI**

At the command prompt type:

```

1 add authentication vsServer <vsServer name> SSL
2
3 bind ssl vsServer <vsServer name> -certKeyName <certkey name>
4
5 add authentication ldapAction <action name> -serverIP <ip_addr> -
 ldapBase <string> -ldapBindDn <string> -ldapBindDnPassword -
 ldapLoginName <string>
6
7 add authentication Policy <policy name> -rule <expression> -action <
 string>
8
9 bind authentication vsServer <vsServer name> -policy <string> -priority <
 positive_integer>
10
11 set cs vsServer <name> -authn401 ON -authnVsName <string>
12 <!--NeedCopy-->

```

**Arguments:****VsServer name:**

Name of the authentication virtual server to which to bind the policy.

Maximum Length: 127

**serviceType:**

Protocol type of the authentication virtual server. Always SSL.

Possible values: SSL

Default value: SSL

**Action name:**

Name for the new LDAP action. Must begin with a letter, number, or the underscore character (`_`), and must contain only letters, numbers, and the hyphen (`-`), period (`.`) pound (`#`), space (), at (`@`), equals (`=`), colon (`:`), and underscore characters. Cannot be changed after the LDAP action is added. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my authentication action” or ‘my authentication action’).

Maximum Length: 127

**serverIP:**

IP address assigned to the LDAP server.

**ldapBase:**

Base (node) from which to start LDAP searches. If the LDAP server is running locally, the default value of base is `dc=netScaler,dc=com`. Maximum Length: 127

**ldapBindDn:**

Full distinguished name (DN) that is used to bind to the LDAP server.

Default: `cn=Manager,dc=netScaler,dc=com`

Maximum Length: 127

**ldapBindDnPassword:**

Password used to bind to the LDAP server.

Maximum Length: 127

**ldapLoginName:**

LDAP login name attribute. The NetScaler appliance uses the LDAP login name to query external LDAP servers or Active Directories. Maximum Length: 127

**Policy name:**

Name for the advance AUTHENTICATION policy. Must begin with a letter, number, or the underscore character (`_`), and must contain only letters, numbers, and the hyphen (`-`), period (`.`) pound (`#`), space (), at (`@`), equals (`=`), colon (`:`), and underscore characters. Cannot be changed after an AUTHENTICATION policy is created. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my authentication policy” or ‘my authentication policy’).

Maximum Length: 127

**rule:**

Name of the rule, or a Advanced policy expression, that the policy uses to determine whether to attempt to authenticate the user with the AUTHENTICATION server.

Maximum Length: 1499

**action:**

Name of the authentication action to be performed if the policy matches.

Maximum Length: 127

**priority:**

Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Policies are evaluated in the order of their priorities, and the first policy that matches the request is applied. Must be unique within the list of policies bound to the authentication virtual server.

Minimum value: 0

Maximum Value: 4294967295

**Example:**

```
1 add authentication vserver swg-auth-vs SSL
2
3 Done
4
5 bind ssl vserver explicit-auth-vs -certkeyName ns-swg-ca-certkey
6
7 Done
8
9 add authentication ldapAction swg-auth-action-explicit -serverIP
 192.0.2.116 -ldapBase "CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDn "CN=
 Administrator,CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDnPassword zzzzz
 -ldapLoginName sAMAccountName
10
11 Done
12
13 add authenticationpolicy swg-auth-policy -rule true -action swg-auth-
 action-explicit
14 Done
15
16 bind authentication vserver swg-auth-vs -policy swg-auth-policy -
 priority 1
17
18 Done
19
20 set cs vserver testswg -authn401 ON -authnVsName swg-auth-vs
21
22 Done
23 <!--NeedCopy-->
```

## Enable user name logging by using the CLI

At the command prompt, type:

```
1 set appflow param -AAAUserName ENABLED
2 <!--NeedCopy-->
```

**Arguments:**

AAAUserName

Enable AppFlow authentication, authorization, and auditing user name logging.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**Example:**

```
1 set appflow param -AAAUserName ENABLED
2 <!--NeedCopy-->
```

## URL filtering

July 27, 2023

**Note:**

URL categorisation in the URL filtering feature is deprecated in this release.

URL Filtering provides policy based control of websites by using the information contained in URLs. This feature helps network administrators monitor and control user access to malicious websites on the network.

### Get started

If you are a new user and want to configure URL filtering, you must complete the initial SSL forward proxy setup. To get started with URL Filtering, you must first log on to the SSL forward proxy wizard. The wizard takes you through a series of configuration steps before you apply the URL Filtering policies.

**Note**

Before you begin, be sure you have a valid URL Threat Intelligence feature license installed on your appliance. If you are using a trial version, be sure to purchase a valid license to continue using this feature on the ADC appliance.

**Log on to SSL forward proxy wizard**

The SSL forward proxy wizard guides you through a series of simplified configuration tasks and the right pane displays the corresponding flow sequence. You can use this wizard to apply URL Filtering policies to a URL list or a predefined list of categories.

**Step 1: Configure proxy settings**

First configure a proxy server through which the client accesses the gateway. This server is of type SSL, and it operates in explicit or transparent mode. For more information about proxy server configuration, see [Proxy Modes](#).

**Step 2: Configure SSL interception**

After configuring the proxy server, you must configure the SSL interception proxy to intercept encrypted traffic at the NetScaler appliance. In the case of URL filtering, the SSL proxy intercepts the traffic and does not allow blocked URLs while all other traffic can be bypassed. For more information about configuring SSL interception, see [SSL Interception](#).

### **Step 3: Configure identity management**

A user is authenticated before being allowed to log on to the enterprise network. Authentication provides the flexibility to define specific policies for a user or a group of users, based on their roles. For more information about user authentication, see [User Identify Management](#).

### **Step 4: Configure URL filtering**

The administrator can apply a URL filtering policy either by using the URL Categorization feature or by using the URL List feature.

[URL Categorization](#). Controls access to websites and webpages by filtering traffic based on a predefined list of categories.

[URL List](#). Controls access to blacklisted websites and webpages by denying access to URLs that are in a URL set imported into the appliance.

### **Step 5: Configure security configuration**

This step enables you to configure a reputation score and allow users to control access to the websites by denying access if the score is too low. Your reputation score can range from one to four, and you can configure the threshold at which the score becomes unacceptable. For scores that exceed the threshold, you can select a policy action to allow, block, or redirect traffic. For more information, see [URL Reputation Score](#).

### **Step 6: Configure SSL forward proxy analytics**

This step enables you to activate SSL forward proxy analytics for categorizing web traffic, logging URL category in the user transaction logs and viewing traffic analytics. For more information about SSL forward proxy analytics, see [Analytics](#).

### **Step 7: Click “Done” to complete the initial configuration and continue managing the URL filtering configuration**

## **URL list**

November 2, 2023

The URL List feature enables enterprise customers to control access to specific websites and website categories. The feature filters websites by applying a responder policy bound to a URL matching algorithm. The algorithm matches the incoming URL against a URL set consisting of up to one million (1,000,000) entries. If the incoming URL request matches an entry in the set, the appliance uses the responder policy to evaluate the request (HTTP/HTTPS) and control access to it.

## URL set types

Each entry in a URL set can include a URL and, optionally, its metadata (URL category, category groups, or any other related data). For URLs with metadata, the appliance uses a policy expression that evaluates the metadata. For more information, see [URL Set](#).

SSL forward proxy supports custom URL sets. You can also use pattern sets to filter URLs.

**Custom URL set.** You can create a customized URL set with up to 1,000,000 URL entries and import it as a text file into your appliance.

**Pattern set.** An ADC appliance can use pattern sets to filter URLs before granting access to websites. A pattern set is a string-matching algorithm that looks for an exact string match between an incoming URL and up to 5000 entries. For more information, see [Pattern Set](#).

Each URL in an imported URL set can have a custom category in the form of URL metadata. Your organization can host the set and configure the ADC appliance to periodically update the set without requiring manual intervention.

After the set is updated, the NetScaler appliance automatically detects the metadata. The category is now available as a policy expression for evaluating the URL and applying an action such as allow, block, redirect, or notify the user.

## Advanced policy expressions used with URL sets

The following table describes the basic expressions you can use to evaluate incoming traffic.

1. `.URLSET_MATCHES_ANY` - Evaluates to TRUE if the URL exactly matches any entry in the URL set.
2. `.GET_URLSET_METADATA()` - The `GET_URLSET_METADATA()` expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there is no match.
3. `.GET_URLSET_METADATA().EQ(<METADATA) - .GET_URLSET_METADATA().EQ(<METADATA)`
4. `.GET_URLSET_METADATA().TYPECAST_LIST_T('').GET(0).EQ()` - Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata but match only the first field.

5. HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL) - Joins the host and URL parameters, which can then be used for matching.

## Responder action types

**Note:** In the table, HTTP.REQ.URL is generalized as `<URL expression>`.

The following table describes the actions that can be applied to incoming internet traffic.

Responder Action	Description
Allow	Allow the request to access the target URL.
Redirect	Redirect the request to the URL specified as the target.
Block	Deny the request.

## Prerequisites

Configure a DNS server if you import a URL Set from a host name URL. This configuration is not required if you use an IP address.

At the command prompt, type:

```
add dns nameServer ((<IP> [-local]) | <dnsVserverName>) [-state (
ENABLED | DISABLED)] [-type <type>] [-dnsProfileName <string>]
```

### Example:

```
add dns nameServer 10.140.50.5
```

## Configure a URL list

To configure a URL list, you can use the Citrix SSL forward proxy wizard or the NetScaler command-line interface (CLI). On the NetScaler appliance, you must first configure the responder policy and then bind the policy to a URL set.

Citrix recommends that you use the Citrix SSL forward proxy wizard as the preferred option to configure a URL list. Use the wizard to bind a responder policy to a URL set. Alternatively, you can bind the policy to a pattern set.

## Configure a URL list by using the SSL forward proxy wizard

To configure URL List for HTTPS traffic by using the GUI:

1. Navigate to **Security > SSL Forward Proxy** page.
2. In the details pane, do one of the following:
  - a) Click **SSL Forward Proxy Wizard**.
  - b) Select an existing configuration and click **Edit**.
3. In the **URL Filtering** section, click **Edit**.
4. Select the **URL List** check box to enable the feature.
5. Select a **URL List** policy and Click **Bind**.
6. Click **Continue** and then **Done**.

For more information, see [How to Create a URL List Policy](#).

## Configure a URL list by using the CLI

To configure a URL list, do the following.

1. Configure a proxy virtual server for HTTP and HTTPS traffic.
2. Configure SSL interception for intercepting HTTPS traffic.
3. Configure a URL list containing a URL set for HTTP traffic.
4. Configure URL list containing URL set for HTTPS traffic.
5. Configure a private URL set.

### Note

If you have already configured an ADC appliance, you can skip steps 1 and 2, and configure with step 3.

**Configuring a proxy virtual server for Internet traffic** The NetScaler appliance supports transparent and explicit proxy virtual servers. To configure a proxy virtual server for internet traffic in explicit mode, do the following:

1. Add a proxy SSL virtual server.
2. Bind a responder policy to the proxy virtual server.

To add a proxy virtual server by using the CLI:

At the command prompt, type:

```
1 add cs vserver <name> <serviceType> <IPAddress> <port>
2 <!--NeedCopy-->
```

**Example:**

```
1 add cs vserver starcs PROXY 10.102.107.121 80 -cltTimeout 180
2 <!--NeedCopy-->
```

To bind a responder policy to a proxy virtual server by using the CLI:

```
1 bind ssl vserver <vServerName> -policyName <string> [-priority <
 positive_integer>]
2 <!--NeedCopy-->
```

**Note**

If you have already configured the SSL interceptor as part of the NetScaler configuration, you can skip the following procedure.

**Configure SSL interception for HTTPS traffic** To configure SSL interception for HTTPS traffic, do the following:

1. Bind a CA certificate-key pair to the proxy virtual server.
2. Enable the default SSL profile.
3. Create a front-end SSL profile, and bind it to the proxy virtual server and enable SSL interception in the front-end SSL profile.

To bind a CA certificate-key pair to the proxy virtual server by using the CLI:

At the command prompt, type:

```
1 bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>
2 <!--NeedCopy-->
```

To configure a front-end SSL profile by using the CLI:

At the command prompt, type:

```
1 set ssl parameter -defaultProfile ENABLED
2
3 add ssl profile <name> -sslInterception ENABLED -ssliMaxSessPerServer <
 positive_integer>
4 <!--NeedCopy-->
```

To bind a front-end SSL profile to a proxy virtual server by using the CLI

At the command prompt, type:

```
1 set ssl vserver <vServer name> -sslProfile <name>
2 <!--NeedCopy-->
```

**Configure a URL list by importing a URL set for HTTP traffic** For information about how to configure a URL Set for HTTP traffic, see [URL Set](#).

**Perform explicit subdomain match** You can now perform an explicit subdomain match for an imported URL set. A new parameter, “subdomainExactMatch” is added to the `import policy URLset` command.

When you enable the parameter, the URL Filtering algorithm performs an explicit subdomain match. For example, if the incoming URL is `news.example.com` and if the entry in the URL set is `example.com`, the algorithm does not match the URLs.

At the command prompt, type:

```
import policy urlset <name> [-overwrite] [-delimiter <character>] [-rowSeparator <character>] -url [-interval <secs>] [-privateSet] [-subdomainExactMatch] [-canaryUrl <URL>]
```

#### Example

```
import policy urlset test -url http://10.78.79.80/top-1k.csv -privateSet -subdomainExactMatch -interval 900
```

**Configure a URL set for HTTPS traffic** To configure a URL Set for HTTPS traffic by using the CLI

At the command prompt type:

```
1 add ssl policy <name> -rule <expression> -action <string> [-undefAction <string>] [-comment <string>]
2 <!--NeedCopy-->
```

#### Example:

```
1 add ssl policy pol1 -rule client.ssl.client_hello.SNI.
 URLSET_MATCHES_ANY("top1m") -action INTERCEPT
2 <!--NeedCopy-->
```

**To configure a URL set for HTTPS traffic by using the SSL forward proxy wizard** Citrix recommends that you use the SSL forward proxy wizard as the preferred option to configure a URL list. Use the wizard to import a custom URL set and bind to a responder policy.

1. Navigate to **Security > SSL Forward proxy > URL Filtering > URL Lists**.
2. In the details pane, click **Add**.
3. On the **URL List Policy** page, specify the policy name.
4. Select an option to import a URL set.
5. On the **URL List Policy** tab page, select the **Import URL Set** check box and specify the following URL Set parameters.

- a) URL Set Name—Name of the custom URL set.
  - b) URL—Web address of the location at which to access the URL Set.
  - c) Overwrite—Overwrite a previously imported URL set.
  - d) Delimiter—Character sequence that delimits a CSV file record.
  - e) Row Separator—Row separator used in the CSV file.
  - f) Interval—Interval in seconds, rounded off to the nearest number of seconds equal to 15 minutes, at which the URL set is updated.
  - g) Private Set—Option to prevent exporting the URL set.
  - h) Canary URL—Internal URL for testing whether the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters.
6. Select a responder action from the drop-down list.
  7. Click **Create** and **Close**.

**Configure a private URL set** If you configure a private URL set and keep its contents confidential, the network administrator might not know the blacklisted URLs in the set. For such cases, you can configure a Canary URL and add it to the URL set. Using the Canary URL, the administrator can request the private URL Set to be used for every lookup request. You can refer to the wizard section for descriptions of each parameter.

To import a URL set by using the CLI:

At the command prompt, type:

```
1 import policy urlset <name> [-overwrite] [-delimiter <character>] [-rowSeparator <character>] -url <URL> [-interval <secs>] [-privateSet] [-canaryUrl <URL>]
2 <!--NeedCopy-->
```

**Example:**

```
1 import policy urlset test1 -url http://10.78.79.80/alytra/top-1k.csv -private -canaryUrl http://www.in.gr
2 <!--NeedCopy-->
```

**Display imported URL set**

You can now display imported URL sets in addition to added URL sets. A new parameter “imported” is added to the `show urlset` command. If you enable this option, the appliance displays all imported URL sets and distinguishes the imported URL sets from the added URL sets.

At the command prompt, type:

```
show policy urlset [<name>] [-imported]
```

### Example

```
show policy urlset -imported
```

## Configure audit log messaging

Audit logging enables you to review a condition or a situation in any phase of a URL List process. When a NetScaler appliance receives an incoming URL, if the responder policy has a URL Set advanced policy expression, the audit log feature collects URL Set information in the URL. It stores the details as a log message for any target allowed by audit logging.

The log message contains the following information:

1. Timestamp.
2. Log message type.
3. The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency).
4. Log message information, such as URL set name, policy action, URL.

To configure audit logging for the URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see [Audit Logging](#) topic.

## URL pattern semantics

July 21, 2023

The following table shows the URL patterns used for specifying the list of pages you to want to filter. For example, the pattern, `www.example.com/bar` matches only one page at `www.example.com/bar`. To match all the pages whose URL starts with `www.example.com/bar`, you add an asterisk (\*) at the end of the URL.

### Semantics for URL pattern to match metadata mapping

The pattern matching semantics is available in a table format. For more information, see [Pattern Semantics](#) PDF page.

## Mapping URL categories

July 27, 2023

**Note:**

URL categorisation in the URL filtering feature is deprecated in this release.

A list of third party categories and category groups. For more information, see [URL Category Mapping](#) page.

## Use case: URL filtering by using custom URL set

July 21, 2023

If you are an enterprise customer looking to control access to specific websites and website categories, use a custom URL set bound to a responder policy. Your organization's network infrastructure can use a URL filter to block access to malicious or dangerous websites. For example, websites featuring adult, violence, gaming, drugs, politics, or job portals. In addition to filtering the URLs, you can create a customized list of URLs and import it to the ADC appliance. For example, your organization's policies might call for blocking access to certain websites such as social networking, shopping portals, and job portals.

Each URL in the list can have a custom category in the form of metadata. The organization can host the list of URLs as a URL set on the NetScaler appliance. Configure the appliance to periodically update the set without requiring manual intervention.

After the set is updated, the NetScaler appliance automatically detects the metadata. The responder policy uses the URL metadata (category details) to evaluate the incoming URL and apply an action such as allow, block, redirect, or notify the user.

To do so, configure in your network, you can perform the following tasks:

1. Import a custom URL set
2. Add a custom URL set
3. Configure a custom URL list in the SSL Forward Proxy wizard.

### Import a custom URL set by using the CLI

At the command prompt, type:

```
1 import policy urlset <name> [-overwrite] [-delimiter <character>] [-
 rowSeparator <character>] -url <URL> [-interval <secs>] [-privateSet
] [-canaryUrl <URL>]
2
3 import policy urlset test1 -url http://10.78.79.80/alytra/top-1k.csv
4 <!--NeedCopy-->
```

## Add a custom URL set by using the CLI

At the command prompt, type:

```
add urlset <urlset_name>
```

**Example:**

```
add urlset test1
```

## Configure a URL list by using the SSL Forward Proxy wizard

Citrix recommends that you use the SSL Forward Proxy wizard as the preferred option to configure a URL list. Use the wizard to import a custom URL set and bind it to a responder policy.

1. Navigate to **Security > SSL Forward Proxy > URL Filtering > URL Lists**.
2. In the details pane, click **Add**.
3. On the **URL List Policy** page, specify the policy name.
4. Select an option to either import a URL set.
5. In the **URL List Policy** tab page, select the **Import URL Set** check box and specify the following URL Set parameters.
  - a) URL Set Name—Name of the custom URL set.
  - b) URL—Web address of the location at which to access the URL Set.
  - c) Overwrite—Overwrite a previously imported URL set.
  - d) Delimiter—Character sequence that delimits a CSV file record.
  - e) Row Separator—Row separator used in the CSV file.
  - f) Interval—Interval in seconds, rounded off to the nearest 15 minutes, at which the URL set is updated.
  - g) Private Set—Option to prevent exporting the URL set.
  - h) Canary URL—Internal URL for testing if the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters.
6. Select a responder action from the drop-down list.
7. Click **Create** and **Close**.

The screenshot shows the 'URL List Policy' configuration page in NetScaler. The page has a dark header with 'URL List Policies' and 'URL List Policy' tabs. The main content area is titled 'URL List Policy' and contains several input fields and checkboxes:

- URL\***: A text input field containing 'http://10.78.79.80/alytra/top-1k.csv'.
- Overwrite**: An unchecked checkbox.
- Delimiter**: A text input field containing '4'.
- Row Separator**: A text input field containing '10'.
- Interval**: A text input field containing '15'.
- Private Set**: An unchecked checkbox.
- Canary URL**: An empty text input field.

Below the main configuration area, there is an **Action\*** dropdown menu set to 'Allow'. At the bottom, there are two buttons: 'Create' (in a blue box) and 'Close' (in a white box with a grey border).

### Metadata semantics for custom URL sets

To import a custom URL set, add the URLs to a text file and bind it to a responder policy to block Social networking URLs.

Following are examples of URLs that you might add to the text file:

cnn.com, News

bbc.com, News

google.com, Search Engine

yahoo.com, Search Engine

facebook.com, Social Media

twitter.com, Social Media

### Configure a responder policy to block social media URLs by using the CLI

```
1 add responder action act_url_unauthorized respondwith '"HTTP/1.1 451
2 Unavailable For Legal Reasons\r\n\r\nURL is NOT authorized\n"'
```

```
3 add responder policy pol_url_meta_match 'HTTP.REQ.HOSTNAME.APPEND(HTTP.
 REQ.URL).GET_URLSET_METADATA("u1").EQ("Social Media")'
 act_url_unauthorized
4 <!--NeedCopy-->
```

## URL categorization

July 27, 2023

**Note:**

URL categorisation in the URL filtering feature is deprecated in this release.

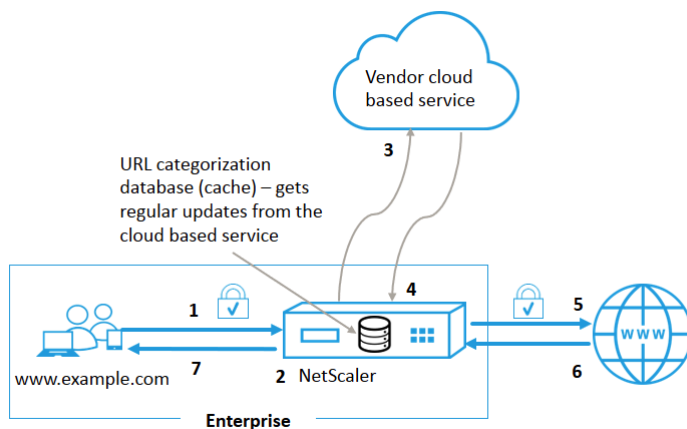

URL Categorization restricts user access to specific websites and website categories. As a subscribed service in collaboration with [NetSTAR](#), the feature enables enterprise customers to filter web traffic using a commercial categorization database. The [NetSTAR](#) database has a vast number (billions) of URLs classified into different categories, such as social networking, gambling, adult content, new media, and shopping. In addition to categorization, each URL has a reputation score kept up to date based on the site's historical risk profile. We can use [NetSTAR](#) data to filter the traffic by configuring advanced policies based on categories, category groups (such as Terrorism, Illegal drugs), or site-reputation scores.

For example, you might block access to dangerous sites, such as sites known to be infected with malware. You might also selectively restrict access to content such as adult content or entertainment streaming media for enterprise users. You can also capture the user's transactional details and outbound traffic details for monitoring web traffic analytics on the NetScaler Console server.

NetScaler uploads or downloads data from the pre-configured [NetSTAR](#) device `nsv10.netstar-inc.com` and `incompasshybridpc.netstar-inc.com` is used as a cloud host by default for cloud-categorization requests. These URLs must be accessible through the firewall for URL filtering to work properly. The appliance uses its NSIP address as a source IP address and 443 as the destination port for communication.

### How URL categorization works

The following figure shows how a NetScaler URL categorization service is integrated with a commercial URL Categorization database and cloud services for frequent updates.

The components interact as follows:

1. A client sends an internet bound URL request.
2. The SSL forward proxy applies a policy enforcement to the request based on the category details, such as, category, category group, and site-reputation score. The category details are retrieved from the URL categorization database. If the database returns the category details, the process jumps to step 5.
3. If the database misses the categorization details, the request is sent to a cloud-based lookup service maintained by a URL categorization vendor. However, the appliance does not wait for a response, instead, the URL is marked as uncategorized and a policy enforcement is performed (jump to step 5). The appliance continues to monitor the cloud query feedback and updates the cache so that future requests can benefit from the cloud lookup.
4. The ADC appliance receives the URL category details (category, category group, and reputation score) from the cloud-based service and stores it in the categorization database.
5. The policy allows the URL and the request is sent to the origin server. Otherwise, the appliance drops, redirects, or responds with a custom HTML page.
6. The origin server responds with the requested data to the ADC appliance.
7. The appliance sends the response to the client.

### **Use Case: Internet usage under corporate compliance for enterprises**

You can use the URL Filtering feature to detect and implement compliance policies to block sites that violate corporate compliance. For example, sites such as adult, streaming media, social networking which can be deemed nonproductive or consume excess internet bandwidth in an enterprise network. Blocking access to these websites can improve employee productivity, reduce operating costs for bandwidth usage, and reduce the overhead of network consumption.

## Prerequisites

The URL Categorization feature works on a NetScaler platform only if it has an optional subscription service with URL filtering capabilities and threat intelligence for SSL forward proxy. The subscription allows customers to download the latest threat categorizations for websites and then enforce those categories to the SSL forward proxy. Before enabling and configuring the feature, you must install the following licenses:

- `CNS_WEBF_SSERVER_Retail.lic`
- `CNS_XXXX_SERVER_PLT_Retail.lic`

Where, XXXXX is the platform type, for example: V25000

## Responder policy expressions

The following table lists the different policy expressions that you can use to verify if an incoming URL must be allowed, redirected, or blocked.

1. `<text>. URL_CATEGORIZE (<min_reputation>, <max_reputation>)` - Returns a `URL_CATEGORY` object. If `<min_reputation>` is greater than 0, the returned object does not contain a category with a reputation lower than `<min_reputation>`. If `<max_reputation>` is greater than 0, the returned object does not contain a category with a reputation higher than `<max_reputation>`. If the category fails to resolve in a timely manner, the `undef` value is returned.
2. `<url_category>. CATEGORY()` - Returns the category string for this object. If the URL does not have a category, or if the URL is malformed, the returned value is “Unknown.”
3. `<url_category>. CATEGORY_GROUP()` - Returns a string identifying the object’s category group. This grouping is a higher level grouping of categories, which is useful in operations that require less detailed information about the URL category. If the URL does not have a category, or if the URL is malformed, the returned value is “Unknown.”
4. `<url_category>. REPUTATION()` - Returns the reputation score as a number from 0 to 5, where 5 indicates the riskiest reputation. If there is the category “Unknown”, the reputation value is 1.

### Policy types:

1. Policy to select requests for URLs that are in the Search Engine category - `add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY().EQ("Search Engine")'`
2. Policy to select requests for URLs that are in the Adult category group - `add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY_GROUP().EQ("Adult")'`

3. Policy to select requests for Search Engine URLs with a reputation score lower than 4 -  
`add responder policy p2 'HTTP.REQ.HOSTNAME.APPEND (HTTP.REQ.URL).URL_CATEGORIZE(4,0).HAS_CATEGORY("Search Engine")'`
4. Policy to select requests for Search Engine and Shopping URLs -  
`add responder policy p3 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY().EQ("good_categories")'`
5. Policy to select requests for Search Engine URLs with a reputation score equal to or greater than 4 -  
`add responder policy p5 'CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(4,0).CATEGORY().EQ("Search Engines")'`
6. Policy to select requests for URLs that are in the Search Engine category and compare them with a URL Set -  
`' HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY().EQ("Search Engine")&& HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("u1")'`

## Responder policy types

There are two types of policies used in a URL Categorization feature and each of these policy types is explained the following table:

Policy Type	Description
URL Category	Categorize web traffic and based on evaluation result blocks, allows, or redirects traffic.
URL Reputation Score	Determines the reputation score of the website and allows you to control access based on the reputation score threshold level set by the administrator.

## Configure URL categorization

To configure URL categorization on a NetScaler appliance, do the following:

1. Enable URL filtering.
2. Configure a proxy server for Web traffic.
3. Configure SSL interception for Web traffic in explicit mode.
4. Configure shared memory to limit cache memory.
5. Configure URL categorization parameters.
6. Configure URL categorization by using the Citrix SSL forward proxy wizard.
7. Configure URL categorization parameters by using the SSL forward proxy wizard.
8. Configure seed database path and cloud server name

**Step 1: Enabling URL Filtering**

To enable URL categorization, enable the URL filtering feature and enable modes for URL categorization.

To enable URL Categorization by using the CLI

At the command prompt, type:

```
enable ns feature URLFiltering
disable ns feature URLFiltering
```

**Step 2: Configure a proxy server for web traffic in explicit mode**

The NetScaler appliance supports transparent and explicit proxy virtual servers. To configure a proxy virtual server for SSL traffic in explicit mode, do the following:

1. Add a proxy server.
2. Bind an SSL policy to the proxy server.

To add a proxy server by using the CLI

At the command prompt, type:

```
add cs vserver <name> [-td <positive_integer>] <serviceType> [-
cltTimeout <secs>]
```

**Example:**

```
add cs vserver starcs PROXY 10.102.107.121 80 -cltTimeout 180
```

**Bind an SSL policy to a proxy virtual server by using the CLI**

```
bind ssl vserver <vServerName> -policyName <string> [-priority <
positive_integer>]
```

**Step 3: Configure SSL interception for HTTPS traffic**

To configure SSL interception for HTTPS traffic, do the following:

1. Bind a CA certificate-key pair to the proxy virtual server.
2. Configure the default SSL profile with SSL parameters.
3. Bind a front-end SSL profile to the proxy virtual server and enable SSL interception in the front-end SSL profile.

To bind a CA certificate-key pair to the proxy virtual server by using the CLI

At the command prompt, type:

```
bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>
-CA -skipCAName
```

To configure the default SSL profile by using the CLI

At the command prompt, type:

```
set ssl profile <name> -denySSLReneg <denySSLReneg> -sslInterception
(ENABLED | DISABLED)-ssliMaxSessPerServer positive_integer>
```

### **Bind a front-end SSL profile to a proxy virtual server by using the CLI**

At the command prompt, type:

```
set ssl vserver <vServer name> -sslProfile ssl_profile_interception
```

### **Step 4: Configure shared memory to limit cache memory**

To configure shared memory to limit cache memory by using the CLI

At the command prompt, type:

```
set cache parameter [-memLimit <megaBytes>]
```

Where, the memory limit configured for caching is set as 10 MB.

### **Step 5: Configure URL categorization parameters**

To configure the URL categorization parameters by using the CLI

At the command prompt, type:

```
set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer
>] [-TimeOfDayToUpdateDB <HH:MM>]
```

#### **Example:**

```
set urlfiltering parameter -urlfilt_hours_betweenDB_updates 20
```

### **Step 6: Configure URL Categorization by using the Citrix SSL forward proxy wizard**

1. Log on to the NetScaler appliance and navigate to **Security > SSL Forward Proxy** page.
2. In the details pane, do one of the following:

- a) Click **SSL Forward Proxy Wizard** to create a new configuration.
  - b) Select an existing configuration and click **Edit**.
3. In the **URL Filtering** section, click **Edit**.
  4. Select the **URL Categorization** check box to enable the feature.
  5. Select a **URL Categorization** policy and Click **Bind**.
  6. Click **Continue** and then **Done**.

For more information about URL Categorization policy, see [How to Create a URL Categorization Policy](#).

### Step 7: Configuring URL Categorization parameters by using an SSL forward proxy Wizard

1. Log on to **NetScaler** appliance and navigate to **Security > URL Filtering**.
2. In the **URL Filtering** page, click **Change URL filtering settings** link.
3. In the **Configuring URL Filtering Params** page, specify the following parameters.
  - a) Hours Between DB Updates. URL Filtering hours between database updates. Minimum value: 0 and Maximum value: 720.
  - b) Time of Day to Update DB. URL Filtering time of day to update database.
  - c) Cloud Host. The URL path of the cloud server.
  - d) Seed DB Path. The URL path of the seed database lookup server.
4. Click **OK** and **Close**.

#### Sample Configuration:

```
1 enable ns feature LB CS SSL IC RESPONDER AppFlow URLFiltering
2
3 enable ns mode FR L3 Edge USNIP PMTUD
4
5 set ssl profile ns_default_ssl_profile_frontend -denySSLReneg NONSECURE
 -sslInterception ENABLED -ssliMaxSessPerServer 100
6
7 add ssl certKey swg_ca_cert -cert ns_swg_ca.crt -key ns_swg_ca.key
8
9 set cache parameter -memLimit 100
10
11 add cs vserver starcs PROXY 10.102.107.121 80 -cltTimeout 180
12
13 add responder action act1 respondwith "\"HTTP/1.1 200 OK\r\n\r\n\" +
 http.req.url.url_categorize(0,0).reputation + \"\n\""
14
15 add responder policy p1 "HTTP.REQ.URL.URL_CATEGORIZE(0,0).CATEGORY.eq
 (\\"Shopping/Retail\\") || HTTP.REQ.URL.URL_CATEGORIZE(0,0).CATEGORY.
 eq(\\"Search Engines & Portals
16
17 \")" act1
```

```
18
19 bind cs vserver starcs_PROXY -policyName p1 -priority 10 -
 gotoPriorityExpression END -type REQUEST
20
21 add dns nameServer 10.140.50.5
22
23 set ssl parameter -denySSLReneg NONSECURE -defaultProfile ENABLED -
 sigDigestType RSA-MD5 RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-
 SHA512 -ssliErrorCache ENABLED
24
25 -ssliMaxErrorCacheMem 100000000
26
27 add ssl policy pol1 -rule "client.ssl.origin_server_cert.subject.
 URL_CATEGORIZE(0,0).CATEGORY.eq(\"Search Engines & Portals\")" -
 action INTERCEPT
28
29 add ssl policy pol3 -rule "client.ssl.origin_server_cert.subject.ne(\"
 citrix\")" -action INTERCEPT
30
31 add ssl policy swg_pol -rule "client.ssl.client_hello.SNI.
 URL_CATEGORIZE(0,0).CATEGORY.ne(\"Uncategorized\")" -action
 INTERCEPT
32
33 set urlfiltering parameter -HoursBetweenDBUpdates 3 -
 TimeOfDayToUpdateDB 03:00
34 <!--NeedCopy-->
```

### Configure seed database path and cloud server name

You can now configure the seed database path and cloud lookup server name for manual setting of the cloud lookup server name and the seed database path. To do this, two new parameters, “CloudHost” and “SeedDBPath”, are added to the URL filtering parameter.

At the command prompt, type:

```
set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer
>] [-TimeOfDayToUpdateDB <HH:MM>] [-LocalDatabaseThreads <positive_integer
>] [-CloudHost <string>] [-SeedDBPath <string>]
```

#### Example:

```
set urlfiltering parameter -HoursBetweenDBUpdates 3 -TimeOfDayToUpdateDB
03:00 -CloudHost localhost -SeedDBPath /mypath
```

The Communication between a NetScaler appliance and NetSTAR might require a domain name server. You can test using a simple console or telnet connection from the appliance.

#### Example:

```
1 root@ns# telnet nsv10.netstar-inc.com 443
```

```
2 Trying 1.1.1.1...
3 Connected to nsv10.netstar-inc.com.
4 Escape character is '^]'.
5
6 root@ns# telnet incompasshybridpc.netstar-inc.com 443
7 Trying 10.10.10.10...
8 Connected to incompasshybridpc.netstar-inc.com.
9 Escape character is '^]'.
10 <!--NeedCopy-->
```

## Configure audit log messaging

Audit logging enables you to review a condition or a situation in any phase of the URL Categorization process. When a NetScaler appliance receives an incoming URL, if the responder policy has a URL Filtering expression, the audit log feature collects URL Set information in the URL. It stores the information as log messages for any target allowed by audit logging.

- Source IP address (the IP address of the client that made the request).
- Destination IP address (the IP address of the requested server).
- Requested URL containing the schema, the host, and the domain name (<http://www.example.com>).
- URL category that the URL filtering framework returns.
- URL category group that the URL filtering framework returned.
- URL reputation number that the URL filtering framework returned.
- Audit log action taken by the policy.

To configure audit logging for a URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see [Audit Logging](#) topic.

## Storing failure errors using SYSLOG messaging

At any stage of the URL Filtering process, if there is a system-level failure, the ADC appliance uses the audit log mechanism to store logs in the ns.log file. The errors are stored as text messages in SYSLOG format so that, an administrator can view it later in a chronological order of event occurrence. These logs are also sent to an external SYSLOG server for archival. For more information, see [article CTX229399](#).

For example, if a failure occurs when you initialize the URL Filtering SDK, the error message is stored in the following messaging format.

```
Oct 3 15:43:40 <local0.err> ns URLFiltering[1349]: Error initializing
NetStar SDK (SDK error=-1). (status=1).
```

The NetScaler appliance stores the error messages under four different failure categories:

- **Download failure.** If an error occurs when you try to download the categorization database.
- **Integration failure.** If an error occurs when you integrate an update into the existing categorization database.
- **Initialization failure.** If an error occurs when you initialize the URL Categorization feature, set categorization parameters, or end a categorization service.
- **Retrieval failure.** If an error occurs when the appliance retrieves the categorization details of the request.

## Configure SNMP traps for NetSTAR events

The URL Filtering feature generates SNMP traps, if the following conditions occur:

- NetSTAR database update fails or succeeds.
- NetSTAR SDK initialization fails or succeeds.

The appliance has a set of conditional entities called SNMP alarms. When a condition in the SNMP alarm is met, the appliance generates traps and sends it to a specified trap destination. For example, if the NetSTAR SDK initialization fails, an SNMP OID 1.3.6.1.4.1.5951.1.1.0.183 is generated and sent to the trap destination.

For the appliance to generate traps, you must first enable and configure SNMP alarms. Then, you specify the trap destination to which the appliance sends the generated trap messages

### Enable an SNMP alarm

The NetScaler appliance generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the URL filtering feature generates trap messages when a success or failure event occurs. Some alarms are enabled by default.

To enable an SNMP alarm by using the command line interface:

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
enable snmp alarm <trapName>
show snmp alarm <trapName>
```

To enable an SNMP alarm by using the NetScaler GUI

1. Navigate to **System > SNMP > Alarms**, and select the alarm.
2. Click **Actions** and select **Enable**.

Configure SNMP alarm by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
set snmp alarm <trapName> [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-time <secs>] [-state (ENABLED | DISABLED)] [-severity <severity>] [-logging (ENABLED | DISABLED)]
```

**Example:**

```
set snmp alarm URL-FIL-DB-UPDATE-STATUS -state ENABLED
set snmp alarm URL-FIL-INIT-SDK -state ENABLED
```

Configure SNMP alarms by using the GUI

Navigate to **System > SNMP > Alarms**, select an alarm, and configure the alarm parameters.

For more information about SNMP traps, see [SNMP](#) topic

## URL reputation score

July 27, 2023

**Note:**

URL categorisation in the URL filtering feature is deprecated in this release.

The URL Categorization feature provides policy-based control to restrict blacklisted URLs. You can control access to websites based on URL category, reputation score, or URL category and reputation score. If network administrators monitor a user accessing highly risky websites, they can use a responder policy bound to the URL reputation score to block such risky websites.

Upon receiving an incoming URL request, the appliance retrieves the category and reputation score from the URL categorization database. Based on the reputation score returned by the database, the appliance assigns a reputation rating for websites. The value can range from 1 to 4, where 4 is the riskiest type of websites, as shown in the following table.

---

URL Reputation Rating	Reputation Comment
1	Clean site
2	Unknown site
3	Potentially dangerous or affiliated to a dangerous site
4	Malicious site

---

### Use Case: Filtering by URL reputation score

Consider an enterprise organization with a network administrator monitoring user transactions and network bandwidth consumption. If malware can enter the network, the administrator must enhance the data security and control access to malicious and dangerous websites accessing the network. To protect the network against such threats, the administrator can configure the URL filtering feature to allow or deny access by URL reputation score.

For more information about monitoring outbound traffic and user activities on the network, see [Analytics](#).

If an employee of the organization tries to access a social networking website, the ADC appliance receives a URL request. It queries the URL Categorization database to retrieve the URL category as social networking and a reputation score 3, which indicates a potentially dangerous website. The appliance then checks the security policy configured by the administrator, such as block access to sites with a reputation rating of 3 or more. It then applies the policy action to control access to the website.

To implement this feature, you must configure the URL reputation score and security threshold levels by using the SSL Forward Proxy wizard.

### Configure reputation score by using the GUI

Citrix recommends that you use the SSL forward proxy wizard to configure the reputation score and security levels. Based on the configured threshold, you can select a policy action to allow, block, or redirect traffic.

1. Navigate to **Security > SSL Forward Proxy**.
2. In the details pane, click **SSL Forward Proxy Wizard**.
3. In the details page, specify the proxy server settings.
4. Click **Continue** to specify other settings such as SSL interception and identify management.
5. Click **Continue** to access the **Security Configuration** section.

6. In the **Security Configuration** section, select the **Reputation Score** check box to control access based on URL reputation score.
7. Select the security level and specify the reputation score threshold value:
  - a) Greater than or equals to—Allow or block a website if the threshold value is greater than or equal to N, where N ranges from one to four.
  - b) Less than or equals to—Allow or block a website if the threshold value is less than or equal to N, where N ranges from one to four.
  - c) In between—Allow or block a website if the threshold value is between N1 and N2 and the range is from one to four.
8. Select a responder action from the drop-down list.
9. Click **Continue** and **Close**.

The following image shows the **Security Configuration** section on the SSL Forward Proxy wizard. Enable the URL Reputation Score option to configure the policy settings.

## Analytics

May 2, 2023

In the NetScaler appliance, all the user records and subsequent records are logged. When you integrate NetScaler Application Delivery Management (ADM) with the NetScaler appliance, the logged user activity and the subsequent records in the appliance are exported to NetScaler Console using the [logstream](#) feature.

NetScaler Console collates and presents information on the activities of users, such as, websites visited and the bandwidth spent. It also reports bandwidth use and detected threats, such as malware

and phishing sites. You can use these key metrics to monitor your network and take corrective actions with the Citrix SWG appliance. For more information, see [Citrix SSL Forward Proxy Analytics](#).

To integrate NetScaler appliance with NetScaler Console:

1. In the NetScaler appliance, while configuring the SSL forward proxy feature, enable Analytics and provide the details of the NetScaler Console instance that you want to use for analytics.
2. In NetScaler Console, add the NetScaler appliance as an instance to NetScaler Console. For more information see [Add Instances to NetScaler Console](#).

## **Use case: Making an enterprise network secure by using ICAP for remote malware inspection**

October 13, 2023

The NetScaler appliance acts as a proxy and intercepts all the client traffic. The appliance uses policies to evaluate the traffic and forwards client requests to the origin server on which the resource resides. The appliance decrypts the response from the origin server and forwards the plain text content to the ICAP server for an antimalware check. The ICAP server responds with a message indicating “No adaptation required,” or error, or modified request. Depending on the response from the ICAP server, the content requested is either forwarded to the client, or an appropriate message is sent.

For this use case, you must perform some general configuration, proxy and SSL interception related configuration, and ICAP configuration on the NetScaler appliance.

### **General configuration**

Configure the following entities:

- NSIP address
- Subnet IP (SNIP) address
- DNS name server
- CA certificate-key pair to sign the server certificate for SSL interception

### **Proxy server and SSL interception configuration**

Configure the following entities:

- Proxy server in explicit mode to intercept all outbound HTTP and HTTPS traffic.
- SSL profile to define SSL settings, such as ciphers and parameters, for connections.

- SSL policy to define rules for intercepting traffic. Set to true to intercept all client requests.

For more details, see the following topics:

- [Proxy modes](#)
- [SSL interception](#)

In the following sample configuration, the antimalware detection service resides at [www.example.com](http://www.example.com).

**Sample general configuration:**

```
1 add dns nameServer 203.0.113.2
2
3 add ssl certKey ns-swg-ca-certkey -cert ns_swg_ca.crt -key ns_swg_ca.
 key
4 <!--NeedCopy-->
```

**Sample proxy server and SSL interception configuration:**

```
1 add cs vserver explicitSWG PROXY 192.0.2.100 80 - Authn401 ENABLED -
 authnVsName explicit-auth-vs
2
3 set ssl parameter -defaultProfile ENABLED
4
5 add ssl profile swg_profile -sslInterception ENABLED
6
7 bind ssl profile swg_profile -ssliCACertkey ns-swg-ca-certkey
8
9 set ssl vserver explicitSWG -sslProfile swg_profile
10
11 add ssl policy ssli-pol_ssli -rule true -action INTERCEPT
12
13 bind ssl vserver explicitSWG -policyName ssli-pol_ssli -priority 100 -
 type INTERCEPT_REQ
14 <!--NeedCopy-->
```

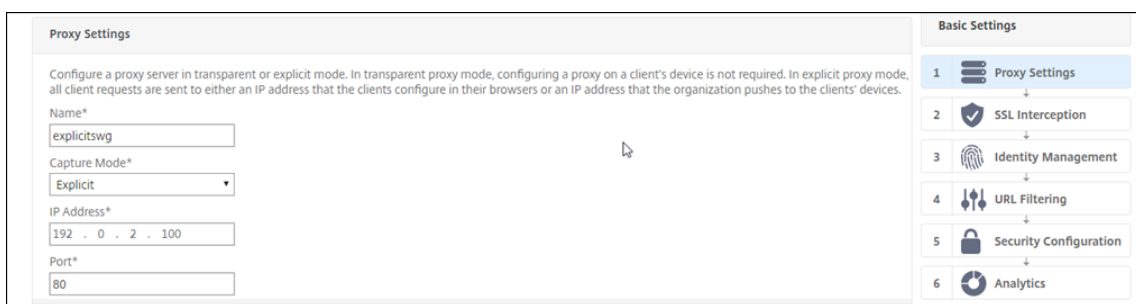

**Sample ICAP Configuration:**

```
1 add service icap_svc 203.0.113.225 TCP 1344
2
3 enable ns feature contentinspection
4
5 add icaprofile icaprofile1 -uri /example.com -Mode RESMOD
6
7 add contentInspection action CiRemoteAction -type ICAP -serverName
 icap_svc -icapProfileName icaprofile1
8
9 add contentInspection policy CiPolicy -rule "HTTP.REQ.METHOD.NE("
 CONNECT)" -action CiRemoteAction
10
11 bind cs vserver explicitSWG -policyName CiPolicy -priority 200 -type
 response
```

12 <!--NeedCopy-->

### Configure the proxy settings

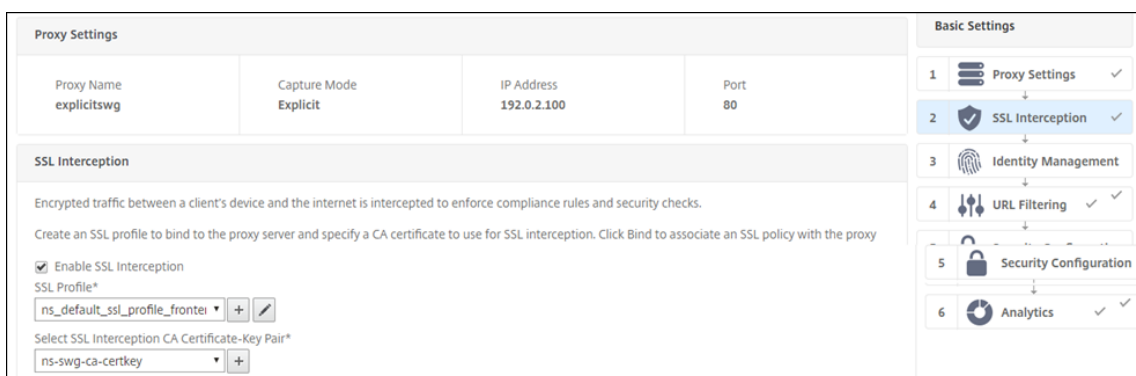

1. Navigate to **Security > SSL Forward Proxy > SSL Forward Proxy Wizard**.
2. Click **Get Started** and then click **Continue**.
3. In the **Proxy Settings** dialog box, enter a name for the explicit proxy server.
4. For **Capture Mode**, select **Explicit**.
5. Enter an IP address and port number.

6. Click **Continue**.

### Configure the SSL interception settings

1. Select **Enable SSL Interception**.

2. In **SSL Profile**, select an existing profile or click “+” to add a new front-end SSL profile. Enable **SSL Sessions Interception** in this profile. If you select an existing profile, skip the next step.

### SSL Interception

- SSL Sessions Interception
- Verify Server Certificate For Reuse On SSL Interception
- SSL Interception Client Renegotiation
- SSL Interception OCSP Check

Maximum SSL Sessions Per Server On SSL Interception

10

3. Click **OK** and then click **Done**.
4. In **Select SSL interception CA Certificate-Key Pair**, select an existing certificate or click “+” to install a CA certificate-key pair for SSL interception. If you select an existing certificate, skip the next step.

### Install SSL Interception CA Certificate

Certificate-Key Pair Name\*

Policy Name	Pattern Set Name	Action
<i>No items</i>		

7. Enter a name for the policy and select **Advanced**. In the Expression editor, enter true.
8. For **Action**, select **INTERCEPT**.

9. Click **Create**.
10. Click **Continue** four times, and then click **Done**.

### Configure the ICAP settings

1. Navigate to **Load Balancing > Services** and click **Add**.
2. Type a name and IP address. In **Protocol**, select **TCP**. In **Port**, type **1344**. Click **OK**.
3. Navigate to **SSL Forward Proxy > Proxy Virtual Servers**. Add a proxy virtual server or select a virtual server and click **Edit**. After entering details, click **OK**.

Click **OK** again.

4. In **Advanced Settings**, click **Policies**.
5. In **Choose Policy**, select **Content Inspection**. Click **Continue**.
6. In **Select Policy**, click the “+” sign to add a policy.

7. Enter a name for the policy. In **Action**, click the “+” sign to add an action.

8. Type a name for the action. In **Server Name**, type the name of the TCP service created earlier. In **ICAP Profile**, click the “+” sign to add an ICAP profile.
9. Type a profile name, URI. In **Mode**, select **REQMOD**.

### Create ICAP Profile

## How-to articles

July 27, 2023

**Note:**

URL categorisation in the URL filtering feature is deprecated in this release.

Following are some configuration instructions or functional use cases available as “How to” articles to help you manage your SSL forward proxy deployment.

### URL filtering

[How to create a URL categorization policy](#)

[How to create a URL list policy](#)

[How to allow an exceptional URL](#)

[How to block adult category websites](#)

## Security

May 2, 2023

The following topics cover configuration and installation information for NetScaler security features. Most of these features are policy based.

Content Filtering	Blocks inappropriate HTML requests, preventing the requests from reaching the Web servers.
Surge Protection	Detects any rapid rise in connection attempts and adjusts the rate at which connections are allowed to proceed to the server, preventing server overload.
DNS Security Options	Simplified UI wizard to create policies to protect against DNS attacks.

---

## Surge protection

May 2, 2023

When a surge in client requests overloads a server, server response becomes slow, and the server is unable to respond to new requests. The Surge Protection feature ensures that connections to the server occur at a rate that the server can handle. The response rate depends on how surge protection is configured. The NetScaler appliance also tracks the number of connections to the server, and uses that information to adjust the rate at which it opens new server connections.

Surge protection is enabled by default. If you do not want to use surge protection, as is the case with some special configurations, you must disable it.

The default surge protection settings are sufficient for most uses, but you can configure surge protection to tune it for your needs. First, you can set the throttle value to tell it how aggressively to manage connection attempts. Second you can set the base threshold value to control the maximum number of concurrent connections that the NetScaler appliance allows before triggering surge protection. (The default base threshold value is set by the throttle value, but after setting the throttle value you can change it to any number you want.)

The following figure illustrates how surge protection is configured to handle traffic to a website.

Figure 1. A Functional Illustration of NetScaler Surge Protection

#### Note

If the NetScaler appliance is installed at the edge of the network, where it interacts with network devices on the client side of the Internet, the surge protection feature must be disabled. Surge protection must also be disabled if you enable USIP (Using Source IP) mode on your appliance.

When surge protection is disabled and a surge in requests occurs, the server accepts as many requests as it can process concurrently, and then begins to drop requests. As the server becomes more overloaded, it goes down and the response rate is reduced to zero. When the server recovers from the crash, several minutes later, it sends resets for all pending requests, which is abnormal behavior, and also responds to new requests with resets. The process repeats for each surge in requests. Therefore, a server that is under DDoS attack and receives multiple surges of requests can become unavailable to legitimate users.

When surge protection is enabled and a surge in requests occurs, surge protection manages the rate of requests to the server, sending requests to the server only as fast as the server can handle those requests. This enables the server to respond to each request correctly in the order it was received. When the surge is over, the backlogged requests are cleared as fast as the server can handle them, until the request rate matches the response rate.

## Disable and reenable surge protection

May 2, 2023

The surge protection feature is enabled by default. When surge protection is enabled, it is active for any service that you add.

### Disable or reenable surge protection by using the CLI

At the command prompt, type one of the following sets of commands to disable or reenable surge protection and verify the configuration:

```

1 - disable ns feature SurgeProtection
2 - show ns feature
3 - enable ns feature SurgeProtection
4 - show ns feature
5 <!--NeedCopy-->

```

#### Example:

```

1 disable ns feature SurgeProtection
2 Done show ns feature
3
4 Feature Acronym Status
5 ----- -
6 1) Web Logging WL ON
7 2) Surge Protection SP OFF
8 .
9 .
10 .
11 24) NetScaler Push push OFF
12 Done
13 <!--NeedCopy-->

```

```

1 enable ns feature SurgeProtection
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 ----- -
7 1) Web Logging WL ON
8 2) Surge Protection SP ON
9 .
10 .
11 .
12
13 24) NetScaler Push push OFF
14 Done
15 >

```

## Disable or reenables surge protection by using the GUI

1. In the navigation pane, expand **System**, and then select **Settings**.
2. In the details pane, click **Change Advanced Features**.
3. In the **Configure Advanced Features** dialog box, clear the selection from the **Surge Protection** check box to disable the surge protection feature, or select the check box to enable the feature.
4. Click **OK**.
5. In the Enable/Disable Features dialog box, click Yes. A message appears in the status bar, stating that the feature has been enabled or disabled.

## Disable or reenables surge protection for a particular service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**. The list of configured services is displayed in the details pane.
2. In the details pane, select the service for which you want to disable or reenables the surge protection feature, and then click **Open**.
3. In the **Configure Service** dialog box, click the **Advanced tab**, and scroll down.
4. In the Others frame, clear the selection from the **Surge Protection** check box to disable the surge protection feature, or select the check box to enable the feature.
5. Click **OK**. A message appears in the status bar, stating that the feature has been enabled or disabled.

**Note:** Surge protection works only when both the feature and the service setting are enabled.

## Set thresholds for surge protection

May 2, 2023

To set the rate at which the NetScaler appliance opens connections to the server, you must configure the threshold and throttle values for surge protection.

### Note

Threshold values are configured globally but they are enforced per individual load balanced server or per service.

The following figure shows the surge protection curves that result from setting the throttle rate to relaxed, normal, or aggressive. Depending on the configuration of the server capacity, you can set base threshold values to generate appropriate surge protection curves.

Figure 1. Surge Protection Curves

Your configuration settings affect the behavior of surge protection in the following manner:

- If you do not specify a throttle rate, it is set to normal (the default value), and the base threshold is set to 200, as shown in the preceding figure.
- If you specify a throttle rate (aggressive, normal, or relaxed) without specifying a base threshold, the curve reflects the default values of the base threshold for that throttle rate. For example, if you set the throttle rate to relaxed, the resulting curve will have the base threshold value of 500.
- If you specify only the base threshold, the entire surge protection curve shifts up or down, depending on the value you specify, as shown in the figure that follows.
- If you specify both a base threshold and a throttle rate, the resulting surge protection curve is based on the set throttle rate and adjusted according to the value set for the base threshold.

In the following figure, the lower curve (Aggressive 1) results when the throttle rate is set to aggressive but the base threshold is not set. The upper curve (Aggressive 2) results when the base threshold is set to 500, but the throttle rate is not set. The second upper curve (Aggressive 2) also results when the base threshold is set to 500, and the throttle rate is set to aggressive.

Figure 2. Aggressive Rate with the Default or a Set Base Threshold

### Set the threshold for surge protection by using the GUI

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Global System Settings.
3. If you want to set a base threshold different from the default for the throttle rate, in the Configure Global Settings dialog box, Base Threshold text box, enter the maximum number of concurrent server connections allowed before surge protection is triggered. The base threshold is the maximum number of server connections that can be open before surge protection is activated. The maximum value for this setting is 32,767 server connections. The default setting for this value is controlled by the throttle rate you choose in the next step.

**Note:** If you do not set an explicit value here, the default value will be used.

4. In the Throttle drop-down list, select a throttle rate. The throttle is the rate at which the NetScaler appliance allows connections to the server to be opened. The throttle can be set to the following values:
  - **Aggressive:** Choose this option when the connection-handling and surge-handling capacity of the server is low and the connection needs to be managed carefully. When you set the throttle to aggressive, the base threshold is set to a default value of 16, which means that surge protection is triggered whenever there are 17 or more concurrent connections to the server.

- **Normal:** Choose this option when there is no external load balancer behind the NetScaler appliance or downstream. The base threshold is set to a value of 200, which means that surge protection is triggered whenever there are 201 or more concurrent connections to the server. Normal is the default throttle option.
- **Relaxed:** Choose this option when the NetScaler appliance is performing load balancing between a large number of Web servers, and can therefore handle a high number of concurrent connections. The base threshold is set to a value of 500, which means that surge protection is triggered only when there are 501 or more concurrent connections to the server.

5. Click OK. A message appears in the status bar, stating that the global settings are configured.

## Flush the surge queue

May 2, 2023

When a physical server receives a surge of requests, it becomes slow to respond to the clients that are currently connected to it, which leaves users dissatisfied and disgruntled. Often, the overload also causes clients to receive error pages. To avoid such overloads, the NetScaler appliance provides features such as surge protection, which controls the rate at which new connections to a service can be established.

The appliance does connection multiplexing between clients and physical servers. When it receives a client request to access a service on a server, the appliance looks for an already established connection to the server that is free. If it finds a free connection, it uses that connection to establish a virtual link between the client and the server. If it does not find an existing free connection, the appliance establishes a new connection with the server, and establishes a virtual link between a client and the server. However, if the appliance cannot establish a new connection with the server, it sends the client request to a surge queue. If all the physical servers bound to the load balancing or content switching virtual server reach the upper limit on client connections (max client value, surge protection threshold or maximum capacity of the service), the appliance cannot establish a connection with any server. The surge protection feature uses the surge queue to regulate the speed at which connections are opened with the physical servers. The appliance maintains a different surge queue for each service bound to the virtual server.

The length of a surge queue increases whenever a request comes for which the appliance cannot establish a connection, and the length decreases whenever a request in the queue gets sent to the server or a request gets timed out and is removed from the queue.

If the surge queue for a service or service group becomes too long, you may want to flush it. You can flush the surge queue of a specific service or service group, or of all the services and service groups

bound to a load balancing virtual server. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. For those requests, the client has to make a fresh request.

You can also flush the surge queue of a content switching virtual server. If a content switching virtual server forwards some requests to a particular load balancing virtual server, and the load balancing virtual server also receives some other requests, when you flush the surge queue of the content switching virtual server, only the requests received from this content switching virtual server are flushed. The other requests in the surge queue of the load balancing virtual server are not flushed.

**Note:**

- You cannot flush the surge queues of cache redirection, authentication, VPN, or GSLB virtual servers or GSLB services.
- Do not use the Surge Protection feature if Use Source IP (USIP) is enabled.

**Flush a surge queue by using the CLI**

The flush ns surgeQ command works in the following manner:

- You can specify the name of a service, service group, or virtual server whose surge queue has to be flushed.
- If you specify a name while running the command, the surge queue of the specified entity is flushed. If more than one entity has the same name, the appliance flushes surge queues of all those entities.
- If you specify the name of a service group, and a server name and port while running the command, the appliance flushes the surge queue of only the specified service group member.
- You cannot directly specify a service group member `<serverName>` and `<port>` without specifying the name of the service group `<name>` and you cannot specify `<port>` without a `<serverName>`. Specify the `<serverName>` and `<port>` if you want to flush the surge queue for a specific service group member.
- If you run the command without specifying any names, the appliance flushes the surge queues of all the entities present on the appliance.
- If a service group member is identified with a server name, you must specify the server name in this command; you cannot specify its IP address.

At the command prompt, type:

```
flush ns surgeQ [-name <name>] [-serverName <serverName> <port>]
```

**Examples**

1. `flush ns surgeQ -name SVC1ANZGB -serverName 10.10.10.1 80`

The preceding command flushes the surge queue of the service or virtual server that is named SVC1ANZGB and has IP address as 10.10.10

## 2. `flush ns surgeQ`

The preceding command flushes all the surge queues on the appliance.

### **Flush a surge queue by using the GUI**

Navigate to Traffic Management > Content Switching > Virtual Servers, select a virtual server and, in the Action list, select Flush Surge Queue.

### **DNS security options**

May 2, 2023

You can now configure the DNS security options from the Add DNS Security Profile page in the NetScaler GUI. To configure the DNS security options from the NetScaler CLI or the NITRO API, use the AppExpert components. For instructions, see the NITRO API documentation and the NetScaler Command Reference Guide.

One option, cache poisoning protection, is enabled by default and cannot be disabled. You can apply the other options to all DNS endpoints or to specific DNS virtual servers in your deployment, as shown in the following table:

Security option	Can be applied to all DNS endpoints?	Can be applied to specific DNS virtual servers?
DNS DDoS protection	Yes	Yes
Manage exceptions – whitelist/blacklist servers	Yes	Yes
Prevent random subdomain attacks	Yes	Yes
Bypass the cache	Yes	No
Enforce DNS transactions over TCP	Yes	Yes
Provide root details in the DNS response	Yes	No

## Cache poisoning protection

A cache poisoning attack redirects users from legitimate sites to malicious websites.

For example, the attacker replaces a genuine IP address in the DNS cache with a fake IP address that they control. When the server responds to requests from these IP addresses, the cache is poisoned. Subsequent requests for the addresses of the domain are redirected to the attacker's site.

The Cache Poisoning Protection option prevents insertion of corrupt data into the database that caches DNS server requests and responses. This feature is inbuilt in the NetScaler appliances and is always enabled.

## DNS DDoS protection

You can configure the DNS DDoS Protection option for each type of request that you suspect might be used in a DDoS attack. For each type, the appliance drops any requests received after a threshold value for the number of requests received in a specified time period (time slice) is exceeded. You can also configure this option to log a warning to the SYSLOG server. For example:

- **DROP:** - Select this option to DROP requests without logging. Assume that you have enabled A record protection with threshold value 15, time slice as 1 second, and chosen DROP. When the incoming requests exceed 15 queries in 1 second, then the packets start getting dropped.
- **WARN:** - Select this option to LOG and DROP requests. Assume that you have enabled A record protection with threshold value 15, time slice as 1 second, and chosen WARN. When the incoming requests exceed 15 queries in 1 second, a warning message is logged indicating a threat and then the packets are dropped. Citrix recommends you to set threshold values for WARN smaller than the threshold value of DROP for a record type. Such a setting helps administrators identify an attack by logging a warning message before the actual attack happens and NetScaler starts dropping incoming requests.

### Set a threshold for incoming traffic by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profile** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
4. Expand **DNS DDoS Protection**.
  - a) Select the record type and enter the threshold limit and the time slice value.
  - b) Select **DROP** or **WARN**.
  - c) Repeat steps a and b for each of the other record types that you want to protect against.
5. Click **Submit**.

## Manage exceptions –allowlist/blocklist servers

Manage exceptions enables you to add exceptions either to block list or allow list domain name and IP addresses. For example:

- When a particular IP address is identified posting an attack, such IP address can be added to the block list.
- When administrators find that there is an unexpectedly high number of requests for a particular domain name, then that domain name can be added to the block list.
- **NXDomains** and some of the existent domains which can consume the server resources can be blacklisted.
- When administrators allow list domain names or IP addresses, queries or requests only from these domains or IP addresses are answered and all others are dropped.

### Create an allow list or a block list by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
  - a) Expand **Manage exceptions –Whitelist/Blacklist Servers**.
  - b) Select **Block** to block queries from blacklisted domains/addresses, or select **Allow** only to allow queries from whitelisted domains/addresses.
  - c) In the **Domain name / IP Address** box, enter the domain names, IP addresses, or IP address ranges. Use commas to separate the entries.

**Note:** If you select **Advanced Option**, you can use the “start with,” “contains,” and “ends with” options to set the criteria.  
For example, you can set criteria to block a DNS query that starts with “image” or ends with “.co.ru” or contains “mobile sites.”
4. Click **Submit**.

### Prevent random subdomain attacks

In random subdomain attacks, queries are sent to random, nonexistent subdomains of legitimate domains. This action increases the load on the DNS resolvers and servers. As a result, they can become overloaded and slow down.

The Prevent Random Subdomain Attacks option directs the DNS responder to drop DNS queries that exceed a specified length.

Assume that example.com is a domain name owned by you and hence the resolution request comes to your DNS server. The attacker can append a random subdomain to example.com and send a request. Based on the specified query length and the FQDN, the random queries are dropped.

For example, if the query is www.image987trending.example.com, it is dropped if the query length is set to 20.

### **Specify a DNS query length by using the GUI**

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
  - a) Expand **Prevent Random Subdomain Attacks**.
  - b) Enter the numerical value for the query length.
4. Click **Submit**.

### **Bypassing the cache**

During an attack, the data that is already cached must be protected. To protect the cache, new requests for certain domains or record types or response codes can be sent to the origin servers instead of cached.

The Bypassing the cache option directs the NetScaler appliance to bypass the cache for specified domains, record types, or response codes when an attack is detected.

### **Bypass the cache for specified domains or record types or response types by using the GUI**

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, expand **Bypassing the cache** and enter the domain names. Optionally, choose the record types or the response types for which the cache has to be bypassed.
  - Click **Domains** and enter the domain names. Use commas to separate the entries.
  - Click **Record Types** and choose the record types.
  - Click **Response Types** and choose the response type.
4. Click **Submit**.

## Enforce DNS transactions over TCP

Some DNS attacks can be prevented if the transactions are forced to use TCP instead of UDP. For example, during a bot attack, the client sends a flood of queries but cannot handle responses. If the use of TCP is enforced for these transactions, then the bots cannot understand the responses and therefore cannot send requests over TCP.

### Force domains or record types to operate at the TCP level by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, expand **Enforce DNS Transactions over TCP** and enter the domain names and / or choose the record types for which the DNS transactions must be enforced over TCP.
  - Click **Domains** and enter the domain names. Use commas to separate the entries.
  - Click **Record Types** and choose the record types.
4. Click **Submit**.

### Provide root details in the DNS response

In some attacks, the attacker sends a flood of queries for unrelated domains that are not configured or cached on the NetScaler appliance. If the `dnsRootReferral` parameter is ENABLED, it exposes all the root servers.

The Provide Root Details in the DNS Response option directs the NetScaler appliance to restrict access to root referrals for a query that is not configured or cached. The appliance sends a blank response.

The Provide Root Details in the DNS Response option can also mitigate or block amplification attacks. When the `dnsRootReferral` parameter is DISABLED, there are no root referrals in the NetScaler responses and hence they do not get amplified.

### Enable or disable access to the root server by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
  - a) Expand **Provide Root Details in the DNS Response**.
  - b) Click **ON** or **OFF** to allow or restrict access to the root server.
4. Click **Submit**.

## System

May 2, 2023

This section provides system-level information of the NetScaler. This includes a detailed explanation of system-level features, the scenarios in which the features can be used, the configuration steps, and examples to help you better understand the features.

## System base operations

November 14, 2023

The following configurations enable you to perform system base operations on a NetScaler appliance.

### How to view, save, and clear NetScaler configuration

NetScaler configurations are stored in the `/nsconfig/ns.conf` directory. For configurations to be available across sessions, you must save the configuration after every configuration change.

### View running configuration by using the command interface

At the command prompt, type:

```
1 show ns runningConfig
2 <!--NeedCopy-->
```

### View running configuration by using the GUI

1. Navigate to **System > Diagnostics** and, in the **View Configuration group**, click **Running Configuration**.

### View the difference between the two configuration files by using the command interface

At the command prompt, type:

```
1 diff ns config <configfile> <configfile2>
2 <!--NeedCopy-->
```

### View the difference between the two configuration files by using the GUI

1. Navigate to **System > Diagnostics** and, in the **View Configuration group**, click **Configuration difference**.

### Save NetScaler configurations by using the command interface

At the command prompt, type:

```
1 save ns config
2 <!--NeedCopy-->
```

### Save NetScaler configurations by using the GUI

1. On the **Configuration** tab, in the top-right corner, click the **Save** icon.

### View saved configurations by using the command interface

At the command prompt, type:

```
1 show ns ns.conf
2 <!--NeedCopy-->
```

### View saved configurations by using the GUI

Navigate to **System > Diagnostics** and, in the **View Configuration** group, click **Saved Configuration**.

## Clear NetScaler configuration by using the command interface

You have the following three options for clearing the NetScaler configuration.

**Basic level.** Clearing your configuration at the basic level clears all settings except the following:

- `Nsroot` password
- Time Zone
- NTP server
- ADM server connect
- License file information
- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions
- Feature and mode settings
- Default administrator password (`nsroot`)

**Extended level.** Clearing your configuration at the extended level clears all settings except the following:

- NSIP and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions

Feature and mode settings revert to their default values.

**Full level.** Clearing your configuration at the full level returns all settings to their factory default values. However, the NSIP and default gateway are not changed, because changing them can cause the appliance to lose network connectivity.

At the command prompt, type:

```
1 clear ns config -force
2 <!--NeedCopy-->
```

**Example:** To forcefully clear the basic configurations on an appliance.

```
1 clear ns config -force basic
2 <!--NeedCopy-->
```

## Clear NetScaler configuration by using the GUI

Navigate to **System > Diagnostics** and, in the Maintenance group, click **Clear Configuration** and select the configuration level to be cleared from the appliance.

## How to restart or shut down appliance for unsaved NetScaler configurations

The NetScaler appliance can be remotely restarted or shut down from the available user interfaces. When you restart or shut down a standalone NetScaler appliance, the unsaved configurations (configurations performed since the last `save ns config` command was issued) are lost.

In a high availability setup, when the primary appliance is rebooted or shut down, the secondary appliance takes over and becomes the primary. The unsaved configurations from the old primary are available on the new primary appliance.

You can also restart the appliance by only rebooting the NetScaler software and not rebooting the underlying operating system. This is called a warm reboot. For example, when you add a new license or change the IP address, you can warm reboot the NetScaler appliance for these changes to take place.

### Note:

You can perform warm reboot only on a standalone NetScaler appliance.

## Restart the appliance by using the command interface

At the command prompt, type:

```
1 reboot [-warm]
2 <!--NeedCopy-->
```

## Restart a NetScaler appliance by using the GUI

1. In the configuration page, click **Reboot**.
2. When prompted to reboot, select **Save configuration** to make sure that you do not lose any configurations.

### Note:

You can perform a warm reboot by selecting Warm reboot.

## Shut down an appliance by using the command interface

At the shell prompt, type:

- `shutdown -p now`: Shuts down the software and switches off the NetScaler. To restart NetScaler MPX, press the AC power switch. To Restart NetScaler VPX, restart the VPX instance.

- `shutdown -h now`: Shuts down the software and leaves the NetScaler switched on. Press any key to restart the NetScaler. This command does not switch off the NetScaler. Therefore, do not switch off the AC power or remove the AC power cables.

**Note:**

You cannot shut down an appliance through the NetScaler GUI.

## How to synchronize system clock with servers on the network

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network.

You can configure clock synchronization on your appliance by adding NTP server entries to the `ntp.conf` file from either the GUI or the command line interface, or by manually modifying the `ntp.conf` file and then starting the NTP daemon (NTPD). The clock synchronization configuration does not change if the appliance is restarted, upgraded, or downgraded. However, the configuration does not get propagated to the secondary NetScaler in a high availability setup.

NetScaler GUI allows you to configure the time zone and the NTP server IP address required for clock synchronization on the first-time-user (FTU) screen.

**Note:**

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site, <<http://www.ntp.org>>, under Public Time Servers List. Before configuring your NetScaler to use a public NTP server, be sure to read the Rules of Engagement page (link included on all Public Time Servers pages).

In NetScaler release 11, the NTP version has been updated from 4.2.6p3 to 4.2.8p2.

## Pre-requisite

To configure clock synchronization, you must configure the following entities:

1. NTP servers
2. NTP synchronization.

## Add an NTP server by using the command interface

At the command prompt, type the following commands to add an NTP server and verify the configuration:

- `add ntp server (<serverIP> | <serverName>)[-minpoll <positive_integer>] [-maxpoll <positive_integer>]`
- `show ntp server`

**Example:**

```
1 add ntp server 10.102.29.30 -minpoll 6 -maxpoll 11
2 <!--NeedCopy-->
```

**Add an NTP server by using the GUI**

Navigate to **System > NTP Servers**, and create the NTP server.

**Enable NTP synchronization by using the command interface**

When you enable NTP synchronization, the NetScaler starts the NTP daemon and uses the NTP server entries in the `ntp.conf` file to synchronize its local time setting. If you do not want to synchronize the appliance time with the other servers in the network, you can disable NTP synchronization, which stops the NTP daemon (NTPD).

At the command prompt, type one of the following commands:

```
1 enable ntp sync
2 <!--NeedCopy-->
```

**Enable NTP synchronization by using the GUI**

Navigate to **System > NTP Servers**, click **Action** and select **NTP Synchronization**.

**Configure clock synchronization to edit a `ntp.conf` file by using the GUI**

1. Log on to the command line interface.
2. Switch to the shell prompt.
3. Copy the `/etc/ntp.conf` file to `/nsconfig/ntp.conf`, unless the `/nsconfig` directory already contains an `ntp.conf` file.
4. For each NTP server you want to add, you must add the following two lines to the `/nsconfig/ntp.conf` file:

```
1 server <IP address for NTP server> iburst
2
```

```

3 restrict <IP address for NTP server> mask <netmask> nomodify
 notrap nopeer noquery
4 <!--NeedCopy-->

```

**Note:**

For security reasons, there should be a corresponding restrict entry for each server entry.

**Example**

In the following example, an administrator has inserted # characters to “comment out” an existing NTP entry, and then added an entry:

```

1 #server 1.2.3.4 iburst
2
3 #restrict 1.2.3.4 mask 55.255.255.255 nomodify notrap nopeer
 noquery
4
5 server 10.102.29.160 iburst
6
7 restrict 10.102.29.160 mask 255.255.255.255 nomodify notrap nopeer
 noquery
8 <!--NeedCopy-->

```

5. If the `/nsconfig` directory does not contain a file named `rc.netscaler`, create the file.
6. Add the following entry to `/nsconfig/rc.netscaler`: `/bin/sh /etc/ntpd_ctl full_start`

This entry starts the `ntpd` service, checks the `ntp.conf` file, and logs messages in the `/var/log` directory.

This process runs every time the NetScaler is restarted.

7. Restart the NetScaler appliance to enable clock synchronization. Or, to start the time synchronization process without restarting the appliance, enter the following commands at the shell prompt:

```

1 rm /etc/ntp.conf
2 ln -s /nsconfig/ntp.conf /etc/ntp.conf
3 /bin/sh /etc/ntpd_ctl full_start
4 <!--NeedCopy-->

```

**How to configure session timeout for idle client connections**

A session timeout interval is provided to restrict the time duration for which a session (GUI, CLI, or API) remains active when not in use. For the NetScaler, the system session timeout can be configured at the following levels:

- **User level timeout.** Applicable to the specific user.

Interface type	Time out configuration
GUI	Navigate to <b>System &gt; User Administration &gt; Users</b> , select a user, and edit the user's timeout setting.
CLI	At the command prompt, enter the following command: <code>set system user &lt;name&gt; -timeout &lt;secs&gt;</code>

- **User group level timeout.** Applicable to all users in the group.

Interface type	Time out configuration
GUI	Navigate to <b>System &gt; User Administration &gt; Groups</b> , select a group, and edit the group's timeout setting.
CLI	At the command prompt, enter the following command: <code>set system group &lt;groupName&gt; -timeout &lt;secs&gt;</code>

- **Global system timeout.** Applicable to all users and users from groups who do not have a timeout configured.

Interface type	Time out configuration
GUI	Navigate to <b>System &gt; Settings</b> , click <b>Change global system</b> settings, and update the timeout value as required.
CLI	At the command prompt, enter the following command: <code>set system parameter -timeout &lt;secs&gt;</code>

The timeout value specified for a user has the highest priority. If timeout is not configured for the user, the timeout configured for a member group is considered. If timeout is not specified for a group (or the user does not belong to a group), the globally configured timeout value is considered. If timeout is not configured at any level, the default value of 900 seconds is set as the system session timeout.

Additionally, you can specify timeout durations for each of the interfaces you are accessing. However, the timeout value specified for a specific interface is restricted to the timeout value configured for the user that is accessing the interface. For example, let us consider an user “publicadmin” who has a timeout value of 20 minutes. Now, when accessing an interface, the user must specify a timeout value that is within 20 minutes.

**Note:**

You can choose to keep a check on the minimum and maximum timeout values by specifying the timeout as restricted (in CLI by specifying the *restrictedTimeout* parameter). This parameter is provided to account for previous NetScaler versions where the timeout value was not restricted.

- When enabled, the minimum configurable timeout value is 5 minutes (300 secs) and the maximum value is 1 day (86400 secs). If the timeout value is already configured to a value larger than 1 day, when this parameter is enabled, you are prompted to change it. If you do not change the value, the timeout value will automatically be reconfigured to the default timeout duration of 15 minutes (900 secs) on the next reboot. The same will happen is the configured timeout value is less than 5 minutes.
- When disabled, the configured timeout durations are considered.
- **Timeout duration at each interface:**

Interface type	Time out configuration
CLI	Specify the timeout value on the command prompt by using the following command: <code>set cli mode -timeout &lt;secs&gt;</code>
API	Specify the timeout value in the login payload.

## How to set system date and time to synchronize the clock with a time server

To change the system date and time, you must use the shell interface to the underlying FreeBSD OS. However, to view the system date and time, you can use the command line interface or the GUI.

### View system date and time by using the command interface

At the command prompt, type:

```
1 show ns config
2 <!--NeedCopy-->
```

## View system date and time by using the GUI

Navigate to **System** and select the **System Information** tab to view the system date.

## How to configure HTTP and HTTPS management ports for internal services

In a single-IP mode deployment of a NetScaler appliance, a single IP address is used as NSIP, SNIP, and VIP addresses. This single IP address uses different port numbers to function as NSIP, SNIP, and VIP addresses.

Port numbers 80 and 443 are well-known ports for HTTP and HTTPS services. Earlier, port 80 and 443 of the NetScaler IP address (NSIP) were dedicated ports for internal HTTP and HTTPS management services. Because these ports were reserved for internal services, you cannot use these well-known ports for providing HTTP and HTTPS data services from a VIP address, which has the same address as the NSIP address in a single-IP mode deployment.

To address this requirement, you can now configure ports for internal HTTP and HTTPS management services (of the NSIP address) other than port 80 and 443.

The following lists the default port numbers for internal HTTP and HTTPS management services in NetScaler MPX, VPX, and CPX appliances:

- NetScaler MPX and VPX appliances: 80 (HTTP) and 443 (HTTPS)
- NetScaler CPX appliances: 9080 (HTTP) and 9443 (HTTPS)

## Configure HTTP and HTTPS management ports by using the command interface

You can configure an HTTP and an HTTPS port to any value on the NetScaler appliance to support the HTTP and HTTPS management service. However, by default, the NetScaler appliance uses 80 and 443 ports for HTTP and HTTPS connection.

At the command prompt, type:

```
1 set ns param -mgmtHttpPort<port>
2 <!--NeedCopy-->
```

### Example:

```
1 set ns param -mgmtHttpPort 2000
2 <!--NeedCopy-->
```

To configure an HTTPS port by using the command interface

At the command prompt, type:

```
1 set ns param -mgmtHttpsPort<port>
2 <!--NeedCopy-->
```

**Example:**

```
1 set ns param -mgmtHttpsPort 3000
2 <!--NeedCopy-->
```

**Configure HTTP and HTTPS management ports by using the GUI**

Follow the steps given below to configure HTTP and HTTPS port values:

1. Navigate to **System > settings > Change global system settings**.
2. In **Configure Global System Settings Parameters** page, under **Other Setting** section, set the following parameters.
  - a) Management HTTP Port. set port value to 2000. Default = 80, Min = 1, Max = 65534.
  - b) Management HTTPS Port. set port value to 3000. Default = 443, Min = 1, Max = 65534.

**Configure the internal HTTP GUI service by using NetScaler GUI, or NetScaler CLI, or NetScaler NITRO APIs**

On a NetScaler appliance, the `/etc/httpd.conf` is the configuration file for the internal HTTP GUI service that manages connections to the NetScaler GUI.

Instead of using the `httpd.conf` file for configuring the internal HTTP GUI service, you can now use NetScaler GUI, or NetScaler CLI, or NetScaler NITRO APIs. For example, you can use the NetScaler CLI to modify the maximum number of clients that can connect to the internal HTTP GUI service at a time.

The internal HTTP GUI service has the following name format: **nshttpd-gui-<loop back IP address>-80**

Use the NetScaler service command operations to configure the internal HTTP GUI service.

**To modify the internal HTTP GUI service by using the CLI:**

- Use the `set service` command. For more information, see [set service](#).
- Use the `show service` command to verify the configuration. For more information, see [show service](#).

**Sample configuration:**

In the following sample configuration, the `maxClient` parameter is set to 300 for the internal HTTP GUI service.

```
1 > sh service nshttpd-gui-127.0.0.1-80
2 nshttpd-gui-127.0.0.1-80 (127.0.0.1:80) - HTTP
3 State: UP
4 Last state change was at Wed Mar 16 20:16:16 2022

## Trigger memory recovery by using the command interface

You can trigger memory recovery from the command line interface.

At the command prompt, type the following command:

```
start ns memrecovery [-percentage <positive_integer>]
```

**Example:**

```
start nsmemrecovery -percentage 30
```

To check the actual amount of memory recovered, use the following command at the command prompt:

```
stat system memory
```

### **How to allocate extra management CPU for data processing and monitoring**

If you need better performance for configuration and monitoring of a NetScaler MPX appliance, you can allocate an extra management CPU from the appliance's packet engine pool. This feature is supported on certain NetScaler MPX models and all VPX models except the VPX instances that run on NetScaler SDX appliances. It affects the output of the `stat system CPU` and `stat system` commands.

Supported NetScaler MPX models:

- 25xxx
- 22xxx
- 14xxx
- 115xx
- 15xxx
- 26xxx

**Note:**

For NetScaler MPX 26xxx models with more than 20 cores, the mandatory extra management CPU feature is enabled by default. For NetScaler VPX models, a license that supports at least 12 vCPUs is required to enable this feature.

### **Allocate an extra management CPU by using the command interface**

At the command prompt, type one of the following commands:

- `enable extramgmtcpu`
- `disable extramgmtcpu`

**Note:**

After you enable and disable this feature, the NetScaler appliance displays a warning to restart the appliance, for the changes to take effect.

To show the configured and effective state of an extra management CPU.

At the command prompt, type:

```
1 show extramgmtcpu
2 <!--NeedCopy-->
```

#### Example:

```
1 > show extramgmtcpu
2 ConfiguredState: ENABLED EffectiveState: ENABLED
3 <!--NeedCopy-->
```

#### Note:

In this example, the show command is entered before restarting the appliance.

### Allocate an extra management CPU by using the GUI

To allocate an extra management CPU by using the GUI, navigate to **System > Settings** and click **Configure Extra Management CPU**. From the **Configured State** drop-down menu, select **Enabled** and then select **OK**.

To check CPU usage, go to **System > Settings > Dashboard**.

### Configure an extra management CPU by using the NITRO API

Use the following NITRO methods and formats to enable, disable, and show an extra management CPU.

#### To enable an extra management CPU:

```
1 HTTP Method: POST
2
3 URL: http://<NSIP>/nitro/v1/config/systemextramgmtcpu?action=enable
4
5 Payload: {
6 "systemextramgmtcpu":{
7 }
8 }
9
10
11 curl -v -X POST -H "Content-Type: application/json" -u nsroot:nsroot
 http://10.102.201.92/nitro/v1/config/systemextramgmtcpu?action=
 enable -d '{
```

```

12 "systemextramgmtcpu":{
13 }
14 }
15 '
16 <!--NeedCopy-->

```

To disable an extra management CPU

```

1 HTTP Method: POST
2 URL: http://<NSIP>/nitro/v1/config/systemextramgmtcpu?action=disable
3 Payload: {
4 "systemextramgmtcpu":{
5 }
6 }
7
8 curl -v -X POST -H "Content-Type: application/json" -u nsroot:nsroot
 http://10.102.201.92/nitro/v1/config/systemextramgmtcpu?action=
 disable -d '{
9 "systemextramgmtcpu":{
10 }
11 }
12 '
13 <!--NeedCopy-->

```

To show an extra management CPU

```

1 HTTP Method: GET
2 URL: http://<NSIP>/nitro/v1/config/systemextramgmtcpu
3 <!--NeedCopy-->

```

#### Example:

```

1 curl -v -X GET -H "Content-Type: application/json" -u nsroot:nsroot
 http://10.102.201.92/nitro/v1/config/systemextramgmtcpu
2 <!--NeedCopy-->

```

### Statistics and monitoring before and after adding extra management CPU

The following examples show the differences in the output of the stat system CPU and stat system commands before and after adding an extra management CPU.

```

1 stat system cpu
2 <!--NeedCopy-->

```

This command displays statistics of CPUs.

Here is a sample output before adding an extra management CPU on one of the supported models.

Example

```

1 > stat system cpu

```

```

2
3 CPU statistics
4
5 ID Usage
6
7 8 1
8
9 7 1
10
11 11 2
12
13 1 1
14
15 6 1
16
17 9 1
18
19 3 1
20
21 5 1
22
23 4 1
24
25 10 1
26
27 2 1
28 <!--NeedCopy-->

```

Here is the output after adding an extra management CPU on the same MPX appliance.

```

1 > stat system cpu
2
3 CPU statistics
4
5 ID Usage
6
7 9 1
8
9 7 1
10
11 5 1
12
13 8 1
14
15 11 2
16
17 10 1
18
19 6 1
20
21 4 1
22
23 3 1

```

```

24
25 2 1
26 <!--NeedCopy-->

```

```

1 stat system
2 <!--NeedCopy-->

```

This command displays CPU use. In the following example, the output before adding an extra management CPU on one of the supported models is:

Mgmt Additional-CPU usage (%) 0.00

#### Example

```

1 > stat system
2
3 NetScaler Executive View
4
5 System Information:
6
7 Up since Wed Oct 11 11:17:54 2017
8
9 /flash Used (%) 0
10
11 Packet CPU usage (%) 1.30
12
13 Management CPU usage (%) 4.00
14
15 Mgmt CPU0 usage (%) 4.00
16
17 Mgmt Additional-CPU usage (%) 0.00
18
19 Memory usage (MB) 2167
20
21 InUse Memory (%) 5.76
22
23 /var Used (%) 0
24 <!--NeedCopy-->

```

In the following example, the output after adding an extra management CPU on the same MPX appliance is:

Mgmt Additional-CPU usage (%) 0.80

```

1 > stat system
2
3
4 NetScaler Executive View
5
6 System Information:
7
8 Up since Wed Oct 11 11:55:56 2017
9

```

```
10 /flash Used (%) 0
11
12 Packet CPU usage (%) 1.20
13
14 Management CPU usage (%) 5.70
15
16 Mgmt CPU0 usage (%) 10.60
17
18 Mgmt Additional-CPU usage (%) 0.80
19
20 Memory usage (MB) 1970
21
22 InUse Memory (%) 5.75
23
24 /var Used (%) 0
25
26 <!--NeedCopy-->
```

## How to backup and restore your appliance to recover lost configuration

When your appliance gets corrupted or needs an upgrade, you can back up your system configuration. The backup procedure is done either through the CLI or GUI interface. The appliance also enables you to import the backup file from an external source. However, you can do this only through the GUI interface and there is no support through the CLI interface.

### Points to remember

You must remember the following points when your backup and restore your appliance.

- There must be a support for network configuration on a new platform.
- The new platform build must be same as the backup file or a later version.

### Back up a NetScaler appliance

Depending on data and backup requirement, you can create a “basic” backup or a “full” backup.

- **Basic backup.** You can perform this type of backup if you want to back up files that constantly change. The files that you can back up are in the following table.

For information about the basic backup details, see the [Table](#) topic.

- **Full backup.** In addition to the files that are backed up by a basic backup, a full backup has less frequently updated files. The files that are backed up when you use the “Full” backup option are:

Directory	Sub-Directory or Files
nsconfig	ssl, license, fips*
/var/	netscaler/ssl/ wi/java_home/jre/lib/security/cacerts/ wi/java_home/lib/security/cacerts/*

The backed-up data is stored as a compressed TAR file in the `/var/ns_sys_backup/` directory. To avoid issues due to non-availability of disk space, you can store up to 50 backup files in this directory. You can use the `rm system backup` command to delete existing backup files and create more backups.

**Note:**

When the backup operation is in progress, do not run commands that affect the configuration.

If a file that is required to be backed up is not available, the operation skips that file.

**Back up a NetScaler appliance using command interface**

Follow the procedure given below to back up a NetScaler appliance by using the NetScaler command interface.

At the command prompt, do the following:

1. Save the NetScaler configurations.

```
1 save ns config
2 <!--NeedCopy-->
```

1. Create the backup file.

```
1 create system backup [<fileName>] -level <basic | full> -comment <
 string>
2 <!--NeedCopy-->
```

**Note:**

If the file name is not specified, the appliance creates a TAR file with the following naming convention: `backup_<level>_<nsip_address>_<date-timestamp>.tgz`.

**Example:** To back up the full appliance using the default naming convention for the backup file.

```
1 > create system backup -level full
2 <!--NeedCopy-->
```

1. Verify that the backup file was created.

```
1 show system backup
2 <!--NeedCopy-->
```

You can view the properties of a specific backup file by using the `fileName` parameter.

## Restore a NetScaler appliance by using the command interface

### Important:

You cannot successfully restore your appliance, if you rename or modify your backup file.

When you restore your appliance, the restore operation untars the backup file from the `/var/ns_sys_backup/` directory. Once the files are untarred, the files are copied to the respective directories.

## Restore the NetScaler from a local backup file by using the command interface

### Note:

Citrix recommends you to back up the current configuration before restoring a previous configuration. However, if you do not want the restore command to automatically create a backup of the current configuration, use the `-skipBackup` parameter.

At the command prompt, do the following:

1. Obtain a list of the backup files available on the appliance.

```
1 show system backup
2 <!--NeedCopy-->
```

2. Restore the appliance by specifying one of the backup files.

```
restore system backup <filename> [-skipBackup]
```

**Example:** To restore by using a full backup of an appliance

```
> restore system backup backup_full_<nsip_address>_<date-timestamp>
>.tgz
```

3. Reboot the appliance.

```
reboot
```

## Backup and restore a NetScaler appliance by using the GUI

1. Navigate to **System > Backup and Restore**.
2. Click **Backup/Import** to start the process.
3. In the **Backup/Import** page, select **Create** and set the following parameters.
  - a) File Name. Name of the appliance backup file.
  - b) Level. Select a backup level as basic or full.
  - c) Comment. Provide a brief description for the backup.
4. Click **Backup**.
5. If you want to import a backup, you must select **Import**.
6. Once backup is complete, you can select the file and click **Download**.
7. To restore, select the backup file and click **Restore**.
8. In the **Restore** page, verify backup file details and click **Restore**.
9. After you restore, you must reboot the appliance.

For more information on how to backup and restore NetScaler instances, see [Backup and Restore using NetScaler Console](#) topic.

For more information on how to backup and restore an SDX appliance, see [Backup and restore SDX appliance](#)

For information about operations performed on system backup, see [System Backup](#) topic.

## How to generate technical support bundle for resolving appliance issues

For help with analyzing and resolving any issues with a NetScaler appliance, you can generate a technical support bundle on the appliance and send the bundle to Citrix technical support. The NetScaler technical support bundle is a zipped tar archive of system configuration data and statistics. It collects the following data from the NetScaler on which you generate the bundle:

- **Configuration files.** All files in the `/flash/nsconfig` directory.
- **Newslog files.** The currently running newslog and some previous files. To minimize the archive file size, newslog collection is restricted to 500 MB, 6 files, or 7 days, whichever occurs first. If older data is needed, it might require manual collection.
- **Log files.** Files in `/var/log/messages`, `/var/log/ns.log`, and other files under `/var/log` and `/var/nslog`.
- **Application core files.** Files created in the `/var/core` directory within the last week, if any.
- **Output of a few CLI show commands.**

- **Output of a few CLI stat commands.**
- **Output of BSD shell commands.**

The technical support bundle is saved on the NetScaler appliance in an archive at the following location:

```
1 /var/tmp/support/support.tgz
2 <!--NeedCopy-->
```

The path is a symlink to the most recent collector for easy access. The full file name varies, depending on the deployment topology, but generally follows a format similar to:

```
1 collector_<P/S>_<NS IP>_<DateTime>.tgz.
2 <!--NeedCopy-->
```

You can use a single command to generate the technical support bundle and securely upload it to the Citrix technical support server. Starting from NetScaler 14.1-8.x release, you must generate an authentication token before you upload the technical support bundle. Previously, you used Citrix username and password to upload the technical support bundle.

To generate the authentication token:

1. Launch a browser and enter the following URL - [https://cis.citrix.com/auth/api/create\\_identity\\_v2/?expiration=3600](https://cis.citrix.com/auth/api/create_identity_v2/?expiration=3600)
2. Log in using multifactor authentication.

**Note:**

For information on how to enroll for multifactor authentication, see <https://support.citrix.com/article/CTX461297/how-to-enroll-into-multi-factor-authentication-mfa>.

3. Click **Copy** to copy the authentication token displayed on the screen. The token is valid for 3600 seconds (1 hour). The maximum allowed length for the token is 1023 characters.

After copying the authentication token, use the CLI or GUI to upload the file.

To upload the technical support bundle using the CLI, run the following command:

```
1 showtechsupport -upload -file <string> -description <string> -authtoken
 <string>
2 <!--NeedCopy-->
```

Example:

```
1 showtechsupport -upload -file /var/tmp/support/callhome/
 collector_callhome_P_10.102.168.52_14Mar2022_12_50.tar.gz -
 description "test upload" -authtoken
 eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.
 eyJzdWIiOiJDSVMiLCJpc3MiOiJidHMuY2lzLmNpdHJpeC5jb20iLCJqdGkiOiJkNDI4N

```

```
2 <!--NeedCopy-->
```

To upload the technical support bundle using the GUI:

1. Navigate to **Configuration > System > Diagnostics**.
2. In the Technical Support Tools section, click **Generate support file**.
3. Use the **Scope** option to specify if you want to gather data on the present node, all cluster nodes, or for the specified partitions.
4. Select **Upload the Collector Archive**.
5. In the **My Citrix Account** section, enter the authentication token in the **Citrix Authentication Token** field.

If your NetScaler appliance does not have direct internet connectivity, you can use a proxy server to directly upload the technical support bundle to the Citrix technical support server. The basic format of the proxy string is:

```
1 proxy_IP:<proxy_port>
2 <!--NeedCopy-->
```

If the proxy server requires authentication, the format is:

```
1 username:password@proxsy_IP:<proxy_port>
2 <!--NeedCopy-->
```

#### Note:

For NetScaler appliances in a high availability pair, you must generate the technical support bundle on each of the two nodes.

For NetScaler appliances in a cluster setup, you can generate the technical support bundle on each node individually, or you can generate smaller abbreviated archives for all nodes by using the cluster IP address.

For NetScaler admin partitions, you must generate the technical support bundle from the default admin partition. To get the technical support bundle for a specific partition, you must specify the name of the partition for which you want to generate the technical support bundle. If you do not specify the name of the partition, data is collected from all admin partitions.

### Generate the NetScaler technical support bundle by using the command interface

At the command prompt, type:

```
1 show techsupport [-scope <scope> <partitionName>] [-upload [-proxy <
 string>] [-casenumber <string>] [-file <string>] [-description <
 string>] [-authtoken <string>]]
2 <!--NeedCopy-->
```

**Note:**

Starting with NetScaler 14.1 release build 8.x, the username and password parameters used to upload the technical support bundle are removed. You must use the authToken parameter to upload the technical support bundle.

Sr. No	Task	Command
1	Generate and upload the technical support bundle to the Citrix technical support server.	show techsupport –upload -authToken eyJhbGciOiJ-SUZl1NiIsInR5cCI6IkpXVCJ9.eyJzdWliOiJDSV
2	Generate and upload the technical support bundle to the Citrix technical support server through a proxy server	show techsupport –upload – proxy 1.1.1.1:80 -authToken eyJhbGciOiJ-SUZl1NiIsInR5cCI6IkpXVCJ9.eyJzdWliOiJDSV
3	Upload an existing technical support bundle to the Citrix technical support server.	show techsupport –upload -file,/var/tmp/support/collector_P_10.102.29 -authToken eyJhbGciOiJ-SUZl1NiIsInR5cCI6IkpXVCJ9.eyJzdWliOiJDSV
4	Generate small, abbreviated archives for all nodes in a Cluster setup. Use cluster IP address to run this command.	show techsupport –scope CLUSTER
5	Generate a technical support bundle specific to an admin partition. Run this command on the default admin partition.	show techsupport –scope PARTITION partition1

**How to collect the technical support bundle from SDX and VPX appliances for insight analysis**

A NetScaler appliance has a built-in mechanism to collect log files. The log files are in turn sent to Citrix Insight Services for analysis.

**Note:**

All procedures are applicable for software release 9.2 or later.

## Download technical support bundle from NetScaler MPX and VPX appliances

To run a collector file by using the NetScaler GUI, you must complete the following procedure:

**Note:**

The procedure is applicable for software release 9.2 or later.

1. Navigate to **System > Diagnostic**.
2. In the **Technical Support Tools** section, click **Generate Support File** link.
3. In the **Tech Support** page, set the following parameters:
  - a) Scope. To collect data from one or more nodes.
  - b) Partition. Name of the partition.
  - c) Citrix technical support load Options. Set all options such as proxy server, service case number, collector archive file name and a brief description of the archive file for uploading the technical support bundle.
  - d) Citrix Account. Enter your Citrix credentials.
4. Click **Run**.
5. The Technical Support bundle is generated.
6. Click **Yes** to download the Technical support bundle to your local desktop.

## Obtain technical support bundle by using the command interface

1. Download the file from the appliance using a Secure FTP (SFTP) or Secure Copy (SCP) utility, such as [WinSCP](#), and upload it to Citrix Insight Services for analysis.

**Note:**

In the NetScaler software release earlier than 9.0, the collector script must be downloaded separately and run.

```
1 > show techsupport -scope CLUSTER
2 <!--NeedCopy-->
```

1. The `show techsupport -scope CLUSTER` command collects show technical support information from all nodes in the cluster and compresses the files into a single archive.
2. After the appliance generates the collector archive the location of the file is displayed as shown in the following screenshot.

```
TEST> sh techsupport

showtechsupport data collector tool - $Revision: #1 $!
NetScaler version 9.2
The NS IP of this box is ...
Current HA state: Primary (or this is not part of HA pair!)
This tool was just run in the last one minute!
The data in this directory will be overwritten!
All the data will be collected under
/var/tmp/support/collector_10_104_00_00_P_21Nov2013_19_50
Copying selected configuration files from nsconfig
Running shell commands
Running CLI show commands
Running CLI stat commands
Running vtysh commands
```

The file is stored in `/var/tmp/support` and you can verify it by logging into a NetScaler appliance and running the following command from a shell prompt.

```
1 root@NS# cd /var/tmp/support/
2 root@NS# ls -l
3 <!--NeedCopy-->
```

### Obtain diagnostic bundle from NetScaler SDX using the GUI

1. Open the NetScaler SDX GUI.
2. Expand the **Diagnostics** node.
3. Select the **Technical Support** node.
4. Click Generate Technical Support File.
5. Select **Appliance** (Including Instances) from the drop-down menu.
6. Click **Add**.
7. Select one or more instances to add in.
8. Click **OK**. Wait for the process to complete.
9. Select the bundle name that was generated and then click **Download**
10. Upload the bundle file to [Citrix Insight Services](#).

## Unified configuration file for the NetScaler appliance

August 16, 2023

The NetScaler appliance supports a unified configuration file (`unified.conf`) that contains the NetScaler configurations (`ns.conf`), dynamic routing configurations (`zebos.conf`), and the Hardware Security Module (HSM) configurations (`chrystoki.conf`).

The unified configuration file provides a single view of different types of configurations. This unified configuration file is only for viewing purpose and it cannot be used to apply the configurations in another NetScaler appliance.

The complete path of the unified configuration file in the NetScaler appliance is: `/nsconfig/unified.conf`. You can access the unified configuration file by using the shell command prompt. The unified configuration file is supported only for standalone NetScaler appliances and high availability setups.

Saving a NetScaler configuration or a dynamic routing configuration also automatically saves the configuration in the unified configuration file along with saving in the NetScaler configuration file (`ns.conf`) or the dynamic routing configuration file (`zebos.conf`).

Saving a Hardware Security Module (HSM) configuration does not automatically saves the configuration in the unified configuration file. You need to perform the `saveconfig` operation, which syncs the HSM configuration file (`chrystoki.conf`) to the unified configuration file.

### Sample output

In the following excerpt of sample unified configuration file (`unified.conf`), the NetScaler configurations are listed first, followed by the dynamic configurations in heading `»> VTYSH START CONFIG »>`, followed by the Hardware Security Module (HSM) configurations listed in heading `»> START OF HSM CONFIG »>`.

```

## System user authentication and authorization

May 2, 2023

To configure NetScaler user authentication and authorization, you must first define the users who have access to the NetScaler appliance, and then you can organize these users into groups. After configuring users and groups, you need to configure command policies to define types of access, and assign the policies to users and/or groups.

You must log on as an administrator to configure users, groups, and command policies. The default NetScaler administrator user name is *nsroot*. After logging on as the default administrator, you should change the password for the *nsroot* account. Once you have changed the password, no user can access the NetScaler appliance until you create an account for that user. If you forget the administrator password after changing it from the default, you can reset it to *nsroot*.

### Note:

- Local users can authenticate to the NetScaler even if external authentication servers are configured. You can restrict this by disabling the `localAuth` parameter of the `set system` parameter command.
- For enhanced security, Citrix recommends that you change the *nsroot* password. Frequently changing the password is advisable. For information about how to change the *nsroot* password, see [Resetting the default administrator \(nsroot\) password](#) topic.

## User, user groups, and command policies

December 15, 2023

You must first define a user with an account and then organize all users into groups. You can create command policies, or use built-in command policies to regulate user access to commands.

**Note:**

If you prefer to know more about configuring user and user groups as part of NetScaler authentication and authorization setup for traffic management, see [Configure users and groups](#) topic.

You can also customize the command-line prompt for a user. Prompts can be defined in a user's configuration, in a user-group configuration, and in the global system configuration settings. The prompt displayed for a user is in the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user's group.
3. Display the prompt as defined in the system global configuration settings.

You can now specify a timeout value for inactive CLI sessions for a system user. If a user's CLI session is idle for a time that exceeds the timeout value, the NetScaler appliance terminates the connection. The timeout can be defined in a user configuration, in a user-group configuration, or in the global system configuration settings. The timeout for inactive CLI sessions for a user is determined in the following order of precedence:

1. User configuration.
2. Group configuration for the user's group.
3. Global system configuration settings.

A NetScaler root administrator can configure the maximum concurrent session limit for system users. By restricting the limit, you can reduce the number of open connections and improve server performance. As long as the CLI count is within the configured limit, concurrent users can log on the GUI any number of times. However, if the number of CLI sessions reaches the configured limit, users can no longer log on to the GUI. For example, if the number of concurrent sessions is configured to 20, concurrent users can log on to 19 CLI sessions. But if the user is logged on to the 20<sup>th</sup> CLI session, any attempt to log on to the GUI, CLI, or NITRO results in an error message ((ERROR: Connection limit to CFE exceeded).

**Note:**

The default the number of concurrent sessions is configured to 20 and the maximum number of concurrent sessions is configured to 40.

## Configure user accounts

To configure user accounts, you simply specify user names and passwords. You can change passwords and remove user accounts at any time.

**Note:**

All characters in a password are not accepted. However, it works if you type the characters within quotes.

Also, the string must not exceed a maximum length of 127 characters.

To create a user account by using the command line interface

At the command prompt, type the following commands to create a user account and verify the configuration:

- `add system user <username> [-externalAuth ( ENABLED | DISABLED )] [-promptString <string>] [-timeout \<secs>] [-logging ( ENABLED | DISABLED )] [-maxsession <positive_integer>]`
- `show system user <userName>`

External users can configure the “logging” parameter to collect external logs using web logging or audit logging mechanism. If the parameter is enabled, the auditing client authenticates itself with NetScaler appliance to collect logs.

**Example:**

```
> add system user johnd -promptString user-%u-at-%T
```

```
1 Enter password:
2 Confirm password:
3 > show system user johnd
4 user name: john
5 Timeout:900 Timeout Inherited From: Global
6 External Authentication: ENABLED
7 Logging: DISABLED
8 Maximum Client Sessions: 20
9 <!--NeedCopy-->
```

For parameter description, see [Authentication and authorization user command reference](#) topic.

**Configure a user account by using the NetScaler GUI**

1. Navigate to **System > User Administration > Users**, and create the user.
2. In the details pane, click **Add** to create a system user.
3. In the **Create System Group** page, set the following parameters:
  - a) User Name. Name of the user group.
  - b) CLI Prompt. The prompt that you prefer to set for the CLI interface access.

- c) Idle Session Timeout (secs). Set the time a user can be inactive before the session times out and closes.
  - d) Maximum sessions. Set the maximum number of sessions that a user can try. For a nsroot user, the max session parameter cannot be modified.
  - e) Enable Logging Privilege. Enable logging privilege for the user.
  - f) Enable external Authentication. Select the option if you want to use an external authentication server for authenticating the user.
  - g) Allowed Management Interface. Select the NetScaler interfaces for which the user group is granted permission to access.
  - h) Command Policies. Bind command policies to the user group.
  - i) Partitions. Bind partitions to the user group.
4. Click **Create** and **Close**.

## Configure user groups

After configuring a user group, you can easily grant the same access rights to everyone in the group. To configure a group, you create the group and bind users to the group. You can bind each user account to more than one group. Binding user accounts to multiple groups might allow more flexibility when applying command policies.

### To create a user group by using the command line interface

At the command prompt, type the following commands to create a user group and verify the configuration:

- `add system group <groupName> [-promptString <string>] [-timeout <secs>]`
- `show system group <groupName>`

#### Example:

```
> add system group Managers -promptString Group-Managers-at-%h
```

### Bind a user account to a group by using the CLI

At the command prompt, type the following commands to bind a user account to a group and verify the configuration:

- `bind system group <groupName> -userName <userName>`
- `show system group <groupName>`

#### Example:

```
> bind system group Managers -userName user1
```

### Configure a user group by using the NetScaler GUI

1. Navigate to **System > User Administration > Groups**, and create the user group.
2. In the details pane, click **Add** to create a system user group.
3. In the **Create System Group** page, set the following parameters:
  - a) Group Name. Name of the user group.
  - b) CLI Prompt. The prompt that you prefer to set for the CLI interface access.
  - c) Idle Session Timeout (secs). Set the time a user can be inactive before the session times out and closes.

- d) Allowed Management Interface. Select the NetScaler interfaces for which the user group is granted permission to access.
  - e) Members. Add user accounts to the group.
  - f) Command Policies. Bind command policies to the user group.
  - g) Partitions. Bind partitions to the user group.
4. Click **Create** and **Close**.

## Configure command policies

Command policies regulate which commands, command groups, virtual servers, and other entities that users and user groups are permitted to use.

The appliance provides a set of built-in command policies, and you can configure custom policies. To apply the policies, you bind them either to users or to groups.

Here are the key points to keep in mind when defining and applying command policies.

- You cannot create global command policies. Command policies must be bound directly to the users and groups on the appliance.
- Users or groups with no associated command policies are subject to the default (DENY-ALL) command policy, and are therefore unable to run any configuration commands until the proper command policies are bound to their accounts.
- All users inherit the policies of the groups to which they belong.
- You must assign a priority to a command policy when you bind it to a user account or group account. This enables the appliance to determine which policy has priority when two or more conflicting policies apply to the same user or group.
- If you bind two different command policies of the same priority to a user account or group account, the policy that you bind first takes the highest priority.
- The following commands are available by default to any user and are unaffected by any command you specify:
- help, show CLI attribute, set CLI prompt, clear CLI prompt, show CLI prompt, alias, unalias, history, quit, exit, whoami, config, set CLI mode, unset CLI mode, and show CLI mode.

The following table describes the built-in policies.

---

<b>Policy name</b>	<b>Allows</b>
read-only	Read-only access to all show commands except show ns runningConfig, show ns ns.conf, and the show commands for the NetScaler command group.
operator	Read-only access and access to commands to enable and disable services and servers.
network	Full access, except to the set and unset SSL commands, show ns ns.conf, show ns runningConfig, and show gslb runningConfig commands.

Policy name	Allows
sysadmin	[Included in NetScaler 12.0 and later] A sysadmin is lower than a superuser in terms of access allowed on the appliance. A sysadmin user can perform all NetScaler operations with the following exceptions: no access to the NetScaler shell, cannot perform user configurations, cannot perform partition configurations, and some other configurations as stated in the sysadmin command policy.
superuser	Full access. Same privileges as the nsroot user.

### Create custom command policies

Regular expression support is offered for users with the resources to maintain more customized expressions, and for those deployments that require the flexibility that regular expressions offer. For most users, the built-in command policies are sufficient. Users who need more levels of control but are unfamiliar with regular expressions might want to use only simple expressions, such as those in the examples provided in this section, to maintain policy readability.

When you use a regular expression to create a command policy, keep the following in mind.

- When you use regular expressions to define commands that are affected by a command policy, you must enclose the commands in double quotation marks. For example, to create a command policy that includes all commands that begin with **show**, type the following:
  - “`^show.*$`”
- To create a command policy that includes all commands that begin with **rm**, type the following:
  - “`^rm.*$`”
- Regular expressions used in command policies are not case sensitive.

The following table lists examples of regular expressions for Command Policies:

Command specification	Matches these commands
“ <code>^rm\s+.*\$</code> ”	All remove actions, because all remove actions begin with the <code>rm</code> string, followed by a space and more parameters such as command groups, command object types, and arguments.

Command specification	Matches these commands
“ <code>^show\s+.*\$</code> ”	All show commands, because all show actions begin with the show string, followed by a space and more parameters such as command groups, command object types, and arguments.
“ <code>^shell\$</code> ”	The shell command alone, but not combined with any additional parameters such as command groups, command object types, and arguments.
“ <code>^add\s+vserver\s+.*\$</code> ”	All create virtual server actions, which consist of add virtual server command followed by a space and more parameters such as command groups, command object types, and arguments.
“ <code>^add\s+(lb\s+vserver)\s+.*\$</code> ”	All create lb virtual server actions, which consist of the add lb virtual server command followed by a space and more parameters such as command groups, command object types, and arguments.

For information about built-in command policies, see table [Built-in command policy](#) table.

To create a command policy by using the command line interface

At the command prompt, type the following commands to create a command policy and verify the configuration:

- `add system cmdPolicy <policyname> <action> <cmdsSpec>`
- `show system cmdPolicy <policyName>`

#### Example:

```
add system cmdPolicy USER-POLICY ALLOW (\ server\)|(\ service(Group)
*\)|(\ vserver\)|(\ policy\)|(\ policylabel\)|(\ limitIdentifier\
)|(^show\ (?!(system|ns\ (ns.conf|runningConfig))))|(save)|(stat\ .*
serv)
```

#### Configure a command policy by using the NetScaler GUI

1. Navigate to **System > User Administration > Command Policies**.
2. In the details pane, click **Add** to create a command policy.
3. In the **Configure Command Policy** page, set the following parameters:

- a) Policy name
- b) Action
- c) Command Spec.

4. Click **OK**.

### Bind command policies to user accounts and user groups

Once you have defined your command policies, you must bind them to the appropriate user accounts and groups. When you bind a policy, you must assign it a priority so that the appliance can determine which command policy to follow when two or more applicable command policies are in conflict.

Command policies are evaluated in the following order:

- Command policies bound directly to users and the corresponding groups are evaluated according to a priority number. A command policy with a lower priority number is evaluated before one with a higher priority number. Therefore, any privileges the lower-numbered command policy explicitly grants or denies are not overridden by a higher-numbered command policy.
- When two command policies, one bound to a user account and other to a group, have the same priority number, the command policy bound directly to the user account is evaluated first.

To bind command policies to a user by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user and verify the configuration:

- `bind system user <userName> -policyName <policyName> <priority>`
- `show system user <userName>`

**Example:**

```
> bind system user user1 -policyName read_all 1
```

**Bind command policies to a user account by using the NetScaler GUI**

Navigate to **System > User Administration > Users**, select the user and bind command policies.

Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

To bind command policies to a group by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user group and verify the configuration:

- `bind system group <groupName> -policyName <policyName> <priority>`
- `show system group <groupName>`

**Example:**

```
> bind system group Managers -policyName read_all 1
```

**Bind command policies to a user group by using the NetScaler GUI**

Navigate to **System > User Administration > Groups**, select the group and bind command policies.

### Example use case: Manage user accounts, user groups, and command policies in a manufacturing organization

The following example shows how to create a complete set of user accounts, groups, and command policies and bind each policy to the appropriate groups and users. The company, Example Manufacturing, Inc., has three users who can access the NetScaler appliance:

- **John Doe.** The IT manager. John must be able to see all parts of the NetScaler configuration but does not need to modify anything.
- **Maria Ramiez.** The lead IT administrator. Maria must be able to see and modify all parts of the NetScaler configuration except for NetScaler commands (which local policy dictates must be performed while logged on as nsroot).

- **Michael Baldrock.** The IT administrator in charge of load balancing. Michael must be able to see all parts of the NetScaler configuration, but must modify only the load balancing functions.

The following table shows the breakdown of network information, user account names, group names, and command policies for the sample company.

---

Field	Value	Note
NetScaler host name	ns01.example.net	N/A
User accounts	johnd, mariar, and michaelb	John Doe, IT manager, Maria Ramirez, IT administrator and Michael Baldrock, IT administrator.
Groups	Managers and SysOps	All managers and all IT administrators.
Command Policies	read_all, modify_lb, and modify_all	Allow complete read-only access, Allow modify access to load balancing, and Allow complete modify access.

---

The following description walks you through the process of creating a complete set of user accounts, groups, and command policies on the NetScaler appliance named ns01.example.net.

The description includes procedures for binding the appropriate user accounts and groups to one another, and binding appropriate command policies to the user accounts and groups.

This example illustrates how you can use prioritization to grant precise access and privileges to each user in the IT department.

The example assumes that initial installation and configuration have already been performed on the NetScaler.

### **Configure user accounts, groups, and command policies for a sample organization**

1. Use the procedure described in Configuring User Accounts section to create user accounts **johnd**, **mariar**, and **michaelb**.
2. Use the procedure described in Configuring User Groups to create user groups **Managers** and **SysOps**, and then bind the users **mariar** and **michaelb** to the **SysOps** group and the user **johnd** to the **Managers** group.
3. Use the procedure described in Creating Custom Command Policies to create the following command policies:

- **read\_all** with action **Allow** and command spec "`(^show\s+(?!system)(?!ns ns .conf)(?!ns runningConfig).*)|(^stat.*)`"
  - **modify\_lb** with action as **Allow** and the command spec "`^set\s+lb\s+.*$`"
  - **modify\_all** with action as **Allow** and the command spec "`^\S+\s+(?!system).*`"
4. Use the procedure described in “Binding Command Policies to Users and Groups” to bind the **read\_all** command policy to the **SysOps** group, with priority value **1**.
  5. Use the procedure described in “Binding Command Policies to Users and Groups” to bind the **modify\_lb** command policy to user **michaelb**, with priority value **5**.

The configuration you just created results in the following:

- John Doe, the IT manager, has read-only access to the entire NetScaler configuration, but he cannot make modifications.
- Maria Ramirez, the IT lead, has near-complete access to all areas of the NetScaler configuration, having to log on only to perform NetScaler-level commands.
- Michael Baldrock, the IT administrator responsible for load balancing, has read-only access to the NetScaler configuration, and can modify the configuration options for load balancing.

The set of command policies that applies to a specific user is a combination of command policies applied directly to the user’s account and command policies applied to one or more groups of which the user is a member.

Each time a user enters a command, the operating system searches the command policies for that user until it finds a policy with an ALLOW or DENY action that matches the command. When it finds a match, the operating system stops its command policy search and allows or denies access to the command.

If the operating system finds no matching command policy, it denies the user access to the command, in accordance with the NetScaler appliance’s default deny policy.

**Note:**

When placing a user into multiple groups, take care not to cause unintended user command restrictions or privileges. To avoid these conflicts, when organizing your users in groups, bear in mind the NetScaler command policy search procedure and policy ordering rules.

## User account and password management

January 10, 2024

NetScaler enables you to manage user accounts and password configuration. Following are some of the activities that you can perform using a system user account or `nsroot` administrative user account.

- System user account lockout
- Lock system user account for management access
- Unlock a locked system user account for management access
- Disable management access for system user account
- Notify users for `nsroot` password change
- Force password change for `nsroot` administrative users
- Remove sensitive files in a system user account
- Strong password configuration for system users

### System user account lockout

To prevent brute force security attacks, you can configure the user lockout configuration. The configuration enables a network administrator to prevent a system user to log on to NetScaler. Also, unlock the user account before the lock period expires.

To get the details of the unsuccessful user login attempts across reboots, the `persistentLoginAttempts` parameter can be enabled.

At the command prompt, type:

```
set aaa parameter -maxloginAttempts <value> -failedLoginTimeout <value> -persistentLoginAttempts (ENABLED | DISABLED)
```

#### Example:

```
set aaa parameter -maxloginAttempts 3 -failedLoginTimeout 10 -persistentLoginAttempts ENABLED
```

#### Note:

For the `aaa.user.login_attempts` expression to take effect, you must disable the “Persistent Login Attempts” parameter.

Run the `unset aaa parameter -persistentLoginAttempts` command to disable (if enabled) the persistent login attempts.

For details about the login attempt functionality, see [Support to retrieve current login attempts for a user](#).

The following show command output displays the configuration status of the authentication, authorization, and auditing parameters:

```
1 show aaaparameter
2
3 Configured AAA parameters
4
5 EnableStaticPageCaching: YES
6
7 EnableEnhancedAuthFeedback: NO
8
9 DefaultAuthType: LOCAL MaxAAAUsers: Unlimited
10
11 AAAD nat ip: None
12
13 EnableSessionStickiness : NO
14
15 aaaSessionLogLevel: INFORMATIONAL
16
17 AAAD Log Level: INFORMATIONAL
18
19 ...
20
21 Persistent Login Attempts: DISABLED
22
23 <!--NeedCopy-->
```

### Configure system user account lockout by using the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > Authentication Settings > Change authentication AAA Settings**.
2. In the **Configure AAA Parameter** page, set the following parameters:
  - a) Max Login Attempts. The maximum number of logon attempts allowed for the user to try.
  - b) Failed Login Timeout. The maximum number of invalid logon attempts by the user.
  - c) Persistent Login Attempts. Persistent storage of unsuccessful user login attempts across reboots.
3. Click **OK**.

## ← Configure AAA Parameter

 ▼

HttpOnly Cookie\*  
 ▼

When you set the parameters, the user account gets locked for 10 minutes for three or more invalid login attempts. Also, the user cannot log on even with valid credentials for 10 minutes.

**Note**

If a locked user tries to log on to NetScaler, an error message, `RBA Authentication Failure: maxlogin attempt reached for test.` appears.

**Lock system user account for management access**

NetScaler enables you to lock a system user for 24 hours and deny access to the user.

NetScaler supports the configuration for both system user and external users.

**Note**

The feature is supported only if you disable the `persistentLoginAttempts` option in the `aaa` parameter.

At the command prompt type:

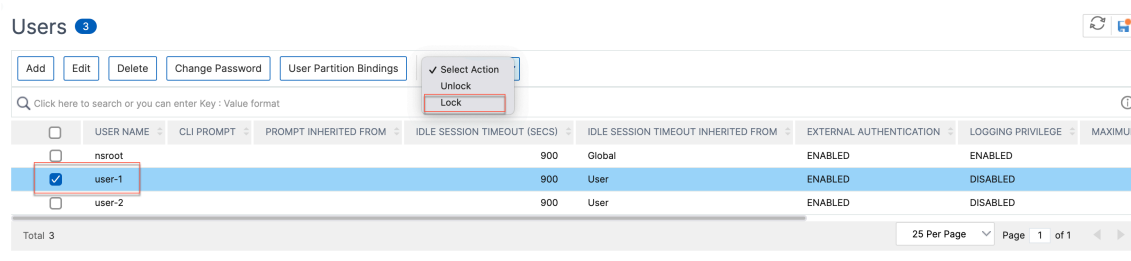

```
set aaa parameter -persistentLoginAttempts DISABLED
```

Now, to lock a user account, at the command prompt, type:

```
lock aaa user test
```

**Lock a system user account by using the GUI**

1. Navigate to **Configuration > Security > AAA-Application Traffic > Authentication Settings > Change authentication AAA Settings.**
2. In **Configure AAA Parameter**, in the **Persistent Login Attempts** list, select **DISABLED.**
3. Navigate to **System > User Administration > Users.**
4. Select a user.
5. In the Select Action list, select **Lock.**

**Note**

The NetScaler GUI does not have an option to lock external users. To lock an external user, the ADC administrator must use the CLI.

When a locked system user (locked with lock authentication, authorization, and auditing user command) attempts to log in to NetScaler, an error message, “RBA Authentication Failure: User test is locked down for 24 hours.” appears.

When a user is locked to log on to management access, console access is exempted. The locked user is able to log on to the console.

**Unlock a locked system user account for management access**

System users and external users can be locked for 24 hours using the lock authentication, authorization, and auditing user command.

**Note**

NetScaler allows admins to unlock the locked user and the feature does not require any settings in “persistentloginAttempts” command.

At the command prompt, type:

```
unlock aaa user test
```

**Configure system user unlock by using the GUI**

1. Navigate to **System > User Administration > Users**.
2. Select a user.
3. Click **Unlock**.

The NetScaler GUI only lists system users created in the ADC, so there is no option in the GUI to unlock external users. To unlock an external user, the nsroot administrator must use the CLI.

## Disable management access for system user account

When external authentication is configured on NetScaler and as an admin, if you prefer to deny access to system users to log on to management access, you must disable the `localAuth` option in the system parameter.

At the command prompt, type the following:

```
set system parameter localAuth <ENABLED|DISABLED>
```

### Example:

```
set system parameter localAuth DISABLED
```

## Disable management access to system user by using the GUI

1. Navigate to **Configuration > System > Settings > Change Global System Settings**.
2. In **Command Line Interface (CLI)** section, unselect the **Local Authentication** checkbox.

By disabling the option, local system users cannot log on to ADC management access.

### Note

External authentication server must be configured and reachable to disallow local system user authentication in the system parameter. If external server configured in ADC for management access is unreachable, local system users can log on to NetScaler. The behavior is set up for recovery purpose.

## Notify users for nsroot password change

For enhanced security, we recommend you to change the `nsroot` password frequently. You are notified for a password change before it expires.

You can set notification for your `nsroot` password change either from the CLI or GUI.

At the command prompt, type:

```
1 set system parameter -daystoexpire 30 -warnpriorndays 30
2 <!--NeedCopy-->
```

You can configure the following parameters:

- **daystoexpire** - The number of days remaining for the password expiration
- **warnpriorndays** - The number of days before password expiration to issue a warning

**Note:**

You must set the `daystoexpire` parameter if you want to set the `warnpriorndays` parameter.

The following is a sample warning message on a NetScaler CLI console:

```
Warning: [
One or more RPC nodes are configured with default passwords.For enhanced security, you must change the default RPC node password.
IMPORTANT : nsroot user password is about to expire in 30 day(s). Please change the password.
]
Done
> █
```

**Notify users for nsroot password change by using the GUI**

1. Navigate to **Configuration > System > Settings > Change Global System Settings**.
2. In the **Other Settings** section, set the following parameters:
  - Days to Expire
  - Warn Prior N Days

## ← Configure Global System Settings Parameters

**Other Settings**

Idle Session Timeout (secs)

3. Click **OK**.

### Force password change for administrative users

For `nsroot` secured authentication, NetScaler prompts the user to change the default password to a new one if the `forcePasswordChange` option is enabled in the system parameter. You can change

your `nsroot` password either from CLI or GUI, on your first login with the default credentials.

At the command prompt, type:

```
set system parameter -forcePasswordChange (ENABLED | DISABLED)
```

#### SSH session example for NSIP:

```
1 ssh nsroot@1.1.1.1
2 Connecting to 1.1.1.1:22...
3 Connection established.
4 To escape to local shell, press Ctrl+Alt+].
5 #####
6 WARNING: Access to this system is for authorized users only #
7 Disconnect IMMEDIATELY if you are not an authorized user! #
8
9 #####
10 Please change the default NSROOT password.
11 Enter new password:
12 Please re-enter your password:
13 Done
14 <!--NeedCopy-->
```

#### Remove sensitive files in a system user account

To manage sensitive data such as authorized keys and public keys for a system user account, you must enable the `removeSensitiveFiles` option. The commands that remove sensitive files when the system parameter is enabled are:

- `rm cluster instance`
- `rm cluster node`
- `rm high availability node`
- `clear config full`
- `join cluster`
- `add cluster instance`

At the command prompt, type:

```
set system parameter removeSensitiveFiles (ENABLED | DISABLED)
```

#### Example:

```
set system parameter -removeSensitiveFiles ENABLED
```

## Strong password configuration for system users

For secured authentication, NetScaler prompts system users and administrators to set strong passwords to log on to the console. The password must be long and must be a combination of:

- One lower case character
- One upper case character
- One numeric character
- One special character

At the command prompt, type:

```
set system parameter -strongpassword <value> -minpasswordlen <value>
```

Where,

**Strongpassword.** After enabling strong password (`enable all` / `enablelocal`) all the passwords or sensitive information must have the following:

- At least 1 lower case character
- At least 1 upper case character
- At least 1 numeric character
- At least 1 special character

Exclude the list in `enablelocal` is - `NS_FIPS`, `NS_CRL`, `NS_RSAKEY`, `NS_PKCS12`, `NS_PKCS8`, `NS_LDAP`, `NS_TACACS`, `NS_TACACS ACTION`, `NS_RADIUS`, `NS_RADIUS ACTION`, `NS_ENCRYPTION_PARAMS`. So no Strong Password checks are performed on these ObjectType commands for the system user.

Possible values: `enableall`, `enablelocal`, `disabled`

Default value: `disabled`

**minpasswordlen.** Minimum length of the system user password. When the strong password is enabled by default, the minimum length is 4. User entered value can be greater than or equal to 4. The default minimum value is 1 when the strong password is disabled. The maximum value is 127 in both cases.

Minimum value: 1

Maximum value: 127

### Example:

```
set system parameter -strongpassword enablelocal -minpasswordlen 6
```

## Default user account

The `nsrecover` user account is used by the administrator to recover the NetScaler appliance. You can log on to NetScaler using `nsrecover` if the default system users (`nsroot`) are unable to log in due to any unforeseen issues. The `nsrecover` login is independent of user configurations and lets you access the shell prompt directly. You are always allowed to log in through the `nsrecover` irrespective of whether the maximum configuration limit is reached.

## How to reset root administrator (nsroot) password

March 26, 2024

The NetScaler root administrator (`nsroot`) account provides complete access to all ADC features. So, to preserve security, the administrative account must be used only if necessary.

As an admin, the recommendation is to change your password. If you forget your password, you must first reset to the default one and then change it to a new password.

As a `nsroot` administrator, to reset your password, you must log on to your appliance and change the password. However, if you do not remember the password, you can reboot the appliance in single user mode. Mount the file system in read/write mode, and then remove the **NetScaler** entry from the `ns.conf` file. As a final step, reboot and log on to your appliance with the default one and then set a new password.

Complete the following steps to reset your root administrator password:

1. Connect a computer to the console port of the NetScaler and log on.

**Note:**

You cannot log on by using SSH to do this procedure; you must connect directly to the appliance.

2. Reboot the NetScaler.
3. Press CTRL+C when the following message appears:

```
Press [Ctrl-C] for command prompt, or any other key to boot immediately.
```

```
Booting [kernel] in # seconds.
```

4. Run the following command to start the NetScaler in a single user mode:

```
boot -s
```

After the appliance boots, it displays the following message:

Enter full path name of shell or RETURN **for** `/bin/sh`:

5. Press ENTER to display the # prompt, and type the following commands to mount the file systems:

- a) Run the following command to check the disk consistency:

```
fsck_ufs /dev/ada0s1a
```

**Note:**

Your flash drive has a specific device name depending on your NetScaler. Run the following command at the ADC CLI and copy the name ending with “1a.”

```
gpart show -p
```

For example,

```
ns0# gpart show -p
=> 63 41942977 ada0 MBR (20G)
 63 41942943 ada0s1 freebsd [active] (20G)
 41943006 34 - free - (17K)

=> 0 41942943 ada0s1 BSD (20G)
 0 3354624 ada0s1a freebsd-ufs (1.6G)
 3354624 8597504 ada0s1b freebsd-swap (4.1G)
 11952128 4096 ada0s1d freebsd-ufs (2.0M)
 11956224 29986719 ada0s1e freebsd-ufs (14G)
```

- b) Access the dev directory and enter ‘ls’ to check the drive details.

```
1 cd /dev/ada0s1a
2
3 ls
4 <!--NeedCopy-->
```

- c) Run the following command to display the mounted partitions:

```
df
```

**Note:**

If the flash partition is not listed, you must mount it manually.

- d) Run the following command to mount the flash drive:

```
mount /dev/ada0s1a /flash
```

6. Run the following command to change to the `nsconfig` directory:

```
cd /flash/nsconfig
```

7. Run the following commands to rewrite the `ns.conf` file and remove the set of system commands defaulting to the admin:

a) Run the following command to create a configuration file that does not have commands defaulting to the administrator:

```
grep -v "set system user nsroot" ns.conf > new.conf
```

b) Run the following command to make a backup of the existing configuration file:

```
mv ns.conf old.ns.conf
```

c) Run the following command to rename the `new.conf` file to `ns.conf`:

```
mv new.conf ns.conf
```

8. Run the following command to reboot the NetScaler:

```
reboot
```

9. Log on using the default administrator credentials. NetScaler prompts you to replace the default `nsroot` password with a new password.

**Note:**

To use the “?” character in a password string, precede this character with the \ character.

For example, `yourexamplepasswd?` is set for the administrator account after you perform the following operation:

```
> set system user nsroot yourexamplepasswd\?
```

10. Once the new password is set, save the configuration using the `save ns config` command.

**Note:**

For resetting a forgotten (`nsroot`) password in a high availability setup, it is recommended to shut down the peer node. If the peer node is active, the password is overwritten, as the config sync is triggered when the node comes up after reboot.

Also, read article, [CTX224027](#) to know how secure SSH access to NetScaler appliance works.

## External user authentication

May 2, 2024

Authentication service in a NetScaler appliance can be local or external. In external user authentication, the appliance uses an external server such as LDAP, RADIUS, or TACACS+ to authenticate the user.

To authenticate an external user and grant the user access into the appliance, you must apply an authentication policy. The NetScaler system authentication uses Advanced authentication policies with advanced policy expressions. The Advanced authentication policies are also used for the system user management in a partitioned NetScaler appliance.

**Note**

If your appliance is still using Classic policies and its expressions, you must stop using it and migrate your Classic policy usage to the Advanced policy infrastructure.

Once you create an authentication policy, you must bind it to the system global entity. You can configure an external authentication server (for example, TACACS) by binding a single authentication policy to the system global entity. Or, you can configure a cascade of authentication servers by binding multiple policies to the system global entity.

**Note**

When an external user logs into the appliance, the system generates an error message, “User does not exist” in the `ns.log` file. The occurrence is because the system runs the `systemuser_systemcmdpolicy_binding` command to initialize the GUI for the user.

## LDAP authentication (using external LDAP servers)

You can configure the NetScaler appliance to authenticate user access with one or more LDAP servers. LDAP authorization requires identical group names in the Active directory, on the LDAP server, and on the appliance. The characters and case must also be the same.

For more information about LDAP authentication policies, see [LDAP authentication policies](#) topic.

By default, LDAP authentication is secured by using the SSL/TLS protocol. There are two types of secure LDAP connections. In the first type, the LDAP server accepts the SSL/TLS connection on a port separate from the port used to accept clear LDAP connections. After users establish the SSL/TLS connection, LDAP traffic can be sent over the connection. The second type allows both unsecure and secure LDAP connections and the single port handles it on the server. In this scenario, to create a secure connection, the client first establishes a clear LDAP connection. Then the **LDAP** command `Start-TLS` is sent to the server over the connection. If the LDAP server supports StartTLS, the connection is converted to a secure LDAP connection by using TLS.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections
- 636 for secure LDAP connections
- 3268 for Microsoft unsecure LDAP connections
- 3269 for Microsoft secure LDAP connections

LDAP connections that use the StartTLS command use port number 389. If port numbers 389 or 3268 are configured on the appliance, it tries to use StartTLS to make the connection. If any other port number is used, connection attempts use SSL/TLS. If StartTLS or SSL/TLS cannot be used, the connection fails.

When configuring the LDAP server, the case of the alphabetic characters must match that on the server and on the appliance. If the root directory of the LDAP server is specified, all subdirectories are also searched to find the user attribute. In large directories, it can affect performance. For this reason, Citrix recommends that you use a specific organizational unit (OU).

The following table lists examples of the base distinguished name (DN).

---

<b>LDAP server</b>	<b>Base DN</b>
Microsoft Active Directory	DC=Citrix, DC=local
Novell eDirectory	dc=Citrix, dc=net
IBM Directory Server	cn=users
Lotus Domino	OU=City, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	ou=People, dc=Citrix, dc=com

---

The following table lists examples of the bind distinguished name (DN).

---

<b>LDAP server</b>	<b>Bind DN</b>
Microsoft Active Directory	CN=Administrator, CN=Users, DC=Citrix, DC=local
Novell eDirectory	cn=admin, dc=Citrix, dc=net
IBM Directory Server	LDAP_dn
Lotus Domino	CN=Notes Administrator, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	uid=admin, ou=Administrators, ou=TopologyManagement, o=NetscapeRoot

---

### **Configure LDAP user authentication by using the CLI**

Complete the following steps to configure LDAP authentication for external users

### **Configure LDAP policy**

At the command prompt, do the following:

Step 1: Create an LDAP action.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr
|*> | { -serverName <string> } } >] [-authTimeout <positive_integer>]
[-ldapBase <string>] [-ldapBindDn <string>] { -ldapBindDnPassword }
[-ldapLoginName <string>] [-groupAttrName <string>] [-subAttributeName
<string>]
```

**Example:**

```
add authentication ldapAction ldap_act -serverIP <IP> -authTimeout 30
-ldapBase "CN=xxxxx,DC=xxxx,DC=xxx"-ldapBindDn "CN=xxxxx,CN=xxxxx,DC
=xxxx,DC=xxx"-ldapBindDnPassword abcd -ldapLoginName sAMAccountName -
groupattrName memberOf -subAttributeName CN
```

For parameter description, see [Authentication and authorization command reference](#) topic.

Step 2: Create a classic LDAP policy.

```
add authentication ldapPolicy <name> <rule> [<reqAction>]
```

**Example:**

```
add authentication ldappolicy ldap_pol_classic ns_true ldap_act
```

**Note**

You can configure using a classic or an advanced LDAP policy but Citrix recommends you to use an advanced authentication policy because classic policies are deprecated from the NetScaler 13.0 release onwards.

Step 3: Create an advanced LDAP policy

```
add authentication Policy <name> <rule> [<reqAction>]
```

**Example:**

```
add authentication policy ldap_pol_advance -rule true -action ldap_act
```

Step 4: Bind the LDAP policy to system global

At the command line prompt, do the following:

```
bind system global <policyName> [-priority <positive_integer>]
```

**Example:**

```
bind system global ldap_pol_advanced -priority 10
```

### Configure LDAP user authentication by using the NetScaler GUI

1. Navigate to **System > Authentication > Advanced Policies > Policy**.
2. Click **Add** to create an authentication policy of type LDAP.
3. Click **Create** and **Close**.

The screenshot shows the 'Create Authentication Policy' form in the NetScaler GUI. The form has the following elements:

- Name\***: A text input field containing 'Authentication-policy-1' with an information icon.
- Action Type\***: A dropdown menu set to 'LDAP'.
- Action\***: A dropdown menu set to 'LDAP-Standard-No-Auth' with 'Add' and 'Edit' buttons.
- Expression\***: A complex field with a dropdown menu set to 'Select', a text input field containing 'LDAP-Standard-No-Auth', and a dropdown menu set to 'LDAP-Standard-No-Auth'. It includes an 'Expression Editor' link, an 'Evaluate' button, and an information icon.
- More**: A section header with a right-pointing arrow.
- Create** and **Close**: Two buttons at the bottom of the form.

### Bind an authentication policy to the system global for LDAP authentication using the NetScaler GUI

1. Navigate to **System > Authentication > Advanced Policies > Authentication PoliciesPolicy**.
2. In the details pane, click **Global Bindings** to create system global authentication policy binding.
3. Click **Global Bindings**.
4. Select an authentication profile.
5. Select the LDAP policy.
6. In the **System Global Authentication Policy Binding** page, set the following parameters:
  - a) Select Policy.
  - b) Binding Details

### Determining attributes in the LDAP directory

If you need help with determining your LDAP directory attributes, you can easily look them up with the free LDAP browser from Softerra.

You can download the LDAP browser from the Softerra LDAP Administrator website at <http://www.ldapbrowser.com>. After the browser is installed, set the following attributes:

- The host name or IP address of your LDAP server.
- The port of your LDAP server. The default is 389.
- The base DN field can be left blank.
- The information provided by the LDAP browser can help you determine the base DN needed for the Authentication tab.
- The Anonymous Bind check determines whether the LDAP server requires user credentials for the browser to connect to it. If the LDAP server requires credentials, leave the check box cleared.

After completing the settings, the LDAP browser displays the profile name in the left pane and connects to the LDAP server.

For more information, see [LDAP](#) topic.

## Key-based authentication support for LDAP users

With key-based authentication, you can now fetch the list of public keys that are stored on the user object in the LDAP server through SSH. The NetScaler appliance during the role-based authentication (RBA) process must extract public SSH keys from the LDAP server. The retrieved public key, which is compatible with SSH, must allow you to log in through the RBA method.

A new attribute “sshPublicKey” is introduced in the “add authentication ldapAction” and “set authentication ldapAction” commands. By using this attribute, you can obtain the following benefits:

- Can store the retrieved public key, and the LDAP action uses this attribute to retrieve SSH key information from the LDAP server.
- Can extract attribute names of up to 24 KB.

### Note

The external authentication server, such as LDAP is used only to retrieve SSH key information. It is not used for the authentication purpose.

Following is an example of the flow of events through SSH:

- SSH daemon sends an AAA\_AUTHENTICATE request with password field empty to authentication, authorization, and auditing daemon port.
- If LDAP is configured to store the SSH public key, authentication, authorization, and auditing responds with the `sshPublicKey` attribute along with other attributes.
- SSH daemon verifies these keys with the client keys.
- SSH daemon passes user name in the request payload, and authentication, authorization, and auditing returns the keys specific to this user along with generic keys.

**To configure the `sshPublicKey` attribute, at the command prompt type the following commands:**

- With add operation, you can add “sshPublicKey” attribute while configuring the `ldapAction` command.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr
|*> | { -serverName <string> } } [-serverPort <port>] ... [-Attribute1
<string>] ... [-Attribute16 <string>][-sshPublicKey <string>][-
authentication off]<!--NeedCopy-->
```

- With set operation, you can configure “sshPublicKey” attribute to an already added ldapAction command.

```
set authentication ldapAction <name> [-sshPublicKey <string>] [-
authentication off]<!--NeedCopy-->
```

## **RADIUS authentication (using external RADIUS servers)**

You can configure the NetScaler appliance to authenticate user access with one or more RADIUS servers. If you are using RSA SecurID, SafeWord, or Gemalto Protiva products, use a RADIUS server.

For more information about RADIUS authentication policies, see [RADIUS authentication](#).

Your configuration might require using a network access server IP address (NAS IP) or a network access server identifier (NAS ID). When configuring the appliance to use a RADIUS authentication server, use the following guidelines:

- If you enable use of the NAS IP, the appliance sends its configured IP address to the RADIUS server, rather than the source IP address used in establishing the RADIUS connection.
- If you configure the NAS ID, the appliance sends the identifier to the RADIUS server. If you do not configure the NAS ID, the appliance sends its host name to the RADIUS server.
- When the NAS IP address is enabled, the appliance ignores any NAS ID that it used for communicating with the RADIUS server.

## **Configure RADIUS user authentication by using the CLI**

At the command prompt, do the following:

Step 1: Create an RADIUS action

```
add authentication radiusaction <name> -serverip <ip> -radkey <key> -
radVendorID <id> -radattributetype <value>
```

Where,

`radVendorID` RADIUS vendor ID attribute, used for RADIUS group extraction.

`radAttributeType` RADIUS attribute type, used for RADIUS group extraction.

### **Example:**

```
add authentication radiusaction RADserver531 rad_action -serverip
1.1.1.1 -radkey key123 -radVendorID 66 -radattributetype 6
```

Step 2: Create a classic RADIUS policy.

```
add authentication radiusPolicy <name> <rule> [<reqAction>]
```

### **Example:**

```
add authentication radiuspolicy radius_pol_classic ns_true radius_act
```

**Note**

You can configure using a classic or an advanced RADIUS policy. Citrix recommends you to use the advanced authentication policy because classic policies are deprecated from the NetScaler 13.0 release onwards.

Step 3: Create an advanced RADIUS policy

```
add authentication policy <policyname> -rule true -action <radius
action name>
```

**Example:**

```
add authentication policy rad_pol_advanced -rule true -action radserver531rad_
```

Step 4: Bind the RADIUS policy to the system global.

```
bind system global <policyName> -priority <positive_integer>
```

**Example:**

```
bind system global radius_pol_advanced -priority 10
```

**Configure RADIUS user authentication by using the GUI**

1. Navigate to **System > Authentication > Advanced Policies > Policy**.
2. Click **Add** to create an authentication policy of type RADIUS.
3. Click **Create** and **Close**.

### Choose RADIUS user authentication protocols

The NetScaler appliance supports implementations of RADIUS that are configured to use any of several protocols for user authentication, including:

- Password Authentication Protocol
- Challenge-Handshake Authentication Protocol (CHAP)
- Microsoft Challenge-Handshake Authentication Protocol (MS-CHAP Version 1 and Version 2)

If your deployment is configured to use RADIUS authentication and your RADIUS server is configured with a Password Authentication Protocol. You can strengthen user authentication by assign-

ing a strong shared secret to the RADIUS server. Strong RADIUS shared secrets consist of random sequences of uppercase and lowercase letters, numbers, and punctuation, and are minimum 22 characters in length. If possible, use a random character generation program to determine RADIUS shared secrets.

To further protect RADIUS traffic, assign a different shared secret to each appliance or virtual server. When you define clients on the RADIUS server, you can also assign a separate shared secret to each client. Also, you must configure separately each policy that uses RADIUS authentication.

### **Configure IP address extraction**

You can configure the appliance to extract the IP address from a RADIUS server. When a user authenticates with the RADIUS server, the server returns a framed IP address that is assigned to the user. The following are attributes for IP address extraction:

- Allows a remote RADIUS server to supply an IP address from the internal network for a user logged on to the appliance.
- Allows configuration for any RADIUS attribute using the type ip-address, including that are vendor encoded.

When configuring the RADIUS server for IP address extraction, you configure the vendor identifier and the attribute type.

The vendor identifier enables the RADIUS server to assign an IP address to the client from a pool of IP addresses that are configured on the RADIUS server. The vendor ID and attributes are used to make the association between the RADIUS client and the RADIUS server. The vendor ID is the attribute in the RADIUS response that provides the IP address of the internal network. A value of zero indicates that the attribute is not vendor encoded. The attribute type is the remote IP address attribute in a RADIUS response. The minimum value is one and the maximum value is 255.

A common configuration is to extract the **RADIUS** attribute *framed IP address*. The vendor ID is set to zero or is not specified. The attribute type is set to eight.

### **Group extraction for RADIUS by using the GUI**

1. Navigate to **System > Authentication > Advanced Policies > Radius**, and select a policy.
2. Select or create RADIUS policy.
3. In the **Configure Authentication RADIUS Server** page, set the following parameters.
  - a) **Group Vendor Identifier**
  - b) **Group Attribute Type**
4. Click **OK** and **Close**.

## TACACS+ authentication (using external TACACS+ servers)

### Important

- Citrix recommends you do not modify any TACACS related configurations when you run a “clear ns config” command.
- TACACS related configuration related to advanced policies is cleared and reapplied when the `RBAconfig` parameter is set to NO in “clear ns config” command for advanced policy.
- When the `RBAconfig` parameter is set to NO as part of the “clear config” operation, NetScaler retains the management access sessions, in addition to retaining the RBA configurations and TACACS policies.

You can configure a TACACS+ server for authentication. Similar to RADIUS authentication, TACACS+ uses a secret key, an IP address, and the port number. The default port number is 49. To configure the appliance to use a TACACS+ server, provide the server IP address and the TACACS+ secret. You must specify port only when the server port number in use is something other than the default port number of 49.

For more information, see [TACACS authentication](#).

### Configure TACACS+ authentication by using the GUI

1. Navigate to **System > Authentication > Advanced Policies > Policy**.
2. Click **Add** to create an authentication policy of type TACACS.
3. Click **Create** and **Close**.

The screenshot shows the 'Create Authentication Policy' form in the NetScaler GUI. The form is titled 'Create Authentication Policy' and has a navigation bar at the top with 'Configuration' selected. The form fields are as follows:

- Name\***: TACACS\_Policy
- Action Type\***: TACACS
- Action\***: TACACS (with 'Add' and 'Edit' buttons)
- Expression\***: TRUE (with 'Expression Editor' label and 'Evaluate' button)

At the bottom of the form, there are 'Create' and 'Close' buttons.

After the TACACS+ server settings are configured on the appliance, bind the policy to the system global entity.

### Bind authentication policies to the system global entity by using the CLI

When the authentication policies are configured, bind the policies to the system global entity.

At the command line prompt, do the following:

```
bind system global <policyName> [-priority <positive_integer>]
```

**Example:**

```
bind system global pol_classic -priority 10
```

Also, read the Citrix article, [CTX113820](#) to know about external authentication using TACACS.

### Bind authentication policies to the system global entity by using the GUI

1. Navigate to **System > Authentication > Advanced Policies > Authentication Policies > Policy**.
2. In the details pane, click **Global Bindings** to create system global authentication policy binding.
3. Click **Global Bindings**.

#### ← System Global Authentication Policy Binding

4. Select the TACACS policy.

### Display number of unsuccessful logon attempts for external users

The NetScaler appliance displays the number of invalid login attempts to the external user when you attempt at least one unsuccessful login before successfully logging on to the NetScaler management console.

**Note**

Currently, NetScaler supports only keyboard interactive authentication for external users with the “persistentLoginAttempts” parameter enabled in the system parameter.

At the command prompt, type:

```
set aaa parameter -maxloginAttempts <value> -failedLoginTimeout <value> -persistentLoginAttempts (ENABLED | DISABLED)]
```

**Example:**

```
set aaa parameter -maxloginAttempts 5 -failedLoginTimeout 4 -persistentLoginAttempts
ENABLED
```

```

1 Following msg will be seen to external user when he tries 1 invalid
 login attempt before successfully login to the ADC management access
 .

**SSH key-based authentication for local system users**

May 2, 2023

To have a secured user access for the NetScaler appliance you can have the public key authentication of the SSH server. The SSH key-based authentication is preferred over traditional user name or password based authentication for the following reasons:

- Provides better cryptographic strength than user passwords.

- Eliminates the need of remembering complicated passwords and prevents shoulder-surfing attacks which are possible if passwords are used.
- Provides a password-less login for making automation scenarios more secured.

NetScaler supports SSH key-based authentication by applying the public and private key concept. The SSH key-based authentication in NetScaler can be enabled either for a specific user or for all local users.

**Note**

The feature is supported only for NetScaler local users and not supported for external users.

### SSH key-based authentication for local system users

In a NetScaler appliance, an administrator can set up SSH key-based authentication for a secured system access. When a user logs into the NetScaler using a private key, the system authenticates the user using the public key configured on the appliance.

#### Configure SSH key-based authentication for the NetScaler local system users by using CLI

Following configuration helps you to configure key-based authentication for NetScaler local system users.

1. Log on to a NetScaler appliance using administrator credentials.
2. By default your `sshd_config` file accesses this path: **AuthorizedKeysFile /nsconfig/ssh/authorized\_keys**.
3. Append the public key to the `authorized_keys` file: **/nsconfig/ssh/authorized\_keys**. The file path for `sshd_config` is `/etc/sshd_config`.
4. Copy the `sshd_config` file into `/nsconfig` to ensure that the changes persist even after restarting the appliance.
5. You can use the following command to restart your `sshd` process.

```
1 kill -HUP `cat /var/run/sshd.pid`
2 <!--NeedCopy-->
```

**Note**

If the `authorized_keys` file is not available, you must first create one and then append the public key. **Make sure the file has the following permission for the `authorized_keys`.**

```
root@NetScaler# chmod 0644 authorized_keys
```

```
1 > shell
2 Copyright (c) 1992-2013 The FreeBSD Project.
```

```
3 Copyright (c) 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992, 1993,
 1994
4 The Regents of the University of California. All rights reserved.
5 root@ns# cd /nsconfig/ssh
6 root@ns# vi authorized_keys
7 ### Add public keys in authorized_keys file
8 <!--NeedCopy-->
```

## User-specific SSH key-based authentication for local system users

In a NetScaler appliance, an administrator can now set up a user specific SSH key-based authentication for a secured system access. The administrator must first configure the `Authorizedkeysfile` option in the `sshd_config` file and then add the public key in the `authorized_keys` file for a system user.

### Note

If the `authorized_keys` file is not available for a user, the administrator must first create one and then add the public key to it.

## Configure user-specific SSH key-based authentication by using the CLI

Following procedure helps you to configure user-specific SSH key-based authentication for NetScaler local system users.

1. Log on to a NetScaler appliance using administrator credentials.
2. At the shell prompt, access the `sshd_config` file and add the following configuration line:

```
AuthorizedKeysFile ~/.ssh/authorized_keys
```

### Note

The `~` is the home directory and differs for different users. It expands to the different home directory.

3. Change the directory to the system user folder and add the public keys in the `authorized_keys` file.

```
/var/pubkey/<username>/.ssh/authorized_keys
```

Once you have completed the earlier steps, restart the `sshd` process on your appliance by the following command:

```
1 kill -HUP `cat /var/run/sshd.pid`
2
3 <!--NeedCopy-->
```

**Note**

If the `authorized_keys` file is not available, you must first create one and then add the public key.

```
1 > shell
2 Copyright (c) 1992-2013 The FreeBSD Project.
3 Copyright (c) 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992, 1993,
 1994
4 The Regents of the University of California. All rights reserved.
5 root@ns# cd /var/pubkey/<username>/
6 root@ns# ls
7 .ssh
8 root@ns# cd .ssh
9 root@ns# vi authorized_keys
10 ### Add public keys in authorized_keys file
11
12 <!--NeedCopy-->
```

Also, read Citrix article, [CTX109011](#) to know how secure SSH access to NetScaler appliance works.

## Two factor authentication for system users and external users

December 29, 2023

Two factor authentication is a security mechanism where a NetScaler appliance authenticates a system user at two authenticator levels. The appliance grants access to the user only after successful validation of passwords by both levels of authentication. If a user is authenticated locally, the user profile must be created in the NetScaler database. If the user is authenticated externally then, the user name and password must match the user identity registered in the external authentication server.

**Note**

Two factor authentication feature works only from NetScaler 12.1 build 51.16 onwards.

### How two factor authentication works

Consider a user trying to log on to a NetScaler appliance. The requested application server sends the user name and password to the first external authentication server (RADIUS, TACACS, LDAP, or AD). Once the user name and password are validated, the user is prompted for a second level of authentication. The user can now provide the second password. Only if both passwords are correct, the user is allowed to access the NetScaler appliance. The following diagram is an illustration of how two-factor authentication works for a NetScaler appliance.

Following are the different use cases for configuring two factor authentication for external and system users.

You can configure two-factor authentication on a NetScaler appliance in different ways. The following are the different configuration scenarios for two factor authentication on a NetScaler appliance.

1. Two factor authentication (2FA) across NetScaler, GUI, CLI, API and SSH.
2. External authentication enabled and local authentication disabled for system users.
3. External authentication enabled with policy based local authentication for system users.
4. External authentication disabled for system users with local authentication enabled.
5. External authentication enabled and local authentication enabled for system users.
6. External authentication enabled for selected LDAP users

### **Use case 1: Two factor authentication (2FA) across NetScaler, GUI, CLI, API and SSH interfaces**

Two-factor authentication is enabled and available across all NetScaler management access for GUI, API, and SSH.

### **Use case 2: Two factor authentication supported on external authentication servers such as LDAP, RADIUS, Active Directory and TACACS**

You can configure two-factor authentication on the following external authentication servers for first-level and second-level user authentication.

- RADIUS
- LDAP
- Active Directory
- TACACS

### Use case 3: External authentication enabled and local authentication disabled for system users

You begin the authentication process by enabling the external authentication option and disabling local authentication for system users.

Complete the following steps by using the command line interface:

1. Add authentication action for LDAP policy
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add and bind authentication policy label to RADIUS server
7. Bind system global authentication for LDAP policy
8. Disable local authentication in system parameter

#### Add authentication action for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributeName <string>-ssoNameAttribute <string>
```

#### Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

### **Add authentication policy for LDAP server (first level authentication)**

At the command prompt, type:

```
add authentication policy <ldap policy name> -rule true -action <ldap
action name>
```

#### **Example:**

```
add authentication policy pol1 -rule true -action ldapact1
```

### **Add authentication action for RADIUS server (second level authentication)**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad
server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad
attribute type>
```

#### **Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123
-radVendorID 1234 -radAttributeType 2
```

### **Add authentication policy for RADIUS server (second level authentication)**

At the command prompt, type:

```
add authentication policy <radius policy name> -rule true -action <
rad action name>
```

#### **Example:**

```
add authentication policy radpol11 -rule true -action radact1
```

### **Add authentication login schema**

You can use the “SingleAuth.xml” login schema for system users to provide the second password for the NetScaler appliance. At the command prompt, type:

```
add authentication loginSchema <login schema name> -authenticationSchema
LoginSchema/SingleAuth.xml
```

#### **Example:**

```
add authentication loginSchema radschema -authenticationSchema
LoginSchema/SingleAuth.xml
```

**Add and bind authentication policy label to RADIUS server**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type (AAATM_REQ |
RBA_REQ)] [-comment <string>][-loginSchema <string>]
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

**Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
bind authentication policylabel label1 -policyName radpol11 -priority
1
```

**Bind authentication system global for LDAP policy**

At the command prompt, type:

```
bind system global ldappolicy -priority <priority> -nextFactor <
policy label name>
```

**Example:**

```
bind system global pol11 -priority 1 -nextFactor label1
```

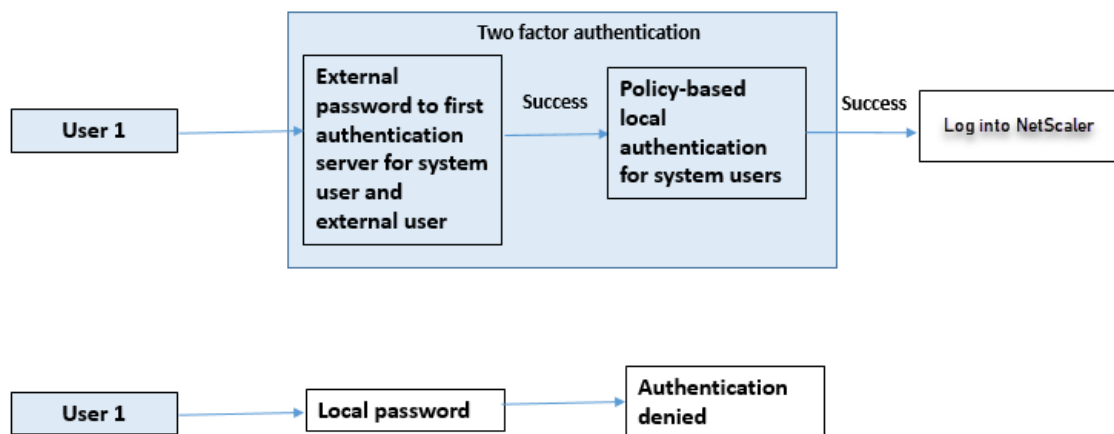

**Disable local authentication in system parameter**

At the command prompt, type:

```
set system parameter -localauth disabled
```

**Use case 4: External authentication enabled for system user with local authentication policy attached**

In this scenario, the user is allowed to log on to the appliance using two-factor authentication with local authentication policy evaluation at the second level of user identification.

Complete the following steps by using the command line interface.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add local authentication policy
4. Add authentication policy label
5. Bind LDAP policy as system global
6. Disable local authentication in system parameter

### Add authentication action for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributeName <string>-ssoNameAttribute <string>
```

#### Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
name -groupAttrName name -subAttributeName name -ssoNameAttribute
name -ssoNameAttribute name
```

### Add authentication policy for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication policy <ldap policy name> -rule true -action <ldap
action name>
```

**Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

**Add local authentication policy for system users (second level authentication)**

At the command prompt, type:

```
add authentication policy <policy> -rule <rule> -action <action name>
```

**Example:**

```
add authentication policy local_policy -rule true -action LOCAL
```

**Add and bind authentication policy label**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type (AAATM_REQ |
RBA_REQ)] [-comment <string>][-loginSchema <string>]
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

**Note**

For management access, the policy type must be RBA\_REQ.

**Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
bind authentication policylabel label1 -policyName radpol11 -priority
1 -gotoPriorityExpression NEXT
```

**Disable local authentication in system parameter**

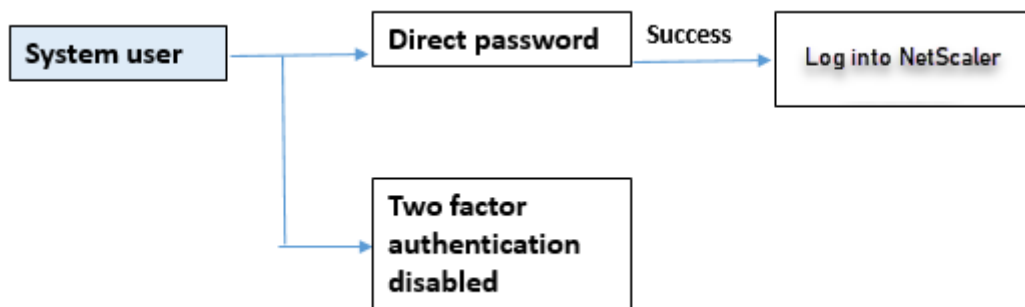

At the command prompt, type:

```
set system parameter -localauth disabled
```

### Use case 5: External authentication disabled and local authentication enabled for system user

If the user has “externalAuth” disabled, it indicates that the user does not exist on the authentication server. User is not authenticated with the external authentication server even if a user with the same user name exists on the external authenticated server. User is authenticated locally.

#### To enable system user password and disable external authentication

At the command prompt, type the following:

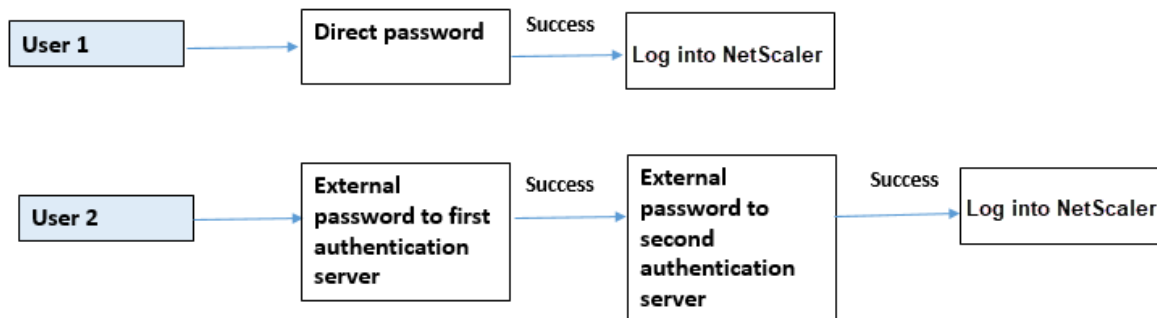

```
add system user <name> <password> -externalAuth DISABLED
```

#### Example:

```
add system user user1 password1 -externalAuth DISABLED
```

### Use case 6: External authentication enabled and local authentication enabled for system users

To configure the appliance to authenticate system users by using a local password. If this authentication fails, the user is then authenticated by using an external authentication password on the external authentication servers at two levels.

Configure the following steps by using the CLI.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add authentication policy label
7. Bind authentication policy label for login schema
8. Bind authentication system global for RADIUS policy
9. Bind authentication system global for LDAP policy

### **Add authentication action for LDAP server**

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributeName <>-ssoNameAttribute <>
```

#### **Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

### **Add authentication policy for LDAP policy**

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap
action name>
```

#### **Example:**

```
add authentication policy pol1 -rule true -action ldapact1
```

### **Add authentication action for RADIUS server**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad
server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad
attribute type>
```

**Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123
-radVendorID 1234 -radAttributeType 2
```

**Add advanced authentication policy for RADIUS server**

At the command prompt, type:

```
add authentication policy <policy name> -rule true -action <rad
action name>
```

**Example:**

```
add authentication policy radpol11 -rule true -action radact1
```

**Add authentication login schema**

You can use the SingleAuth.xml login schema to display the login page and authenticate the system user at the second level authentication.

At the command prompt, type:

```
add authentication loginSchema <name> -authenticationSchema <string>
```

**Example:**

```
add authentication loginSchema radschema -authenticationSchema
LoginSchema/SingleAuth.xml
```

**Add and bind authentication policy label to RADIUS authentication policy for user login**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type (AAATM_REQ |
RBA_REQ)] [-comment <string>][-loginSchema <string>]
```

**Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
```

```
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

**Example:**

```
bind authentication policylabel label1 -policyName rad pol11 -priority
1
```

**Bind authentication policy global**

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>] [-
nextFactor <string>] [-gotoPriorityExpression <expression>]]
```

**Example:**

```
bind system global radpol11 -priority 1 -nextFactor label11
```

**Use case 7: External authentication enabled for selected external users only**

To configure selective external users with two-factor authentication as per the search filter configured in the LDAP action while other system users are authenticated using single factor authentication.

Configure the following steps by using the CLI.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add authentication policy label
7. Bind authentication policy label for login schema
8. Bind authentication system global for RADIUS policy

**Add authentication action for LDAP server**

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributeName <>-ssoNameAttribute <>
```

**Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

**Add authentication policy for LDAP policy**

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap
action name>
```

**Example:**

```
add authentication policy pol1 -rule true -action ldapact1
```

**Add authentication action for RADIUS server**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad
server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad
attribute type>
```

**Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123
-radVendorID 1234 -radAttributeType 2
```

**Add advanced authentication policy for RADIUS server**

At the command prompt, type:

```
add authentication policy <policy name> -rule true -action <rad
action name>
```

**Example:**

```
add authentication policy radpol11 -rule true -action radact1
```

**Add authentication login schema**

You can use the SingleAuth.xml login schema to provide the login page for the appliance to authenticate a system user at a second level of authentication.

At the command prompt, type:

```
add authentication loginSchema <name> -authenticationSchema <string>
```

**Example:**

```
add authentication loginSchema radschema -authenticationSchema
LoginSchema/SingleAuth.xml
```

**Add and bind authentication policy label to RADIUS authentication policy for user login**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type (AAATM_REQ |
RBA_REQ)] [-comment <string>][-loginSchema <string>]
```

**Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

**Example:**

```
bind authentication policylabel label1 -policyName radpol11 -priority
```

**Bind authentication policy global**

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>] [-
nextFactor <string>] [-gotoPriorityExpression <expression>]]
```

**Example:**

```
bind system global radpol11 -priority 1 -nextFactor label11
```

To configure without two-factor authentication for group users using the search filter:

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP server
3. Bind authentication system global for LDAP server

### Add authentication action for LDAP server

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributeName <>-searchFilter<>
```

#### Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
name -groupAttrName name -subAttributeName name - searchFilter "
memberOf=CN=grp4,CN=Users,DC=aaatm-test,DC=com"
```

### Add authentication policy for LDAP server

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap
action name>
```

#### Example:

```
add authentication policy pol1 -rule true -action ldapact1
```

### Bind authentication system global for LDAP policy

At the command prompt, type:

```
bind system global ldappolicy -priority <priority> -nextFactor <
policy label name>
```

#### Example:

```
bind system global pol11 -priority 1 -nextFactor label11
```

## Display customized prompt message for two factor authentication

When you configure two factor password field with SingleAuth.xml file at `/flash/nsconfig/loginschema/LoginSchema`

Following is the snippet of a SingleAuth.xml file where 'SecondPassword:' is the second password field name which is prompted to the user to enter a second password.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <AuthenticateResponse xmlns="http://citrix.com/authentication/response

19 <!--NeedCopy-->

```

## Configuring two-factor authentication by using the NetScaler GUI

1. Log on to NetScaler appliance.
2. Go to **System > Authentication > Advanced Policies > Policy**.

3. Click **Add** to create the first level authentication policy.
4. In **Create Authentication Policy** page, set the following parameters.
  - a) Name. Name of the policy
  - b) Action Type. Select action type as LDAP, Active Directory, RADIUS, TACACS, and so on
  - c) Action. The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create an action of the proper type.
  - d) Expression. Provide an advanced policy expression.
5. Click **Create**.
6. Click **Add** to create the second level authentication policy.
7. In the **Create Authentication Policy** page, set the following parameters:
  - a) Name. Name of the policy
  - b) Action Type. Select action type as LDAP, Active Directory, RADIUS, TACACS, and so on
  - c) Action. The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the + icon to create an action of the proper type.
  - d) Expression. Provide an advanced policy expression
8. Click **Create**.
9. In the **Authentication Policies** page, click **Global Binding**.
10. In the **Create Global Authentication Policy Binding** page, select the first level authentication policy, and click **Add Binding**.
11. In the **Policy Binding** page, select the authentication policy and set the following policy binding parameter.
  - a) Next Factor. Select the second level authentication policy label.
12. Click **Bind** and **Close**.

## ← System Global Authentication Policy Binding

factor-2

Bind
Close

13. Click **Done**.

14. Log on to the NetScaler appliance for the second level authentication. The user can now provide the second password. Only if both passwords are correct, the user is allowed to access the NetScaler appliance.

### Note

The TACACS configured for a second factor authentication does not support authorization and accounting even if you enable it on the “tacacsAction” command. The second factor is used for the authentication purpose only.

Also, see [Two factor authentication in NetScaler nFactor authentication](#) topic.

## Restricted system user authentication to NetScaler management interfaces

May 2, 2023

You can restrict system user access to specific NetScaler management interfaces such as CLI or API. The `allowedManagementInterface` parameter defines the list of permitted management inter-

faces. For example, if the management interface for a user or a group is set to API, all users in the group can access NetScaler through API and not through CLI. However, the NetScaler GUI is part of the API interface and users with API permission can also access the GUI interface.

**Note:**

By default, users and groups have access to all interfaces (CLI, API, and the GUI).

You can configure the parameter either at the user level or at the user group level. When you configure at the group level, the configuration is applied across all user accounts in the group. If a user is bound to multiple groups, the appliance allows access to an aggregated set of management interfaces. You can specify settings for a user in a group by configuring the parameter at user level. In this case –user level setting is configured for a group.

In certain scenarios, when the customer is using an external authentication server for managing user accounts, the server details are configured on the appliance. In this case, the administrator can create a user group in the NetScaler appliance and add all users (grouped in the external server) to the group. For example, all users managed in the external server are added to the API\_users group and the admin can configure the group locally on the appliance.

**Note:**

The NetScaler appliance allows only `nsroot` administrator (superuser) to configure the parameter and does not allow any system user to change the parameter setting.

## Configure user access to NetScaler management interfaces by using the CLI

To allow user access to a specific management interface, you must set the allowed management interface parameter. At the command prompt, type:

```
set system group <groupName> [-allowedManagementInterface (CLI | API)]
```

**Example:**

```
set system group network_usergroup -allowedManagementInterface CLI
```

For parameter description, see [Authentication and authorization command reference](#) topic.

To know about GUI and CLI interfaces, see [Access NetScaler](#) topic.

## TCP Configurations

April 17, 2024

TCP configurations for a NetScaler appliance can be specified in an entity called a TCP profile, which is a collection of TCP settings. The TCP profile can then be associated with services or virtual servers that want to use these TCP configurations.

A default TCP profile can be configured to set the TCP configurations that will be applied by default, globally to all services and virtual servers.

**Note:**

When a TCP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence. The NetScaler appliance also provides other approaches for configuring TCP.

## **Supported TCP configuration**

The NetScaler appliance supports the following TCP capabilities:

### **Defending TCP against spoofing attacks as per RFC 5961**

NetScaler supports RST window attenuation and SYN spoof protection methods to defend TCP against spoofing attacks and is compliant with RFC 4953.

Starting from NetScaler 14.1-4.x release, NetScaler is compliant with RFC 5961 which provides improved protection against TCP spoofing attacks. With RFC 5961 compliance, NetScaler provides the following capabilities in addition to RST window attenuation and SYN spoof protection:

- Reduces the probability of invalid data injection.
- Allows imposing a limit on the number of challenge ACK responses per second sent by the NetScaler.

By default, RFC 5961 compliance is disabled. You can enable it by using the CLI or the GUI. For more information, see [Defending TCP against spoofing attacks](#).

### **Explicit Congestion Notification (ECN)**

The appliance sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption. The NetScaler implementation of ECN is RFC 3168 compliant.

### **Round trip time measurement (RTTM) using the timestamp option**

For the TimeStamp option to work, at least one side of the connection (client or server) must support it. The NetScaler implementation of the [TimeStamp](#) option is RFC 1323 compliant.

## Detection of spurious retransmissions

This detection can be done using TCP duplicate selective acknowledgment (D-SACK) and forward RTO-Recovery (F-RTO). If there are spurious retransmissions, the congestion control configurations are reverted to their original state. The NetScaler implementation of D-SACK is RFC 2883 compliant, and F-RTO is RFC 5682 compliant.

## Congestion control

This functionality use New-Reno, BIC, CUBIC, Nile, TCP Westwood, and BBR algorithms.

- **BBR:** Operates by monitoring the round-trip time (RTT) and bandwidth rather than reacting to packet loss. This approach allows BBR to regulate traffic effectively that results in improved throughput and latency.
- **BIC:** Optimized for high speed networks with high latency (long fat networks). For these networks, BIC has a significant advantage over other congestion control algorithms in correcting severely under-utilized bandwidth.
- **CUBIC:** Achieves high bandwidth connections over networks more quickly and reliably during high latency. It helps to optimize long fat networks.
- **Default/New Reno** - Prevents too many packet losses due to congestion, and maintains fairness with other flows.
- **Nile:** NetScaler has developed this TCP optimization algorithm for high-speed networks such as LTE, LTE advanced, and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions, and carrier aggregation. For more information, see NILE algorithm. For more information, see [NILE algorithm](#).
- **Westwood:** TCP Westwood (TCPW) algorithm is a sender-side modification of the TCP congestion window algorithm that improves the performance in both wired and wireless networks.

### Configure BBR algorithm:

Starting from NetScaler release 14.1-21.x, NetScaler supports the Bottleneck Bandwidth and Round-trip propagation time (BBR) algorithm for TCP. While using this algorithm, NetScaler provides an enhanced network performance and a more efficient traffic management system.

To configure BBR support using the CLI, run the following command:

```
1 set ns tcpprofile <tcpprofile> -SACK [enable|disable] -flavor [BBR |
 BIC | CUBIC | Default | Nile | Westwood]
2 <!--NeedCopy-->
```

#### Note:

For optimal functionality of the BBR congestion control algorithm, the Selective Acknowledge-

ment (SACK) feature must be enabled on the TCP profile.

**Example:**

```
1 set ns tcpprofile <tcpprofilename> -SACK enable -flavor BBR
2 <!--NeedCopy-->
```

To configure BBR support using the GUI:

1. Navigate to **System > Profiles > TCP profiles** and click **Add**.
2. In the **Create TCP Profile** page, for the **TCP Flavor** field, select **BBR**.

### Window scaling

This increases the **TCP receive** window size beyond its maximum value of 65,535 bytes.

Points to consider before you configure window scaling

- You do not set a high value for the scale factor, because this might have adverse effects on the appliance and the network.
- You do not configure window scaling unless you clearly know why you want to change the window size.
- Both hosts in the TCP connection send a window scale option during connection establishment. If only one side of a connection sets this option, window scaling is not used for the connection.
- Each connection for the same session is an independent window scaling session. For example, when a client's request and the server's response flow through the appliance, it is possible to have window scaling between the client and the appliance without window scaling between the appliance and the server.

### TCP maximum congestion window

The window size is a user configurable one. The default value is 8190 bytes.

### Selective acknowledgment (SACK)

This uses the data receiver (either a NetScaler appliance or a client) notifies the sender about all the segments that have been received successfully.

### Forward acknowledgment (FACK)

This functionality avoids TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either a NetScaler or a client) control the amount of data injected into the network during retransmission timeouts.

### **TCP connection multiplexing**

This functionality enables reuse of existing TCP connections. The NetScaler appliance stores established TCP connections to the reuse pool. Whenever a client request is received, the appliance checks for an available connection in the reuse pool and serves the new client if the connection is available. If it is unavailable, the appliance creates a connection for the client request and stores the connection to the reuse pool. The NetScaler supports connection multiplexing for HTTP, SSL, and DataStream connection types.

### **Dynamic receive buffering**

This allows the receive buffer to be adjusted dynamically based on memory and network conditions.

### **MPTCP Connection**

MPTCP connections between the client and the NetScaler. MPTCP connections are not supported between the NetScaler and the back-end server. The NetScaler implementation of MPTCP is RFC 6824 compliant.

You can view MPTCP statistics such as active MPTCP connections and active subflow connections by using the command line interface.

At the command prompt, type one of the following commands to display a summary or detailed summary of MPTCP statistics, or to clear the statistics display:

1. `Stat MPTCP`
2. `Stat mptcp -detail`
3. `Clearstats basic`

**Note:**

To establish an MPTCP connection, both the client and the NetScaler appliance must support the same MPTCP version. If you use the NetScaler appliance as an MPTCP gateway for your servers, the servers do not have to support MPTCP. When the client starts a new MPTCP connection, the appliance identifies the client's MPTCP version from the MP\_CAPABALE option in the SYN packet. If the client's version is higher than the one supported on the appliance, the appliance indicates its highest version in the MP\_CAPABALE option of the SYN-ACK packet. The client then falls back to a lower version and sends the version number in the MP\_CAPABALE option of the ACK packet. If that version is supportable, the appliance continues the MPTCP connection. Otherwise, the ap-

pliance falls back to a regular TCP. The NetScaler appliance does not initiate subflows (MP\_JOIN's). The appliance expects the client to initiate subflows.

### Support for additional address advertisement (ADD\_ADDR) in MPTCP

In an MPTCP deployment, if you have a virtual server bound with an IP set that has additional virtual server IP addresses, then the additional address advertisement (ADD\_ADDR) functionality advertises the IP address of the virtual servers bound to the IP set. Clients can initiate additional MP\_JOIN subflows to the advertised IP addresses.

#### Points to remember about MPTCP ADD\_ADDR functionality

- You can send a maximum of 10 IP addresses as part of the ADD\_ADDR option. If there are more than 10 IP addresses with the `mptcpAdvertise` parameter enabled, after advertising the 10 IP address, the appliance ignore the rest of the IP addresses.
- If the MP-CAPABLE subflow is made to one of the IP addresses in the IP set instead of the primary virtual server IP address, then the virtual server IP address is advertised if the `mptcpAdvertise` parameter is enabled for the virtual server IP address

#### Configure more address advertisement (ADD\_ADDR) feature to advertise additional VIP address by using the CLI

You can configure the MPTCP ADD\_ADDR functionality for both IPv4 and IPv6 address types. In general, multiple IPv4 and IPv6 IPs can be attached to a single IP set and the parameter can be enabled on any subset of IP addresses. In the ADD\_ADDR feature, only the IP addresses that have the “mptcpAdvertise” option enabled is advertised and the remaining IP addresses from the IP set is ignored. Complete the following steps to configure the ADD\_ADDR feature:

1. Add an IP set.
2. Add an IP address of type virtual server IP (VIP) with MPTCP advertise enabled.
3. Bind the IP address with the IP set.
4. Configure IP set with the load balancing virtual server.

**Add an IP set** At the command prompt, type:

```
1 add ipset <name> [-td <positive_integer>]
2 <!--NeedCopy-->
```

#### Example:

```
1 add ipset ipset_1
2 <!--NeedCopy-->
```

**Add an IP address of type virtual server IP (VIP) with MPTCP advertise enabled** At the command prompt, type:

```
1 add ns ip <IPAddress>@ <netmask> [-mptcpAdvertise (YES | NO)] -type <
 type>
2 <!--NeedCopy-->
```

**Example:**

```
add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP
```

**Bind IP addresses to the IP set** At the command prompt, type:

```
1 bind ipset <name> <IPAddress>
2 <!--NeedCopy-->
```

**Example:**

```
bind ipset ipset_1 10.10.10.10
```

**Configure IP set to load balancing virtual server** At the command prompt, type:

```
1 set lb vserver <name> [-ipset <string>]
2 <!--NeedCopy-->
```

**Example:**

```
1 set lb vserver lb1 -ipset ipset_1
2 <!--NeedCopy-->
```

**Sample Configuration:**

```
1 Add ipset ipset_1
2 add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP
3 bind ipset ipset_1 10.10.10.10
4 set lb vserver lb1 -ipset ipset_1
5 <!--NeedCopy-->
```

**Configure advertising external IP address using ADD\_ADDR functionality**

If the advertised IP address is owned by the external entity and the NetScaler appliance needs to advertise the IP address, the “MPTCPAdvertise” parameter must be enabled with state and ARP parameters disabled.

Complete the following steps to configure [ADD\\_ADDR](#) for advertising the external IP address.

1. Add an IP address of type virtual server IP (VIP) with MPTCP advertise enabled.

2. Bind the IP address with the IP set.
3. Bind IP set with the load balancing virtual server

**Add an external IP address of type virtual server IP (VIP) with MPTCP advertise enabled** At the command prompt, type:

```
1 add ns ip <IPAddress>@ <External-IP-mask -type VIP> [-mptcpAdvertise (
 YES | NO)] -type <type> -state DISABLED -arp DISABLED
2 <!--NeedCopy-->
```

**Example:**

```
add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP -
state DISABLED -arp DISABLED
```

**Bind IP addresses to the IP set** At the command prompt, type:

```
1 bind ipset <name> <IPAddress>
2 <!--NeedCopy-->
```

**Example:**

```
bind ipset ipset_1 10.10.10.10
```

**Configure IP set to load balancing virtual server** At the command prompt, type:

```
1 set lb vserver <name> [-ipset <string>]
2 <!--NeedCopy-->
```

**Example:**

```
set lb vserver lb1 -ipset ipset_1
```

**Sample Configuration:**

```
1 add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP
 state DISABLED -arp DISABLED
2 bind ipset ipset_1 10.10.10.10
3 set lb vserver lb1 -ipset ipset_1
4 <!--NeedCopy-->
```

**Advertise an IP address to MPTCP enabled clients by using the NetScaler GUI**

Complete the following step to advertise the IP address to the MPTCP enabled clients:

1. Navigate to **System > Network > IPs**.

2. In the details pane, click **Add**.
3. In the **Create IP Address** page, select the **MPTCP Advertise** check box to set the parameter. By default, it is disabled.

### **Extracting the TCP/IP path overlay option and inserting the client-IP HTTP header**

Extracting TCP/IP path overlay and inserting client-IP HTTP header. Data transport through overlay networks often uses connection termination or Network Address Translation (NAT), in which the IP address of the source client is lost. To avoid this, the NetScaler appliance extracts the TCP/IP path overlay option and inserts the source client's IP address into the HTTP header. With the IP address in the header, the web server can identify the source client that made the connection. The extracted data is valid for a lifetime of the TCP connection and therefore, this prevents the next hop host from having to interpret the option again. This option is applicable only for web services that have the client-IP insertion option enabled.

### **TCP segmentation offload**

Offloads TCP segmentation to the NIC. If you set the option as "AUTOMATIC", TCP segmentation is offloaded to the NIC, if NIC is supported.

### **Synchronizing cookie for TCP handshake with clients**

This is used for resisting SYN flood attacks. You can enable or disable the [SYNCOOKIE](#) mechanism for TCP handshake with clients. Disabling [SYNCOOKIE](#) prevents [SYN](#) attack protection on the NetScaler appliance.

### **Learning MSS to enable MSS learning for all the virtual servers configured on the appliance**

#### **Supported TCP Parameters**

The following table provides a list of TCP parameters and their default values:

---

Parameter	Default Value	Description
Window Management		
TCP Delayed-ACK Timer	100 millisecond	Timeout for TCP delayed ACK, in milliseconds.

Parameter	Default Value	Description
TCP minimum Retransmission Timeout(RTO) in milli sec	1000 milli sec	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10)
Connection idle time before starting keep-alive probes	900 seconds	Silently drop TCP established connections on idle timeouts established connections on idle timeout
TCP Timestamp Option	DISABLED	The timestamp option allows for accurate RTT measurement. Enable or Disable TCP Timestamp option.
Multipath TCP session timeout	0 seconds	MPTCP session timeout in seconds. If this value is not set, idle. MPTCP sessions are flushed after the virtual server's client idle timeout.
Silently Drop HalfClosed connections on idle timeout	0 seconds	Silently drop TCP half closed connections on idle timeout.
Silently Drop Established connections on idle timeout	DISABLED	Silently drop TCP established connections on idle timeout
Memory Management		
TCP Buffer Size	131072 bytes	TCP buffer size is the receive buffer size on the NetScaler. This buffer size is advertised to clients and servers from NetScaler and it controls their ability to send data to NetScaler. The default receive buffer is 131072 and usually it is safe to increment this when talking to internal server. <b>Note:</b> The buffer size is also impacted by the actual application ports to NetScaler. For SSL endpoint cases, the buffer size is set to 40 K and for Compression, it is set to 96 K.
TCP Send Buffer Size	8190 bytes	TCP Send Buffer Size
TCP Dynamic Receive Buffering	DISABLED	Enable or disable control their receive buffer size when NetScaler. The default receive buffer is 131072 and usually it is safe to increment this when talking to internal server. <b>Note:</b> The buffer size is also impacted by the actual application ports to NetScaler. For SSL endpoint cases, the buffer size is set to 40 K and for Compression, it is set to 96 K.

---

Parameter	Default Value	Description
TCP Max congestion window(CWND)	524288 bytes	TCP Maximum Congestion Window
Window Scaling status	ENALBED	Enable or disable window scaling.
Window Scaling factor	8	Factor used to calculate the new window size. This argument is needed only when window scaling is enabled.
Connection Setup		
Keep-alive probes	DISABLED	Send periodic TCP keep-alive (KA) probes to check if peer is still up.
Connection idle time before starting keep-alive probes	900 seconds	Duration, in seconds, for the connection to be idle, before sending a keep-alive (KA) probe.
Keep-alive probe interval	75 seconds	Time interval, in seconds, before the next keep-alive (KA) probe, if the peer does not respond.
Maximum keep-alive probes to be missed before dropping connection.	3	Number of keep-alive (KA) probes to be sent when not acknowledged, before assuming the peer to be down.
RFC 5961 compliance	DISABLED	Enable RFC 5961 compliance to protect against spoofing. When enabled, provides both RST window attenuation and SYN spoof protection and also allows you to control the number of challenge ACK sent by the NetScaler. Note that for RFC 5961 compliance feature to work, you must disable both RST window attenuation and SYN spoof protection.

Parameter	Default Value	Description
RST window attenuation (spoof protection).	DISABLED	Enable or disable RST window attenuation to protect against spoofing. When enabled, the reply is with corrective ACK when a sequence number is invalid.
Accept RST with last acknowledged sequence number. Data transfer	ENABLED	
Immediate ACK on PUSH packet	ENABLED	Send immediate positive acknowledgment (ACK) on receipt of TCP packets with PUSH flag.
Maximum packets per MSS	0	Maximum number of octets to allow in a TCP data segment
Nagle's Algorithm	DISABLED	Nagle's Algorithm fights with the problem of small packets in TCP transmission. Applications like Telnet and other real time engines which require every key stroke to be passed to the other side often create small packets. With Nagle's algorithm NetScaler can buffer such small packets and sends them together to increase on the connection efficiency. This algorithm needs to work along with other TCP optimization techniques in the NetScaler.
Maximum TCP segments allowed in a burst	10 MSS	Maximum number of TCP segments allowed in a burst
Maximum out-of-order packets to queue	300	Maximum size of out-of-order packets queue. A value of 0 means no limit
Congestion Control		

---

Parameter	Default Value	Description
TCP Flavor	CUBIC	
Initial congestion window(cwnd) setting	4 MSS	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server
TCP Explicit Congestion Notification(ECN)	DISABLED	Explicit Congestion Notification (ECN) provides end to end notification of network congestion without dropping packets.
TCP Max congestion window(CWND)	524288 bytes	TCP maintains a congestion window (CWND), limiting the total number of unacknowledged packets that may be in transit end-to-end. In TCP, the congestion window is one of the factors that determines the number of bytes that can be outstanding at any time. The congestion window is a means of stopping a link between the sender and the receiver from becoming overloaded with too much traffic. It is calculated by estimating how much congestion there is on the link.
TCP Hybrid Start (HyStart)	8 bytes	
TCP minimum Retransmission Timeout(RTO) in milli sec	1000	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10).
TCP dupack threshold	DISABLED	

Parameter	Default Value	Description
Burst Rate Control	3	TCP Burst Rate Control DISABLED/FIXED/DYNAMIC. FIXED requires a TCP rate to be set
TCP Rate	DISABLED	TCP connection payload send rate in Kb/s
TCP Rate Maximum Queue	0	Maximum connection queue size in bytes, when BurstRateControl is used.
MPTCP		
Multipath TCP	DISABLED	Multipath TCP (MPTCP) is a set of extensions to regular TCP to provide a Multipath TCP service, which enables a transport connection to operate across multiple paths simultaneously.
Multipath TCP drop data on pre-established subflow	DISABLED	Enable or disable silently dropping the data on Pre-Established subflow. When enabled, DSS data packets are dropped silently instead of dropping the connection when data is received on pre established subflow.
Multipath TCP fastopen	DISABLED	Enable or disable Multipath TCP fastopen. When enabled, DSS data packets are accepted before receiving the third ack of SYN handshake.
Multipath TCP session timeout	0 seconds	MPTCP session timeout in seconds. If this value is not set, idle MPTCP sessions are flushed after the virtual server's client idle timeout.
Security		

---

Parameter	Default Value	Description
SYN spoof protection	DISABLED	Enable or disable drop of invalid SYN packets to protect against spoofing. When disabled, established connections are reset when a SYN packet is received.
TCP Syncookie	DISABLED	This is used for resisting SYN flood attacks. Enable or disable the SYNCOOKIE mechanism for TCP handshake with clients. Disabling SYNCOOKIE prevents SYN attack protection on the NetScaler appliance.
Loss Detection and Recovery		
Duplicate Selective Acknowledgment (DSACK)	ENABLED	A NetScaler appliance uses Duplicate Selective Acknowledgment (DSACK) to determine if a retransmission was sent in error.
Forward RTO recovery (FRTO)	ENABLED	Detects spurious TCP retransmission timeouts. After retransmitting the first unacknowledged segment triggered by a timeout, the algorithm of the TCP sender monitors the incoming acknowledgments to determine whether the timeout was spurious. It then decides whether to send new segments or retransmit unacknowledged segments. The algorithm effectively helps to avoid another unnecessary retransmissions and thereby improves TCP performance in the case of a spurious timeout.

Parameter	Default Value	Description
TCP Forward Acknowledgment (FACK)	ENABLED	Enable or disable FACK (Forward ACK).
Selective Acknowledgement(SACK) status	ENABLED	TCP SACK addresses the problem of multiple packet losses which reduces the overall throughput capacity. With selective acknowledgment the receiver can inform the sender about all the segments which are received successfully, enabling the sender to only retransmit the segments which were lost. This technique helps NetScaler improve overall throughput and reduce the connection latency.
Maximum packets per retransmission	1	Allows NetScaler to control how many packets to be retransmitted in one attempt. When NetScaler receives a partial ACK and it has to do retransmission then this setting is considered. This does not impact the RTO based retransmissions.
TCP Delayed-ACK Timer	100 millisecc	Timeout for TCP delayed ACK, in milliseconds
TCO Optimization		
TCP Optimization mode	TRANSPARENT	TCP Optimization modes TRANSPARENT/ENDPOINT
Apply adaptive TCP optimizations	DISABLED	Apply Adaptive TCP optimizations

Parameter	Default Value	Description
TCP Segmentation Offload	AUTOMATIC	Offload TCP segmentation to the NIC. If set to AUTOMATIC, TCP segmentation is offloaded to the NIC, if the NIC supports it.
ACK Aggregation	DISABLED	Enable or disable ACK Aggregation
TCP Time-wait(or Time_wait)	40 secs	Time to elapse before releasing a closed TCP connection
Delink client and server on RST	DISABLED	Delink client and server connection, when there is outstanding data to be sent to the other side.

**Note:**

When HTTP/2 is enabled, Citrix recommends you to disable TCP Dynamic Receive Buffering parameter in the TCP profile.

**Setting Global TCP Parameters**

The NetScaler appliance allows you to specify values for TCP parameters that are applicable to all NetScaler services and virtual servers. This can be done using:

- Default TCP profile
- Global TCP command
- TCP buffering feature

**Notes:**

- The `recvBuffSize` parameter of the `set ns tcpParam` command is deprecated from release 9.2 onwards. In later releases, set the buffer size by using the `bufferSize` parameter of the `set ns tcpProfile` command. If you upgrade to a release where the `recvBuffSize` parameter is deprecated, the `bufferSize` parameter is set to its default value.
- While configuring TCP profile, ensure that the TCP `bufferSize` parameter is lesser or equal to the `httppipelinebuffersize` parameter. If the `bufferSize` parameter in TCP profile is greater than the `httppipelinebuffersize`

parameter in HTTP profile, the TCP payload might get accumulated and exceed the HTTP pipeline buffer size. This results in NetScaler appliance resetting the TCP connection.

### Default TCP profile

A TCP profile, named as `nstcp_default_profile`, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level.

#### Notes:

- Not all TCP parameters can be configured through the default TCP profile. Some settings have to be performed by using the global TCP command (see section below).
- The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default TCP profile

- Using the command line interface, at the command prompt enter:

```
1 set ns tcpProfile nstcp_default_profile...
2 <!--NeedCopy-->
```

- On the GUI, navigate to **System > Profiles**, click **TCP Profiles** and update `nstcp_default_profile`.

### Global TCP command

Another approach you can use to configure global TCP parameters is the global TCP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using a TCP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default TCP profile.

For example, if the SACK parameter is updated using this approach, the value is reflected in the SACK parameter of the default TCP profile (`nstcp_default_profile`).

#### Note:

Citrix recommends that you use this approach only for TCP parameters that are not available in the default TCP profile.

To configure the global TCP command

- Using the command line interface, at the command prompt enter:

```
1 set ns tcpParam ...
2 <!--NeedCopy-->
```

- On the GUI, navigate to **System > Settings**, click **Change TCP parameters** and, update the required TCP parameters.

### TCP buffering feature

NetScaler provides a feature called TCP buffering that you can use to specify the TCP buffer size. The feature can be enabled globally or at service level.

**Note:**

The buffer size can also be configured in the default TCP profile. If the buffer size has different values in the TCP buffering feature and the default TCP profile, the greater value is applied.

### Configure the TCP buffering feature globally

- At the command prompt enter:

```
enable ns mode TCPB
```

```
set ns tcpbufParam -size <positiveInteger> -memLimit <positiveInteger>
```

- On the GUI, navigate to **System > Settings**, click **Configure Modes** and, select **TCP Buffering**.  
And, navigate to **System > Settings**, click **Change TCP parameters**, specify values for **Buffer size** and **Memory usage limit**.

### Setting Service or Virtual Server Specific TCP Parameters

Using TCP profiles, you can specify TCP parameters for services and virtual servers. You must define a TCP profile (or use a built-in TCP profile) and associate the profile with the appropriate service and virtual server.

**Note:**

You can also modify the TCP parameters of default profiles as per your requirements.

You can specify the TCP buffer size at service level using the parameters specified by the TCP buffering feature.

To specify service or virtual server level TCP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the TCP profile.

```
1 set ns tcpProfile <profile-name>...
2 <!--NeedCopy-->
```

2. Bind the TCP profile to the service or virtual server.

```
1 set service <name>
2 <!--NeedCopy-->
```

**Example:**

```
> set service service1 -tcpProfileName profile1
```

To bind the TCP profile to the virtual server:

```
1 set lb vserver <name>
2 <!--NeedCopy-->
```

**Example:**

```
1 > set lb vserver lbvserver1 -tcpProfileName profile1
2 <!--NeedCopy-->
```

To specify service or virtual server level TCP configurations by using the GUI

At the GUI, perform the following:

1. Configure the TCP profile.

Navigate to **System > Profiles > TCP Profiles**, and create the TCP profile.

2. Bind the TCP profile to the service or virtual server.

Navigate to **Traffic Management > Load Balancing > Services/Virtual Servers**, and create the TCP profile, which should be bound to the service or virtual server.

**Built-in TCP Profiles**

For convenience of configuration, the NetScaler provides some built-in TCP profiles. Review the built-in profiles listed for the following and select a profile and use it as it is or modify it to meet your requirements. You can bind these profiles to your required services or virtual servers.

---

Built-in profile	Description
nstcp_default_profile	Represents the default global TCP settings on the appliance.

---

Built-in profile	Description
nstcp_default_tcp_lan	Useful for back-end server connections, where these servers reside on the same LAN as the appliance.
nstcp_default_WAN	useful for WAN deployments.
nstcp_default_tcp_lan_thin_stream	Similar to the nstcp_default_tcp_lan profile. However, the settings are tuned to small size packet flows.
nstcp_default_tcp_interactive_stream	Similar to the nstcp_default_tcp_lan profile. However, it has a reduced delayed ACK timer and ACK on <b>PUSH packet</b> settings.
nstcp_default_tcp_lfp	Useful for long fat pipe networks (WAN) on the client side. Long fat pipe networks have long delay, high bandwidth lines with minimal packet drops.
nstcp_default_tcp_lfp_thin_stream	Similar to the nstcp_default_tcp_lfp profile. However, the settings are tuned for small size packet flows.
nstcp_default_tcp_lnp	Useful for long narrow pipe networks (WAN) on the client side. Long narrow pipe networks have considerable packet loss occasionally.
nstcp_default_tcp_lnp_thin_stream	Similar to the nstcp_default_tcp_lnp profile. However, the settings are tuned for small size packet flows.
nstcp_internal_apps	Useful for internal applications on the appliance (for example, GSLB site syncing). This contains tuned window scaling and SACK options for the desired applications. This profile should not be bound to applications other than internal applications.
nstcp_default_Mobile_profile	Useful for mobile devices.
nstcp_default_XA_XD_profile	Useful for the Citrix Virtual Apps and Desktops deployment.

---

## Sample TCP Configurations

Sample command line interface examples for configuring the following:

## Defending TCP against spoofing attacks

**Prior to RFC 5961 compliance support** To enable RST window attenuation and SYN spoof protection by using the CLI:

```
1 > set ns tcpProfile profile1 -rstWindowAttenuate ENABLED -spoofSynDrop
 ENABLED
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

To enable RST window attenuation and SYN spoof protection by using the GUI:

1. Navigate to **System > Profiles > TCP Profiles**, and click **Add** to create a TCP profile.
2. Select the **RST Window Attenuation** and **SYN Spoof Protection**.
3. Click **Create**.

**From NetScaler release 14.1-4.x onwards with RFC 5961 compliance support** To enable RFC 5961 compliance by using the CLI:

```
1 > set ns tcpProfile profile1 -rstWindowAttenuate DISABLED -spoofSynDrop
 DISABLED -rfc5961Compliance ENABLED
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

To impose the limit on the number of challenge ACKs allowed per second, enable the `rfc5961ChallengeAckLimit` parameter:

```
1 > set ns tcpParam -rfc5961ChlgAckLimit 100
2 Done
3 <!--NeedCopy-->
```

To enable RFC 5961 compliance by using the GUI:

1. Navigate to **System > Profiles > TCP Profiles**, and click **Add** to create a TCP profile.
2. Clear **RST Window Attenuation** and **SYN Spoof Protection**.
3. Select **RFC5961 Compliance** and click **Create**.
4. Navigate to the **System > Settings > Change TCP Parameters**.
5. Enter a value in **RFC5961 Chlg Ack Limit** and click **OK**.

## Explicit Congestion Notification (ECN)

Enable ECN on the required TCP profile.

```
1 > set ns tcpProfile profile1 -ECN ENABLED
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

### Selective Acknowledgment (SACK)

Enable SACK on the required TCP profile.

```
1 > set ns tcpProfile profile1 -SACK ENABLED
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

### Forward Acknowledgment (FACK)

Enable FACK on the required TCP profile.

```
1 > set ns tcpProfile profile1 -FACK ENABLED
2 > set lb vserver lbvserver1 -tcpProfileName profile1
3 <!--NeedCopy-->
```

### Window Scaling (WS)

Enable window scaling and set the window scaling factor on the required TCP profile.

```
1 set ns tcpProfile profile1 -WS ENABLED -WSVal 9
2 Done
3 set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

### Maximum Segment Size (MSS)

Update the MSS related configurations.

```
1 > set ns tcpProfile profile1 -mss 1460 -maxPktPerMss 512
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

### NetScaler to learn the MSS of a virtual server

Enable the NetScaler to learn the VSS and update other related configurations.

```
1 > set ns tcpParam -learnVsvrMSS ENABLED -mssLearnInterval 180 -
 mssLearnDelay 3600
2 Done
3 <!--NeedCopy-->
```

### TCP keep-alive

Enable TCP keep-alive and update other related configurations.

```
> set ns tcpProfile profile1 -KA ENABLED -KaprobeUpdateLastactivity
ENABLED -KAconnIdleTime 900 -KAmaxProbes 3 -KaprobeInterval 75
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

### Buffer size - using TCP profile

Specify the buffer size.

```
> set ns tcpProfile profile1 -bufferSize 8190
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

### Buffer size - using TCP buffering feature

Enable the TCP buffering feature (globally or for a service) and then specify the buffer size and the memory limit.

```
> enable ns feature TCPB
Done
> set ns tcpbufParam -size 64 -memLimit 64
Done
```

### MPTCP

Enable MPTCP and then set the optional MPTCP configurations.

```
> set ns tcpProfile profile1 -mptcp ENABLED
Done
> set ns tcpProfile profile1 -mptcpDropDataOnPreEstSF ENABLED -
mptcpFastOpen ENABLED -mptcpSessionTimeout 7200
Done
> set ns tcpparam -mptcpConCloseOnPassiveSF ENABLED -mptcpChecksum
ENABLED -mptcpSFtimeout 0 -mptcpSFReplaceTimeout 10
-mptcpMaxSF 4 -mptcpMaxPendingSF 4 -mptcpPendingJoinThreshold 0 -
mptcpRTOsToSwitchSF 2 -mptcpUseBackupOnDSS ENABLED
Done
```

### **Congestion control**

Set the required TCP congestion control algorithm.

```
set ns tcpProfile profile1 -flavor Westwood
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

### **Dynamic receive buffering**

Enable dynamic receive buffering on the required TCP profile.

```
> set ns tcpProfile profile1 -dynamicReceiveBuffering ENABLED
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

### **Support for TCP Fast Open (TFO) in Multipath TCP (MPTCP)**

A NetScaler appliance now supports the TCP Fast Open (TFO) mechanism for establishing Multipath TCP (MPTCP) connections and speed up data transfers. The mechanism allows subflow data to be carried during the initial MPTCP connection handshake in SYN and SYN-ACK packets and also enables data to be consumed by the receiving node during the MPTCP connection establishment.

For more information, see [TCP Fast Open](#) topic.

## Support for Variable TFO Cookie Size for MPTCP

A NetScaler appliance now enables you to configure a variable length TCP Fast Open (TFO) cookie of a minimum size of 4 bytes and a maximum size of 16 bytes in a TCP profile. By doing this, the appliance can respond with the configured TFO cookie size in the SYN-ACK packet to the client.

To configure the TCP Fast Open (TFO) cookie in a TCP profile by using the command line interface

At the command prompt, type:

```
set tcpProfile nstcp_default_profile -tcpFastOpenCookieSize <positive_integer>
```

Example

```
set tcpProfile nstcp_default_profile -tcpFastOpenCookieSize 8
```

To configure the TCP Fast Open (TFO) cookie in a TCP profile by using the GUI

1. Navigate to **Configuration > System > Profiles**.
2. In the details pane, go to **TCP Profiles** tab and select a TCP profile.
3. In the **Configure TCP Profile** page, set the **TCP Fast Open** cookie size.
4. Click **OK** and **Done**.

## SYN-Cookie timeout interval

The `TCPSyncookie` parameter is enabled by default in TCP profiles to provide robust (RFC 4987) based protection against SYN Attacks. If you need to accommodate custom TCP clients that are not compatible with this protection but still want to ensure a fallback in case of attack, the `synAttackDetection` handles this for you by automatically activating the `SYNCookie` behavior internally for a period of time determined by the `autosyncookietimeout` parameter..

To configure the maximum SYN ACK retransmission threshold by using the command line interface:

At the command prompt, type:

```
1 set ns tcpparam [-maxSynAckRetx <positive_integer>]
2
3 Set ns tcpparam [-maxSynAckRetx 150]
4 <!--NeedCopy-->
```

To configure auto SYN cookie timeout interval by using the command line interface

At the command prompt, type:

```
set ns tcpparam [-autosyncookietimeout <positive_integer>]
```

```
Set ns tcpparam [-autosyncookietimeout 90]
```

### Enhanced ISN generation

When enabled, the parameter increases the variance of the initial sequence numbers (ISN) generated by NetScaler while establishing a TCP connection. This scenario is applicable only for TCP connections where NetScaler acts as the server. By default, the parameter is disabled.

To enable enhanced ISN generation using the CLI, run the following command:

```
1 set ns tcpparam -enhancedISNgeneration [ENABLED | DISABLED]
2 <!--NeedCopy-->
```

#### Example:

```
1 set ns tcpparam -enhancedISNgeneration ENABLED
2 <!--NeedCopy-->
```

To enable enhanced ISN generation using the GUI:

1. Navigate to **Configuration -> System -> Settings -> Change TCP Parameters**.
2. In the **Configure TCP Parameters** page, select **Enhanced ISN Generation**.
3. Click **OK**.

### Delink client and server connection

When enabled, the parameter delinks client and server connection when there is outstanding data to be sent to the other side. By default, the parameter is disabled.

```
1 set ns tcpparam -delinkClientServerOnRST ENABLED
2 Done
3 <!--NeedCopy-->
```

**Configure the slow start threshold parameter** You can use the slow start threshold `slowStartThreshold` parameter to configure the `tcp-slowstartthreshold` value for the `Nile` variant of the congestion control algorithm. The acceptable values for the parameter are `min` = 8190 and `max` = 524288. The default value is 524288. The TCP variant `Nile`, under the TCP profile is no more dependent on the `maxcwnd` parameter. You have to configure the `slowStartThreshold` parameter for the `Nile` variant.

At the command prompt type:

```
1 set tcpprofile nstcp_default_profile -slowstartthreshold 8190
2 Done
3
4 <!--NeedCopy-->
```

## HTTP configurations

April 8, 2024

### **Important:**

Starting from NetScaler release 13.0 build 71.x, a NetScaler appliance can handle large header size HTTP requests to accommodate the L7 application requests. The header size can be configurable up to 120 KB.

HTTP configurations for a NetScaler appliance can be specified in an entity called an HTTP profile, which is a collection of HTTP settings. The HTTP profile can then be associated with services or virtual servers that want to use these HTTP configurations.

A default HTTP profile can be configured to set the HTTP configurations that are applied by default, globally to all services and virtual servers.

### **Note:**

When an HTTP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence.

The NetScaler appliance also provides other approaches for configuring HTTP. Read on for more information.

The NetScaler supports a WebSocket protocol which allows browsers and other clients to create a bi-directional, full duplex TCP connection to the servers. The NetScaler implementation of WebSocket is RFC [6455](#) compliant.

### **Note:**

A NetScaler appliance supports the User Source IP (USIP) address configuration for both HTTP/1.1 and HTTP/2 protocols.

## Setting global HTTP parameters

The NetScaler appliance allows you to specify values for HTTP parameters that are applicable to all NetScaler services and virtual servers. This can be done using:

- Default HTTP profile
- Global HTTP command

## Default HTTP profile

An HTTP profile, named as `nshttp_default_profile`, is used to specify HTTP configurations that are used if no HTTP configurations are provided at the service or virtual server level.

### Notes:

- Not all HTTP parameters can be configured through the default HTTP profile. Some settings are performed by using the global HTTP command (see the following section).
- The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default HTTP profile

- Using the command line interface, at the command prompt enter:  

```
set ns httpProfile nshttp_default_profile ...
```
- On the GUI, navigate to **System > Profiles**, click **HTTP Profiles** and update `nshttp_default_profile`.

## Global HTTP command

Another approach you can use to configure global HTTP parameters is the global HTTP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using an HTTP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default HTTP profile.

For example, if the `maxReusePool` parameter is updated using this approach, the value is reflected in the `maxReusePool` parameter of the default HTTP profile (`nshttp_default_profile`).

### Note:

We recommend you to use this approach only for HTTP parameters that are not available in the default HTTP profile.

To configure the global HTTP command

- Using the command line interface, at the command prompt enter:  

```
set ns httpParam ...
```
- On the GUI, navigate to **System > Settings**, click **Change HTTP parameters** and update the required HTTP parameters.

To configure an ignore Coding scheme for connect request

To enable HTTP/2 and set HTTP/2 parameters to ignore the Coding scheme in the connect request, at the command prompt, type:

```
set ns httpParam [-ignoreConnectCodingScheme (ENABLED | DISABLED)]
```

**Example:**

```
set ns httpParam -ignoreConnectCodingScheme ENABLED
```

To bind the HTTP profile to a virtual server by using the NetScaler command line

**Configure HTTP profile to drop TRACE or TRACK invalid requests**

You can enable the markTraceReqInval parameter to mark TRACE and TRACK requests as invalid. When you enable this option along with the dropInvalidReqs option on the virtual IP address, you can reset a client sending TRACE or TRACK requests to a NetScaler appliance.

To configure the HTTP profile using the CLI

At the command prompt, type:

```
set ns httpProfile <profile name> [-markTraceReqInval ENABLED |
DISABLED]
```

**Example:**

```
set ns httpProfile profile1 -markTraceReqInval ENABLED
```

**Configure HTTP profile for a service group**

At the command prompt, type:

```
1 add serviceGroup <serviceName>@ <serviceType> [-cacheType <
 cacheType>] [-td <positive_integer>] [-maxClient <positive_integer>]
 [-maxReq <positive_integer>] [-cacheable (YES | NO)] [-cip (
 ENABLED | DISABLED) [<cipHeader>]] [-usip (YES | NO)] [-
 pathMonitor (YES | NO)] [-pathMonitorIndv (YES | NO)] [-
 useproxyport (YES | NO)] [-healthMonitor (YES | NO)] [-sp (ON |
 OFF)] [-rtspSessionidRemap (ON | OFF)] [-cltTimeout <secs>] [-
 svrTimeout <secs>] [-CKA (YES | NO)] [-TCPB (YES | NO)] [-CMP (
 YES | NO)] [-maxBandwidth
2 <positive_integer>] [-monThreshold <positive_integer>] [-state ENABLED
 DISABLED][-downStateFlush (ENABLED | DISABLED)] [-tcpProfileName
 <string>] [-httpProfileName <string>] [-comment <string>] [-
 appflowLog (ENABLED | DISABLED)] [-netProfile <string>] [-
 autoScale <autoScale> -memberPort <port> [-autoDisablegraceful (YES
 | NO)] [-autoDisabledelay <secs>]] [-monConnectionClose (RESET |
 FIN)]
3
4 <!--NeedCopy-->
```

**Example:**

```
add serviceGroup Service-Group-1 HTTP -maxClient 0 -maxReq 0 -cip
ENABLED -usip NO -useproxyport YES -cltTimeout 200 -svrTimeout 300 -
CKA NO -TCPB NO -CMP NO -httpProfileName profile1
```

**Configure the HTTP profile using the NetScaler GUI**

To mark TRACE or TRACK invalid requests, complete the following procedure.

1. Sign into NetScaler appliance and navigate to **Configuration > System > Profiles**.
2. In the **HTTP Profiles** tab page, click **Add**.
3. In the **Create HTTP Profile** page, select **Mark TRACE Requests as Invalid** option.
4. Click **Create**.

**Setting service or virtual server specific HTTP parameters**

Using HTTP profiles, you can specify HTTP parameters for services and virtual servers. You have to define an HTTP profile (or use a built-in HTTP profile) and associate the profile with the appropriate service and virtual server.

**Note:**

You can also modify the HTTP parameters of default profiles as per your requirements.

**To specify service or virtual server level HTTP configurations by using the command line interface**

At the command prompt, perform the following:

1. Configure the HTTP profile.  

```
set ns httpProfile <profile-name>...
```
2. Bind the HTTP profile to the service or virtual server.

To bind the HTTP profile to the service:

```
set service <name>
```

**Example:**

```
1 > set service service1 -httpProfileName profile1
2 <!--NeedCopy-->
```

To bind the HTTP profile to the virtual server:

```
set lb vsrver <name>
```

**Example:**

```
1 > set lb vsrver lbvserver1 -httpProfileName profile1
2 <!--NeedCopy-->
```

**To specify service or virtual server level HTTP configurations by using the GUI**

At the GUI, perform the following:

1. Configure the HTTP profile.  
 Navigate to **System > Profiles > HTTP Profiles**, and create the HTTP profile.
2. Bind the HTTP profile to the service or virtual server.  
 Navigate to **Traffic Management > Load Balancing > Services/Virtual Servers**, and create the HTTP profile, which must be bound to the service/virtual server.

**Built-in HTTP profiles**

For convenience of configuration, the NetScaler provides some built-in HTTP profiles. Review the profiles listed and use it as it is or modify it to meet your requirements. You can bind these profiles to the required services or virtual servers.

Built-in profile	Description
nshttp_default_profile	Represents the default global HTTP settings on the appliance.
nshttp_default_strict_validation	Settings for deployments that require strict validation of HTTP requests and responses.

**Sample HTTP configurations**

Sample command line interface examples to configure the following:

- HTTP band statistics
- WebSocket connections

## HTTP band statistics

Specify the band size for HTTP requests and responses.

```
1 > set protocol httpBand reqBandSize 300 respBandSize 2048
2 Done
3 > show protocol httpband -type REQUEST
4 <!--NeedCopy-->
```

## WebSocket connections

Enable WebSocket on the required HTTP profile.

```
1 > set ns httpProfile http_profile1 -webSocket ENABLED
2 Done
3 > set lb vserver lbvserver1 -httpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

## Configure the NetScaler appliance to delete or pass the upgrade header to the back-end server

The `passProtocolUpgrade` parameter in the HTTP profile prevents attack on the back-end servers. Depending on the state of this parameter, the upgrade header is passed in the request sent to the back-end server or deleted before sending the request.

- If the `passProtocolUpgrade` parameter is enabled, then the upgrade header is passed to the back-end server. The server accepts the upgrade request and notifies it in its response.
- If the parameter is disabled, then the upgrade header is deleted and the remaining request is sent to the back-end server.

The `passProtocolUpgrade` parameter is added to the following profiles:

- `nshttp_default_profile` - enabled by default
- `nshttp_default_strict_validation` - disabled by default
- `nshttp_default_internal_apps` - disabled by default
- `nshttp_default_http_quic_profile` - enabled by default

We recommend you to set the `passProtocolUpgrade` parameter to disabled by default.

## Set the `passProtocolUpgrade` parameter by using the CLI

At the command prompt, type the following:

```
set ns httpProfile <name> [-passProtocolUpgrade (ENABLED | DISABLED)]
```

**Example:**

```
set ns httpProfile profile1 -passProtocolUpgrade ENABLED
```

**Set the passProtocolUpgrade parameter by using the GUI**

1. Navigate to **System > Profiles > HTTP Profiles**.
2. Create or edit an HTTP profile.
3. Select **Pass Protocol Upgrade**.

**Configure HTTP profile to validate host headers**

From NetScaler release 14.1-21.x, NetScaler supports validating the host headers in the incoming HTTP requests to prevent host header injections or attacks.

When the host header validation is enabled, the following checks are performed:

- The length of the host header that is the IP address or the DNS name portion of the host header is not more than 255 characters.
- The port number, if specified, is not more than 5 characters because the maximum port number is 65535.

If the host header does not adhere to the defined conditions, such HTTP requests are dropped.

By default, the host header validation is disabled in default profiles and enabled in secure or strict HTTP profiles.

**Validate HTTP host headers using the NetScaler CLI**

At the command prompt, type the following:

```
1 set ns httpprofile <name> -hostHeaderValidation (ENABLED | DISABLED)
2 <!--NeedCopy-->
```

**Example:**

```
1 set ns httpProfile http_profile1 -hostHeaderValidation ENABLED
2 <!--NeedCopy-->
```

## Validate HTTP host headers using the NetScaler GUI

1. Navigate to **System > Profiles > HTTP Profiles**.
2. Create or edit an HTTP profile.
3. In the **Configure HTTP Profile** page, select **Host header validation**.

## HTTP/2 configuration

February 2, 2024

**Note:**

The HTTP/2 functionality is supported on the NetScaler MPX, VPX, and SDX models. In a NetScaler VPX appliance, the HTTP/2 functionality is supported from NetScaler version 11.0 onwards.

The problem with web application performance is directly related to the trend toward increasing the page size and the number of objects on the webpages. HTTP/1.1 was developed to support smaller webpages, slower Internet connections, and more limited server hardware than are common today. It is not suitable for new technologies such as JavaScript and cascading style sheets (CSS) or new media types such as Flash videos and graphics-rich images. This is because it can request only one resource per connection to the server. The limitation significantly increases the number of round trips, causing longer page-rendering and reduced network performance.

The HTTP/2 protocol addresses these limitations by allowing communication to occur with less data transmitted over the network, and providing the ability to send multiple requests and responses across a single connection. At its core, HTTP/2 addresses the key limitations of HTTP/1.1 by using the underlying network connections more efficiently. It changes the way requests and responses travel over the network.

HTTP/2 is a binary protocol. It is more efficient to parse, more compact on the wire, and most importantly, it is less error-prone, compared to textual protocols like HTTP/1.1. The HTTP/2 protocol uses a binary framing layer that defines the frame type and how HTTP messages are encapsulated and transferred between the client and server. The HTTP/2 functionality supports the use of the CONNECT method to establish a tunnel connection through a single HTTP/2 stream to a remote host.

The HTTP/2 protocol includes many performance-enhancing changes that significantly improve performance, particularly for clients connecting over a mobile network.

The following table lists the major improvements in HTTP/2 over HTTP/1.1:

<b>HTTP/2 features</b>	<b>Description</b>
Header Compression	HTTP headers have much repetitive information and therefore consume unnecessary bandwidth during data transmission. HTTP/2 reduces bandwidth requirements by compressing the header and minimizing the requirement to transport HTTP headers with every request and response.
Connection Multiplexing	Latency can have a huge impact on page load times and the end user experience. Connection multiplexing overcomes this problem by sending multiple requests and responses across a single connection.
Server Push	Server push enables the server to proactively push content to the client browser, avoiding round trip delay. This feature caches the responses it thinks the client needs, reduces the number round trips, and improves the page rendering time. Important: The NetScaler appliance does not support the server push functionality.
No Head-of-line Blocking	Under HTTP 1.1, browsers can download one resource at a time per connection. When a browser has to download a large resource, it blocks all other resources from downloading until the first download is complete. HTTP/2 overcomes this problem with a multiplexing approach. It allows the client browser to download other web components in parallel over the same connection and display them as they become available.

---

<b>HTTP/2 features</b>	<b>Description</b>
Request Prioritization	Not all resources have equal priority when the browser renders a webpage. To accelerate the load time, all modern browsers prioritize requests by type of asset, their location on the page, and even by learned priority from previous visits. With HTTP/1.1, the browser has limited ability to use the priority data, because this protocol does not support multiplexing, and there is no way to communicate request prioritization by the server. The result is unnecessary network latency. HTTP/2 overcomes this problem by allowing the browser to dispatch all requests. The browser can communicate its stream prioritization preference via stream dependencies and weights, enabling the servers to optimize response delivery. Important: The NetScaler appliance does not support the request prioritization functionality.

---

### **How HTTP/2 works**

A NetScaler appliance supports HTTP/2 on the client side as well on the server side. On the client side, the NetScaler appliance acts as a server that hosts an HTTP/HTTPS virtual server for HTTP/2. On the back-end side, the NetScaler acts as a client to the servers that are bound to the virtual server.

Therefore, the NetScaler appliance maintains separate connections on the client side as well on the server side. The NetScaler appliance has separate HTTP/2 configurations for the client side and the server side.

### **HTTP/2 for HTTPS (SSL) load balancing configuration**

For an HTTPS load balancing configuration, the NetScaler appliance uses the TLS ALPN extension (RFC 7301) to determine whether the client/server supports HTTP/2. If it does, the appliance chooses HTTP/2 as the application-layer protocol to transmit data (as described in RFC 7540 - Section 3.3) on the client/server side.

The appliance uses the following order of preference when choosing the application-layer protocol through the TLS ALPN extension:

- HTTP/2 (if enabled in the HTTP profile)
- HTTP/1.1

## HTTP/2 for HTTP load balancing configuration

For an HTTP load balancing configuration, the NetScaler appliance uses one of the following methods to start communicating with the client/server using HTTP/2.

### Note

In the following method descriptions, client and server are general terms for an HTTP/2 connection. For example, for a load balancing setup of a NetScaler appliance using HTTP/2, the NetScaler appliance acts as a server on the client side and acts as a client to the server side.

- **HTTP/2 Upgrade.** A client sends an HTTP/1.1 request to a server. The request includes an upgrade header, which asks the server for upgrading the connection to HTTP/2. If the server supports HTTP/2, the server accepts the upgrade request and notifies it in its response. The client and the server start communicating using HTTP/2 after the client receives the upgrade confirmation response.
- **Direct HTTP/2.** A client directly starts communicating to a server in HTTP/2 instead of using the HTTP/2 upgrade method. If the server does not support HTTP/2 or is not configured to directly accept HTTP/2 requests, it drops the HTTP/2 packets from the client. This method is helpful if the admin of the client device already knows that the server supports HTTP/2.
- **Direct HTTP/2 using Alternative Service (ALT-SVC).** A server advertises that it supports HTTP/2 to a client by including an Alternative Service (ALT-SVC) field in its HTTP/1.1 response. If the client is configured to understand the ALT-SVC field, the client and the server start directly communicating using HTTP/2 after the client receives the response.

The NetScaler appliance provides configurable options in an HTTP profile for the HTTP/2 methods. These HTTP/2 options can be applied to the client side as well to the server side of an HTTPS or HTTP load balancing setup. For more information for HTTP/2 methods and options, refer to the [HTTP/2 options](#) PDF.

## Before you Begin

Before you begin configuring HTTP/2 on a NetScaler appliance, note the following points:

- The NetScaler appliance supports HTTP/2 on the client side as well on the server side.

- The NetScaler appliance does not support the HTTP/2 server push functionality.
- The NetScaler appliance does not support the HTTP/2 request prioritization functionality.
- The NetScaler appliance does not support HTTP/2 SSL renegotiation for HTTPS load balancing setups.
- The NetScaler appliance does not support HTTP/2 NTLM authentication.
- With HTTP/2 enabled, connection multiplexing disabled (like USIP enabled) and one to one mapping of client and server TCP connections, close events such as FIN, reset (RST) are forwarded from the client or server connection to the linked peer connection.

## Configuring HTTP/2

Configuring HTTP/2 for a load balancing setup (HTTPS or HTTP) consists of the following tasks:

- **Enable HTTP/2 and set optional HTTP/2 parameters in an HTTP Profile.** Enable HTTP/2 in an HTTP profile. When you only enable HTTP/2 in an HTTP profile, the NetScaler appliance uses only the upgrade method (for HTTP) or TLS ALPN method (for HTTPS) for communicating in HTTP/2.

For the NetScaler appliance to use the direct HTTP/2 method, the **Direct HTTP/2** option must be enabled in the HTTP profile. For the NetScaler appliance to use the direct HTTP/2 using the alternative service method, the **Alternative Service (altsvc)** option must be enabled in the HTTP profile.

- **Bind the HTTP profile to a virtual server or a service.** Bind the HTTP profile to a virtual server to configure HTTP/2 for the client side of the load balancing setup. Bind the HTTP profile to a service to configure HTTP2 for the server side of the load balancing setup.

### Note

Citrix recommends binding separate HTTP profiles for the client side and the server side.

- **Enable the global parameter for HTTP/2 server side support.** Enable the **HTTP/2 Service Side (HTTP2Serverside)** global HTTP parameter for enabling the HTTP/2 support on the server side of all the load balancing setups that has HTTP/2 configured.

HTTP/2 does not work on the server side of any load balancing setups if **HTTP/2 Service Side** is disabled even if the **HTTP/2** is enabled on the HTTP profile bound to the related load balancing services.

### NetScaler Command Line procedures:

To enable HTTP/2 and set HTTP/2 parameters by using the NetScaler command line

- To enable HTTP/2 and set HTTP/2 parameters while adding an HTTP profile, at the command prompt, type:

```
add ns httpProfile <name> - http2 (ENABLED | DISABLED)[-http2Direct
 (ENABLED | DISABLED)] [-altsvc (ENABLED | DISABLED)]
show ns httpProfile <name>
```

- To enable HTTP/2 and set HTTP/2 parameters while modifying an HTTP profile, at the command prompt, type:

```
set ns httpProfile <name> -http2 (ENABLED | DISABLED)[-http2Direct
 (ENABLED | DISABLED)] [-altsvc (ENABLED | DISABLED)]
show ns httpProfile <name>
```

To bind the HTTP profile to a virtual server by using the NetScaler command line

At the command prompt, type:

```
set lb vservice <name> - httpProfileName <string>
show lb vservice <name>
```

To bind the HTTP profile to a load balancing service by using the NetScaler command line

At the command prompt, type:

```
set service <name> -httpProfileName <string>
show service <name>
```

To enable HTTP/2 support globally on the server side by using the NetScaler command line

At the command prompt, type:

```
set ns httpParam -HTTP2Serverside(ENABLED | DISABLED)
show ns httpParam
```

To enable HTTP/2 and set HTTP/2 parameters by using the NetScaler GUI

1. Navigate to **System > Profiles**, and click **HTTP Profiles** tab.
2. Enable **HTTP/2** while adding an HTTP profile or modifying an existing HTTP profile.

To bind the HTTP profile to a virtual server by using the NetScaler GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open the virtual server.
2. In **Advanced Settings**, click **+ HTTP Profile** to bind the created HTTP profile to the virtual server.

To bind the HTTP profile to a load balancing service by using the NetScaler GUI

1. Navigate to **Traffic Management > Load Balancing > Service**, and open the service.
2. In **Advanced Settings**, click **+ HTTP Profile** to bind the created HTTP profile to the service.

To enable HTTP/2 support globally on the server side by using the GUI

Navigate to **System > Settings**, click **Change HTTP parameters** and enable **HTTP/2 Server Side**.

## Sample configurations

In the following sample configuration, HTTP/2 and direct HTTP/2 is enabled on HTTP profile HTTP-PROFILE-HTTP2-CLIENT-SIDE. The profile is bound to virtual server LB-VS-1.

```
1 set ns httpProfile HTTP-PROFILE-HTTP2-CLIENT-SIDE -http2 enabled -
 http2Direct enabled
2 Done
3
4 set lb vsServer LB-VS-1 -httpProfileName HTTP-PROFILE-HTTP2-CLIENT-SIDE
5
6 Done
7 <!--NeedCopy-->
```

In the following sample configuration, HTTP/2 and alternative service (ALT-SVC) is enabled on HTTP profile HTTP-PROFILE-HTTP2-SERVER-SIDE. The profile is bound to service LB-SERVICE-1.

```
1 set ns httpParam -HTTP2Serverside ENABLED
2 Done
3
4 set ns httpProfile HTTP-PROFILE-HTTP2-SERVER-SIDE -http2 ENABLED -
 altsvc ENABLED
5 Done
6
7 set service LB-SERVICE-1 -httpProfileName HTTP-PROFILE-HTTP2-SERVER-
 SIDE
8 Done
9 <!--NeedCopy-->
```

## Configure HTTP/2 initial connection window size

As per RFC 7540, the flow-control window for HTTP2 stream and connection must be set to 64 K (65535) octets, and any change made to this value must be communicated to the peer. The ADC appliance communicates the change in flow-control window size as follows:

- Using the [SETTINGS](#) frame for the stream.
- Using the [WINDOW\\_UPDATE](#) frame for the connection.

In an HTTP profile, you must configure the [http2InitialWindowSize](#) parameter to set the initial window size at the stream level. Because of an internal system error, the ADC appliance initializes the flow-control window for the connection also. When there is a change in the configured flow-control window for the stream, the ADC appliance communicates to the peer using the [SETTINGS](#) frame. But the ADC appliance fails to communicate the change in flow-control window for the connection using the [WINDOW\\_UPDATE](#) frame. This leads to a connection freeze.

To overcome the issue, the [http2InitialConnWindowSize](#) parameter (in bytes) is now added to control the flow-control window for connection. By using separate configurable parameters, you can

now enable the appliance to send updates for changed window size at both stream and connection levels.

### Configure the HTTP/2 initial connection window size parameter by using the CLI

At the command prompt, type:

```
1 set http profile p1 -http2InitialConnWindowSize 8290
2 Initial window size for stream level flow control, in bytes.
3 Default value: 65535
4 Minimum value: 8192
5 Maximum value: 20971520
6 <!--NeedCopy-->
```

#### Note:

When HTTP/2 is enabled, Citrix recommends you to disable TCP Dynamic Receive Buffering parameter in the TCP profile.

### WebSocket over HTTP/2 configuration

The NetScaler appliance supports WebSocket connections over HTTP/2. You can enable the WebSocket connections using CLI or GUI interface. The WebSocket HTTP/2 connection can be multiplexed.

### Configure the WebSocket connections over HTTP/2 by using the CLI

By default, the **WebSocket Connections** parameter is disabled. You can enable the WebSocket connections using the CLI interface.

#### Enable Frontend HTTP/2 WebSocket connections:

At the command prompt, type:

#### For SSL configuration:

```
1 add httpprofile <http_profile_name> -http2 enabled -websocket enabled
2
3 <!--NeedCopy-->
```

#### For Plain text configuration:

```
1 add httpprofile <http_profile_name> -http2 enabled -http2direct enabled
 -websocket enabled
2
3 <!--NeedCopy-->
```

**Enable Backend HTTP/2 WebSocket connections:**

At the command prompt, type:

**For SSL configuration:**

```
1 add httpprofile <http_profile_name> -http2 enabled
2 set httpparam -http2serverside ON
3 <!--NeedCopy-->
```

**For Plain text configuration:**

```
1 add httpprofile <http_profile_name> -http2 enabled -http2direct enabled
2 set httpparam -http2serverside ON
3 <!--NeedCopy-->
```

**Configure the WebSocket connections over HTTP/2 by using the GUI**

You can use the following procedure to enable the WebSocket connections using the GUI interface.

**Edit the existing Profiles:**

1. Navigate to **System>Profiles>HTTP Profiles**.
2. Select the required profile from the **Profiles** and click **Edit**.
3. In the **Configure HTTP Profile**, enable **HTTP2** or **DirectHTTP2** check boxes.
4. Enable the WebSocket connections by selecting the **Enable WebSocket connections** check box.

**Add new Profiles:**

1. Navigate to **System>Profiles>HTTP Profiles**.
2. You can add a new HTTP2 profile by clicking **Add**.
3. In the **Create HTTP Profile**, enable **HTTP2** or **DirectHTTP2** check boxes.
4. Select the **Enable WebSocket Connections** check box.

The following table describes the WebSocket connection behavior when the backend multiplexing is disabled:

HTTP packet version	WebSocket in HTTP profile	Request action	Backend HTTP/1.1	Backend HTTP/2
HTTP/1.1	Disabled	dropped	NA	NA

HTTP packet version	WebSocket in HTTP profile	Request action	Backend HTTP/1.1	Backend HTTP/2
HTTP/1.1	Enabled	HTTP/1.1	Each HTTP/1.1 connection is mapped to a dedicated HTTP/1.1 connection on the backend	Dedicated HTTP/2 connection on the backend for each HTTP/1.1 connection
HTTP/2	Enabled	HTTP/2	Each stream on the front end is mapped to a dedicated HTTP/1.1 connection	All front end streams can be mapped to a single HTTP/2 connection or maximum of three HTTP/2 connections on the backend.
HTTP/2	Disabled	dropped	NA	NA

The following table describes the WebSocket connection behavior when the backend multiplexing is enabled:

HTTP packet version	WebSocket in HTTP profile	Request action	Backend HTTP/1.1	Backend HTTP/2
HTTP/1.1	Disabled	dropped	NA	NA
HTTP/1.1	Enabled	HTTP/1.1	Each HTTP/1.1 connection is mapped to a dedicated HTTP/1.1 connection on the backend	Multiple Http/1.1 clients can be multiplexed to a single HTTP/2 connection or multiple HTTP/2 connections

HTTP packet version	WebSocket in HTTP profile	Request action	Backend HTTP/1.1	Backend HTTP/2
HTTP/2	Enabled	HTTP/2	Each stream on the front end is mapped to a dedicated HTTP/1.1 connection	All front end streams can be mapped to a single HTTP/2 connection or multiple HTTP/2 connections on the backend
HTTP/2	Disabled	dropped	NA	NA

## HTTP/2 DoS mitigation

November 11, 2023

The Http/2 Denial-of-Service (DoS) attacks no longer have any impact on a NetScaler appliance. If the appliance receives frames more than the maximum limit, the appliance silently closes the connection.

To mitigate attacks, HTTP profile enables you to change the default configuration of frames received in a HTTP/2 connection.

The [HTTP/2 DoS mitigation](#) table shows the list of HTTP/2 DoS attacks and its mitigation.

### Configure the maximum limit for HTTP/2 frames to mitigate DoS attacks by using the command line interface

At the command prompt, type the following:

```
set ns httpprofile <profile_name> - http2MaxEmptyFramesPerMin <
positive_integer> -http2MaxPingFramesPerMin <positive_integer> -
http2MaxSettingsFramesPerMin <positive_integer> -http2MaxResetFramesPerMin
<positive_integer> -http2MaxRxResetFramesPerMin <value>
```

#### Example:

```
set ns httpprofile profile1 -http2MaxEmptyFramesPerMin 20 -http2MaxPingFramesP
20 -http2MaxSettingsFramesPerMin 20 -http2MaxResetFramesPerMin 20 -
http2MaxRxResetFramesPerMin 100
```

## Configure the maximum limit for frames received in a HTTP/2 connection by using the NetScaler GUI

Follow the steps given below to configure the maximum limit for frames received in a HTTP/2 connection:

1. On the navigation pane, expand **System** and then click **Profiles**.
2. On the **Profile** page, select the **HTTP Profiles** tab.
3. In the **HTTP Profiles** tab page, click **Add**.
4. In the **Configure HTTP Profile** page, set the following parameter.
  - a) `http2MaxPingFramesPerMin`. Set the maximum PING frames received per connection in a minute. If the number of PING frames exceed the configured limit, NetScaler silently drops packets on the connection.
  - b) `http2MaxSettingsFramesPerMin`. Set the maximum SETTINGS frames received per connection in a minute. If the number of SETTINGS frames exceed the configured limit, NetScaler silently drops packets on the connection.
  - c) `http2MaxResetFramesPerMin`. Set the maximum RESET frames sent per connection in a minute. If the number of RESET frames exceed the configured limit, NetScaler silently drops packets on the connection.
  - d) `http2MaxEmptyFramesPerMin`. Set the maximum empty frames sent per connection in a minute. If the number of empty frames exceed the configured limit, NetScaler silently drops packets on the connection.
  - e) `http2MaxRxResetFramesPerMin`. Set the maximum RESET frames received per connection in a minute. If the number of RESET frames exceed the configured limit, NetScaler drops packets on the connection.
5. Click **OK** and **Close**.

## HTTP3 over QUIC protocol

May 2, 2023

HTTP/2 over TCP is the preferred standard for sending multiple streams of HTTP requests over a single connection. But, in TCP transport mechanism there are certain limitations and latency issues in accessing websites and web applications. When you multiplex several requests over the same connection they are subjected to reliability of the same connection. If packet for one request is lost, all other multiplexed requests are delayed until the lost packet is detected and retransmitted. This causes head-of-line-blocking delays and latency issues.

For connection and transport delays, HTTP/3 uses QUIC instead of TCP protocol. The QUIC is an emerging protocol that uses UDP instead of TCP as its base transport. In HTTP-over-QUIC, you can multiplex several independent requests without depending on a single TCP connection. QUIC implements a reliable connection upon which, you can stream multiple HTTP requests. QUIC also incorporates TLS as an integrated component and not as an additional layer as in HTTP/1.1 or HTTP/2.

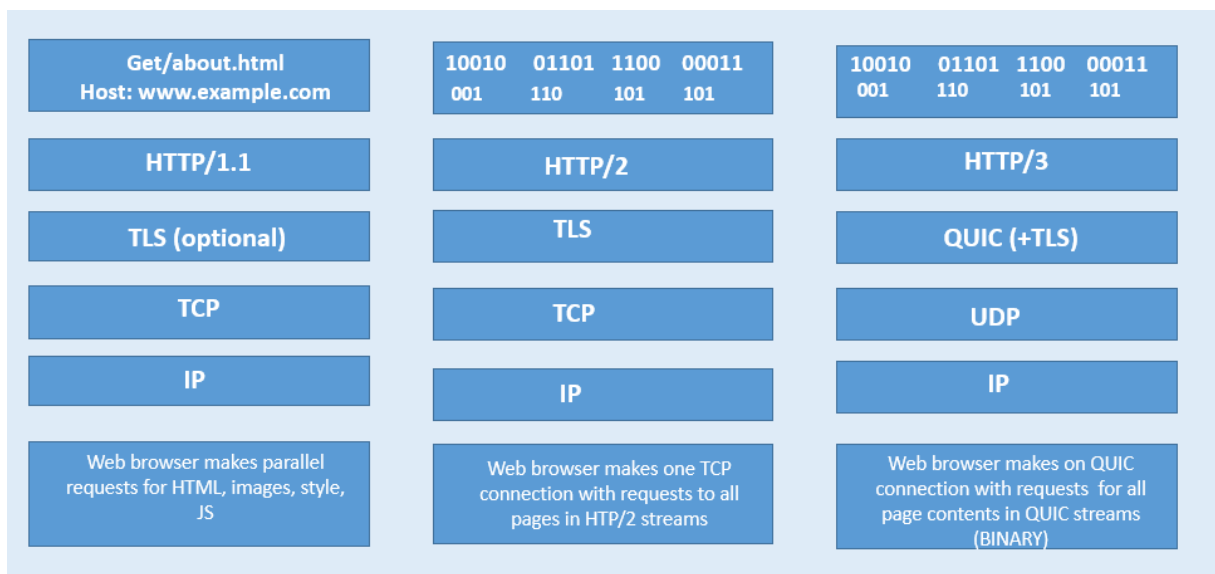

### Advantage of using HTTP/3 protocol

Some of the important benefits of using QUIC protocol for HTTP/3 data transport is given below:

- Stream multiplexing
- Stream and connection-level flow control
- Low-latency connection establishment
- Connection migration and resilience to NAT rebinding
- Authenticated and encrypted header and payload

### Transport stack in HTTP protocols

The below illustration shows transport stack in HTTP/1.1, HTTP/2 and HTTP/3 protocols.

## How QUIC and HTTP/3 connection management works in NetScaler

The following illustration shows how QUIC and HTTP/3 connection management in a NetScaler appliance and how the components interact with each other.

Step 1: Client-side HTTP/3 request over QUIC protocol to NetScaler appliance.

Step 2: Request forwarded by NetScaler as HTTP/1.1 or HTTP/2 depending on back-end server support.

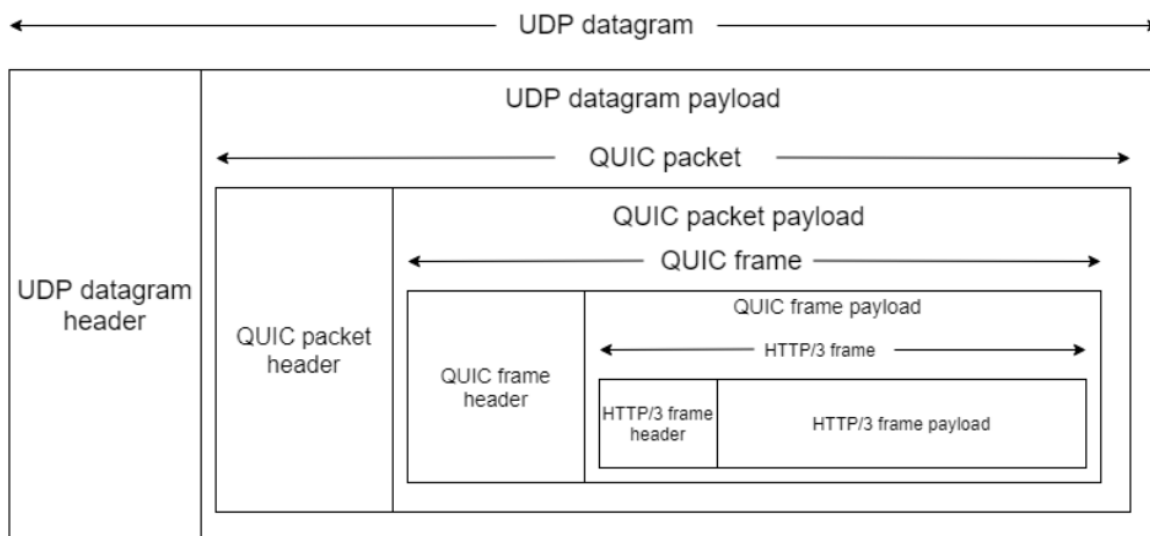

Step 3: Response through HTTP/2 or HTTP/1.1 from back-end server to NetScaler.

Step 4: ADC forwards the response as HTTP/3 response to client.

## How HTTP/3 protocol works

In HTTP/3, when a client knows that an HTTP/3 server exists at a certain endpoint, it opens a QUIC connection. The QUIC protocol provides multiplexing and flow control. Within each stream, the basic unit of HTTP/3 communication is a frame. Each frame type serves a different purpose. For example, HEADERS and DATA frames form the basis of HTTP requests and responses.

Multiplexing of requests is performed using the QUIC stream abstraction. Each request-response pair consumes a single QUIC stream. Streams are independent of each other, so one stream that is blocked or suffers packet loss does not prevent progress on other streams. Server push is an interaction mode introduced in HTTP/2 which permits a server to push a request-response exchange to a client in anticipation of the client making the indicated request. This trades off network usage against a potential latency gain. Several HTTP/3 frames are used to manage server push, such as PUSH\_PROMISE, MAX\_PUSH\_ID, and CANCEL\_PUSH. As in HTTP/2, request and response fields are compressed for transmission. Because HPACK relies on in-order transmission of compressed field sections (a guarantee not provided by QUIC), HTTP/3 replaces HPACK with QPACK. QPACK uses separate unidirectional streams to modify and track field table state, while encoded field sections refer to the state of the table without modifying it.

## HTTP/3 configuration and Stat summary

December 29, 2023

To configure a HTTP/3 protocol for sending multiple streams of HTTP/3 data using QUIC, you must complete the following steps:

1. Enable SSL and load balancing features.
2. Add load balancing and content switching (optional) virtual servers of type HTTP\_QUIC.
3. Associate QUIC protocol parameters with the HTTP\_QUIC virtual server.
4. Enable HTTP/3 on the HTTP\_QUIC virtual server.
5. Bind SSL certificate-key pair with HTTP\_QUIC virtual server.
6. Associate SSL/TLS protocol parameters with the HTTP\_QUIC virtual server.

### Enable SSL and load balancing

Before you begin, make sure that the SSL and Load Balancing features are enabled on the appliance. At the command prompt type:

```
1 enable ns feature ssl lb
2 <!--NeedCopy-->
```

## Add load balancing and content switching (optional) virtual servers of type HTTP\_QUIC for HTTP/3 service

You add a load balancing virtual server to accept HTTP/3 traffic over QUIC.

Note: The load balancing virtual server of type HTTP\_QUIC has built-in QUIC, SSL, and HTTP3 profiles. If you prefer to create user-defined profiles, you can add new profiles and bind it with the load balancing virtual server.

```
1 add lb vserver <vserver-name> HTTP_QUIC <IP-address> <UDP-listening-
 port>
2
3 add cs vserver <vserver-name> HTTP_QUIC <IP-address> <UDP-listening-
 port>
4 <!--NeedCopy-->
```

### Example:

```
add lb vserver lb-http3 HTTP_QUIC 1.1.1.1 443
add cs vserver cs-http3 HTTP_QUIC 10.10.10.10 443
```

## Associate QUIC protocol parameters with HTTP\_QUIC virtual server

You can create a QUIC profile and specify QUIC parameters for the QUIC service and associate it to the load balancing virtual server. You must either create a user-defined profile or use the in-built QUIC profile and bind the profile to the load balancing virtual server.

Step 1: configure a user-defined QUIC profile

At the command prompt, type:

```
1 set quic profile <profile_name> -transport_param <value>
2 <!--NeedCopy-->
```

### Example:

```
set quic profile quic_http3 -ackDelayExponent 10 -activeConnectionIDlimit
4
```

The different QUIC transport parameters are as follows:

-ackDelayExponent. An integer value advertised by the NetScaler to the remote QUIC endpoint, indicating an exponent that the remote QUIC endpoint should use, to decode the ACK Delay field in QUIC ACK frames sent by the NetScaler.

-activeConnectionIDlimit. An integer value advertised by the NetScaler to the remote QUIC endpoint. It specifies the maximum number of QUIC connection IDs from the remote QUIC endpoint, that the NetScaler is willing to store.

- activeConnectionMigration. Specify whether the NetScaler must allow the remote QUIC endpoint to perform active QUIC connection migration.
- congestionCtrlAlgorithm. Specify the congestion control algorithm to be used for QUIC connections.
- initialMaxData. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the initial value, in bytes, for the maximum amount of data that can be sent on a QUIC connection.
- initialMaxStreamDataBidiLocal. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for bi-directional QUIC streams initiated by the NetScaler.
- initialMaxStreamDataBidiRemote. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for bi-directional QUIC streams initiated by the remote QUIC endpoint.
- initialMaxStreamDataUni. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for uni-directional streams initiated by the remote QUIC endpoint.
- initialMaxStreamsBidi. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the initial maximum number of bi-directional streams the remote QUIC endpoint must initiate.
- initialMaxStreamsUni. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the initial maximum number of uni-directional streams the remote QUIC endpoint must initiate.
- maxAckDelay. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the maximum amount of time, in milliseconds, by which the NetScaler delays sending acknowledgments.
- maxIdleTimeout. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the maximum idle timeout, in seconds, for a QUIC connection. A QUIC connection that remains idle, for longer than the minimum of the idle timeout values advertised by the NetScaler and the remote QUIC endpoint, and three times the current Probe Timeout (PTO), will be silently discarded by the NetScaler.
- maxUDPPayloadSize. An integer value advertised by the NetScaler to the remote QUIC endpoint, specifying the size of the largest UDP datagram payload, in bytes, that the NetScaler is willing to receive on a QUIC connection.
- newTokenValidityPeriod. An integer value, specifying the validity period, in seconds, of address validation tokens issued through QUIC NEW\_TOKEN frames sent by the NetScaler.
- retryTokenValidityPeriod. An integer value, specifying the validity period, in seconds, of address validation tokens issued through QUIC Retry packets sent by the NetScaler.

-statelessAddressValidation. Specify whether the NetScaler must perform stateless address validation for QUIC clients, by sending tokens in QUIC Retry packets during QUIC connection establishment, and by sending tokens in QUIC NEW\_TOKEN frames after QUIC connection establishment.

Step 2: Associate the user-defined QUIC profile to a load balancing virtual server of type http\_quic

At the command prompt, type:

```
1 set lb vserver <name>@ [-IPAddress <ip_addr|ipv6_addr|*>@] <
 serviceName>@] [-persistenceType <persistenceType>] [-
 quicProfileName <string>]
2 <!--NeedCopy-->
```

**Example:**

```
set lb vserver lb-http3 -quicProfileName quic_http3
```

### Enable and bind HTTP/3 on a HTTP\_QUIC virtual server

To enable HTTP/3 on an HTTP\_QUIC virtual server, a set of configuration parameters is added to the HTTP profile configuration. To facilitate ease of configuration, when you add an HTTP\_QUIC virtual server, a new default/built-in HTTP profile is available on the appliance. The profile has the HTTP/3 protocol support parameters set to ENABLED, and also bounded to the HTTP\_QUIC virtual servers (applicable if you choose not to associate the HTTP\_QUIC virtual server with a user-added HTTP profile). The value of the HTTP/3 parameters in the HTTP profile decides whether to select the HTTP/3 protocol and advertise when processing the TLS ALPN (Application Layer Protocol Negotiation) extension, during the QUIC protocol handshake.

You can create a HTTP/3 profile and specify HTTP parameters for the HTTP/3 service and load balancing virtual server. You must either create a user-defined profile or use the in-built HTTP/3 profile and bind the profile to the load balancing virtual server.

Step 1: configure a user-defined HTTP/3 profile

At the command prompt, type:

```
1 Add ns httpProfile <profile_name> -http3 ENABLED
2 <!--NeedCopy-->
```

**Example:**

```
add ns httpProfile http3_quic -http3 ENABLED
```

Step 2: Bind the user-defined HTTP/3 profile to a load balancing virtual server of type http\_quic

At the command prompt, type:

```
1 set lb vserver <name>@ [-IPAddress <ip_addr|ipv6_addr|*>@] <
 serviceName>@] [-persistenceType <persistenceType>] [-
 httpProfileName <string>]
```

```
2 <!--NeedCopy-->
```

**Example:**

```
set lb vserver lb-http3 -httpProfileName http3_quic
```

**Bind SSL certificate-key pair with HTTP\_QUIC virtual server**

For processing encrypted traffic, you must add an SSL certificate-key pair and bind it to the HTTP\_QUIC virtual server.

At the command prompt, type:

```
1 bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>
2
3 <!--NeedCopy-->
```

**Example:**

```
bind ssl vserver lb-http3 -certkeyName rsa_certkeypair
```

For more information, see [Bind SSL certificate](#) topic.

**Bind SSL/TLS protocol parameters with a HTTP\_QUIC virtual server**

Virtual servers of type HTTP\_QUIC has in-built TLS 1.3 server functionality because the QUIC protocol uses TLS 1.3 as a mandatory security component. To facilitate the configuration when adding a HTTP\_QUIC virtual server, a new default or built-in SSL profile of type - QUIC-FrontEnd is added. The SSL profile has TLS 1.3 version enabled with TLS 1.3 cipher suites (and elliptic curves) configured. The SSL profile must then be bound to the newly added HTTP\_QUIC virtual servers.

You can create an SSL profile and specify SSL encryption parameters for the TLP 1.1 service and load balancing virtual server. You must either create a user-defined profile or use the in-built SSL profile and bind the profile to the load balancing virtual server.

Step 1: configure a user-defined SSL profile

At the command prompt, type:

```
1 add ssl profile <name> -sslprofileType QUIC-FrontEnd
2 <!--NeedCopy-->
```

**Example:**

```
add ssl profile ssl_profile1 -sslprofileType QUIC-FrontEnd -tls13
ENABLED -tls12 DISABLED -tls11 DISABLED -tls1 DISABLED
```

Step 2: Bind the user-defined SSL profile to a load balancing virtual server of type HTTP\_QUIC

At the command prompt, type:

```
1 set ssl vserver <name>@ [-sslProfile <string>]
2 <!--NeedCopy-->
```

**Example:**

```
set ssl vserver lb-http3 -sslprofile ssl_profile1
```

**Enable SSL and load balancing features by using the GUI**

Complete the following steps to enable SSL and load balancing features:

1. On the navigation pane, expand **System** and then click **Settings**.
2. On the **Configure Basic Features** page, select the **SSL** and **Load Balancing**.
3. Click **OK**, and then click **Close**.

**Add load balancing and content switching (optional) virtual servers of type HTTP\_QUIC by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server of type HTTP\_QUIC.
3. In **Load Balancing Virtual Server** page, click **Profiles**.
4. In the **Profiles** section, select the profile type as QUIC. Note: QUIC, HTTP/3 and SSL profiles are built-in ones.
5. Click **OK** and then **Done**.

← Load Balancing Virtual Server

**Basic Settings**

Create a virtual server by specifying a name, an IP address, a port, and a protocol type. If an application is accessible from the Internet, the virtual server IP (VIP) address is a public IP address. If the application is accessible only from the local area network (LAN) or wide area network (WAN), the VIP is usually a private (ICANN non-routable) IP address. You can configure multiple virtual servers to receive client requests, thereby increasing the availability of resources to process client requests.

## Associate QUIC protocol parameters with the HTTP\_QUIC virtual server by using the GUI

Step 1: Add QUIC profile

1. Navigate to **System > Profiles > QUIC Profile**.
2. Click **Add**.
3. In the QUIC Profile page, set the following parameters. For detailed description of each parameter, see the Associate QUIC protocol CLI section.
  - a) **Ack Delay Exponent**
  - b) **Active Connection ID Limit**
  - c) **Active Connection Migration**
  - d) **Congestion Control Algorithm**
  - e) **Initial Maximum Data**
  - f) **Initial Maximum Stream Data Bidi Local**
  - g) **Initial Maximum Stream Data Bidi Remote**
  - h) **Initial Maximum Stream Data Unit**
  - i) **Initial Maximum Stream bidi**
  - j) **Initial Maximum Stream Uni**
  - k) **Maximum Acknowledgment Delay**
  - l) **Maximum Idle Timeout**
  - m) **Maximum UDP Data GramsperBurst**
  - n) **New Token Validity Period**
  - o) **Retry Token Validity Period**
  - p) **Stateless Address Validation**

## ← QUIC Profile

Stateless Address Validation

Step 2: Associate QUIC profile with load balancing virtual server of type HTTP\_QUIC

1. In the **Traffic Management > Virtual Server**, select the virtual server of type HTTP\_QUIC.
2. In the **Profiles** section, select the QUIC profile.

**Note:**

QUIC, HTTP/3 and SSL profiles are built-in ones.

3. Click **OK** and then **Done**.

### **Associate SSL/TLS protocol parameters with the virtual server of type SSL by using the GUI**

Step 1: Add SSL profile

1. Navigate to **System > Profiles > SSL Profile**.
2. Click **Add**.
3. In the **QUIC Profile** page, set the SSL parameters. For detailed description see, SSL Profile configuration topic.
4. Click **OK** and **Close**.

## View QUIC, and HTTP/3 statistics

The following commands display a detailed summary of QUIC, and HTTP3 statistics. At the command prompt, type the following:

```
1 > stat quic
2 > stat quic -detail
3 <!--NeedCopy-->
```

To clear the statistics display, type one of the following:

```
1 > stat quic -clearstats basic
2 > stat quic -clearstats full
3
4 <!--NeedCopy-->
```

To display a detailed summary of HTTP/3 statistics:

```
1 > stat http3
2 > stat http3 -detail
3 <!--NeedCopy-->
```

To clear the statistics display, type one of the following:

```
1 > stat http3 -clearstats basic
2 > stat http3 -clearstats full
3 <!--NeedCopy-->
```

## Policy configuration for HTTP/3 traffic

May 2, 2023

HTTP/3 uses QUIC transport which is based on UDP. If you had policy expression defined for the HTTP or SSL virtual server that includes TCP policy expressions, it can no longer be used with a HTTP\_QUIC virtual server. All other policies that do not have TCP or classic expressions can be bound with a HTTP\_QUIC virtual server. For the policies to take effect, you must ensure that the feature policies are bound to the newly added global bind points as per the following.

- HTTPQUIC\_REQ\_DEFAULT
- HTTPQUIC\_REQ\_OVERRIDE
- HTTPQUIC\_RES\_DEFAULT
- HTTPQUIC\_RES\_OVERRIDE

Or, the policies can be bound to specific virtual server bind points:

- REQUEST
- RESPONSE

For more information, see [Bind policy using advanced policy infrastructure](#) topic.

Following are the policies supported for HTTP over QUIC configuration:

- Responder
- Rewrite
- HTTP Compression
- Integrated Caching
- Web Application Firewall
- URL transformation
- SSL
- Front end optimization (FEO)
- AppQoE

### **Responder policy configuration for HTTP/3 traffic**

HTTP over QUIC type virtual servers have responder policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 QUIC virtual servers or HTTP over QUIC global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

### Add responder action for redirecting URLs

To add a responder action, at the command prompt, type:

```
1 add responder action <name> <type> (<target> | <htmlpage>) [-comment <
 string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <
 expression>] [-headers <name(value)> ...]
2 <!--NeedCopy-->
```

#### Example:

```
add responder action redirectURL redirect "\"https://www.citrix.com
/\""
```

### Add responder policy

To add a responder policy, at the command prompt, type:

```
1 add responder policy <name> <rule> <action> [<undefAction>] [-comment <
 string>] [-logAction <string>] [-appflowAction <string>]
2 <!--NeedCopy-->
```

#### Example:

```
add responder policy res-pol "CLIENT.IP.SRC.IN_SUBNET(10.10.10.10/32)
"redirectURL
```

### Add responder policy based UDP expression

To add a responder policy based UDP expression, at the command prompt, type:

```
1 add responder policy <name> <rule> <action> [<undefAction>] [-comment <
 string>] [-logAction <string>] [-appflowAction <string>]
2 <!--NeedCopy-->
```

#### Example:

```
add responder policy redirectCitrixUdp "CLIENT.UDP.DSTPORT.EQ(443)"
redirectURL
```

### Bind responder policy based UDP expression with HTTP/3 QUIC based load balancing virtual server

To bind a responder policy based UDP expression to a load balancing virtual server, at the command prompt, type:

```

1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>]
) | <serviceName>@ | (-policyName <string>@ [-
 priority <positive_integer>] [-gotoPriorityExpression <expression>]
 [-type <type>] [-invoke (<labelType> <labelName>)]) | -
 analyticsProfile <string>@)
2 <!--NeedCopy-->

```

**Example:**

```
bind lb vserver lb-http3 -policyName redirectCitrixUdp -priority 9 -
gotoPriorityExpression END -type REQUEST
```

**Bind responder policy with HTTP/3 QUIC based load balancing virtual server**

To bind a responder policy to a load balancing virtual server, at the command prompt, type:

```

1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>]
) | <serviceName>@ | (-policyName <string>@ [-
 priority <positive_integer>] [-gotoPriorityExpression <expression>]
 [-type <type>] [-invoke (<labelType> <labelName>)]) | -
 analyticsProfile <string>@)
2 <!--NeedCopy-->

```

**Example:**

```
bind lb vserver lb-http3 -policyName redirectCitrixUdp -priority 10 -
gotoPriorityExpression END -type REQUEST
```

**Bind responder policy to HTTP/3 global bind point**

To bind a responder policy with the HTTP/3 global bind point, at the command prompt, type:

```

1 bind responder global <policyName> <priority> [<gotoPriorityExpression
 >] [-type <type>] [-invoke (<labelType> <labelName>)] bind
 responder global redirectCitrixUdp 3 -type HTTPQUIC_REQ_DEFAULT
2 <!--NeedCopy-->

```

**Example:**

```
bind responder global redirectCitrixUdp 3 -type HTTPQUIC_REQ_DEFAULT
```

**Note:**

For more information, see [Responder policy documentation](#).

## Rewrite policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have rewrite policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Following are the configuration steps to configure the rewrite policy for HTTP3 over QUIC.

### Add rewrite action for HTTP over QUIC

To add rewrite action, at the command prompt, type:

```
1 add rewrite action <name> <type> <target> [<stringBuilderExpr>] [-
 search <expression>] [-refineSearch <expression>] [-comment <string
 >]
2 <!--NeedCopy-->
```

#### Example:

```
add rewrite action http3-altsvc-action insert_http_header Alt-Svc q/"
h3-29=":443\"; ma=3600; persist=1"/
```

### Add rewrite policy for HTTP over QUIC

To add a write action, at the command prompt, type:

```
1 add rewrite policy <name> <rule> <action> [<undefAction>] [-comment <
 string>] [-logAction <string>]
2 <!--NeedCopy-->
```

#### Example:

```
add rewrite policy http3-altsvc-policy true http3-altsvc-action
```

### Bind rewrite policy to load balancing virtual server of type HTTP/3\_QUIC

To bind rewrite policy to the load balancing virtual server, at the command prompt, type:

---

```

1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>])
 | <serviceGroupName>@ | (-policyName <string>@ [-priority <
 positive_integer>] [-gotoPriorityExpression <expression>] [-type <
 type>] [-invoke (<labelType> <labelName>)]) | -analyticsProfile <
 string>@)
2 <!--NeedCopy-->

```

**Example:**

```
bind lb vserver lb-http3 -policyName http3-altsvc-policy -priority 10
-type RESPONSE
```

**Bind rewrite policy to HTTP/3 global bind point**

```

1 To bind a responder policy with HTTP/3 global bind point, at the
 command prompt, type:
2 bind rewrite global <policyName> <priority> [<gotoPriorityExpression>]
 [-type <type>] [-invoke (<labelType> <labelName>)]
3 <!--NeedCopy-->

```

**Example:**

```
bind rewrite global http3-altsvc-policy 3 -type HTTPQUIC_RES_DEFAULT
```

**Note:**

For more information, see [Rewrite policy documentation](#).

**Compression policy configuration for HTTP/3 traffic**

When the NetScaler receives an HTTP response from a server, it evaluates the built-in compression policies and any custom compression policies to determine whether to compress the response and, if so, the type of compression to apply. Priorities assigned to the policies determine the order in which the policies are matched against the requests.

HTTP over QUIC type virtual servers have compression policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

## Add compression policy

To add compression policy, at the command prompt, type:

```
1 add cmp policy <name> -rule <expression> -resAction <string>
2 <!--NeedCopy-->
```

### Example:

```
add cmp policy udp_port_cmp_policy -rule "CLIENT.UDP.DSTPORT.EQ(443)"
-resAction COMPRESS
```

## Bind compression policy with load balancing virtual server of type HTTP/3\_QUIC

To bind URL transformation policy with load balancing virtual server of type HTTP/3\_QUIC, at the command prompt, type:

```
1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>]
) | <serviceGroupName>@ | (-policyName <string>@ [-priority <
 positive_integer>] [-gotoPriorityExpression <expression>] [-type (
 REQUEST | RESPONSE)] [-invoke (<labelType> <labelName>)]) |
 -analyticsProfile <string>@)
2 <!--NeedCopy-->
```

### Example:

```
bind lb vserver lb-http3 -policyName udp_port_cmp_policy -priority 10
-type RESPONSE
```

## Bind compression global to HTTP/3 global bind point

To bind a compression policy with the HTTP/3 global bind point, at the command prompt, type:

```
1 bind compression global <policyName> <priority> [<
 gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <
 labelName>)] bind responder global redirectCitrixUdp 3 -type
 HTTPQUIC_REQ_DEFAULT
2 <!--NeedCopy-->
```

### Example:

```
bind cmp global udp_port_cmp_policy -priority 100 -type HTTPQUIC_RES_DEFAULT
Global built-in compression policies
```

After you upgrade your appliance to NetScaler release 13.0 build 82.x, the following compression policies will be automatically bound to the HTTP/3 default bind point.

```
1 > sho cmp global -type HTTPQUIC_RES_DEFAULT
2 Policy Name: ns_adv_nocmp_xml_ie
3 Priority: 8700
4 GotoPriorityExpression: END
5 Type: HTTPQUIC_RES_DEFAULT
6
7 Policy Name: ns_adv_nocmp_mozilla_47
8 Priority: 8800
9 GotoPriorityExpression: END
10 Type: HTTPQUIC_RES_DEFAULT
11
12 Policy Name: ns_adv_cmp_mscss
13 Priority: 8900
14 GotoPriorityExpression: END
15 Type: HTTPQUIC_RES_DEFAULT
16
17 Policy Name: ns_adv_cmp_msapp
18 Priority: 9000
19 GotoPriorityExpression: END
20 Type: HTTPQUIC_RES_DEFAULT
21
22 Policy Name: ns_adv_cmp_content_type
23 Priority: 10000
24 GotoPriorityExpression: END
25 Type: HTTPQUIC_RES_DEFAULT
26 <!--NeedCopy-->
```

If not bound, the following commands can be configured through the command prompt and you can configuration on your appliance.

```
bind cmp global ns_adv_nocmp_xml_ie -priority 8700 -gotoPriorityExpression
END -type HTTPQUIC_RES_DEFAULT
```

```
bind cmp global ns_adv_nocmp_mozilla_47 -priority 8800 -gotoPriorityExpression
END -type HTTPQUIC_RES_DEFAULT
```

```
bind cmp global ns_adv_cmp_mscss -priority 8900 -gotoPriorityExpression
END -type HTTPQUIC_RES_DEFAULT
```

```
bind cmp global ns_adv_cmp_msapp -priority 9000 -gotoPriorityExpression
END -type HTTPQUIC_RES_DEFAULT
```

```
bind cmp global ns_adv_cmp_content_type -priority 10000 -gotoPriorityExpressio
END -type HTTPQUIC_RES_DEFAULT
```

For more information, see [Compression policy configuration](#).

## Caching policy configuration for HTTP/3 traffic

The integrated cache provides in-memory storage on the NetScaler appliance and serves Web content to users without requiring a round trip to an origin server. For static content, the integrated cache requires little initial setup. After you enable the integrated cache feature and perform basic setup (for example, determining the amount of NetScaler appliance memory the cache is permitted to use), the integrated cache uses built-in policies to store and serve specific types of static content, including simple webpages and image files. You can also configure the integrated cache to store and serve dynamic content that is marked as non-cacheable by Web and application servers (for example, database records and stock quotes).

HTTP over QUIC type virtual servers have cache policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

### Add cache content group

To add the cache content group, at the command prompt, type:

```
1 add cache contentGroup <name> [-weakPosRelExpiry <secs> | -relExpiry <secs> | -relExpiryMilliSec <msecs> | -absExpiry <HH:MM> ... | -absExpiryGMT <HH:MM> ...] [-heurExpiryParam <positive_integer>] [-weakNegRelExpiry <secs>] [-maxResSize <KBytes>] [-memLimit <MBytes>]
...
2 <!--NeedCopy-->
```

#### Example::

```
add cache contentGroup DEFAULT -maxResSize 500
```

### Add cache policy

To add cache policy, at the command prompt, type:

```
1 add cache policy <policyName> -rule <expression> -action <action> [-storeInGroup <string>] [-invalGroups <string> ...] [-invalObjects <string> ...] [-undefAction (NOCACHE | RESET)] add cache policy <name> <rule> <profileName> [-comment <string>] [-logAction <string>]
2 <!--NeedCopy-->
```

**Example:**

```
add cache policy ctx_doc_pdf -rule "HTTP.REQ.URL.ENDSWITH(\".pdf\")"-
action CACHE -storeInGroup DEFAULT
```

**Bind cache policy with load balancing virtual server of type HTTP/3\_QUIC**

To bind cache policy with load balancing virtual server of type HTTP/3\_QUIC, at the command prompt, type:

```
1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>]
) | <serviceGroupName>@ | (-policyName <string>@ [-priority <
 positive_integer>] [-gotoPriorityExpression <expression>] [-type (
 REQUEST | RESPONSE)) [-invoke (<labelType> <labelName>)]) |
 -analyticsProfile <string>@)
2 <!--NeedCopy-->
```

**Example:**

```
bind lb vserver lb-http3 -policyName ctx_doc_pdf -priority 100 -type
REQUEST
```

**Bind cache policy global to HTTP/3 global bind point**

To bind a cache policy HTTP/3 global bind point:

```
1 bind cache global <policy> -priority <positive_integer> [-
 gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
 labelType> <labelName>)]
2 <!--NeedCopy-->
```

**Example:**

```
bind cache global ctx_doc_pdf -priority 3 -type HTTPQUIC_REQ_DEFAULT
```

For more information, see [Integrated cache policy configuration](#).

**Global built-in cache policies**

After you upgrade your appliance to NetScaler release 13.0 build 82.x, the following cache policies will be automatically bound to the HTTP/3 default bind point.

On upgrade to the 13.0 82.x release, the following cache policies are automatically bound to the HTTP/3 default bind point.

```
1 > sho cache global -type HTTPQUIC_REQ_DEFAULT
2 1) Policy Name: NOPOLICY
3 Priority: 185883
4 GotoPriorityExpression: USE_INVOCATION_RESULT
5 Invoke type: policylabel Invoke name:
 _httpquicReqBuiltinDefaults
6 Global bindpoint: HTTPQUIC_REQ_DEFAULT
7
8 Done
9 > sho cache global -type HTTPQUIC_RES_DEFAULT
10 1) Policy Name: NOPOLICY
11 Priority: 185883
12 GotoPriorityExpression: USE_INVOCATION_RESULT
13 Invoke type: policylabel Invoke name:
 _httpquicResBuiltinDefaults
14 Global bindpoint: HTTPQUIC_RES_DEFAULT
15
16 <!--NeedCopy-->
```

After an upgrade, if the policies are not bound, you can use the following commands to manually bind and save the configuration.

```
1 add cache policylabel _httpquicReqBuiltinDefaults -evaluates
 HTTPQUIC_REQ
2
3 add cache policylabel _httpquicResBuiltinDefaults -evaluates
 HTTPQUIC_RES
4
5 bind cache policylabel _httpquicReqBuiltinDefaults -policyName
 _nonGetReq -priority 100
6
7 bind cache policylabel _httpquicReqBuiltinDefaults -policyName
 _advancedConditionalReq -priority 200
8
9 bind cache policylabel _httpquicReqBuiltinDefaults -policyName
 _personalizedReq -priority 300
10
11 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _uncacheableStatusRes -priority 100
12
13 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _uncacheableVaryRes -priority 200
14
15 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _uncacheableCacheControlRes -priority 300
16
17 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _cacheableCacheControlRes -priority 400
18
19 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _uncacheablePragmaRes -priority 500
20
```

```
21 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _cacheableExpiryRes -priority 600
22
23 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _imageRes -priority 700
24
25 bind cache policylabel _httpquicResBuiltinDefaults -policyName
 _personalizedRes -priority 800
26
27 bind cache global NOPOLICY -priority 185883 -gotoPriorityExpression
 USE_INVOCATION_RESULT -type HTTPQUIC_REQ_DEFAULT -invoke policylabel
 _httpquicReqBuiltinDefaults
28
29 bind cache global NOPOLICY -priority 185883 -gotoPriorityExpression
 USE_INVOCATION_RESULT -type HTTPQUIC_RES_DEFAULT -invoke policylabel
 _httpquicResBuiltinDefaults
30
31 <!--NeedCopy-->
```

**Note:**

The first two commands in the list of commands, and the last two commands in the same list, are included for the sake of completeness. You might encounter an error when running the four commands, since the commands are already run at the time of appliance restart. But you can ignore these errors.

## URL Transformation policy configuration for HTTP/3 traffic

The URL transformation modifies all URLs in designated requests from an external version seen by outside users to an internal URL seen only by your Web servers and administrators. You can redirect user requests seamlessly, without exposing your network structure to users. You can also modify complex internal URLs that users might find difficult to remember into simpler, more easily remembered external URLs.

HTTP over QUIC type virtual servers have cache policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included. New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

### Add URL Transform profile

To add a URL transformation profile, at the command prompt, type:

```
1 add transform profile <name> [-type URL]
```

```
2 <!--NeedCopy-->
```

**Example:**

```
add transform profile msapps
```

**Add URL Transform action**

To add URL transformation action, at the command prompt, type:

```
1 add transform action <name> <profileName> <priority> [-state (ENABLED
 | DISABLED)]
2 <!--NeedCopy-->
```

**Example:**

```
add transform action docx2doc msapps 2
```

**Add URL Transform action**

To add URL transform action to replace URL, at the command prompt, type:

```
1 add transform action <name> <profileName> <priority> [-state (ENABLED
 | DISABLED)]
2 <!--NeedCopy-->
```

**Example:**

```
add transform action docx2doc msapps 1
```

**Add URL Transform policy**

To add a URL transformation policy, at the command prompt, type:

```
1 add transform policy <name> <rule> <profileName> [-comment <string>]
 [-logAction <string>]
2 <!--NeedCopy-->
```

**Example:**

```
add transform policy urltrans_udp "CLIENT.UDP.DSTPORT.EQ(443)"msapps
```

**Bind URL Transform policy with load balancing virtual server of type HTTP/3\_QUIC**

To bind URL transformation policy with load balancing virtual server of type HTTP/3\_QUIC, at the command prompt, type:

```

1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>]
) | <serviceGroupName>@ | (-policyName <string>@ [-priority <
 positive_integer>] [-gotoPriorityExpression <expression>] [-type (
 REQUEST | RESPONSE)) [-invoke (<labelType> <labelName>)]) |
 -analyticsProfile <string>@)
2 <!--NeedCopy-->

```

**Example:**

```
bind lb vs lb-http3 -policyName urltrans_udp -type REQUEST -priority
8
```

**Bind URL transform policy global with HTTP/3 QUIC based load balancing virtual server**

To bind a URL transform policy HTTP/3 global bind point, at the command prompt, type:

```

1 bind transform global <policyName> <priority> [<gotoPriorityExpression
 >] [-type <type>] [-invoke (<labelType> <labelName>)]
2 <!--NeedCopy-->

```

**Example:**

```
bind transform global urltrans_udp 100 -type HTTPQUIC_REQ_DEFAULT
```

For more information, see [URL transformation policy configuration](#).

**Front end optimization (FEO) policy configuration for HTTP/3 traffic**

The HTTP protocols that underlie web applications were originally developed to support the transmission and rendering of simple webpages. New technologies such as JavaScript and cascading style sheets (CSS), and new media types such as Flash videos and graphics-rich images, place heavy demands on front-end performance, that is, on performance at the browser level. The NetScaler front end optimization (FEO) feature addresses such issues and reduces the load time and render time of webpages.

**Note:**

HTTP\_QUIC \_Override/Default\_Request Type is not supported for FEO policy global binding.

**Add Front end optimization (FEO) action**

To add a FEO action, at the command prompt, type:

```

1 add feo action <name> [-pageExtendCache] [<cacheMaxage>][-
 imgShrinkToAttrib] [-imgGifToPng] [-imgToWebp] [-imgToJpegXR] [-
 imgInline] [-cssImgInline] [-jpgOptimize] [-imgLazyLoad] [-cssMinify
] [-cssInline] [-cssCombine] [-convertImportToLink] [-jsMinify] [-
 jsInline] [-htmlMinify] [-cssMoveToHead] [-jsMoveToEND][-
 domainSharding <string> <dnsShards> ...] [-clientSideMeasurements]
2
3 <!--NeedCopy-->

```

**Example:**

```
add feo action feoact -imgGifToPng -pageExtendCache
```

**Add Front end optimization (FEO) policy**

To add a FEO policy, at the command prompt, type:

```
add feo policy <name> <rule> <action>
```

**Example:**

```
add feo policy udp_feo_img "CLIENT.UDP.DSTPORT.EQ(443)"IMG_OPTIMIZE
```

**Bind FEO policy with load balancing virtual server of type HTTP/3\_QUIC**

To bind FEO policy with load balancing virtual server of type HTTP/3\_QUIC, at the command prompt, type:

```

1 bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>]
) | <serviceName>@ | (-policyName <string>@ [-
 priority <positive_integer>] [-gotoPriorityExpression <expression>]
 [-type <type>] [-invoke (<labelType> <labelName>)]) | -
 analyticsProfile <string>@)
2 <!--NeedCopy-->

```

**Example:**

```
bind lb vserver lb-http3 -policyName udp_feo_img -priority 4 -gotoPriorityExpr
END -type REQUEST
```

**Bind FEO policy to HTTP/3 global bind point**

To bind a cache policy to the HTTP/3 global bind point, at the command prompt, type:

```

1 bind cache global <policy> -priority <positive_integer> [-
 gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
 labelType> <labelName>)]
2 <!--NeedCopy-->

```

**Example:**

```
bind cache global ctx_doc_pdf -priority 3 -type HTTPQUIC_REQ_DEFAULT
```

For more information, see [Front end optimization policy configuration](#).

**SSL Policy configuration for HTTP/3 traffic**

HTTP over QUIC type virtual servers have SSL policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

SSL policies with actions that are supported for TLSv1.3 are only applicable for HTTP/3 bind points or virtual servers.

**Add SSL Policy**

To add a FEO policy, at the command prompt, type:

```
1 add ssl policy <name> -rule <expression> [-action <string>] [-
 undefAction <string>] [-comment <string>]
2 <!--NeedCopy-->
```

**Example:**

```
add ssl policy ssl-pol -rule CLIENT.SSL.IS_SSL -action NOOP
```

**Bind SSL Policy to HTTP/3 virtual server**

To bind an SSL policy to the HTTP/3 virtual server, at the command prompt:

```
1 bind ssl policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
2 <!--NeedCopy-->
```

**Example:**

```
bind ssl vserver lb-http3 -policyName ssl-pol -priority 4 -type
REQUEST
```

### Add SSL policy with UDP expression for SSL Policy

To add an SSL policy with UDP expression, at the command prompt:

```
1 add ssl policy <name> -rule <expression> [-action <string>] [-
 undefAction <string>] [-comment <string>]
2 <!--NeedCopy-->
```

#### Example:

```
add ssl policy ssl_udp_clnt -rule "CLIENT.UDP.DSTPORT.EQ(443)"-action
NOOP
```

### Bind SSL Policy with UDP expression to HTTP/3 virtual server

To bind an SSL policy with UDP expression to the HTTP/3 virtual server, at the command prompt, type

```
1 bind ssl policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]
2 <!--NeedCopy-->
```

#### Example:

```
bind ssl vs lb-http3 -policyName ssl_udp_clnt -priority 8 -type
REQUEST
```

### Add SSL policy for CLIENTHELLO bind point for HTTP/3 traffic

To bind SSL policy for CLIENTHELLO bind point for HTTP/3 traffic, at the command prompt, type:

```
1 bind ssl policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]
2 <!--NeedCopy-->
```

#### Example:

```
add ssl policy ssl-pol-ch -rule "CLIENT.SSL.CLIENT_HELLO.CIPHERS.
HAS_HEXCODE(0x1301)"-action RESET
```

### Bind SSL policy to CLIENTHELLO bind point

To bind an SSL policy to the CLIENTHELLO bind point, at the command prompt, type:

```
1 bind ssl policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]
2 <!--NeedCopy-->
```

**Example:**

```
bind ssl vs lb-http3 -policyName ssl-pol-ch -type CLIENTHELLO_REQ -
priority 100
```

**Bind SSL policy to HTTP/3 global bind point**

To bind an SSL policy to the HTTP/3 global bind point, at the command prompt, type:

```
bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpressi
<expression>] [-type <type>] [-invoke (<labelType> <labelName>)]
```

**Example:**

Following is an example of a DATA policy being bound to a HTTP/3 global bind point:

```
Bind ssl global -policyName ssl-pol-ch -priority 7 -type HTTPQUIC_DATA_DEFAULT
```

**Note:**

Forward action that can be set for CLIENTHELLO bind point for SSL virtual servers is currently not supported for HTTP\_QUIC type virtual servers.

**Application Firewall Policy configuration for HTTP/3 traffic**

HTTP over QUIC type virtual servers have web application firewall policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

**Add Web Application Firewall policy with UDP expression**

To add Web Application Firewall policy with UDP expression, at the command prompt:

```
1 add appfw policy <name> <rule> <profileName> [-comment <string>] [-
 logAction <string>]
2 <!--NeedCopy-->
```

**Example:**

```
add appfw policy appfw_udp "CLIENT.UDP.DSTPORT.EQ(443)"APFW_BYPASS
```

### Bind log expressions with UDP based expression for Web Application Firewall profile

To bind log expressions with UDP for Web Application Firewall profile, at the command prompt:

**Example:**

```
bind appfw profile APPFW_BLOCK -logExpression logexp-1 "CLIENT.UDP.
DSTPORT.EQ(443)"
```

### Bind Application Firewall policy with HTTP/3 virtual server

To bind Web Application Firewall policy with HTTP/3 virtual server, at the command prompt:

```
1 bind appfw policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
2 <!--NeedCopy-->
```

**Example:**

```
bind lb vs lb-http3 -policyName appfw_udp -priority 3 -type REQUEST
```

### Bind Web Application Firewall policy to HTTP/3 global bind point

To bind a Web Application Firewall policy to the HTTP/3 global bind point, at the command prompt, type:

```
1 bind appfw global <policy> -priority <positive_integer> [-
 gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
 labelType> <labelName>)]
2 <!--NeedCopy-->
```

**Example:**

```
bind appfw global appfw_udp 100 -type HTTPQUIC_REQ_DEFAULT
```

### AppQoE Policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have AppQoE policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included. New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

### Add AppQoE policy with UDP based expression

To add AppQoE policy with UDP expression, at the command prompt:

```
1 add AppQoE policy <name> <rule> <profileName> [-comment <string>] [-
 logAction <string>]
2 <!--NeedCopy-->
```

#### Example:

```
add appqoe policy appqoe-pol-udp -rule "CLIENT.UDP.DSTPORT.EQ(443)"-
action appqoe-act-basic-prhigh
```

### Bind AppQoE policy with HTTP/3 virtual server

To bind the AppQoE policy with the HTTP/3 virtual server, at the command prompt, type:

```
1 bind appqoe policylabel <labelName> <policyName> <priority> [<
 gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]
2 <!--NeedCopy-->
```

#### Example:

```
bind lb vs lb-http3 -policyName appqoe-pol-udp -type REQUEST -priority
3
```

### Bind AppQoE policy to HTTP\_QUIC virtual server

To bind AppQoE policy to HTTP\_QUIC virtual server, at the command prompt, type:

```
1 bind appqoe <policy> -priority <positive_integer> [-
 gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
 labelType> <labelName>)]
2 <!--NeedCopy-->
```

#### Example:

```
bind lb vs lb-http3 -policyName appqoe-pol-primd -priority 8 -type
REQUEST
```

## HTTP/3 service discovery

May 2, 2023

HTTP protocol relies on using HTTP Alternative Services for origin server to advertise the availability of an equivalent service. HTTP/3 service discovery also uses the same principle. An alternative HTTP/3 endpoint can be advertised using any one of the following methods:

- HTTP Alt-Svc response header
- HTTP/2 Alt-Svc Frame in the response
- Application Layer Protocol Negotiation (ALPN)

The alternative service advertises the usage of an HTTP Alt-Svc response header and the HTTP/2 Alt-Svc frame as HTTP/3 endpoint. Servers may serve HTTP/3 on any UDP port. An alternative service advertisement includes an explicit port, and URLs contain either an explicit port or a default port associated with the scheme.

Clients receiving alternate service headers or frames are not bound to use them. The client, if made aware of an alternate service and if it supports the alternate service mechanism should use the appropriate alternate service advertised. In other words, a HTTP/1.1 service or a HTTP/2 service may advertise an equivalent endpoint that supports HTTP/3 protocol. The client on receiving this alternate service information can choose to establish a QUIC connection with the specified alternate service and once available, this connection can be used for any subsequent requests. If the establishment of the connection with the selected alternate service fails, the client can fall back to the original endpoint. When the client starts using the alternate service advertised, will indicate this by including a Alt-Used header.

NetScaler supports advertising equivalent HTTP/3 endpoints on HTTP and SSL type virtual servers.

## Configure HTTP/3 service discovery

Complete the following steps to configure HTTP/3 service discovery:

1. Configure HTTP/3 alternative service endpoint by using an HTTP Alt-Svc Header
2. Configure HTTP/3 alternative service endpoint by using an HTTP/2 Alt-Svc frame  
Configure HTTP/3 alternative service endpoint by using an HTTP Alt-Svc Header  
To advertise an HTTP/3 endpoint by using a HTTP Alt-Svc Header, type the following command:

Note: The main purpose of advertising alternative service is to let user know that HTTP/3 capability can be accessed on HTTP/1.1 or HTTP/2 service on a.b.c.d:443 also.

```
1 add ns httpProfile <name> -custom -altsvc [ENABLED | DISABLED]
2 <!--NeedCopy-->
```

### Example:

```
1 add ns httpProfile http-profile -altsvc ENABLED -altSvcValue "h3
 -29=\":443\"; ma=3600; persist=1"
2 <!--NeedCopy-->
```

or

```
1 set ns httpProfile http-custom -altsvc ENABLED -altSvcValue "h3
 -29=\"":443\""; ma=3600; persist=1"
2 <!--NeedCopy-->
```

### Configure HTTP/3 alternative service endpoint by using an HTTP/2 Alt-Svc frame

To advertise an HTTP/3 endpoint by using a HTTP/2 Alt-svc frame, type the following command:

```
1 add ns httpProfile <name> -custom -altsvc [ENABLED | DISABLED] -
 http2AltSvcFrame [ENABLED | DISABLED]
2 <!--NeedCopy-->
```

#### Example:

```
add ns httpProfile http-custom -http2 ENABLED -http2Direct ENABLED -
http2AltSvcFrame ENABLED -altsvc ENABLED -altSvcValue "h3-29=\"":443\"";
ma=3600; persist=1"
```

or

```
set ns httpProfile http-custom -http2 ENABLED -http2Direct ENABLED -
http2AltSvcFrame ENABLED -altsvc ENABLED -altSvcValue "h3-29=\"":443\"";
ma=3600; persist=1"
```

### Configure HTTP/3 alternative service with HTTP Alt-Svc header value by using GUI

1. Navigate to **System > Profiles > HTTP Profiles**.
2. Click **Add**.
3. In **Create HTTP Profile** page, go to HTTP/3 section and select **Alternative Service** checkbox.
4. The system displays the **Alternative Service Value** text box in the http2 section.
5. Enter the alternative service value as “h3-29=“:443”; ma=3600; persist=1”
6. Click **OK** and **Close**.

**HTTP/2**

HTTP/2

Direct HTTP/2

Alternative Service

Alternative Service Value

h3-29=":443"; ma=3600; persist=1

## gRPC

May 2, 2023

gRPC in a NetScaler appliance is a lightweight, high performance, and open-source universal Remote Procedure Call (RPC) framework. The framework is optimal to work across multiple languages running on any operation system. Also when compared to other protocols, gRPC offers better performance and security.

gRPC for NetScaler is preferred for the following reasons:

- Build distributed applications for data-center and public/private cloud infrastructure.
- Provide client-server communication for mobile, web, or cloud.
- Access cloud services and applications
- Microservice deployments

### Why gRPC in NetScaler

gRPC in NetScaler is implemented over HTTP/2 to support highly performance and scalable APIs. The use of binary than text keeps the payload compact and efficient. In NetScaler, the HTTP/2 requests are multiplexed over a single TCP connection, allowing multiple concurrent messages to be in flight without compromising the network resource usage. It also uses header compression to reduce the size of requests and responses.

gRPC supports the following types of service methods for a client to remotely invoke parameters and return types.

1. **Unary RPC.** Client sends a single request to the gRPC server and gets a single response back.

**Example:**

```
rpc SayHello(HelloRequest) returns (HelloResponse);
```

2. **Server streaming RPC.** Client sends a single request to the gRPC server and gets a stream response.

**Example:**

```
rpc StreamingResponse(HelloRequest) returns (HelloResponse);
```

3. **Client streaming RPC.** Client sends a sequence of messages and waits for the server to read and return its response.

**Example:**

```
rpc IntroduceYourself(stream HelloRequest) returns (HelloResponse)
```

4. **Bidirectional streaming RPC.** Both client and server from both sides send a stream of messages using the read-write stream. The two streams operate independently.

**Example:**

```
rpc ChatSession (stream HelloRequest) returns (stream HelloResponse)
```

NetScaler supports the following capabilities for its services with gRPC endpoints:

- Load balancing
- Content switching
- Secure end-point services like Web Application Firewall, authentication .
- Policy configuration
- Stats and logging
- Content rewriting, content filtering
- Layer 4 and Layer 7 optimizations, TLS offering
- Gateway solutions for protocol translations

## gRPC end-to-end configuration

December 29, 2023

The gRPC end-to-end configuration works by sending a gRPC request from a client over HTTP/2 protocol and again forwarding gRPC messages responded by the gRPC server.

### How end-to-end gRPC configuration works

The following diagram shows a gRPC configuration works in a NetScaler appliance.

1. To deploy the gRPC configuration, you must first enable HTTP/2 in the HTTP profile and also enable HTTP/2 support globally on server side.

2. When a client sends a gRPC request, the load balancing virtual server evaluates the gRPC traffic using policies.
3. Based on policy evaluation, the load balancing virtual server (with gRPC service bound to it) terminates the request and forwards it as a gRPC request to the back-end gRPC server.
4. Similarly, when the gRPC server responds to the client, the appliance terminates the response and forwards it as a gRPC response to the client.

### Example for gRPC request sent to gRPC server

The request header is sent as HTTP/2 headers in HEADERS+CONTINUATION Frames.

```
1 ```\n2 HEADERS (flags = END_HEADERS)\n3 : method = POST\n4 : scheme = http\n5 : path = /helloworld.citrix-adc/SayHello\n6 : authority = 10.10.10.10.:80\n7 grpc-timeout = 15\n8 content-type = application/grpc+proto\n9 grpc-encoding = gzip\n10 DATA (flags = END_STREAM)\n11 <Length-Prefixed Message>\n12 <!--NeedCopy--> ```\n
```

### Example for gRPC response header from gRPC server to NetScaler appliance

Response-Headers & Trailers-Only are delivered in a single HTTP/2 HEADERS frame block. Most responses are expected to have both headers and trailers but Trailers-Only is permitted for calls that produce an immediate error. Status must be sent in Trailers even if the HTTP status code is OK.

```
1 ```\n2 HEADERS (flags = END_HEADERS)\n3 : status = 200\n4 Grpc-encoding= gzip\n5 Content-type = application/grpc+proto\n6 DATA\n7 <Length-Prefixed Message>\n8 HEADERS (flags = END_STREAM, END_HEADERS)\n9 grpc-status = 0 # OK\n10\n11 <!--NeedCopy--> ```\n
```

### Configure gRPC by using the CLI

To configure an end-to-end gRPC deployment, you must complete the following:

- Add HTTP profile with HTTP/2 and HTTP/2 direct enabled.
- Enable global back end HTTP/2 support in HTTP parameter
- Add load balancing virtual server of type SSL/HTTP and set HTTP profile
- Add Service for gRPC endpoint and set HTTP profile
- Bind gRPC end point service to load balancing virtual server

### **Add HTTP profile with HTTP/2 and HTTP/2 direct enabled**

You must enable HTTP/2 and HTTP/2 direct parameters in the HTTP profile. Also, you must enable the HTTP/2 direct parameter if gRPC over HTTP/2 cleartext is required.

At the command prompt, type:

```
add ns httpProfile <name> - http2 (ENABLED | DISABLED)[-http2Direct
 (ENABLED | DISABLED)]
```

#### **Example:**

```
add ns httpProfile http2gRPC -http2Direct ENABLED -http2 ENABLED
```

### **Enable global back-end HTTP/2 support through HTTP parameter**

To enable HTTP/2 support globally on the server side by using the NetScaler command line.

At the command prompt, type:

```
set ns httpParam -http2ServerSide(ON | OFF)
```

#### **Example:**

```
set ns httpParam -http2ServerSide ON
```

### **Add load balancing virtual server of type SSL/HTTP and set HTTP profile**

To add a load balancing virtual server by using the **NetScaler** command interface:

At the command prompt, type:

```
add lb vservice <name> <service type> [((<IP address>@ <port>)] [-
httpProfileName <string>]
```

#### **Example:**

```
add lb vservice lb-grpc HTTP 10.10.10.11 80 -httpProfileName http2gRPC
```

**Note:**

If you are using a load balancing virtual server of type SSL, then you must bind the server certificate. See Bind server certificate topic for more information.

**Add Service for gRPC endpoint and set HTTP profile**

To add a gRPC service with HTTP profile by using the **NetScaler** command interface:

At the command prompt, type:

```
add service <name> (<IP> | <serverName>)<serviceType> <port> [-
httpProfileName <string>]
```

**Example:**

```
add service svc-grpc 10.10.10.10 HTTP 80 -httpProfileName http2gRPC
```

**Bind gRPC end point service to load balancing virtual server**

To bind a gRPC service to load balancing virtual server by using the **NetScaler** command interface:

At the command interface, type:

```
bind lb vserver <name> <serviceName>
```

**Example:**

```
bind lb vserver lb-grpc svc-grpc
```

**Configure end-to-end gRPC deployment by using the GUI**

Complete the following steps to configure gRPC by using the GUI.

**Add HTTP profile with HTTP/2 and HTTP/2 direct enabled**

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Select the **HTTP/2** checkbox in a new HTTP profile or existing HTTP profile.

**Enable global back end HTTP/2 support in HTTP parameter**

1. Navigate to **System > Settings > HTTP Parameters**.
2. In the **Configure HTTP Parameter** page, select the **HTTP/2 on Server Side** checkbox.
3. Click **OK**.

### **Add load balancing virtual server of type SSL/HTTP and set HTTP profile**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click Add to create a load balancing virtual server for gRPC traffic.
3. In Load Balancing Virtual Server page, click Profiles.
4. In the Profiles section, select the profile type as HTTP.
5. Click OK and then Done.

### **Add Service for gRPC endpoint and set HTTP profile**

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Click Add to create an application server for gRPC traffic.
3. In Load Balancing Service page, go to Profile section.
4. Under Profiles, add HTTP profile for gRPC endpoint.
5. Click OK and then Done.

For detailed GUI procedures related to loading balancing, see [Load Balancing](#) topic.

## **gRPC bridging**

December 29, 2023

When a client sends a request over HTTP/1.1 protocol, the NetScaler appliance supports bridging of the gRPC requests over HTTP/1.1 protocol which is in compliance with the gRPC server over HTTP/2 protocol. Similarly, in reverse bridging, the appliance receives the client gRPC request over the HTTP/2 protocol and performs reverse bridging for the gRPC requests in compliance with the gRPC server of the HTTP/1.1 protocol.

### **How gRPC bridging works**

In this scenario, the NetScaler appliance seamlessly bridges gRPC content received on an HTTP/1.1 connection and forwards it to the back-end gRPC server over HTTP/2.

The following diagram shows how components interact with each other in a gRPC bridging configuration.

1. When a gRPC request is sent, the NetScaler appliance checks if the connection is HTTP/1.1 and the content type is application/grpc. The HTTP/1.1 requests translate to the following pseudo headers.
2. On receiving a gRPC request on HTTP/1.1. connection as indicated by the Content-Type header, the ADC appliance transforms the request into gRPC over HTTP/2 as given below:

```

1 :method: Method-name in HTTP/1.1 request
2 :path: Path is HTTP/1.1 request
3 content-type: application/grpc
4 <!--NeedCopy-->

```

1. Based on policy evaluation, the load balancing virtual server (with the gRPC service bound to it) terminates the request or forwards it over HTTP/2 frames to the back-end gRPC server.
2. On receiving the response on a HTTP/2 connection from the gRPC server, the appliance buffers until it receives the HTTP/2 trailer and then checks for the gRPC-status code. If it is non-zero gRPC error status, the appliance looks for the mapping HTTP Status code and send a suitable HTTP/1.1 error response.

## Configure gRPC bridging by using the CLI

To configure gRPC bridging, you must complete the following steps:

1. Add HTTP profile with HTTP/2 and HTTP/2 direct enabled
2. Enable global back-end HTTP/2 support in the HTTP parameter
3. Add load balancing virtual server of type SSL/HTTP and set the HTTP profile
4. Add Service for gRPC endpoint and set the HTTP profile
5. Bind gRPC end point service to load balancing virtual server
6. Map gRPC status code to the HTTP response for non-zero gRPC status
7. Configure gRPC buffering by time and/or size

**Add HTTP profile with the HTTP/2 and HTTP/2 direct enabled**

To begin the configuration, you must enable the HTTP/2 feature in the HTTP profile. If the client sends the HTTP 1.1 requests, the appliance bridges the request and forward it to the back-end server.

At the command prompt, type:

```
add ns httpProfile <name> - http2 (ENABLED | DISABLED)[-http2Direct
(ENABLED | DISABLED)]
```

**Example:**

```
add ns httpProfile http2gRPC -http2Direct ENABLED -http2 ENABLED
```

**Enable global back end HTTP/2 support in the HTTP parameter**

To enable the HTTP/2 support globally on the server side by using the NetScaler command line.

At the command prompt, type:

```
set ns httpParam -http2ServerSide(ON | OFF)
```

**Example:**

```
set ns httpParam -http2ServerSide ON
```

**Add load balancing virtual server of type SSL/HTTP and set the HTTP profile**

To add a load balancing virtual server by using the **NetScaler** command interface

At the command prompt, type:

```
add lb vserver <name> <service type> [((<IP address>@ <port>)] [-
httpProfileName <string>]
```

**Example:**

```
add lb vserver lb-grpc HTTP 10.10.10.10 80 -httpProfileName http2gRPC
```

**Note:**

If you are using a load balancing virtual server of type SSL, then you must bind the server certificate. See [Bind server certificate](#) topic for more information.

### Add Service for gRPC endpoint and set the HTTP profile

To add a gRPC service with the HTTP profile by using the **NetScaler** command interface.

At the command prompt, type:

```
add service <name> (<IP> | <serverName>)<serviceType> <port> [-
httpProfileName <string>]
```

#### Example:

```
add service svc-grpc 10.10.10.10 HTTP 80 -httpProfileName http2gRPC
```

### Bind gRPC end point service to load balancing virtual server

To bind a gRPC end point service to the load balancing virtual server by using the CLI.

At the command interface, type:

```
bind lb vserver <name> <serviceName>
```

#### Example:

```
bind lb vserver lb-grpc svc-grpc
```

### Map gRPC status code to HTTP status-code in the HTTP/1.1 response

In gRPC bridging scenario, the gRPC service responds to the request with a gRPC status-code. The appliance maps the gRPC status code to a corresponding HTTP response code and reason phrase. The mapping is done based on the table provided below. The NetScaler appliance when sending the HTTP/1.1 response to the client sends the HTTP status code and the reason phrase.

---

<b>gRPC status-code</b>	<b>HTTP response status-code</b>	<b>HTTP response reason-phrase</b>
OK = 0	200	OK
CANCELLED = 1	499	*
UNKNOWN = 2	500	Internal Server Error
INVALID_ARGUMENT = 3	400	Bad Request
DEADLINE_EXCEEDED = 4	504	Gateway Timeout
NOT_FOUND = 5	404	*
ALREADY_EXISTS = 6	409	Conflict
PERMISSION_DENIED = 7	403	Forbidden

<b>gRPC status-code</b>	<b>HTTP response status-code</b>	<b>HTTP response reason-phrase</b>
UNAUTHENTICATED = 16	401	Unauthorized
RESOURCE_EXHAUSTED = 8	429	*
FAILED_PRECONDITION = 9	400	Bad Request
ABORTED = 10	409	Conflict
OUT_OF_RANGE = 11	400	Bad Request
UNIMPLEMENTED = 12	501	Not Implemented
INTERNAL = 13	500	Internal Server Error
UNAVAILABLE = 14	503	Service Unavailable
DATA_LOSS = 15	500	Internal Server Error

### Configure gRPC buffering by time and/or size

The NetScaler appliance buffers the gRPC response from the back-end server until the response trailer is received. This breaks bi-directional gRPC calls. Also, if the gRPC response is huge, it consumes a significant amount of memory to buffer the response completely. To resolve the issue, the gRPC bridging configuration is enhanced to limit buffering by time and/or size. If the buffer size or time limit exceeds threshold, the appliance stops buffering and forwards the response to the client even when any one of the limitations triggers (either the trailer is not received within the configured buffer size or if the configured timeout occurs). As a result, the configured policies and its expressions (based on gRPC-status code) do not work as expected.

To limit gRPC buffering by time and/or size by the CLI, you can configure when you add a new HTTP profile or configure when you modify an existing profile.

At the command prompt, type:

```
add ns httpProfile http2gRPC [-grpcHoldLimit <positive_integer>] [-
grpcHoldTimeout <positive_integer>]
```

Or

```
set ns httpProfile http2gRPC [-grpcHoldLimit <positive_integer>] [-
grpcHoldTimeout <positive_integer>]
```

Where,

**grpcHoldLimit**. Maximum size in bytes allowed to buffer gRPC packets until trailer is received. You can configure both the parameters and any one.

Default value: 131072

Minimum value: 0

Maximum value: 33554432

`grpchoholdtimeout`. Maximum time in milliseconds allowed to buffer gRPC packets until trailer is received. The value should be in multiples of 100.

Default value: 1000

Minimum value: 0

Maximum value: 180000

**Example:**

```
add httpprofile http2gRPC -grpchoholdlimit 1048576 -grpchoholdtimeout
5000
set httpprofile http2gRPC -grpchoholdlimit 1048576 -grpchoholdtimeout
5000
```

## Configure gRPC bridging by using the GUI

Complete the following steps to configure gRPC bridging by using the NetScaler GUI.

### Add HTTP profile with HTTP/2 and HTTP/2 direct enabled

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Select **HTTP/2** in the HTTP profile.

### Enable global back-end HTTP/2 support in the HTTP parameter

1. Navigate to **System > Settings > HTTP Parameters**.
2. In the **Configure HTTP Parameter** page, select **HTTP/2 on Server Side** option.
3. Click **OK**.

### Add load balancing virtual server of type SSL/HTTP and set HTTP profile

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Profiles**.
4. In the **Profiles** section, select the profile type as HTTP.
5. Click **OK** and then **Done**.

### **Add Service for gRPC endpoint and set HTTP profile**

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Click **Add** to create an application server for gRPC traffic.
3. In **Load Balancing Service** page, go to **Profile** section.
4. Under **Profiles**, add **HTTP profile** for gRPC endpoint.
5. Click **OK** and then **Done**.

### **Bind Service for gRPC endpoint to load balancing virtual server**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Service and Service Groups** section.
4. In the **Load Balancing Virtual Server Service Binding** page, select the gRPC service to bind.
5. Click **Close** and then **Done**.

### **Configure gRPC buffering by time and size by using the GUI**

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Select **HTTP/2** in the HTTP profile.
3. In the **Configure HTTP Profile** page, set the following parameters:
  - a) `grpcHoldTimeout`. Enter the time in milliseconds to buffer gRPC packets until the trailer is received.
  - b) `grpcHoldLimit`. Enter the maximum size in bytes to buffer gRPC packets until the trailer is received.
4. Click **OK** and **Close**.

For detail GUI procedures for binding service and load balancing virtual servers, see [Load Balancing](#) topic.

## gRPC reverse bridging

December 29, 2023

In this scenario, the NetScaler appliance seamlessly bridges gRPC content received on an HTTP/2 connection and forwards it to the back-end gRPC server over HTTP/1.1.

### How reverse bridging works

The following diagram shows how components interact with each other in a gRPC bridging configuration.

1. Client sends a gRPC request on HTTP/2 connection with gRPC headers in HTTP/2 frames and proto-buf payload.

2. Based on policy evaluation, the load balancing virtual server (with gRPC service bound to it) translates and forwards the request over HTTP/1.1 connection to backend server.
3. On receiving the HTTP/1.1 response, if there is no grpc-status code in the response, ADC derives a grpc status-case from the HTTP response code.
4. The appliance then inserts the gRPC headers into HTTP/2 trailer before forwarding the response to the client.

## Configure gRPC reverse bridging by using the CLI

To configure gRPC reverse bridging, you must complete the following steps:

- Add HTTP profile 1 with HTTP/2 and HTTP/2 direct enabled for load balancing virtual server
- Add HTTP profile 2 with HTTP/2 disabled for back-end server
- Add load balancing virtual server of type SSL/HTTP and set to HTTP profile 1
- Add service for gRPC endpoint and set to HTTP profile 2
- Bind Service for gRPC endpoint to load balancing virtual server
- Map HTTP-status code to gRPC status code if the response does not have a grpc status code

### Add HTTP profile 1 with HTTP/2 and HTTP/2 direct enabled for load balancing virtual server

To begin the reverse bridging configuration, you must add two HTTP profiles. One profile for enabling HTTP/2 for gRPC client requests and another profile for disabling HTTP/2 for non-gRPC server response.

At the command prompt, type:

```
add ns httpProfile <name> - http2 (ENABLED | DISABLED)[-http2Direct
(ENABLED | DISABLED)]
```

#### Example:

```
add ns httpProfile profile1 -http2 ENABLED -http2Direct ENABLED
```

### Add HTTP profile 2 with HTTP/2 disabled for back-end server

To disable HTTP/2 support on the HTTP profile for back-end server response by using the NetScaler command line.

At the command prompt, type:

```
add ns httpProfile <name> - http2 (ENABLED | DISABLED)[-http2Direct
(ENABLED | DISABLED)]
```

#### Example:

```
add ns httpProfile profile2 -http2 DISABLED http2Direct DISABLED
```

### Add load balancing virtual server of type SSL/HTTP and set to HTTP profile 1

To add a load balancing virtual server by using the NetScaler command interface.

At the command prompt, type:

```
add lb vserver <name> <service type> [(<IP address>@ <port>)] [-
httpProfileName <string>]
```

#### Example:

```
add lb vserver lb-grpc HTTP 10.10.10.10 80 -httpProfileName profile1
```

#### Note:

If you are using a load balancing virtual server of type SSL, then you must bind the server certificate. See Bind server certificate topic for more information.

### Add service for gRPC endpoint and set to HTTP profile 2

To add a service with gRPC endpoint and set HTTP profile 2 by using the NetScaler command interface.

At the command prompt, type:

```
add service <name> (<IP> | <serverName>)<serviceType> <port> [-
httpProfileName <string>]
```

#### Example:

```
add service svc-grpc 10.10.10.11 HTTP 80 -httpProfileName profile2
```

### Bind service for gRPC endpoint to load balancing virtual server

To bind a gRPC service to load balancing virtual server by using the NetScaler command interface.

At the command interface, type:

```
bind lb vserver <name> <serviceName>
```

#### Example:

```
bind lb vserver lb-grpc svc-grpc
```

### Map HTTP response code to gRPC status code

If the server does not generate a gRPC status code, the NetScaler appliance generates a suitable gRPC status code based on the HTTP response received. The status codes are listed in the below mapping table.

---

HTTP Response status-code	gRPC status code
200	OK
400	INTERNAL = 13
403	PERMISSION_DENIED = 7
401	UNAUTHENTICATED = 16
429, 502, 503, 504	UNAVAILABLE = 14
404	UNIMPLEMENTED = 12

---

## Configure gRPC reverse bridging by using the GUI

### Add HTTP profile 1 with HTTP/2 and HTTP/2 direct enabled for load balancing virtual server

1. Navigate to System > Profiles and click HTTP Profiles.
2. Enable HTTP/2 option in a HTTP profile 1.

### Add HTTP profile 2 with HTTP/2 disabled for back-end server

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Enable **HTTP/2** option in a HTTP profile 2.
3. Click **OK**.

### Add load balancing virtual server of type SSL/HTTP and set to HTTP profile 1

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Profiles**.
4. In the **Profiles** section, select the profile type as HTTP.
5. Click **OK** and then **Done**.

### Add service with gRPC endpoint and set to HTTP profile 2

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Click **Add** to create an application server for gRPC traffic.
3. In **Load Balancing Service** page, go to **Profile** section.
4. Under **Profiles**, add **HTTP profile** for gRPC endpoint.
5. Click **OK** and then **Done**.

### Bind Service for gRPC endpoint to load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Service** and **Service Groups** section.
4. In the **Load Balancing Virtual Server Service Binding** page, select the gRPC service to bind.
5. Click **Close** and then **Done**.

For detail GUI procedures, see [Load Balancing](#) topic.

### gRPC call termination

May 2, 2023

When a NetScaler appliance has policies such as rate limiting, Web App Firewall security configured and if a policy evaluates to true, the appliance can terminate the call and respond with a computable gRPC error message to the client.

### gRPC with rewrite policy

May 2, 2023

The gRPC with rewrite policy use case explains how NetScaler appliance works in rewriting some information in the gRPC requests or responses. The following diagram shows the components interact.

The following diagram shows how components interact with each other in a gRPC with rewrite policy configuration.

1. Enable rewrite feature on the appliance.
2. Configure rewrite action to modify, add, or delete gRPC headers.

3. Configure rewrite policy for determining the gRPC requests (traffic) on which an action has to be taken.
4. Bind the rewrite policy to the load balancing virtual server to examine if the traffic matches the policy expression.
5. By using a rewrite policy, you can perform the following based on gRPC status code.
  - a) Modify responses from gRPC web server.
  - b) Modify, add, or delete gRPC headers.
  - c) Modify the URL of the request to the gRPC server.

### **Configure gRPC call termination with rewrite policy**

To configure gRPC call termination with rewrite policy, you must complete the following steps:

1. Enable rewrite feature
2. Add rewrite policy
3. Bind rewrite policy to load balancing virtual server

#### **Enable rewrite feature**

To use the rewrite feature, you must first enable it.

At the command prompt, type:

```
enable ns rewrite
```

#### **Add rewrite policy**

After you configure a rewrite action, you must next configure a rewrite policy to select the gRPC requests to which the NetScaler appliance must rewrite.

At the command prompt, type:

```
add rewrite policy <name> <expression> <action> [<undefaction>]-
appFlowaction <actionName>
```

#### **Example:**

```
add rewrite policy grpc-rewr_pol1 "http.res.header(\"grpc-status\").
NE(\"0\")"RESET
```

## Bind rewrite policy to load balancing virtual server

To put a policy into effect, you must bind it to the load balancing virtual server with the gRPC service.

At the command prompt, type:

```
bind rewrite global <policyName> <priority> [<gotoPriorityExpression>
 [-type <type>] [-invoke (<labelType> <labelName>)]
```

### Example:

```
bind lb vserver lb-grpc -policyName grpc-rewr_pol1 -priority 100
```

## gRPC with the responder policy

May 2, 2023

The gRPC with responder policy configuration explains how a NetScaler appliance provides different responses to gRPC requests over the HTTP/2 protocol. When users request a website home page, you might want to provide a different home page depending on where each user is located or the browser the user is using.

The following diagram shows the components that interact.

1. Enable the responder feature on the appliance.
2. Configure the responder action to generate a custom response, redirect a request to a different webpage, or reset a connection.
3. Configure the responder policy for determining the gRPC requests (traffic) on which an action has to be taken.
4. Bind the responder policy to the load balancing virtual server to examine if the traffic matches the policy expression.
5. By using a responder policy, you can perform the following based on the gRPC status code.

## Configure gRPC call termination with the responder policy by using the CLI

To configure gRPC call termination with the responder policy, you must complete the following steps:

1. Enable the responder feature
2. Add a responder action
3. Add a responder policy and associate responder action
4. Bind the responder policy to load balancing virtual server

### Enable the responder feature

To use the responder feature, you must first enable it.

At the command prompt, type:

```
enable ns responder
```

### Add the responder action

After enabling the feature, you must configure the responder action for handling the gRPC response based on the status code returned by the back-end server.

At the command prompt, type:

```
add responder action <name> <type>
```

#### Example:

```
add responder action grpc-act respondwith "HTTP/1.1 200 OK\r\nServer: NS-Responder\r\nContent-Type:application/grpc\r\ngrpc-status: 12\r\ngrpc-message: Not Implemented\r\n\r\n"+ "Method: "+ HTTP.REQ.URL+ " is not implemented."
```

### Adding responder policy

After you configure a responder action, you must next configure a responder policy to select the gRPC request to which the NetScaler appliance must respond.

At the command prompt, type:

```
add responder policy <name> <expression> <action> [<undefaction>]-appFlowaction <actionName>
```

#### Example:

```
add responder policy grpc-resp-pol1 HTTP.REQ.URL.NE("/helloworld.
Greeter/SayHello")grpc-act
```

### Bind responder policy to load balancing virtual server

To put a policy into effect, you must bind it to the load balancing virtual server with the gRPC service.

At the command prompt, type:

```
bind responder global <policyName> <priority> [<gotoPriorityExpression
> [-type <type>] [-invoke (<labelType> <labelName>)]]
```

#### Example:

```
bind lb vserver lb-grpc svc-grpc -policyName grpc-resp-pol1 -priority
100
```

For more information about the responder policy, see [Responder Policy](#) topic.

### Policy expressions for matching gRPC protocol buffer fields

The NetScaler appliance supports the following policy expressions in the gRPC configuration:

- **gRPC protocol buffer field access.** The arbitrary gRPC API call matches the message field number with the new policy expressions. In a PI configuration, the matches are done using only the ‘field numbers’ and ‘API path’.
- **gRPC header filtering.** The “HttpProfile” parameters for gRPC is used to adjust the default behavior of gRPC parsing (including gRPC policy expressions). The following parameters are applicable to gRPC policy expressions:
  - **gRPCLengthDelimitation.** It is enabled by default and expects the protocol buffers to be presented with a length delimited message.
  - **gRPCHoldLimit.** The default value is 131072. It is the maximum protocol buffer message size in bytes. It is also the maximum string length and the maximum ‘byte’ field length as well.

### Configure gRPC advance policy expressions by using the CLI

At the command prompt, type:

```
1 set ns httpProfile <name> -http2 \ (ENABLED | DISABLED) -
 gRPCLengthDelimitation \ (ENABLED | DISABLED) -gRPCHoldLimit <int>
```

#### Example:

```
1 set ns httpProfile http2gRPC -http2 ENABLED -gRPCLengthDelimitation
 ENABLED -gRPCHoldLimit 131072
```

### Configure gRPC header filtering parameters by using the GUI

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. On the **Create HTTP Profile** page, scroll down to **HTTP/3** section, select **gRPC Length Delimitation**.

The following policy expression example shows a value in message 5, submessage 4, and field 3. It is a 32-bit int equal to 2.

```
1 http.req.body(1000).grpc.message(5).message(4).int32(3).eq(2)
```

The following policy expressions are added for matching gRPC protocol buffer message fields by number:

- message
- double
- float
- int32
- int64
- uint32
- uint64
- sint64
- sint32
- fixed32
- fixed64
- sfixed32
- sfixed64
- bool
- string
- enum
- bytes

### API path matching

The API path matching is used to match the correct gRPC API call when more than one API is used. Match the API path, which can be found in the ‘: path’ pseudo header in the HTTP request.

#### Example:

```
1 http.req.header(":path").eq("acme.inventory.v1/ListBooks")
```

## gRPC health check monitor

December 22, 2023

The **gRPC** health monitor probes the **gRPC** servers for its health status. The **gRPC** health monitor checks the overall health of the **gRPC** service or the health of a particular service. Currently, the NetScaler appliance support only the check method.

In the NetScaler appliance, The health check monitor is configured by setting the **gRPC** parameters such as **gRPCHealthCheck**, **gRPCStatusCode**, **gRPCServiceName**, and **httprequest** in the HTTP2 monitor configuration. A client implementing the protocol queries the server for its status (healthy, not healthy, unknown, or service not implemented) and expects the status response from the service.

The following table gives details about the new **gRPC** parameters and its description:

gRPC parameters	Value	Description
<b>gRPCHealthCheck</b>	Yes/No	Enable or disable the <b>gRPC</b> health check probe.
<b>gRPCStatusCode</b>	Unsigned int (0-65535), Default: 12	Configure up to 16 <b>gRPC</b> status code. The appliance looks for the status code 0 in the status response. If it fails to receive 0, the service can set to up if any of the 16 code matches with the service status.
<b>gRPCServiceName</b>	Service name within double quotes, Default = ""(empty string)	Check the health of the particular service.

### Configure the gRPC health monitor in HTTP/2 by using the command interface

To perform a **gRPC** health check probe, you must enable the health check service, configure the **gRPC** status code, and provide the **gRPC** service name for which the **gRPC** health check must be performed. At the command prompt, type:

```
add lb monitor <monitor_name> HTTP2 -httpRequest <string> -grpcHealthCheck
(YES | NO)- grpcStatusCode <positive_integer> - grpcServiceName
string>]
```

**Example:**

```
add lb monitor http2 HTTP2 -httprequest "POST /grpc.health.v1.Health/
Check"- grpcHealthCheck Yes -grpcStatusCode 0 -grpcServiceName "ECHO"
```

### Configure the gRPC health monitor in HTTP/2 by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Monitors**.
2. Click **Add**.
3. In the **Create Monitor** page, set the following parameters:
  - a) Name. Name of the gRPC health monitor.
  - b) Type. Select the service type as HTTP/2.
  - c) gRPC HealthCheck. Enable gRPC health check probe.
  - d) gRPC StatusCode. The gRPC service status is “UP” only if the gRPC status code is zero or the configured value. The status goes “down” if the status code is a value other than zero or the configured value.
  - e) gRPC Service name. Service for which the health check is performed.
4. Create **Create**.

## QUIC

May 2, 2023

Quick UDP Internet Protocol (QUIC) is a combination of (TCP+TLS+HTTP/2) protocols implemented on UDP. The QUIC transport protocol multiplexes the connections between two endpoints using UDP. Also when compared to other protocols, QUIC provides a high performance in terms of security, fast delivery of traffic, and lower latency.

A QUIC bridge is configured in a NetScaler appliance for load balancing QUIC traffic between a QUIC client and QUIC back-end server. The QUIC bridge enables you to have persistent QUIC connections between client and server if there is a NAT rebinding or a connection migration. This configuration however does not process data. It is used only for load balancing of QUIC traffic through the NetScaler appliance.

QUIC packets contain connection ID to allow endpoints to associate the packets with different address or 4-tuple to the same connection. The connection ID contains the details of the server ID that are shared to the NetScaler appliance and to the back end servers. The NetScaler appliance extracts the connection ID details of the server ID and sends the traffic back to the back end server. The connection IDs are in protected packets that makes the connections robust in the event of connection migration.

#### **Important**

The back end servers must have support to encode server ID in QUIC connection ID.

### **Benefits of QUIC bridge**

QUIC bridge for the NetScaler appliance is preferred for the following reasons:

- No expensive crypto operations.
- Stateless routing is possible (no 4-tuple based load balancing).

### **Crypto offload support for QUIC**

If a NetScaler appliance is equipped with the SSL hardware chips, it does the crypto acceleration transparently and accelerates QUIC transactions. This acceleration is done by offloading crypto processing from software to hardware. No explicit configuration is needed for this support. The acceleration of QUIC transactions is supported in the NetScaler appliances with [Intel Coletto](#) hardware.

## **QUIC bridge configuration**

December 29, 2023

To configure QUIC bridge, you must complete the following:

- Add QUIC bridge profile
- Add QUIC back-end servers
- Add QUIC service on the appliance
- Add load balancing virtual server of type QUIC bridge
- Bind QUIC bridge to load balancing virtual server of type QUIC bridge

#### **Important**

Before you configure the QUIC bridge, ensure you first enable the load balancing feature on the appliance. For more information, see [Set up basic load balancing](#).

## Configure QUIC bridge by using the CLI

The following sections must be configured by using the CLI.

### Add a QUIC bridge profile

Add a QUIC bridge profile.

At the command prompt, type:

```
1 add quicBridge profile <name> -routingAlgorithm <PLAINTEXT> -
 serveridlen <value>
```

#### Example:

```
1 add quicBridge profile q1 -routingAlgorithm PLAINTEXT -serveridlen 6
```

#### Note

The `serveridlen` parameter configured in the example is the length of a custom server ID, which is the hex string of IP and PORT.

### Add QUIC back-end application server

Add QUIC back-end application servers.

At the command prompt, type:

```
1 - add server <name> (<IPAddress>)
2 - add server <name> (<IPAddress>)
```

#### Example:

```
1 - add server s1 192.0.2.20
2 - add server s2 192.0.2.30
```

### Add QUIC bridge service

You must add QUIC bridge service to the application servers.

At the command prompt, type:

```

1 - add service <name> \(<IP> | <serverName>) <serviceType> <port> \[-
 CustomServerID <string>]
2
3 - add service <name> \(<IP> | <serverName>) <serviceType> <port> \[-
 CustomServerID <string>]

```

**Example:**

```

1 - add service src1 s1 QUIC_BRIDGE 443 -CUSTOMSERVERID C0A8026401BB
2
3 - add service src2 s2 QUIC_BRIDGE 443 -CUSTOMSERVERID C0A802C801BB

```

**Note**

The `CustomServerID` parameters configured in the preceding example are the hex string of a corresponding IP and the PORT of the server (s1 and s2). For the QUIC bridge feature, Citrix recommends you to configure the `CustomServerID` parameter in the hex string format only.

**Add a load balancing virtual server of type QUIC bridge**

You must add a load balancing virtual server of type QUIC bridge.

At the command prompt, type:

```

1 add lb vserver <name> [<IPAddress>@ <port>] [-persistenceType <
 persistenceType >] [-lbMethod < lbMethod >] [-rule <rule>] [-
 cltTimeout <secs>] [-quickBridgeProfileName <name>]

```

**Example:**

```

1 add lb vserver quic_bridge_vip QUIC_BRIDGE 192.0.2.10 443 -
 persistenceType CUSTOMSERVERID -lbMethod TOKEN -rule QUIC.
 CONNECTIONID -cltTimeout 120 -quickBridgeProfileName q1

```

**Note**

While configuring the QUIC bridge virtual server, you must configure a `persistenceType` parameter as `CUSTOMSERVERID`, `rule` parameter as `QUIC.CONNECTIONID`, and a `LbMethod` parameter as `TOKEN`.

**Bind QUIC bridge service to the load balancing virtual server of type QUIC bridge**

You must bind the QUIC bridge service to the load balancing virtual server of type QUIC bridge.

At the command prompt, type:

```

1 - bind lb vserver <name> (<serviceName>)
2

```

```
3 - bind lb vserver <name> (<serviceName>)
```

**Example:**

```
1 - bind lb vserver quic_bridge_vip src1
2
3 - bind lb vserver quic_bridge_vip src2
```

**Configure QUIC bridge for service groups**

You can also configure QUIC bridge capabilities to service groups. The following steps guide you to configure QUIC bridge for service groups.

To configure QUIC bridge for service groups, you must complete the following:

**Add QUIC bridge profile**

At the command prompt, type:

```
1 add quicBridge profile <name> -routingAlgorithm <PLAINTEXT> -
 serveridlen <value>
```

**Example:**

```
1 add quicBridge profile q1 -routingAlgorithm PLAINTEXT -serveridlen 6
```

**Add server of type QUIC**

At the command prompt, type:

```
1 - add server <name> (<IPAddress>)
2 - add server <name> (<IPAddress>)
```

**Example:**

```
1 - add server s1 192.0.2.20
2 - add server s2 192.0.2.30
```

**Add QUIC bridge service group**

At the command prompt, type:

```
1 add serviceGroup <serviceGroupName> \(<IP> | <serverName>) <serviceType>
>
```

**Example:**

```
1 add serviceGroup svg1 QUIC_BRIDGE
```

**Bind the QUIC servers to the service group**

At the command prompt, type:

```
1 - bind serviceGroup <serviceName> \(<IP>@ | \(<serverName>) \[-
 CustomServerID <string>]
2 - bind serviceGroup <serviceName> \(<IP>@ | \(<serverName>) \[-
 CustomServerID <string>]
```

**Example:**

```
1 - bind serviceGroup svg1 s1 443 -customServerID C0A8026401BB
2 - bind serviceGroup svg1 s2 443 -customServerID C0A802C801BB
```

**Add load balancing virtual server of type QUIC bridge**

At the command prompt, type:

```
1 add lb vserver <name> [<IPAddress>@ <port> [-persistenceType <
 persistenceType >] [-lbMethod < lbMethod > [-cltTimeout <secs>]] [-
 quickBridgeProfileName <name>]
```

**Example:**

```
1 add lb vserver quic_bridge_vip QUIC_BRIDGE 192.0.2.10 443 -
 persistenceType CUSTOMSERVERID -lbMethod TOKEN -cltTimeout 120 -
 quickBridgeProfileName q1
```

**Bind the load balancing virtual server of type QUIC bridge to the service group**

At the command prompt, type:

```
1 bind lb vserver <name>@ (<serviceName>@ <serviceName>@ <serviceName>@
```

**Example:**

```
1 bind lb vserver quic_bridge_vip svg1
```

**Configure QUIC bridge using the GUI**

Complete the following steps to configure QUIC bridge by using the GUI.

1. Navigate to **Traffic Management > Load balancing > Virtual Servers**.
2. On the **Virtual Servers** page, click **Add**.
3. On the **Load Balancing Virtual Server** page, select the Protocol as QUIC\_BRIDGE and enter the details.
4. Click **Continue** and **Done**.

### Configure load balancing for the services by using the GUI

Complete the following steps to configure load balancing for the services by using the GUI.

1. Navigate to **Traffic Management > Load Balancing > Services**. On the **Services** page, click **Add**.
2. On the **Load Balancing Service** page, enter the details and click **OK**.

#### ← Load Balancing Service

**Basic Settings**

Cancel

3. On the **Virtual Servers** page, select the created virtual server to bind the service.
4. Scroll down on the **Load Balancing Virtual Server** page and select the **Services and Service Groups**.
5. On the **Service Binding** screen, click **Select Service** field.

6. On the **Service** screen, select the service to bind to the load balancing virtual server, and click **Select**.
7. On the **Service Binding** screen, select the service that you created and click **Bind**.
8. On the **Load Balancing Virtual Server** page, click **Done**.

## View statistics for QUIC bridge

QUIC bridge supports statistics command to view a detailed summary of QUIC bridge statistics.

The following commands display a detailed summary of QUIC bridge statistics. At the command prompt, type the following:

- `stat quicbridge`
- `stat quicbridge -detail`

To clear the statistics display, type one of the following:

- `stat quicbridge -clearstats basic`
- `stat quicbridge -clearstats full`

## View QUIC bridge statistics by using the GUI

Complete the following steps to view QUIC bridge statistics.

1. On the **Dashboard** tab, hover the mouse to **System Overview** section.
2. Click **System Overview** and select QUIC BRIDGE from the drop-down list.

## Proxy protocol

December 29, 2023

Proxy protocol safely transports client details from client to server across NetScaler appliances. The appliance adds a proxy protocol header with client details and forwards it to the back-end server. Following are some of the usage scenarios for proxy protocol in a NetScaler appliance.

- Learning original client IP address
- Selecting a language for a website
- Block listing selected IP addresses
- Logging and collecting statistics.

Following are the three modes of operation:

- **Insert.** NetScaler inserts the client details and sends it to the back-end server.
- **Forward.** NetScaler forwards the client details to the back-end server. Starting from NetScaler 14.1-12.x release, along with the client details, NetScaler forwards the TLV (Type Length Value) information sent in proxy protocol V2 to back-end servers if the Proxy Protocol feature is enabled on the virtual server and service.
- **Stripped.** NetScaler stores the client details for log purpose. Also, if the proxy protocol is not supported on the back-end server, sends the client details to the server by using the rewrite policy configuration

The following table provides you information on the status of LB virtual server and service in different proxy protocol modes:

Proxy Protocol Mode	LB virtual server	Service
Insert	Disabled	Enabled
Forward	Enabled	Enabled
Stripped	Enabled	Disabled

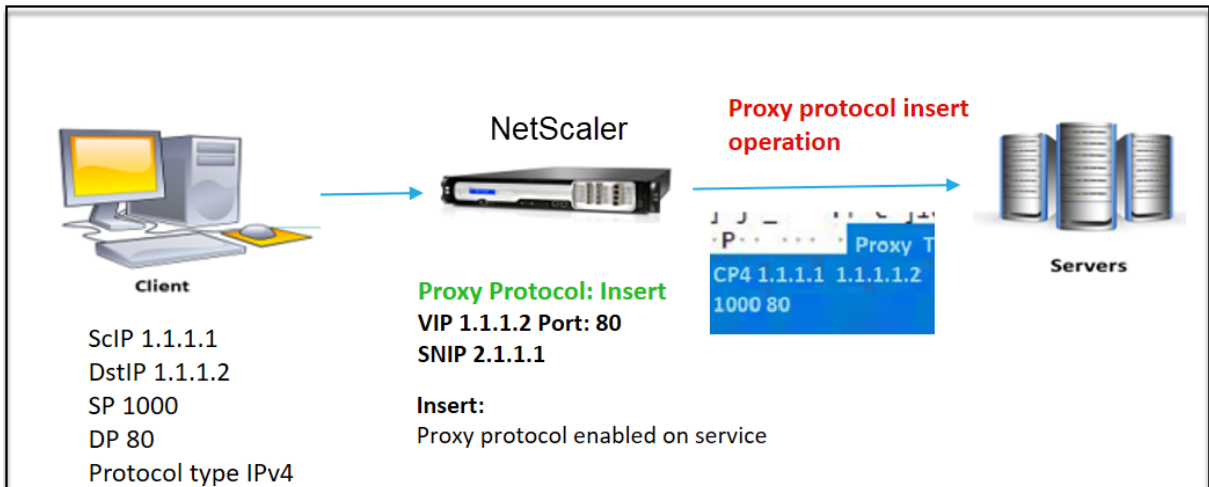

### Limitations

The proxy protocol is not supported for the TCP Fast Open (TFO) and MultiPath TCP features. The feature is supported only for services for which the NetScaler appliance does TCP connection termination. It is not support for other services, for example, “ANY”.

### How proxy protocol works in a NetScaler appliance

The following flow diagrams show how you can configure the proxy protocol across NetScaler appliances for Insert, Forwards, and Stripped operation:

### Insert operation

The component interact is as follows:

- At the NetScaler instance, you must enable proxy protocol in the net profile and bind it to the service.
- In the Insert operation, NetScaler adds a proxy header with client connection details and forwards it to the back-end server.
- On the sending side, the appliance decides the proxy protocol version based on CLI configuration.

### Forward operation

The component interact is as follows:

- A client sends a request along with the proxy header to the NetScaler. The appliance dynamically identifies the version.
- In NetScaler, it is a Forward operation. The proxy protocol is enabled on the load balancing virtual server or content switching virtual server and enabled on the service. The appliance receives the proxy header along with the TLV in Proxy Protocol V2 and forwards the header and TLV to the back-end server.
- If the proxy header details are in invalid format, the appliance resets the connection.
- On the sending side, the appliance decides the proxy protocol version based on CLI configuration.

### Stripped operation

The component interact is as follows:

- A client sends a request along with a proxy header to the NetScaler appliance.
- In the NetScaler appliance, if it is a Stripped operation, the appliance forwards the client information obtained from the proxy protocol and inserts it into the HTTP header using rewrite policy expressions.
- The client details such as source IP address, destination IP address, source port, and destination port are added in an HTTP header using rewrite policy expressions. The rewrite policy evaluates the expression and if “true,” the corresponding rewrite policy action is triggered. And the client details are forwarded to the back-end server in an HTTP header.
- If the proxy header details are in invalid format, the appliance resets the connection.

### Proxy protocol version formats

The Proxy protocol version is available as two formats. The appliance decides to use a format based on the incoming data length. For detailed information, see [Proxy Protocol RFP](#).

1. Proxy protocol version-1 format

PROXY TCP4/TCP6/UNKNOWN <SRC IP> <DST IP> <SRC PORT> <DST PORT>

- PROXY -> Unique string format for Proxy header version -1.
- Support protocols TCP over IPv4 and TCP over IPv6. For the remaining protocols, this is UNKNOWN.
- SRC IP –Source IP (Original Client IP) address of a packet.
- DST IP –Destination IP address of a packet.
- SRC port –Source port of a packet.
- DST port –Destination port of a packet.

## 2. Proxy protocol version-2 format

0D 0A 0D 0A 00 0D 0A 51 55 49 54 0A <13th byte> <14th byte>  
<15–16th byte> <17th byte onwards>

- D 0A 0D 0A 00 0D 0A 51 55 49 54 0A -> Unique binary string for Proxy header version -2.
- Support protocols TCP over IPv4 and TCP over IPv6. For the remaining protocols, this is UNKNOWN.
- Thirteenth byte –protocol version and command.
- Fourteenth byte –address and protocol family.
- 15-16th byte –Address length in network order.
- Seventeenth byte onwards –Addresses info present in network order- src IP, dst IP, src port, dst port.

## Responder policy infrastructure expression support

The proxy protocol supports the following responder policy infrastructure expressions for virtual servers of type TCP and HTTP:

1. CLIENT.PROXY.SRCIP\_STR
2. CLIENT.PROXY.DSTIP\_STR
3. CLIENT.PROXY.SRCPORT
4. CLIENT.PROXY.DSTPORT
5. CLIENT.PROXY.ETHERTYPE

### Note

NetScaler supports responder policy infrastructure expression for the proxy protocol on a virtual server of type TCP from NetScaler release 13.1-48.x onwards.

## Configure Proxy protocol in NetScaler appliance

Complete the following steps to configure the Proxy protocol in your NetScaler appliance.

1. Enable proxy protocol as global.
2. Configure proxy protocol for Insert operation.
3. Configure proxy protocol for Forward operation.
4. Configure proxy protocol for Strip operation.

### Enable the proxy protocol as global

At the command prompt, type the following:

```
set ns param -proxyProtocol ENABLED
```

### Configure proxy protocol for Insert operation

To configure the proxy protocol for Insert operation, you must disable the protocol on the load balancing virtual server and enable the protocol on the service.

**Add net profile with Proxy protocol disabled for load balancing virtual server** At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion <V1/V2>
```

#### Example:

```
Add netprofile proxyprofile-1 -proxyProtocol DISABLED -proxyprotocoltxversion V1
```

#### Note:

If you disable proxy protocol on your appliance, you need not set the protocol version parameter.

**Add net profile with a proxy protocol enabled for service** At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion <V1/V2>
```

#### Example:

```
add netprofile proxyprofile-2 -proxyProtocol ENABLED -proxyprotocoltxversion V1
```

**Add load balancing virtual server for NetScaler appliance in the proxy layer** At the command prompt, type the following:

```
add lb vserver <name>@ <serviceType> [(<IPAddress>@ <port>)]
```

**Example:**

```
add lb vserver lbvserver-1 http 1.1.1.1 80
```

**Add HTTP service for NetScaler appliance in the proxy layer** At the command prompt, type the following:

```
add service <name>@ (<IP>@ | <serverName>@)<serviceType> <port>
```

**Example:**

```
Add service http-service-1 2.2.2.1 http 80
```

**Set net profile with load balancing virtual server in NetScaler appliance** At the command prompt, type the following:

```
set lb vserver <vserver name> -netprofile <name>
```

**Example:**

```
set lb vserver lbvserver-1 -netprofile proxyProfile-1
```

**Set net profile with HTTP service in NetScaler appliance** At the command prompt, type the following:

```
set service <service name> -netprofile <name>
```

**Example:**

```
set service http-service-1 -netprofile proxyProfile-2
```

**Bind the load balancing virtual server to service** At the command prompt, type the following:

```
bind lb vserver <vserver name> <service name>
```

**Example:**

```
bind lb vserver lbvserver-1 http-service-1
```

### Configure proxy protocol for forward operation

To configure the proxy protocol for Forward operation for the next NetScaler instance in the proxy layer, you must enable the protocol and bind to the virtual server or service.

**Note:**

The net profile created for load balancing virtual server can also be used for service .

**Add net profile with proxy protocol enabled for load balancing virtual server** At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion
<V1/V2>
```

**Example:**

```
add netprofile proxyprofile-3 -proxyProtocol ENABLED -proxyprotocoltxversion
V1
```

**Add net profile with proxy protocol enabled for service** At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion
<V1/V2>
```

**Example:**

```
add netprofile proxyprofile-4 -proxyProtocol ENABLED -proxyprotocoltxversion
V1
```

**Add load balancing virtual server for NetScaler appliance in the proxy layer** At the command prompt, type the following:

```
add lb vserver <name>@ <serviceType> [((<IPAddress>@ <port>)]
```

**Example:**

```
add lb vserver lbvserver-2 http 2.2.2.2 80
```

**Add HTTP service for NetScaler appliance in the proxy layer** At the command prompt, type the following:

```
add service <name>@ (<IP>@ | <serverName>@)<serviceType> <port>
```

**Example:**

```
Add service http-service-2 3.3.3.1 http 80
```

**Set net profile with load balancing virtual server in NetScaler appliance** At the command prompt, type the following:

```
set lb vserver <vserver name> -netprofile <name>
```

**Example:**

```
set lb vserver lbvserver-2 -netprofile proxyProfile-3
```

**Set net profile with HTTP service in NetScaler appliance** At the command prompt, type the following:

```
set service <service name> -netprofile <name>
```

**Example:**

```
set service http-service-2 -netprofile proxyProfile-4
```

**Bind the load balancing virtual server to service** At the command prompt, type the following:

```
bind lb vserver <vserver name> <service name>
```

**Example:**

```
bind lb vserver lbvserver-2 http-service-2
```

### **Configure proxy protocol for strip operation**

To configure the proxy protocol for strip operation, you must enable the proxy protocol on the load balancing virtual server and disable the proxy protocol on the service.

**Add net profile with proxy protocol enabled for virtual server** At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED> -proxyprotocoltxversion
<V1/V2>
```

**Example:**

```
add netprofile proxyprofile-5 -proxyProtocol ENABLED -proxyprotocoltxversion
V1
```

**Add load balancing or content switching virtual server for NetScaler appliance in the proxy layer**

At the command prompt, type the following:

```
add lb vserver <name>@ <serviceType> [((<IPAddress>@ <port>)]
```

**Example:**

```
add lb vserver lbvserver-3 http 2.2.2.2 80
```

**Add HTTP service for NetScaler appliance in the proxy layer** At the command prompt, type the following:

```
add service <name>@ (<IP>@ | <serverName>@)<serviceType> <port>
```

**Example:**

```
Add service http-service-3 3.3.3.1 http 80
```

**Set net profile with load balancing or content switching virtual server in NetScaler appliance**

At the command prompt, type the following:

```
set lb vserver <vserver name> -netprofile <name>
```

**Example:**

```
set lb vserver lbvserver-3 -netprofile proxyProfile-5
```

**Bind the load balancing virtual server to service** At the command prompt, type the following:

```
bind lb vserver <vserver name> <service name>
```

**Example:**

```
bind lb vserver lbvserver-3 http-service-3
```

**Configure responder policy infrastructure expression for proxy protocol by using the CLI**

To configure a responder policy, at the command prompt, type:

```
add responder policy <name> <expression> <action>
```

Example:

```
1 > add responder policy resppol_proxy_srcip "CLIENT.PROXY.SRCIP_STR.EQ
 ("10.106.26.83*)" RESET
2 Done
3 <!--NeedCopy-->
```

To bind the responder policy with the load balancing virtual server, at the command prompt, type:

```
bind lb vserver <name> -policyname <string> -priority <positive_integer>
> -gotoPriorityExpression <expression> -type <type>
```

Example:

```
1 > bind lb vserver lb_tcp1 -policyName resppol_proxy_srcip -priority 10
 -gotoPriorityExpression END -type REQUEST
2 Done
3 <!--NeedCopy-->
```

### Sample end-to-end configuration

```
1 > add ns tcpProfile tcp-proxy-profile -tcpmode ENDPOINT
2
3 > add netprofile net_proxyv1 -MBF DISABLED -proxyProtocol
4 ENABLED
5
6 > enable ns mode l2
7
8 > enable ns mode l3 usnip
9
10 > add ns ip 10.106.26.146 255.255.255.0 -type SNIP
11 Done
12 > add ns ip 10.106.26.144 255.255.255.0 -type SNIP
13 Done
14
15 > add lb vserver lb_tcp1 TCP 10.106.26.141 80
16 > add service s1 10.106.26.82 TCP 8080
17
18 > bind lb vserver lb_tcp1 s1
19
20 > set lb vserver lb_tcp1 -tcpProfileName tcp_proxy -netProfile
 net_proxyv1
21
22 > set ns param -proxyProtocol ENABLED
23
24 > add responder policy resppol_proxy_srcip "CLIENT.PROXY.SRCIP_STR.EQ
 (\\"10.106.26.83\\")" RESET
25
26 > bind lb vserver lb_tcp1 -policyName resppol_proxy_srcip -priority 10
 -gotoPriorityExpression END -type REQUEST
27 Done
28 <!--NeedCopy-->
```

### Configure Proxy protocol by using NetScaler GUI

1. Navigate to **System > Settings > Change Global System Settings**.

2. In the **Configure Global System Settings Parameters** page, select **Proxy Protocol** check box.
3. Click **OK** and **Close**.
4. Navigate to **System > Network > Net Profiles**.
5. In the details pane, click **Add** to create a net profile for the load balancing virtual server.
6. In the **Net Profile** page, set the following parameters:
  - a) **Name** : Name of the net profile.
  - b) **Proxy Protocol**: Enable or disable proxy protocol for the load balancing virtual server.
  - c) **Proxy Protocol TX Version**: Set proxy protocol version as V1 or V2 based on incoming data format.
7. Click **OK**.
8. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
9. In the details pane, click **Add**.
10. In the **Load Balancing Virtual Server** page, the set the basic parameters.
11. In the **Advanced Settings** section, select **Profiles**.
12. In the **Profiles** section, click the pencil icon.
13. Select a net profile and click **OK**.
14. Click **Done**.
15. Navigate to **Traffic Management > Load Balancing > Services**.
16. In the details pane, click **Add**.
17. In the **Load Balancing Service** page, set the basic parameters.
18. In the **Advanced Settings** section, select **Profiles**.
19. In the **Profiles** section, click the pencil icon.
20. Select a net profile and click **OK**.
21. Click **Done**.

**Note:**

If you have more than one NetScaler appliance as part of the proxy layer, you must set the proxy protocol configuration on each appliance for the Forward operation.

## Client IP address in TCP option

May 2, 2023

The NetScaler appliance uses many ways to send the client information to the back-end server. One such method is by sending the client IP address in the TCP option. The appliance uses the TCP option number in the TCP profile, if the back-end server is using the TCP option to read the client IP address.

The NetScaler appliance sends the client IP address, in the TCP option header, only in the following packets:

- final ACK packet of the three-way handshake
- first data packet.

Following are some of the usage scenarios for the TCP option configuration in a NetScaler appliance.

- Learning original client IP address
- Selecting a language for a website
- Block listing the selected IP addresses

Following are the two modes of operation for sending the client IP address in the TCP option:

- **Insert.** In insert mode, the appliance adds the client details in the TCP option 28 (configurable but the preferable value is 28) field and sends it to the back-end server.
- **Forward.** In forward mode, the virtual server receives the client IP details in the TCP option from a proxy device. For the virtual server, you must configure the same TCP option, which the proxy device has used to send the client IP details.

The appliance then sends the client details in the TCP option field to the back-end server. For the service representing the back-end server, you can set any TCP option but the preferable value is 28.

The NetScaler appliance also supports sending the client port in the TCP option for insert mode configuration.

### Notes:

- Multiplexing is not supported for the received traffic on a virtual server if the Client IP TCP option is enabled on the bound TCP profile.
- For a TCP or HTTP virtual server, the TCP option number is forwarded with or without this feature enabled in transparent mode.

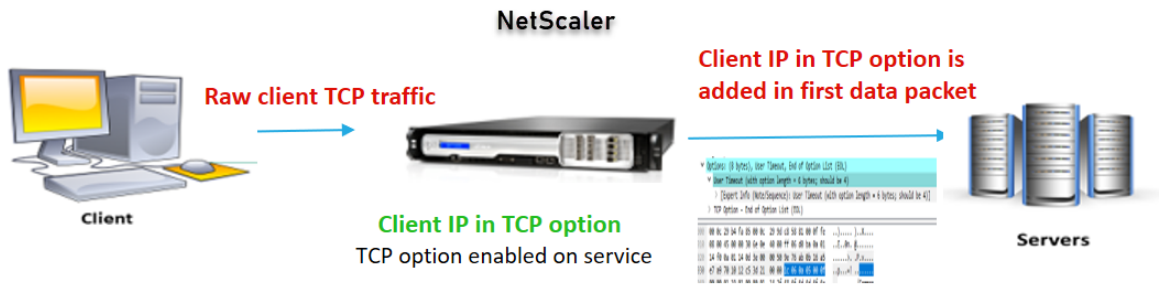

## Limitations

The TCP option configuration feature is not supported in TFO, MultiPath TCP, and HTTP2 features.

## How TCP option configuration in a NetScaler appliance

The following flow diagrams show how you can configure the TCP option in the NetScaler appliances for Insert and forward operations.

**Insert operation:**

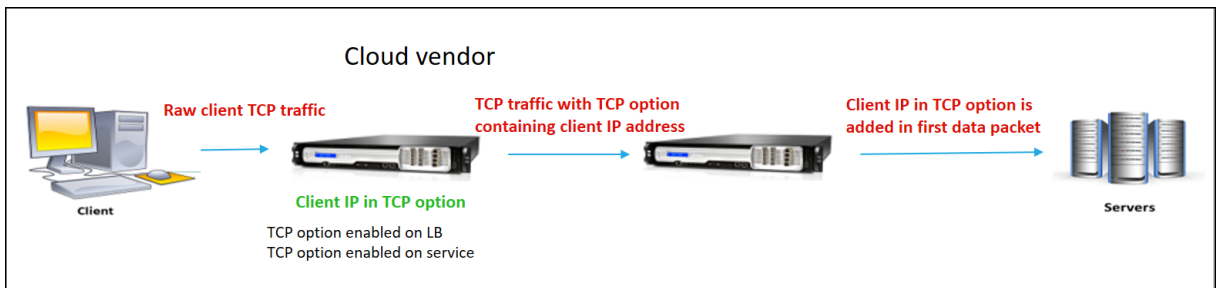

The component interact is as follows:

- A client sends a request to NetScaler.
- In the Insert operation, the NetScaler appliance inserts the client IP address and port in the configured TCP option of the following packets to the back-end server.
  - final ACK packet of the three-way handshake
  - first data packet

**Note:**

If the incoming traffic is HTTPS, the client IP address and the client port in the TCP option is sent in the SSL client hello message, which is the first data packet at the TCP level.

**Forward operation:**

The component interact is as follows:

- A client sends a HTTP/HTTPS request to the NetScaler appliance.
- For the Forward operation, the TCP option is enabled on a load balancing virtual server or a content switching virtual server and also enabled on the service. The appliance receives the client details in the TCP option number specified in the virtual server.
- The NetScaler appliance then inserts the client IP address and port in the configured TCP option (for the service) of the following packets to the back-end server.

- final ACK packet of the three-way handshake
- first data packet

## Configure TCP option for Insert operation

Configuring the TCP option for Insert operation consists of the following steps:

1. Configure a TCP profile. Enable the Client IP TCP option (`clientIpTcpOption`), and specify the TCP option number (`clientIpTcpOptionNumber`). Optionally, enable the `sendClientPortInTcpOption` to send the client port in the TCP option header.

**Note:**

Citrix recommends configuring TCP option number as 28 in the TCP profile.

2. Bind the TCP profile to a service

### To configure a TCP profile by using CLI:

At the command prompt, type:

- `add tcpprofile <name> -clientIpTcpOption (ENABLED | DISABLED) - clientIpTcpOptionNumber <positive_integer> -sendClientPortInTcpOption (ENABLED | DISABLED)`
- `show tcpprofile <name>`

### To bind the TCP profile to the service by using CLI:

At the command prompt, type:

- `set service <name> -tcpprofileName <name>`
- `show service <name>`

## Sample configuration

```
1 add tcpprofile TCP-PROFILE-1 -clientIpTcpOption ENABLED -
 clientIpTcpOptionNumber 28 -sendClientPortInTcpOption ENABLED
2 set service SERVICE-1 -tcpprofileName TCP-PROFILE-1
3 <!--NeedCopy-->
```

## Configure the TCP option for Forward operation

Configuring the TCP option for forward operation consists of the following steps:

1. Configure a TCP profile. Enable the Client IP TCP option (`clientIpTcpOption`), and specify the TCP option number (`clientIpTcpOptionNumber`).
2. Bind the TCP profile to a load balancing or content switching virtual server
3. Bind the TCP profile to the services.

**To configure a TCP profile by using CLI:**

At the command prompt, type:

- `add tcpprofile <name> -clientIpTcpOption (ENABLED | DISABLED) - clientIpTcpOptionNumber <positive_integer>`
- `show tcpprofile <name>`

**To Bind the TCP profile to a load balancing or content switching virtual server by using CLI:**

At the command prompt, type:

- `set lb vserver <name> -tcpprofileName <name>`
- `show lb vserver <name>`

**To bind TCP profile to service by using CLI:**

At the command prompt, type:

- `set service <name> -tcpprofileName p1`
- `show service <name>`

**Sample configuration**

```
1 add tcpprofile TCP-PROFILE-2 -clientIpTcpOption ENABLED -
 clientIpTcpOptionNumber 29
2 set lb vserver LBVS-2 -tcpprofileName TCP-PROFILE-2
3 set service SERVICE-2 -tcpprofileName TCP-PROFILE-2
4 <!--NeedCopy-->
```

**Configure TCP option by using NetScaler GUI**

1. Navigate to **System > Profiles**.
2. In the **TCP Profile** tab page, click **Add**.
3. In the **Configure TCP profile** page, configure the following parameters:
  - **clientiptcption**. Enables the TCP option to send or receive client IP address.
  - **clientiptcptionnumber**. Sets TCP option number.
  - **sendClientPortInTcpOption** Sends client port in the TCP option for insert mode configuration.

4. Click **OK** and **Close**.

## SNMP

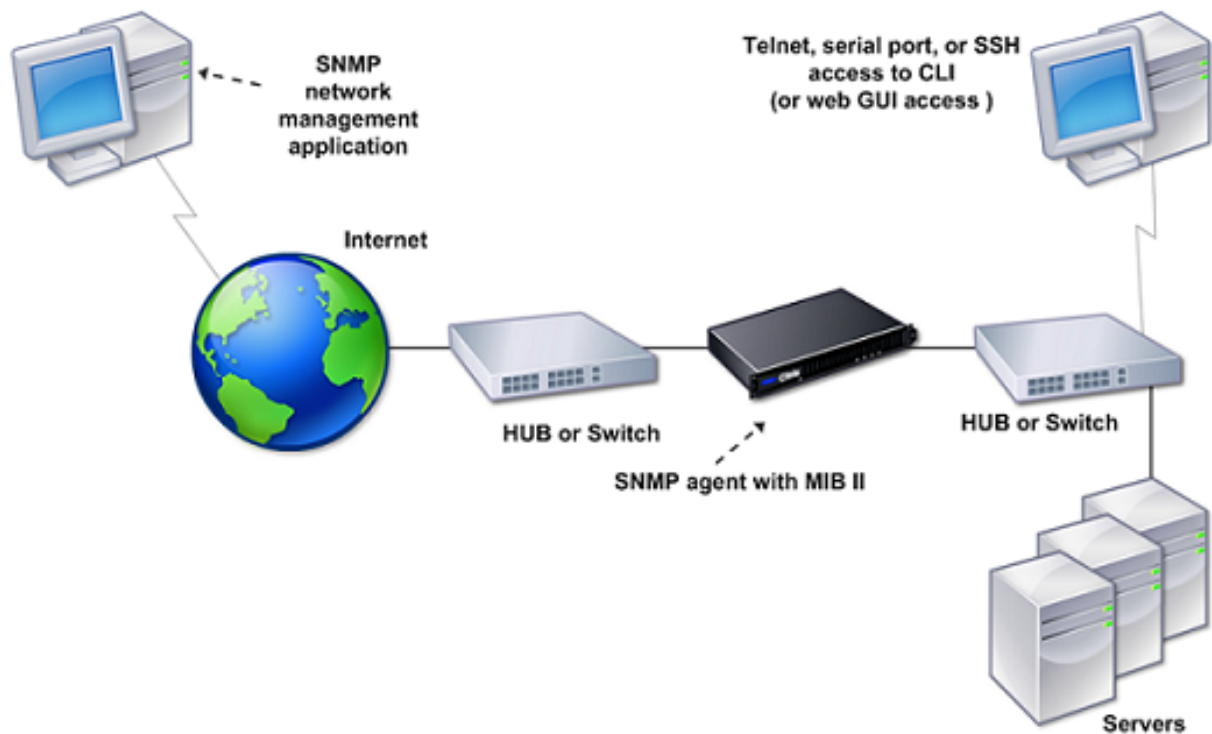

May 2, 2023

You can use Simple Network Management Protocol (SNMP) to configure the SNMP agent on the NetScaler appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the NetScaler. The traps are then sent to a remote device called a *trap listener*, which signals the abnormal condition on the NetScaler appliance. Or, you can query the SNMP agent for System-specific information from a remote device called an *SNMP manager*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The SNMP agent on the NetScaler can generate traps compliant with SNMPv1, SNMPv2, and SNMPv3. For querying, the SNMP agent supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3).

For information about SNMP parameters, traps, and its descriptions, see [NetScaler SNMP OID Reference](#).

The following figure illustrates a network with a NetScaler that has SNMP enabled and configured. In the figure, each SNMP network management application uses SNMP to communicate with the SNMP agent on the NetScaler. The SNMP agent searches its management information base (MIB) to collect the data requested by the SNMP Manager and provides the information to the application.

### Important

The SNMP module in a NetScaler appliance supports a maximum length of 128 bytes (as compliant with RFC 3416) for an SNMP OID. A long index variable name for an object can result in an SNMP OID exceeding 128 bytes in length.

To resolve this issue, the NetScaler SNMP module supports a maximum length of 31 characters for an index variable name. If an index variable name exceeds 31 characters in length, the SNMP module using a hash algorithm converts the name to a 31 characters hash value. This hashed value is used in the SNMP OID for that variable.

The original index variable name is stored in another variable, which has the following name format: `<variable type>FullName`. For example, When the name of a load balancing virtual server has more than 31 characters, `vserverName` SNMP OID contains the hashed value and `vsvrFullName` SNMP OID contains the full (original) name of the virtual server.

Similarly, for SNMP traps, the index variable displays a hashed value. `<variable type>FullName`, which stores the full name of the original index variable name, is also part of the trap messages.

### Importing MIB Files to the SNMP Manager and Trap Listener

To monitor a NetScaler appliance, you must download the MIB object definition files. The NetScaler appliance supports the following enterprise-specific MIBs:

- **A subset of standard MIB-2 groups.** Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- **A system enterprise MIB.** Provides system-specific configuration and statistics.

You can obtain the MIB object definition files from the `/netscaler/snmp` directory or from the Downloads tab of the GUI.

## Configuring the NetScaler to generate SNMP traps

May 2, 2023

You can configure the NetScaler appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the appliance. The traps are sent to a remote device called a *trap listener*. It helps administrators monitor the appliance and respond promptly to any issues.

The NetScaler appliance provides a set of condition entities called *SNMP alarms*. When the condition in any SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

To configure the NetScaler appliance to generate traps, you need to enable and configure alarms. Then, you specify the trap listeners to which the appliance sends the generated trap messages.

### Enabling an SNMP alarm

The NetScaler appliance generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the appliance generates corresponding trap messages when some events occur. Some alarms are enabled by default.

### To enable an SNMP alarm by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `enable snmp alarm <trapName>`
- `show snmp alarm <trapName>`

### To enable an SNMP alarm by using the GUI

1. Navigate to **System > SNMP > Alarms**, and select the alarm.
2. Click **Actions** and select **Enable**.

### Configuring alarms

The NetScaler appliance provides a set of condition entities called *SNMP alarms*. When the condition set for an SNMP alarm is met, the appliance generates SNMP traps messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

You can assign an SNMP alarm with a severity level. When you do this, the corresponding trap messages are assigned that severity level.

The following are the severity levels, defined on the appliance, in decreasing order of severity.

- Critical
- Major
- Minor
- Warning
- Informational

For example, if you set a warning severity level for the SNMP alarm named LOGIN-FAILURE, the trap messages generated when there is a login failure is assigned with the warning severity level.

#### Note

NetScaler supports various SNMP alarms. For more information, see [SNMP alarms](#).

You can also configure an SNMP alarm to log the corresponding trap messages generated whenever the condition on that alarm is met.

### To configure an SNMP alarm by using the CLI

At the command prompt, type the following commands to configure an SNMP alarm and verify the configuration:

- `set snmp alarm <trapName> [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-time <secs>] [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]`
- `show snmp alarm <trapName>`

Where,

**ThresholdValue:** Value for the high threshold. The NetScaler appliance generates an SNMP trap message when the value of the attribute associated with the alarm is greater than or equal to the specified high threshold value.

**NormalValue:** Value for the normal threshold. A trap message is generated if the value of the respective attribute falls to or below this value after exceeding the high threshold.

### **To configure SNMP alarms by using the GUI**

Navigate to **System > SNMP > Alarms**, select an alarm, and configure the alarm parameters.

### **Configuring SNMPv1 or SNMPv2 traps**

After configuring the alarms, you need to specify the trap listener to which the appliance sends the trap messages. Apart from specifying parameters such as IP or IPv6 address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

You can also configure the appliance to send SNMP trap messages with a source IP address other than the NetScaler IP (NSIP or NSIP6) address to a particular trap listener. For a trap listener that has an IPv4 address, you can set the source IP to either a mapped IP (MIP) address or a subnet IP (SNIP) address configured on the appliance. For a trap listener that has an IPv6 address, you can set the source IP to a subnet IPv6 (SNIP6) address configured on the appliance.

You can also configure the appliance to send trap messages to a trap listener based on a severity level. For example, if you set the severity level as Minor for a trap listener, all trap messages of the severity level equal to or greater than Minor (Minor, Major, and Critical) are sent to the trap listener.

If you have defined a community string for the trap listener, you must also specify a community string for each trap that is to be sent to the listener. A trap listener for which a community string has been defined accepts only trap messages that include a community string matching the community string defined in the trap listener. Other trap messages are dropped.

### **To add an SNMP trap by using the CLI**

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp trap <trapClass> <trapDestination> -version ( V1 | V2 ) -destPort <port> -communityName <string> -srcIP <ip_addr> -severity <severity>`

- `show snmp trap`

**Example:**

```
1 > `add snmp trap specific 192.0.2.10 -version V2 -destPort 162 -
 communityName com1 -severity Major`
2 <!--NeedCopy-->
```

**To configure SNMP traps by using the GUI**

Navigate to **System > SNMP > Traps**, and create the SNMP trap.

**Configuring SNMPv3 traps**

SNMPv3 provides security capabilities such as authentication and encryption by using the credentials of SNMP users. An SNMP manager can receive SNMPv3 trap messages only if its configuration includes the password assigned to the SNMP user.

The trap destination can now receive SNMPv1, SNMPv2, and SNMPv3 trap messages.

**To configure an SNMPv3 trap by using the CLI**

At the command prompt, do the following:

1. Add an SNMPv3 trap.

```
add snmp trap <trapClass> <trapDestination> -version (V1 | V2 |
 V3)-destPort <port> -communityName <string> -srcIP <ip_addr> -
 severity <severity>
```

**Note**

Once set, the SNMP trap version cannot be modified.

**Example**

```
1 > add snmp trap specific 192.0.2.10 -version V3 -destPort 162 -
 communityName com1 -severity Major
2 <!--NeedCopy-->
```

2. Add an SNMP user.

```
add snmp user <name> -group <string> [-authType (MD5 | SHA){ -
 authPasswd } [-privType (DES | AES){ -privPasswd }]]
```

**Example**

```
1 > add snmp user edocs_user -group edocs_group
2 <!--NeedCopy-->
```

3. Bind the SNMPv3 trap to the SNMP user.

```
bind snmp trap <trapClass> <trapDestination> [-version <version>] (-
userName <string> [-securityLevel <securityLevel>])
```

#### Example

```
1 > bind snmp trap specific 192.0.2.10 -version V3 -userName
 edocs_user -securityLevel authPriv
2 <!--NeedCopy-->
```

### To configure an SNMPv3 trap by using the GUI

1. Add an SNMPv3 trap.

Navigate to **System > SNMP > Traps**, and create the SNMP trap by selecting V3 as the SNMP version.

2. Add an SNMP user.

Navigate to **System > SNMP > Users** and create the SNMP user.

3. Bind the SNMPv3 trap to the SNMP user.

- Navigate to **System > SNMP > Traps**, and select the SNMP version 3 trap.
- Select the user to which the trap should be bound and define the appropriate Security Level.

### SNMP trap logging

A NetScaler appliance can log SNMP trap messages (for SNMP alarms in which logging capability is enabled) when you enable the SNMP trap logging option and at least one trap listener is configured on the appliance. Now, you can specify the audit log level of trap messages sent to an external log server. The default log level is Informational. Possible values are Emergency, Alert, Critical, Error, Warning, Debug, and Notice.

For example, you can set the audit log level to Critical for an SNMP trap message generated by a logon failure. That information is then available on the NSLOG or SYSLOG server for troubleshooting.

### To enable SNMP trap logging and configure trap log level by using the CLI

At the command prompt, type the following commands to configure SNMP trap logging and verify the configuration:

- `set snmp option [-snmpTrapLogging (ENABLED | DISABLED)][-snmpTrapLoggingLevel <snmpTrapLoggingLevel>]`
- `show snmp option`

### To enable SNMP trap logging and configure SNMP trap log level by using the GUI

Navigate to **System > SNMP**, click Change SNMP Options, and set the following parameters:

1. SNMP Trap Logging—Select this check box to enable SNMP trap logging when at least one trap listener is configured on the appliance.
2. SNMP Trap Logging Level—Select an audit log level for the SNMP trap. By default, the audit level for an SNMP trap is set to “Informational.”

## Configuring NetScaler for SNMP v1 and v2 queries

May 2, 2023

You can query the NetScaler SNMP agent for system-specific information from a remote device called *SNMP managers*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The following types of SNMP v1 and v2 queries are supported by the SNMP agent:

- GET
- GET NEXT
- ALL
- GET BULK

You can create strings called community strings and associate each of these to query types. You can associate one or more community strings to each query type. Community strings are passwords and used to authenticate SNMP queries from SNMP managers.

For example, if you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the NetScaler appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

## Specifying an SNMP manager

You must configure the NetScaler appliance to allow the appropriate SNMP managers to query it. You must also provide the SNMP manager with the required NetScaler-specific information. You can add up to a maximum of 100 SNMP managers or networks.

For an IPv4 SNMP manager you can specify a host name instead of the manager's IP address. If you do so, you must add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host-name based SNMP managers.

**Note:**

The appliance does not support use of host names for SNMP managers that have IPv6 addresses. You must specify the IPv6 address.

If you do not configure at least one SNMP manager, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds only to SNMP queries from those specific IP addresses.

If you remove an SNMP manager from the configuration, that manager can no longer query the appliance.

### To add SNMP managers by specifying IP addresses by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp manager <IPAddress> ... [-netmask <netmask>]`
- `show snmp manager`

**Example** > `add snmp manager 10.102.29.10 10.102.29.15 10.102.29.30`

### To add an SNMP manager by specifying its host name by using the command line interface

Important: If you specify the SNMP manager's host name instead of its IP address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see "[Adding a Name Server](#)."

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp manager <IPAddress> [-domainResolveRetry ****<integer>]`
- `show snmp manager`

### Example

```
add nameserver 10.103.128.15
add snmp manager engwiki.eng.example.net -domainResolveRetry 10
```

### To add an SNMP manager by using the GUI

1. Navigate to **System > SNMP > Managers**, and create the SNMP manager.

#### Important:

If you specify the SNMP manager's host name instead of its IPv4 address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address.

#### Note:

The appliance does not support host names for SNMP managers that have IPv6 addresses.

### Specifying an SNMP community

You can create strings called community strings and associate them with the following SNMP query types on the appliance:

- GET
- GET NEXT
- ALL
- GET BULK

You can associate one or more community strings to each query type. For example, when you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

If you do not associate any community string to a query type then the SNMP agent responds to all SNMP queries of that type.

### To specify an SNMP community by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp community <communityName> <permissions>`
- `show snmp community`

**Example** > `add snmp community com all`

### To configure an SNMP community string by using the GUI

Navigate to **System > SNMP > Community**, and create the SNMP community.

## Configuring NetScaler for SNMPv3 queries

May 2, 2023

Simple Network Management Protocol Version 3 (SNMPv3) is based on the basic structure and architecture of SNMPv1 and SNMPv2. However, SNMPv3 enhances the basic architecture to incorporate administration and security capabilities, such as authentication, access control, data integrity check, data origin verification, message timeliness check, and data confidentiality.

To implement message level security and access control, SNMPv3 introduces the user-based security model (USM) and the view-based access control model (VACM).

- **User-Based Security Model.** The user-based security model (USM) provides message-level security. It enables you to configure users and security parameters for the SNMP agent and the SNMP manager. USM offers the following features:
  - **Data integrity:** To protect messages from being modified during transmission through the network.
  - **Data origin verification:** To authenticate the user who sent the message request.
  - **Message timeliness:** To protect against message delays or replays.
  - **Data confidentiality:** To protect the content of messages from being disclosed to unauthorized entities or individuals.
- **View-Based Access Control Model.** The view-based access control model (VACM) enables you to configure access rights to a specific subtree of the MIB based on various parameters, such as security level, security model, user name, and view type. It enables you to configure agents to provide different levels of access to the MIB to different managers.

NetScaler supports the following entities that enable you to implement the security features of SNMPv3:

- SNMP Engines
- SNMP Views
- SNMP Groups
- SNMP Users

These entities function together to implement the SNMPv3 security features. Views are created to allow access to subtrees of the MIB. Then, groups are created with the required security level and access to the defined views. Finally, users are created and assigned to the groups.

**Note:**

The view, group, and user configuration are synchronized and propagated to the secondary node in a high availability (HA) pair. However, the engine ID is neither propagated nor synchronized as it is unique to each NetScaler appliance.

To implement message authentication and access control, you need to do the following:

### Setting the engine ID

SNMP engines are service providers that reside in the SNMP agent. They provide services such as sending, receiving, and authenticating messages. SNMP engines are uniquely identified using engine IDs.

The NetScaler appliance has a unique engineID based on the MAC address of one of its interfaces. It is not necessary to override the engineID. However, if you want to change the engine ID, you can reset it.

#### To set the engine ID by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `set snmp engineId <engineID>`
- `show snmp engineId`

**Example** > `set snmp engineId 8000173f0300c095f80c68`

#### To set the engine ID by using GUI

Navigate to **System > SNMP > Users**, click **Configure Engine ID** and type an engine ID.

### Configure a view

SNMP views restrict user access to specific portions of the MIB. SNMP views are used to implement access control.

### To add an SNMP view by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp view <name> <subtree> -type ( included | excluded )`
- `show snmp view <name>`
- `rm snmp view <name> <subtree>`

Where,

**Name.** Name for the SNMPv3 view. It can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) characters. You should choose a name that helps identify the SNMPv3 view.

**Subtree.** A particular branch (subtree) of the MIB tree that you want to associate with this SNMPv3 view. You must specify the subtree as an SNMP OID. This is an argument of maximum Length: 99.

**type.** Include or exclude the subtree, specified by the subtree parameter, in or from this view. This setting can be useful when you have included a subtree, such as A, in an SNMPv3 view and you want to exclude a specific subtree of A, such as B, from the SNMPv3 view. This is a mandatory argument. Possible values: included, excluded.

**Examples**   `add snmp view SNMPv3test 1.1.1.1 -type included`  
`sh snmp view SNMPv3test`  
`rm snmp view SNMPv3test 1.1.1.1`

### To configure an SNMP view by using the GUI

Navigate to **System > SNMP > Views**, and create the SNMP view.

### Configure a group

SNMP groups are logical aggregations of SNMP users. They are used to implement access control and to define the security levels. You can configure an SNMP group to set access rights for users assigned to that group, thereby restricting the users to specific views.

You need to configure an SNMP group to set access rights for users assigned to that group.

## To add an SNMP group by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp group <name> <securityLevel> -readViewName <string>`
- `show snmp group <name> <securityLevel>`

Where,

**Name.** Name for the SNMPv3 group. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) characters. You should choose a name that helps identify the SNMPv3 group.

**securityLevel.** Security level required for communication between the NetScaler appliance and the SNMPv3 users who belong to the group. Specify one of the following options:

**noAuthNoPriv.** Require neither authentication nor encryption.

**authNoPriv.** Require authentication but no encryption.

**authPriv.** Require authentication and encryption. Note: If you specify authentication, you must specify an encryption algorithm when you assign an SNMPv3 user to the group. If you also specify encryption, you must assign both an authentication and an encryption algorithm for each group member. This is a mandatory argument. Possible values: noAuthNoPriv, authNoPriv, authPriv.

**readViewName.** Name of the configured SNMPv3 view that you want to bind to this SNMPv3 group. An SNMPv3 user bound to this group can access the subtrees that are bound to this SNMPv3 view as type INCLUDED, but cannot access the ones that are type EXCLUDED. If the NetScaler appliance has multiple SNMPv3 view entries with the same name, all such entries are associated with the SNMPv3 group. This is a mandatory argument. Maximum Length: 31

## To configure an SNMP group by using the GUI

Navigate to **System > SNMP > Groups**, and create the SNMP group.

## Configuring a user

SNMP users are the SNMP managers that the agents allow to access the MIBs. Each SNMP user is assigned to an SNMP group.

You need to configure users at the agent and assign each user to a group.

## To configure a user by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp user <name> -group <string> [-authType ( MD5 | SHA ) { -authPasswd } [-privType ( DES | AES ) { -privPasswd } ]]`
- `show snmp user <name>`

Where,

authType is the authentication option available while configuring an user. There are two authentication types such as MD5 and SHA.

privType is the encryption option available while configuring an user. There are two types of encryption such as DES of key size 128 bit, and AES of key size 128 bit.

### Example

```
1 > add snmp user edocs_user -group edocs_group
2 <!--NeedCopy-->
```

## To configure an SNMP user by using the GUI

Navigate to **System > SNMP > Users**, and create the SNMP user.

## Configuring SNMP Alarms for rate limiting

September 21, 2023

NetScaler appliances are rate limited. For information about the different models available for each platform, see the data sheet. The data sheet is available on [www.citrix.com](http://www.citrix.com). Click **Products**. Under **App Delivery and Security**, click **NetScaler**. Click **Platforms > Physical appliances** and then click **NetScaler MPX/SDX data sheet**.

The maximum throughput (Mbps) and packets per second (PPS) are determined by the license purchased for the appliance. For rate-limited platforms, you can configure SNMP traps to send notifications when throughput and PPS approach their limits and when they return to normal.

Throughput and PPS are monitored every seven seconds. You can configure traps with high-threshold and normal-threshold values, which are expressed as a percentage of the licensed limits. The appliance then generates a trap when throughput or PPS exceeds the high threshold, and a second trap when the monitored parameter falls to the normal threshold. In addition to sending the traps to the

configured destination device, the NetScaler appliance logs the events associated with the traps in the `/var/log/ns.log` file as `EVENT ALERTSTARTED` and `EVENT ALERTENDED`.

Exceeding the throughput limit can result in packet loss. You can configure SNMP alarms to report packet loss.

For more information about SNMP alarms and traps, see “[Configuring the NetScaler to generate SNMP v1 and v2 Traps.](#)”

This document includes the following details:

- Configuring an SNMP alarm for throughput or PPS
- Configuring an SNMP alarm for dropped packets

### Configuring an SNMP alarm for throughput or PPS

To monitor both throughput and PPS, you must configure separate alarms and set the threshold PPS value in Mbps.

#### To configure an SNMP alarm for the throughput rate by using the CLI

At the command prompt, type the following commands to configure the SNMP alarm, set threshold value in Mbps and verify the configuration:

- `set snmp alarm PF-RL-RATE-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]`
- `show snmp alarm PF-RL-RATE-THRESHOLD`

#### Example

```
1 > set snmp alarm PF-RL-RATE-THRESHOLD -thresholdValue 70 -normalValue
 50
2 <!--NeedCopy-->
```

#### To configure an SNMP alarm for PPS by using the CLI

At the command prompt, type the following commands to configure the SNMP alarm for PPS and verify the configuration:

- `set snmp alarm PF-RL-PPS-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]`
- `show snmp alarm PF-RL-PPS-THRESHOLD`

**Example**

```
1 > set snmp alarm PF-RL-PPS-THRESHOLD -thresholdValue 70 -normalValue 50
2 <!--NeedCopy-->
```

**To configure an SNMP alarm for throughput or PPS by using the GUI**

1. Navigate to **System > SNMP > Alarms**, and select **PF-RL-RATE-THRESHOLD** (for throughput rate) or **PF-RL-PPS-THRESHOLD** (for packets per second).
2. Set the alarm parameters and enable the selected SNMP alarm.

**Configuring SNMP alarm for dropped packets**

You can configure an alarm for packets dropped as a result of exceeding the throughput limit and an alarm for packets dropped as a result of exceeding the PPS limit.

**To configure an SNMP alarm for packets dropped because of excessive throughput by using the CLI**

At the command prompt, type:

```
set snmp alarm PF-RL-RATE-PKTS-DROPPED [-state (ENABLED | DISABLED)]
[-severity <severity>] [-logging (ENABLED | DISABLED)]
```

**To configure an SNMP alarm for packets dropped because of excessive PPS by using the CLI**

At the command prompt, type:

```
set snmp alarm PF-RL-PPS-PKTS-DROPPED [-state (ENABLED | DISABLED)]
[-severity <severity>] [-logging (ENABLED | DISABLED)]
```

**To configure an SNMP alarm for dropped packets by using the GUI**

1. Navigate to **System > SNMP > Alarms**, and select **PF-RL-RATE-PKTS-DROPPED** (for packets dropped because of excessive throughput) or **PF-RL-PPS-PKTS-DROPPED** (for packets dropped because of excessive PPS).
2. Set the alarm parameters and enable the selected SNMP alarm.

## Configuring SNMP in FIPS mode

May 2, 2023

FIPS mode requires Simple Network Management Protocol version 3 (SNMPv3) with the authentication and privacy (authPriv) option. SNMP version 1 and version 2 use a community string mechanism to provide secured access to management data. The community string is sent as clear text between an SNMP manager and an SNMP agent. This type of communication is unsecure, allowing intruders to access SNMP information on the network.

The SNMPv3 protocol uses the User-based Security Model (USM) and View-based Access Control Model (VACM) to authenticate and control management access to SNMP messaging data. SNMPv3 has three security levels: no authentication no privacy (noAuthNoPriv), authentication and no privacy (authNoPriv), and authentication and privacy (authPriv).

Enabling FIPS mode and restarting the NetScaler appliance removes the following SNMP configurations from the appliance:

1. Community configuration for SNMPv1 and SNMPv2 protocols.
2. SNMPv3 groups configured with the noAuthNoPriv or authNoPriv security-level option.
3. Traps configured for SNMPv1 or SNMPv2, or SNMPv3 with the noAuthNoPriv security-level option.

After restarting the appliance, configure SNMPv3 with the authPriv option. For more information about configuring authPriv option in SMNP v3, see [SNMPV3 topic](#)

### Note:

Enabling FIPS mode and restarting your appliance blocks execution of the following SNMP trap and group commands:

```

1 1. add snmp community <communityName> <permissions>
2
3 2. add snmp trap <trapClass> <trapDestination> ... [-version: v1/
4 v2] [-td <positive_integer>] [-destPort <port>] [-
5 communityName <string>] [-srcIP <ip_addr|ipv6_addr>] [-severity
6 <severity>] [-allPartitions (ENABLED | DISABLED)]
7
8 3. add snmp group <name> <securityLevel : noAuthNoPriv/ authNoPriv
9 > -readViewName <string>
10
11 4. bind snmp trap specific <TrapIp>-userName <v3 user name> -
12 securityLevel <noAuthNoPriv/ authNoPriv>
13 <!--NeedCopy-->
```

## Audit logging

May 2, 2023

### Important

Citrix recommends you to update a SYSLOG or NSLOG configuration only during maintenance or downtime. If you update a configuration after creating a session, the changes are not applied to the existing session logs.

Auditing is a methodical examination or review of a condition or situation. The audit logging feature enables you to log the NetScaler states and status information collected by various modules. The log information can be in the kernel and in the user-level daemons. For audit logging, you can use the SYSLOG protocol, the native NSLOG protocol, or both.

SYSLOG is a standard protocol for logging. It has two components:

- **SYSLOG auditing module.** Runs on the NetScaler appliance.
- **SYSLOG server.** Runs on the underlying FreeBSD operating system (OS) of the NetScaler appliance or on a remote system.

SYSLOG uses a user data protocol (UDP) for data transfer.

Similarly, the native NSLOG protocol has two components:

- **NSLOG auditing module.** Runs on the NetScaler appliance.
- **NSLOG server.** Runs on the underlying FreeBSD OS of the NetScaler appliance or on a remote system.

NSLOG uses TCP for data transfer.

When you run a SYSLOG or NSLOG server, it connects to the NetScaler appliance. The NetScaler appliance then starts sending all the log information to the SYSLOG or NSLOG server. And the server filters the log entries before storing them in a log file. An NSLOG or SYSLOG server receives log information from more than one NetScaler appliance. The NetScaler appliance sends log information to more than one SYSLOG server or NSLOG server.

If multiple SYSLOG servers are configured, the NetScaler appliance sends its SYSLOG events and messages to all the configured external log servers. It results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms. The appliance can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastPackets, and AuditlogHash.

**Note**

The NetScaler appliance can send audit log messages up to 16 KB to an external SYSLOG server.

The log information that a SYSLOG or NSLOG server collects from a NetScaler appliance is stored in a log file in the form of messages. These messages typically contain the following information:

- The IP address of a NetScaler appliance that generated the log message.
- A time stamp
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information

To configure audit logging, you first configure the audit modules on the NetScaler appliance. The appliance involves creating audit policies and specifying the NSLOG server or SYSLOG server information. You then install and configure the SYSLOG or the NSLOG server on the underlying FreeBSD OS of the NetScaler appliance or on a remote system.

**Note**

SYSLOG is an industry standard for logging program messages, and various vendors provide support. The documentation does not include SYSLOG server configuration information.

The NSLOG server has its own configuration file (auditlog.conf). You can customize logging on the NSLOG server system by making extra modifications to the configuration file (auditlog.conf).

**Note**

ICMP access to Syslog server is mandatory if syslog server is used as FQDN under Syslog Action in the network. If ICMP access is blocked in the environment, configure it as load balanced Syslog server and set the value of the healthMonitor parameter in the set service command to NO.

For configuring ICMP, see [Load balancing SYSLOG servers](#)

## Configuring NetScaler appliance for audit logging

January 17, 2024

**Warning:**

Classic policy expressions and its usage are deprecated (discouraged from use but still supported) from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you

to use advanced policies. For more information, see [Advanced Policies](#).

Audit logging displays status information from different modules so that an administrator can see event history in the chronological order. The main components of an Audit framework are ‘audit action’ and ‘audit policy’. ‘Audit action’ describes Audit Server configuration information whereas ‘audit policy’ links a bind entity to an ‘audit action’. The audit policies use the ‘Classic Policy Engine’ (CPE) framework or Progress Integration (PI) framework to link ‘audit action’ to ‘system global bind entities’.

However, the policy frameworks differ from each other in binding audit log policies to global entities. Previously, the audit module supported only classic and advanced policy expressions. Currently, using the advanced expression you can bind audit log policies only to System global entities.

#### Note

When you bind a policy to global entities, you must bind it to a system global entity of the same expression. For example, you can’t bind a classic policy to an advanced global entity or bind an advanced policy to a classic global entity.

Also, you can’t bind both classic audit log policy and advanced audit log policy to a load balancing virtual server.

## Configuring audit log policies in a classic policy expression

Configuring audit logging in classic policy consists of the following steps:

1. **Configuring an audit log action.** You can configure an audit action for different servers and for different log levels. ‘Audit action’ describes Audit Server configuration information whereas ‘audit policy’ links a bind entity to an ‘audit action’. By default, the SYSLOG uses a user data protocol (UDP) for data transfer and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data. When using TCP for SYSLOG, you can set the buffer limit on the NetScaler appliance to store the logs. After the buffer limit is reached, the logs are sent to the SYSLOG server.
2. **Configuring audit log policy.** You can configure either SYSLOG policies to log messages to a SYSLOG server or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule that is set to **true** or **ns\_true** for the messages to be logged, and a SYSLOG or NSLOG action.
3. **Binding audit log policies to global entities.** You must globally bind the audit log policies to global entities such as SYSTEM, VPN, NetScaler AAA and so on. You can do it to enable logging of all NetScaler system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

Each of these steps is explained in the following sections.

## Configuring audit log action

To configure SYSLOG action in advanced policy infrastructure by using the CLI.

### Note

The NetScaler appliance allows you to configure only one SYSLOG action to SYSLOG server IP address and port. The appliance does not allow you to configure multiple SYSLOG actions to the same server IP address and port.

A syslog action contains a reference to a syslog server. It specifies which information to log and mentions how to log that information.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit syslogAction <name> <serverIP> [-serverPort <port>] -
 logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)] [-
 transport (TCP | UDP)]`
2 - show audit syslogAction [<name>]
3
4 <!--NeedCopy-->
```

To configure NSLOG action in advanced policy infrastructure by using the CLI.

An ns log action contains a reference to a nslog server. It specifies which information to log and mentions how to log that information.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit nslogAction <name> <serverIP> [-serverPort <port>] -
 logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)]
2 - show audit nslogAction [<name>]
3 <!--NeedCopy-->
```

## Configuring audit log policies

Configure audit log Policies in classic Policy infrastructure by using the CLI.

At the command prompt, type:

```
1 - add audit syslogpolicy <name> <-rule> <action>
2 - add audit nslogpolicy <name> <-rule> <action>
3 <!--NeedCopy-->
```

## Binding audit syslog policies to audit syslog global

Bind audit log policy in advanced policy framework by using the CLI.

At the command prompt, type:

```
bind syslogGlobal -policyName <policyName> -priority <priority>
unbind syslogGlobal -policyName <policyName> -priority <priority>
```

Bind audit log policy in classic policy framework by using the CLI.

At the command prompt, type:

```
bind systemglobal <policy Name> <Priority>
unbind systemglobal <policy Name> <Priority>
```

## Configuring audit log policies using advanced policy expression

Configuring audit logging in advanced policy consists of the following steps:

1. **Configuring an audit log action.** You can configure an audit action for different servers and for different log levels. ‘Audit action’ describes Audit Server configuration information whereas ‘audit policy’ links a bind entity to an ‘audit action’. By default, SYSLOG uses a user data protocol (UDP) for data transfer and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data. When using TCP for SYSLOG, you can set the buffer limit on the NetScaler appliance to store the logs. After the buffer limit is reached, the logs are sent to the SYSLOG server.
2. **Configuring audit log policy.** You can configure either SYSLOG policies to log messages to a SYSLOG server or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule that is set to **true** or **ns\_true** for the messages to be logged, and a SYSLOG or NSLOG action.
3. **Binding audit log policies to global entities.** You must globally bind the audit log policies to SYSTEM global entity to enable logging of all NetScaler system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

### Note

The NetScaler appliance evaluates all the policies that are bind to true.

## Configuring audit log action

To configure syslog action in advanced policy infrastructure by using the CLI.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1 - add audit syslogAction <name> <serverIP> [-serverPort <port>] -
 logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)] [-
 transport (TCP | UDP)]
2 - show audit syslogAction [<name>]
3 <!--NeedCopy-->

```

Configure the NSLOG action in advanced policy infrastructure by using the CLI:

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1 - add audit nslogAction <name> <serverIP> [-serverPort <port>] -
 logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)]
2 - show audit nslogAction [<name>]
3 <!--NeedCopy-->

```

## Configuring audit log policies

To add a syslog audit action by using the CLI.

At the command prompt, type:

```

1 add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
2 | -lbVserverName <string>))[-serverPort <port>] -logLevel <logLevel>
3 > [-managementlog <managementlog> ...] ... [-managementloglevel
4 <managementloglevel> ...][-dateFormat <dateFormat>]
5 [-logFacility <logFacility>][-tcp (NONE | ALL)] [-acl (ENABLED
6 | DISABLED)]
7 [-timeZone (GMT_TIME | LOCAL_TIME)][-userDefinedAuditlog (YES |
8 NO)]
9 [-appflowExport (ENABLED | DISABLED)] [-lsn (ENABLED | DISABLED
10)][-alg (ENABLED | DISABLED)]
11 [-subscriberLog (ENABLED | DISABLED)][-transport (TCP | UDP)]
12 [-tcpProfileName <string>][-maxLogDataSizeToHold]
13 <!--NeedCopy-->

```

## Example

```

1 > add audit syslogaction audit-action1 10.102.1.1 -loglevel
2 INFORMATIONAL -dateFormat MMDDYYYY
3 > add audit nslogAction nslog-action1 10.102.1.3 -serverport 520 -
4 loglevel INFORMATIONAL -dateFormat MMDDYYYY
5 > add audit syslogpolicy syslog-pol1 TRUE audit-action1
6 > add audit nslogPolicy nslog-pol1 TRUE nslog-action1
7 > bind system global nslog-pol1 -priority 20
8 <!--NeedCopy-->

```

**Note:**

The `managementlog` option in the `syslogaction` configuration supports only server IP and port configuration. Domain Based Service (DBS) and load balancing virtual server name configurations are not supported.

For management logs, use the supported command:

```
add syslogAction <serverIP>
```

The following configurations are not supported:

```
add syslogAction <serverDomainName>
```

```
add syslogAction -lbVserverName <lb_vserver_name>
```

For more information, see [Export management logs directly from NetScaler to Splunk](#).

Add a `nslog` audit action by using the CLI.

At the command prompt, type:

```
1 add audit nslogAction <name> (<serverIP> | (<serverDomainName>[-
 domainResolveRetry <integer>])) [-serverPort <port>] -
 logLevel <logLevel> ... [-dateFormat <dateFormat>][-logFacility
 <logFacility>] [-tcp (NONE | ALL)][-acl (ENABLED | DISABLED)
] [-timeZone (GMT_TIME | LOCAL_TIME)][-userDefinedAuditlog (
 YES | NO)][-appflowExport (ENABLED | DISABLED)] [-lsn (
 ENABLED | DISABLED)][-alg (ENABLED | DISABLED)] [-
 subscriberLog (ENABLED | DISABLED)]`
2 <!--NeedCopy-->
```

**Binding audit log policies to global entities**

Bind the `syslog` audit log policy in advanced policy framework by using the CLI.

At the command prompt, type:

```
bind audit syslogGlobal <policyName> [-globalBindType <globalBindType
```

```
unbind audit syslogGlobal <policyName>[-globalBindType <globalBindType
>]
```

**Configuring audit log policy by using the GUI**

1. Navigate to **Configuration > System > Auditing > Syslog**.
2. Select **Servers** tab.

3. Click **Add**.
4. In the **Create Auditing Server** page, populate the relevant fields, and click **Create**.
5. To add the policy, select the **Policies** tab, and click **Add**.
6. In the **Create Auditing Syslog Policy** page, populate the relevant fields, and click **Create**.
7. To bind the policy globally, select **Advanced Policy Global Bindings** from the drop-down list. Select the **best\_syslog\_policy\_ever** policy. Click **Select**.
8. From the drop-down list, select the bind point as **SYSTEM\_GLOBAL** and click **Bind**, and then click **Done**.

## Configuring policy-based logging

You can configure policy-based logging for rewrite and responder policies. Audit messages are then logged in a defined format when the rule in a policy evaluates to TRUE. To configure policy-based logging, you configure an audit-message action that uses advanced policy expressions to specify the format of the audit messages. And associate the action with a policy. The policy can be bound either globally or to a load balancing or content switching virtual server. You can use audit-message actions to log messages at various log levels, either in syslog format only or in both syslog and new nslog formats

### Prerequisites

- User Configurable Log Messages (userDefinedAuditlog) option is enabled for when configuring the audit action server to which you want to send the logs in a defined format.
- The related audit policy is bound to system global.

### Configuring an audit message action

You can configure audit message actions to log messages at various log levels, either in syslog format only or in both syslog and new ns log formats. Audit-message actions use expressions to specify the format of the audit messages.

**Create an audit message action by using the CLI** At the command prompt, type:

```
1 add audit messageaction <name> <logLevel> <stringBuilderExpr> [-
 logtoNewnslog (YES|NO)]
2 <!--NeedCopy-->
```

```
1 add audit messageaction log-act1 CRITICAL '"Client:"+CLIENT.IP.SRC+"
 accessed "+HTTP.REQ.URL '
2 <!--NeedCopy-->
```

**Configure an audit message action by using the GUI** Navigate to **System > Auditing > Message Actions**, and create the audit message action.

### Binding audit message action to a policy

After you've created an audit message action, you must bind it to a rewrite or responder policy. For more information about binding log message actions to a rewrite or responder policy, see [Rewrite](#) or [Responder](#).

## Installing and configuring the NSLOG server

May 2, 2023

During installation, the NSLOG server executable file (auditserver) is installed along with other files. The auditserver executable file includes options for performing several actions on the NSLOG server, including running and stopping the NSLOG server. In addition, you use the auditserver executable to configure the NSLOG server with the IP addresses of the NetScaler appliances from which the NSLOG server will start collecting logs. Configuration settings are applied in the NSLOG server configuration file (auditlog.conf).

Then, you start the NSLOG server by executing the auditserver executable. The NSLOG server configuration is based on the settings in the configuration file. You can further customize logging on the NSLOG server system by making additional modifications to the NSLOG server configuration file (auditlog.conf).

#### **Attention:**

The version of the NSLOG server package must be the same as that of the NetScaler. For example, if the version of the NetScaler is 10.1 Build 125.9, the NSLOG server must also be of the same version.

The following table lists the operating systems on which the NSLOG server is supported.

---

Operating system	Software requirements	Remarks
Windows	Windows XP Professional, Windows Server 2003, Windows 2000/NT, Windows Server 2008, Windows Server 2008 R2	

Operating system	Software requirements	Remarks
Linux	RedHat Linux 4 or later, SUSE Linux Enterprise 9.3 or later	
FreeBSD	FreeBSD 6.3 or later	For NetScaler 10.5, use only FreeBSD 8.4.
Mac OS	Mac OS 8.6 or later	Not supported on NetScaler 10.1 and later releases.

The minimum hardware specifications for the platform running the NSLOG server are as follows:

- Processor- Intel x86 ~501 megahertz (MHz)
- RAM - 512 megabytes (MB)
- Controller - SCSI

### Installing NSLOG server on the Linux operating system

Log on to the Linux system as an administrator. Use the following procedure to install the NSLOG server executable files on the system.

#### To install the NSLOG server package on a Linux operating system

1. At a Linux command prompt, type the following command to copy the NSauditserver.rpm file to a temporary directory:

```
cp <path_to_cd>/Utilities/auditserver/Linux/NSauditserver.rpm /tmp
```

2. Type the following command to install the NSauditserver.rpm file.

```
rpm -i NSauditserver.rpm
```

This command extracts the files and installs them in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

#### To uninstall the NSLOG server package on a Linux operating system

1. At a command prompt, type the following command to uninstall the audit server logging feature:

```
rpm -e NSauditserver
```

2. For more information about the NSauditserver RPM file, use the following command:

```
rpm -qpi *.rpm
```

3. To view the installed audit server files use the following command:

```
rpm -ql *.rpm
```

`\*.rpm`: Specifies the file name.

## Installing NSLOG server on the FreeBSD operating system

Before you can install the NSLOG server, you have to copy the NSLOG package from the NetScaler product CD or download it from [www.citrix.com](http://www.citrix.com). The NSLOG package has the following name format:

```
AuditServer_<release number>-<build number>.zip
```

For example: `AuditServer_10.5-58.11.zip`

This package contains files for all supported platforms: Linux, Windows, and FreeBSD. On a FreeBSD operating system, install the NSLOG package that has the following name format:

```
audserver_bsd-<release number>-<build number>.tgz
```

For example: `audserver_bsd-10.5-58.11.tgz`

To download NSLOG package from [www.citrix.com](http://www.citrix.com):

1. In a web browser, go to [www.citrix.com](http://www.citrix.com).
2. In the menu bar, click **Log In**.
3. Enter your login credentials, and then click **Log In**.
4. In the menu bar, click **Downloads**.
5. From the **Select a product** list, select **NetScaler**.
6. On the **NetScaler** page, select the release for which you want to download the NSLOG package (for example, Release 10.5), and then select **Firmware**.
7. Under **Firmware**, select the NetScaler firmware for the build number for which you want to download the NSLOG package.
8. On the page that appears, scroll down, select **Audit Servers**, and click **Download File** next to the package that you want to download.

To install the NSLOG server package on a FreeBSD operating system

1. On the system to which you have downloaded the NSLOG package `AuditServer_<release number>-<build number>.zip` (for example, `AuditServer_9.3-51.5.zip`), extract the FreeBSD NSLOG server **package** `audserver_bsd-<release`

`number>--<build number>.tgz` (for example, `audserver_bsd-9.3-51.5.tgz`) from the package.

2. Copy the FreeBSD NSLOG server package `audserver_bsd-<release number>--<build number>.tgz` (for example, `audserver_bsd-9.3-51.5.tgz`) to a directory on a system running FreeBSD OS.
3. At a command prompt for the directory into which the FreeBSD NSLOG server package was copied, run the following command to install the package:

```
pkg_add audserver_bsd-<release number>--<build number>.tgz
```

**Example:**

```
1 pkg_add audserver_bsd-9.3-51.5.tgz
2 <!--NeedCopy-->
```

The following directories are extracted:

- `<root directory extracted from the FreeBSD NSLOG server package tgz file>NetScalerbin` (for example, `/var/auditserver/netScaler/bin`)
  - `<root directory extracted from the FreeBSD NSLOG server package tgz file>netScaler/etc` (for example, `/var/auditserver/netScaler/etc`)
  - `<root directory extracted from the FreeBSD NSLOG server package tgz file>\netScaler\samples` (for example, `/var/auditserver/samples`)
4. At a command prompt, type the following command to verify that the package is installed:

```
pkg_info | grep NSaudserver
```

**To uninstall the NSLOG server package on a FreeBSD operating system**

At a command prompt, type:

```
pkg_delete NSaudserver
```

**Installing NSLOG Server Files on the Windows Operating System**

Before you can install the NSLOG server, you have to copy the NSLOG package from the NetScaler product CD or download it from [www.citrix.com](http://www.citrix.com). The NSLOG package has the following name format `AuditServer _<release number>--<build number>.zip` (for example, `AuditServer_9.3-51.5.zip`). This package contains NSLOG installation packages for all supported platforms.

### To download NSLOG package from [www.Citrix.com](http://www.Citrix.com)

1. In a web browser, go to [www.citrix.com](http://www.citrix.com).
2. In the menu bar, click Log In.
3. Enter your login credentials, and then click Log In.
4. In the menu bar, click Downloads.
5. Search to find the page that provides the appropriate release number and build.
6. On that page, under Audit Servers, click Download to download the NSLOG package, having the format `AuditServer_<release number>-<build number>.zip`, to your local system (for example, `AuditServer_9.3-51.5.zip`).

### To install NSLOG server on a Windows operating system

1. On the system, where you have downloaded the NSLOG package `AuditServer_<release number>-<build number>.zip` (for example, `AuditServer_9.3-51.5.zip`), extract `audserver_win-<release number>-<build number>.zip` (for example, `audserver_win-9.3-51.5.zip`) from the package.
2. Copy the extracted file `audserver_<release number>-<build number>.zip` (for example, `audserver_win-9.3-51.5.zip`) to a Windows system on which you want to install the NSLOG server.
3. Unzip the `audserver_<release number>-<build number>.zip` file (for example, `audserver_win-9.3-51.5.zip`).
4. The following directories are extracted:
  - a) `<root directory extracted from the Windows NSLOG server package zip file>\bin` (for example, `C:\audserver_win-9.3-51.5\bin`)
  - b) `<root directory extracted from the Windows NSLOG server package zip file>\etc` (for example, `C:\audserver_win-9.3-51.5\etc`)
  - c) `<root directory extracted from the Windows NSLOG server package zip file>\samples` (for example, `C:\audserver_win-9.3-51.5\samples`)
5. At a command prompt, run the following command from the `<root directory extracted from the Windows NSLOG server package zip file>\bin` path

```
audserver -install -f <directorypath>\auditlog.conf
```

`<directorypath>`: Specifies the path to the configuration file (`auditlog.conf`). By default, `log.conf` is under `\<root directory extracted from Windows NSLOG`

`server package zip file\>\samples` directory. But you can copy `auditlog.conf` to your desired directory.

### To uninstall the NSLOG server on a Windows operating system

At a command prompt, run the following from the `<root directory extracted from Windows NSLOG server package zip file>\bin` path:

```
audserver -remove
```

### NSLOG Server Command Options

For information about NSLOG server commands, see [Audit Server Options](#).

Run the `audserver` command from the directory in which the audit server executable is present:

- On Windows: `\ns\bin`
- On Solaris and Linux: `\usr\local\netscaler\bin`

The audit server configuration files are present in the following directories:

- On Windows: `\ns\etc`
- On Linux: `\usr\local\netscaler\etc`

The audit server executable is started as `./auditserver` in Linux and FreeBSD.

### Adding the NetScaler Appliance IP Addresses on the NSLOG Server

In the configuration file (`auditlog.conf`), add the IP addresses of the NetScaler appliances whose events must be logged.

#### To add the IP addresses of the NetScaler appliance

At a command prompt, type the following command:

```
audserver -addns -f <directorypath>\auditlog.conf
```

`<directorypath>`: Specifies the path to the configuration file (`auditlog.conf`).

You are prompted to enter the information for the following parameters:

NSIP: Specifies the IP address of the NetScaler appliance, for example, 10.102.29.1.

Userid: Specifies the user name, for example, nsroot.

Password: Specifies the password, for example, nsroot.

If you add multiple NetScaler IP addresses (NSIP), and later you do not want to log all of the NetScaler appliance event details, you can delete the NSIPs manually by removing the NSIP statement at the end of the `auditlog.conf` file. For a high availability (HA) setup, you must add both primary and secondary NetScaler IP addresses to `auditlog.conf` by using the `audserver` command. Before adding the IP address, make sure the user name and password exist on the system.

## Verifying the NSLOG Server Configuration File

Check the configuration file (`audit log.conf`) for syntax correctness to enable logging to start and function correctly.

To verify configuration, at a command prompt, type the following command:

```
audserver -verify -f <directorypath>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (`audit log.conf`).

## Running the NSLOG server

September 21, 2020

### To start audit server logging

Type the following command at a command prompt:

```
audserver -start -f <directorypath>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (`audit log.conf`).

### To stop audit server logging that starts as a background process in FreeBSD or Linux

Type the following command:

```
audserver -stop
```

### To stop audit server logging that starts as a service in Windows

Type the following command:

```
audserver -stopservice
```

## Customizing logging on the NSLOG server

May 2, 2023

You can customize logging on the NSLOG server by making additional modifications to the NSLOG server configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the server system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information from a NetScaler appliance or a set of NetScaler appliances.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

This document includes the following details:

- Creating Filters
- Specifying Log Properties

### Creating filters

You can use the default filter definition located in the configuration file (audit log.conf), or you can modify the filter or create a new filter. You can create more than one log filter.

**Note:**

For consolidated logging, if a log transaction occurs for which there is no filter definition, the default filter is used (if it is enabled.) The only way you can configure consolidated logging of all the NetScaler appliances is by defining the default filter.

### To create a filter

At the command prompt, type the following command in the configuration file ( auditlog.conf):

```
1 filter <filterName> [IP <ip>] [NETMASK <mask>] ON | OFF]
2 <!--NeedCopy-->
```

filterName: Specify the name of the filter (maximum of 64 alphanumeric characters).

ip: Specify the IP addresses.

mask: Specify the subnet mask to be used on a subnet.

Specify ON to enable the filter to log transactions, or specify OFF to disable the filter. If no argument is specified, the filter is ON.

### Examples:

```
1 filter F1 IP 192.168.100.151 ON
2 <!--NeedCopy-->
```

To apply the filter F2 to IP addresses 192.250.100.1 to 192.250.100.254:

```
1 filter F2 IP 192.250.100.0 NETMASK 255.255.255.0 ON
2 <!--NeedCopy-->
```

filterName is a required parameter if you are defining a filter with other optional parameters, such as IP address, or the combination of IP address and Netmask.

## Specifying log properties

Log properties associated with the filter are applied to all the log entries present in the filter. The log property definition starts with the key word BEGIN and ends with END as illustrated in the following example:

```
1 BEGIN <filename>
2 logFilenameFormat ...
3 logDirectory ...
4 logInterval ...
5 logFileSizeLimit
6 END
7 <!--NeedCopy-->
```

Entries in the definition can include the following:

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: A constant string that specifies the absolute path and the file name.
  - Dynamic: An expression that includes the following format specifiers:
    - \* Date (%{format}t)
    - \* creates file name with NSIP

### Example:

```
1 LogFileNameFormat Ex%` {
2 `%m%d%y }
3 t.log
4 <!--NeedCopy-->
```

This creates the first file name as Exmddy.log. New files are named: Exmddy.log.0, Exmddy.log.1, and so on. In the following example, the new files are created when the file size reaches 100MB.

### Example:

```
1 LogInterval size
2 LogFileSize 100
3 LogFileNameFormat Ex%` {
4 `m%d%y }
5 t
6 <!--NeedCopy-->
```

### Caution

The date format `%t` specified in the `LogFileNameFormat` parameter overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use `%t` in the `LogFileNameFormat` parameter.

- **logDirectory** specifies the directory name format of the log file. The name of the file can be either of the following:
  - Static: Is a constant string that specifies the absolute path and file name.
  - Dynamic: Is an expression containing the following format specifiers:
    - \* Date (`%{format}t`)
    - \* creates directory with NSIP

The directory separator depends on the operating system. In Windows, use the directory separator.

### Example:

```
1 LogDirectory dir1\dir2\dir3
2 <!--NeedCopy-->
```

In the other operating systems (Linux, FreeBSD, and so forth.), use the directory separator.

- **LogInterval** specifies the interval at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour. Default value.
  - Daily: A file is created every day at midnight.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly : A file is created on the first day of the month at midnight.
  - None: A file is created only once, when audit server logging starts.
  - Size: A file is created only when the log file size limit is reached.

### Example:

```
1 LogInterval Hourly
2 <!--NeedCopy-->
```

- **LogFileSizeLimit** specifies the maximum size (in MB) of the log file. A new file is created when the limit is reached.

**Note**

You can override the `loginterval` property by assigning `size` as its value.

The default `LogFileSizeLimit` is 10 MB.

**Example:**

```
1 LogFileSizeLimit 35
2 <!--NeedCopy-->
```

## SYSLOG Over TCP

May 2, 2023

Syslog is a standard for sending event notification messages. These messages can be stored locally or on an external log server. Syslog enables network administrators to consolidate log messages and derive insights from the collected data.

Syslog is originally designed to work over UDP, which can transmit a huge amount of data within the same network with minimal packet loss. However, telco operators prefer to transmit syslog data over TCP, because they need reliable, ordered data transmission between networks. For example, telco tracks user activities, and TCP provides retransmission in the event of network failure.

### How Syslog over TCP works

To understand how syslog over TCP works, consider two hypothetical cases:

Sam, a network administrator, wants to log significant events on an external syslog server.

XYZ Telecom, an ISP, has to transmit and store a significant amount of data on syslog servers to comply with government regulations.

In both cases, the log messages must be transmitted over a reliable channel and stored safely on an external syslog server. Unlike UDP, TCP establishes a connection, transmits messages securely, and retransmits (from sender to receiver) any data that is corrupted or lost because of network failure.

The NetScaler appliance sends log messages over UDP to the local syslog daemon, and sends log messages over TCP or UDP to external syslog servers.

## SNIP support for Syslog

When the audit-log module generates syslog messages, it uses a NetScaler IP (NSIP) address as the source address for sending the messages to an external syslog server. To configure a SNIP as the source address, you must make it part of the netProfile option and bind the netProfile to the syslog action.

### Note

TCP uses SNIP for sending monitoring probes to check the connectivity and then sends the logs over NSIP. Hence the syslog server must be reachable via SNIP. Net profiles can be used to redirect all the TCP syslog traffic through SNIP entirely.

**Use of a SNIP address is not supported in internal logging.**

## Fully qualified domain name Support for audit Log

Previously, the audit-log module was configured with the destination IP address of the external syslog server to which the log messages are sent. Now, the audit-log server uses a fully qualified domain name (FQDN) instead of the destination IP address. The FQDN configuration resolves the configured domain name of the syslog server to the corresponding destination IP address for sending the log messages from the audit-log module. The name server must be properly configured to resolve the domain name and avoid domain based service issues.

### Note

When configuring an FQDN, server domain name configuration of the same NetScaler appliance in syslog action or nslog action is not supported.

## Configuring Syslog over TCP by using the Command Line Interface

To configure a NetScaler appliance to send syslog messages over TCP by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
domainResolveRetry <integer>])) | -lbVserverName<string>))[-
serverPort <port>] -logLevel <logLevel>[-dateFormat <dateFormat
>] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (
ENABLED | DISABLED)][-timeZone (GMT_TIME | LOCAL_TIME)][-
userDefinedAuditlog (YES | NO)][-appflowExport (ENABLED |
DISABLED)] [-lsn (ENABLED | DISABLED)][-alg (ENABLED |
DISABLED)] [-subscriberLog (ENABLED | DISABLED)][-transport (
TCP | UDP)] [-tcpProfileName <string>][-maxLogDataSizeToHold <
```

```

 positive_integer>][-dns (ENABLED | DISABLED)] [-netProfile <
 string>]
2 <!--NeedCopy-->

```

```

1 add audit syslogaction audit-action1 10.102.1.1 -loglevel
 INFORMATIONAL -dateformat MMDDYYYY -transport TCP
2 <!--NeedCopy-->

```

### Adding SNIP IP address to net profile option by using the command line interface

To add a SNIP IP address to the net profile by using the command line interface

At the command prompt, type:

```

1 add netProfile <name> [-td <positive_integer>] [-srcIP <string>][-
 srcippersistency (ENABLED | DISABLED)][-overrideLsn (ENABLED
 | DISABLED)]add syslogaction <name> <serverIP> -loglevel all
 -netprofile net1
2 <!--NeedCopy-->

```

```

1 add netprofile net1 -srcip 10.102.147.204`
2 <!--NeedCopy-->

```

Where, srcIP is the SNIP.

### Adding net profile in a syslog action by using the command line interface

To add a netProfile option in a syslog action by using the command line interface

At the command prompt, type:

```

1 add audit syslogaction <name> (<serverIP> | -lbVserverName <string
 >) -logLevel <logLevel>
2 -netProfile <string> ...
3
4 <!--NeedCopy-->

```

```

1 add syslogaction sys_act1 10.102.147.36 -loglevel all -netprofile
 net1
2 <!--NeedCopy-->

```

Where, -netprofile specifies the name of the configured net profile. The SNIP address is configured as part of the netProfile and this netProfile option is bound to the syslog action.

#### Note

You must always bind the netProfile to the SYSLOGUDP or SYSLOGTCP services that are bound to the SYSLOGUDP or SYSLOGTCP load balancing virtual server.

### Configuring FQDN support by using the command line interface

To add a server domain name to a Syslog action by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
 domainResolveRetry <integer>])) | -lbVserverName <string>)) -logLevel
 <logLevel> ...
2 set audit syslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>]-
 serverDomainName <string>] [-lbVserverName <string>]-
 domainResolveRetry <integer>] [-domainResolveNow]
3 <!--NeedCopy-->
```

To add a server domain name to a Nslog action by using the command line interface.

At the command prompt, type:

```
1 add audit nslogAction <name> (<serverIP> | (<serverDomainName>[-
 domainResolveRetry <integer>])) -logLevel <logLevel> ...
2 set audit nslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>]-
 serverDomainName <string>] [-domainResolveRetry <integer>]-
 domainResolveNow]
3 <!--NeedCopy-->
```

Where serverDomainName. Domain name of the log server. Is mutually exclusive with serverIP/ lbVserverName.

DomainResolveRetry integer. Time (in seconds) that the NetScaler appliance waits, after a DNS resolution fails, before sending the next DNS query to resolve the domain name.

DomainResolveNow. Included if the DNS query has to be sent immediately to resolve the server's domain name.

### Configuring Syslog over TCP by using the GUI

To configure the NetScaler appliance to send Syslog messages over TCP by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select Transport Type as **TCP**.

**Configuring a net profile for SNIP support by using the GUI** To configure net profile for SNIP support by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select a net profile from the list.

### **Configuring FQDN by using the GUI** To configure FQDN by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select a Server Type and Server Domain Name from the list.

## **Load balancing SYSLOG servers**

March 28, 2024

The NetScaler appliance sends its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
add service <name>(<IP> | <serverName>)<serviceType (SYSLOGTCP |
SYSLOGUDP)> <port>
```

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

```
add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-
lbMethod <AUDITLOGHASH>]
```

3. Bind the service to the load balancing virtual server.

```
Bind lb vserver <name> <serviceName>
```

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogaction <name> <serverIP> [-lbVserverName <string>] [-
logLevel <logLevel>]
```

5. Add a SYSLOG policy by specifying the rule and action.

```
add syslogpolicy <name> <rule> <action>
```

6. Bind the SYSLOG policy to the system global for the policy to take effect.

```
bind system global <policyName>
```

#### Load balancing of SYSLOG servers using the GUI

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

Navigate to **Traffic Management > Services**, click **Add** and select **SYSLOGTCP** or **SYSLOGUDP** as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

Navigate to **Traffic Management > Virtual Servers**, click **Add** and select **SYSLOGTCP** or **SYSLOGUDP** as protocol.

3. Bind the service to the load balancing virtual server.

- a) Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select the load balancing virtual server, and click **Edit**.
- b) In the **Services and Service Groups** section, click **Load Balancing Virtual Server Service Binding** and click **Add Binding**.
- c) On the **Service Binding** page, click **Select Service**, select the service with service type as SYSLOGTCP or SYSLOGUDP, and click **Select**.
- d) On the **Service Binding** page, click **Bind**.
- e) Click **Close** and then **Done** to navigate back to the **Virtual Servers** page.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

Navigate to **System > Auditing**, click **Servers** and add a server by selecting **LB Vserver** option in **Servers**.

5. Add a SYSLOG policy by specifying the rule and action.

Navigate to **System > Syslog**, click **Policies** and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to **System > Syslog**, select a SYSLOG policy and click **Action**, and then click **Global Bindings** and bind the policy to system global.

#### Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. AUDITLOGHASH method load balances

the traffic based on input hash value from the audit agents. The agents are the modules which generate auditlog in a NetScaler appliance. For example, if an agent LSN wants to load balance auditlogs based on client IP address, LSN module generates the hash value based on clientIP and passes the hash value to auditlog module. The auditlog module sends the auditlog messages which have same hash value to the external syslog server.

The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
1 add service service1 192.0.2.10 SYSLOGUDP 514
2 add service service2 192.0.2.11 SYSLOGUDP 514
3 add service service3 192.0.2.11 SYSLOGUDP 514
4 add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
5 bind lb vserver lbvserver1 service1
6 bind lb vserver lbvserver1 service2
7 bind lb vserver lbvserver1 service3
8 add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
9 add syslogpolicy syspoll1 ns_true sysaction1
10 bind system global syspoll1
11 <!--NeedCopy-->
```

Use the following command to configure SYSLOG using LB server with FQDN when ICMP packet is blocked:

```
set service service1 -healthMonitor NO
```

**Limitations:**

- The NetScaler appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

## Default settings for the log properties

September 21, 2020

The following is an example of the default filter with default settings for the log properties:

```
1 begin default
2 logInterval Hourly
3 logFileSizeLimit 10
4 logFilenameFormat auditlog%`{
5 `%y%m%d }
6 t.log
7 end default
8 <!--NeedCopy-->
```

Following are two examples of defining the default filters:

**Example 1:**

```
1 Filter f1 IP 192.168.10.1
2 <!--NeedCopy-->
```

This creates a log file for NSIP 192.168.10.1 with the default values of the log in effect.

**Example 2:**

```
1 Filter f1 IP 192.168.10.1
2 begin f1
3 logFilenameFormat logfiles.log
4 end f1
5 <!--NeedCopy-->
```

This creates a log file for NSIP 192.168.10.1. Since the log file name format is specified, the default values of the other log properties are in effect.

**Sample configuration file (audit.conf)**

May 2, 2023

Following is a sample configuration file:

```
1 #####
2 # This is the Auditserver configuration file
3 # Only the default filter is active
4 # Remove leading # to activate other filters
5 #####
6 MYIP <NSAuditserverIP>
7 MYPORT 3023
8 # Filter filter_nsip IP <Specify the NetScaler IP address to filter
9 on > ON
10 # begin filter_nsip
11 # logInterval Hourly
12 # logFileSizeLimit 10
13 # logDirectory logdir\%A\
14 # logFilenameFormat nsip%\{\
15 \\%d%m%Y }
16 t.log
17 # end filter_nsip
18 Filter default
19 begin default
20 logInterval Hourly
21 logFileSizeLimit 10
22 logFilenameFormat auditlog%\{\
23 \%y%m%d }
24 t.log
25 end default
```

## Web server logging

May 2, 2023

You can use the Web server logging feature to send logs of HTTP and HTTPS requests to a client system for storage and retrieval. This feature has two components:

- The Web log server, which runs on the NetScaler.
- The NetScaler Web Logging (NSWL) client, which runs on the client system.

When you run the NetScaler Web Logging (NSWL) client:

1. It connects to the NetScaler.
2. The NetScaler buffers the HTTP and HTTPS request log entries before sending them to the client.
3. The client can filter the entries before storing them.

To configure Web server logging, you first enable the Web logging feature on the NetScaler and configure the size of the buffer for temporarily storing the log entries. Then, you install NSWL on the client system. You then add the NetScaler IP address (NSIP) to the NSWL configuration file. You are now ready to start the NSWL client to begin logging. You can customize Web server logging by making additional modifications to the NSWL configuration file (log.conf).

## Configuring the NetScaler for web server logging

March 20, 2024

To configure the NetScaler for web server logging you are required to only enable the Web Server Logging feature. Optionally, you can perform the following configurations:

- Modify the size of the buffer (default size is 16 MB) that stores the logged information before it is sent to the NetScaler Web Logging (NSWL) client.
- Specify the custom HTTP headers that you want to export to the NSWL client. You can configure a maximum of two HTTP request and two HTTP response header names.

For more information on how to configure NetScaler web server logging (NSWL), see the following video:

[This is an embedded video. Click the link to watch the video](#)

## To configure web server logging by using the command line interface

At the command prompt, perform the following operations:

- Enable the web server logging feature.

```
enable ns feature WL
```

- [Optional] Modify the buffer size for storing the logged information.

```
set ns weblogparam -bufferSizeMB <size>
```

**Note:**

To activate your modification, you must disable and then re-enable the Web server logging feature.

- [Optional] Specify the custom HTTP header names that you want to export.

```
set ns weblogparam [-customReqHdrs <string> ...] [-customRspHdrs <string> ...]
```

```
1 > enable ns feature WL
2 Done
3 > set ns weblogparam -bufferSizeMB 60
4 Done
5 > show ns weblogparam
6 Web Logging parameters:
7 Log buffer size: 60MB
8 Custom HTTP request headers: (none)
9 Custom HTTP response headers: (none)
10 Done
11 > set ns weblogparam -customReqHdrs req1 req2 -customRspHdrs res1
12 res2
13 Done
14 > show ns weblogparam
15 Web Logging parameters:
16 Log buffer size: 60MB
17 Custom HTTP request headers: req1, req2
18 Custom HTTP response headers: res1, res2
18 Done
19 <!--NeedCopy-->
```

## To configure web server logging by using the GUI

1. Navigate to **System > Settings** and perform the following operations:
  - a) To enable the web server logging feature, click **Change Advanced Features** and select **Web Logging**.

- b) To modify the buffer size, click **Change Global System Settings** and under **Web Logging**, enter the buffer size.
- c) To specify the custom HTTP headers to be exported, click **Change Global System Settings** and under **Web Logging**, specify the header values.

## Installing the NetScaler web logging (NSWL) client

May 2, 2023

When you install NSWL, the client executable file (NSWL) is installed along with other files. The NSWL executable file provides a list of options that you can use. For details, see [Configuring the NSWL Client](#).

### Attention

The version of the NSWL client must be the same as NetScaler. For example, if the version of the NetScaler is 10.1 Build 125.9, the NSWL client must also be of the same version. Also, the web logging (NSWL) client works on both 32 bit and on 64 bit server machines. The download page has only a 32 bit weblog client. The 64 bit weblog client is available on request, and recommends you to contact NetScaler support for more information.

The following table lists the operating systems on which the NSWL client can be installed.

Operating system	Version	Hardware requirements	Remarks
Windows	Windows Server 2016 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	
macOS	macOS 8.6 or later	Not supported on NetScaler 10.1 and later releases.	
Linux	Ubuntu, SUSE Linux, CentOS, Red Hat Enterprise Linux released in 2016 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	

Operating system	Version	Hardware requirements	Remarks
Solaris	Solaris Sun OS 5.6 or later	Processor - UltraSPARC-IIi 400 MHz, RAM - 512 MB, Controller - SCSI	Not supported on NetScaler 10.5 and later releases.
FreeBSD	FreeBSD 6.3 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	For NetScaler 10.5, use only FreeBSD 8.4.
AIX	AIX 6.1	-	Not supported on NetScaler 10.5 and later releases.

If the NSWL client system cannot process the log transaction because of a CPU limitation, the Web log buffer overruns and the logging process reinitiates.

#### Caution

Reinitiation of logging can result in loss of log transactions.

To temporarily solve an NSWL client system bottleneck caused by a CPU limitation, you can tune the Web server logging buffer size on the NetScaler appliance. To solve the problem, you need a client system that can handle the site's throughput.

## Download NSWL client

You can obtain the NSWL client package from either the NetScaler product CD or the NetScaler downloads site. Within the package there are separate installation packages for each supported platform.

### To download the NSWL client from the Citrix website

1. Log on to Citrix by accessing the URL <https://www.citrix.com/downloads/citrix-adc/>.
2. Navigate to a particular NetScaler release version and look for its Firmware.
3. Click **Firmware** (for example, NetScaler Release (Feature Phase) 13.0 Build 52.24).

## Citrix ADC (NetScaler ADC)

[Subscribe to RSS notifications of new downloads](#)

Permanent fixes for CVE-2019-19781 ADC versions 13.0, 12.1, 12.0 and 11.1 are available now in this page:

These fixes also apply to Citrix ADC/Gateway Virtual Appliances (VPX) hosted on any of ESX, Hyper-V, KVM, XenServer, Azure, AWS, GCP or on a Citrix ADC Service Delivery Appliance (SDX).

It is necessary to upgrade all Citrix ADC/Gateway for instances running 13.0 (MPX or VPX) to build 13.0.47.24, for instances running 12.1 (MPX or VPX) to build 12.1.55.18, for instances running 12.0 (MPX or VPX) to build 12.0.63.13, for instances running 11.1 (MPX or VPX) to build 11.1.63.15 and for instances running 10.5 (MPX or VPX) to build 10.5.70.12 to install the security vulnerability fixes.

## Install NSWL client on Solaris

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_solaris-<release number>-<build number>.tar` file from the package.
2. Copy the extracted file to a Solaris system on which you want to install the NSWL client.
3. Extract the files from the tar file with the following command:

```
tar xvf nswl_solaris-9.3-51.5.tar
```

A directory Weblog is created in the temporary directory, and the files are extracted to the Weblog directory.

- Install the package with the following command:

```
pkgadd -d
```

- The list of available packages appears. In the following example, one Weblog package is shown:

```
1 NSweblog NetScaler Weblogging (SunOS,sparc)7.0
```

You are prompted to select the packages. Select the package number of the Weblog to be installed.

After you select the package number and press **Enter**, the files are extracted and installed in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

1. To check whether the NSWL package is installed, run the following command:

```
pkginfo | grep NSweblog
```

2. To uninstall the NSWL package, run the following command:

```
pkgrm NSweblog
```

## Install NSWL client on Linux

### Important

The installation of an NSWL client on Linux replaces the configuration file. You must take a backup before installing it.

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_linux-<release number>-<build number>.rpm` file from the package.
2. Copy the extracted file to a system, running Linux OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
rpm -i nswl_linux-9.3-51.5.rpm
```

This command extracts the files and installs them in the following directories.

- `/usr/local/netscaler/etc`
- `/usr/local/netscaler/bin`
- `/usr/local/netscaler/samples`

1. To uninstall the NSWL package, run the following command:

```
rpm -e NSweblog
```

2. To get more information about the Weblog RPM file, run the following command:

```
rpm -qpi *.rpm
```

3. To view the installed Web server logging files, run the following command:

```
rpm -qpl *.rpm
```

### Install NSWL client on FreeBSD

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_bsd-<release number>-<build number>.tgz` file from the package.
2. Copy the extracted file to a system, running FreeBSD OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
pkg_add nswl_bsd-9.3-51.5.tgz
```

This command extracts the files and installs them in the following directories.

```
1 - /usr/local/netscaler/etc
2 - /usr/local/netscaler/bin
3 - /usr/local/netscaler/samples
```

1. To uninstall the NSWL package, run the following command:

```
pkg_delete NSweblog
```

2. To verify that the package is installed, run the following command:

```
pkg_info | grep NSweblog
```

## Install the NSWL client on Mac

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_macos-<release number>-<build number>.tgz` file from the package.
2. Copy the extracted file to a system, running macOS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
pkg_add nswl_macos-9.3-51.5.tgz
```

This command extracts the files and installs them in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

1. To uninstall the NSWL package, run the following command:

```
pkg_delete NSweblog
```

2. To verify that the package is installed, run the following command:

```
pkg_info | grep NSweblog
```

## Install NSWL client on Windows

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_win-<release number>-<build number>.zip` file from the package.
2. Copy the extracted file to a Windows system on which you want to install the NSWL client.
3. On the Windows system, unzip the file in a directory (referred as `<NSWL-HOME>`). The following directories are extracted: `/bin`, and `/etc` and `/samples`.
4. At the command prompt, run the following command from the `<NSWL-HOME>\bin` directory:

```
nswl -install -f <directorypath>\log.conf
```

Where,

Directory path refers to the path of the configuration file (log.conf). By default, the file is in the <NSWL-HOME> and /etc directory. You can copy the configuration file to any other directory.

**Note**

To uninstall the NSWL client, at the command prompt, run the following command from the <NSWL-HOME>\bin directory:

```
1 > nswl -remove
```

## Install NSWL client on AIX system

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_aix-<release number>-<build number>.rpm` file from the package.
2. Copy the extracted file to a system, running AIX OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
rpm -i nswl_aix-9.3-51.5.rpm
```

This command extracts the files and installs them in the following directories.

- /usr/local/netscaler/etc
- /usr/local/netscaler/
- usr/local/netscaler/samples

1. To uninstall the NSWL package, run the following command:

```
rpm -e NSweblog
```

2. To get more information about the Weblog RPM file, run the following command:

```
rpm -qpi *.rpm
```

3. To view the installed Web server logging files, run the following command:

```
rpm -qpl *.rpm
```

## Configure NSWL client

May 2, 2023

After you install the NSWL client, you can configure the NSWL client using the `nswl` executable. These configurations are stored in the NSWL client configuration file (`log.conf`).

**Note:**

You can further customize logging on the NSWL client by making more modifications to the NSWL configuration file (`log.conf`). For details, see [Customizing Logging on the NSWL Client System](#).

The following table describes the commands that you can use to configure the NSWL client.

---

<b>NSWL command</b>	<b>Specifies</b>
<code>nswl -help</code>	The available NSWL help options.
<code>nswl -addns -f</code> <path-to-configuration-file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the NetScaler appliance. Enter a valid user name and password.
<code>nswl -verify -f</code> <path-to-configuration-file>	Check for syntax or semantic errors in the configuration file.
<code>nswl -start -f</code> <path-to-configuration-file>	Start the NSWL client based on the settings in the configuration file. Note: For Solaris and Linux: To start Web server logging as a background process, type the ampersand sign (&) at the end of the command.
<code>nswl -stop</code> (Solaris and Linux only)	Stop the NSWL client if it was started as a background process; otherwise, use CTRL+C to stop Web server logging.
<code>nswl -install -f</code> <path-to-configuration-file> (Windows only)	Install the NSWL client as a service in Windows.
<code>nswl -startservice</code> (Windows only)	Start the NSWL client by using the settings in the configuration file specified in the <code>nswl install</code> option. You can also start NSWL client from <b>Start &gt; Control Panel &gt; Services</b> . Note: The NSWL log files are created in <code>C:\Windows\SysWOW64</code> .
<code>nswl -stopservice</code> (Windows only)	Stops the NSWL client.
<code>nswl -remove</code>	Remove the NSWL client service from the registry.

---

Run the following commands from the directory in which the NSWL executable is located:

- **Windows:** `\ns\bin`
- **Solaris and Linux:** `\usr\local\netscaler\bin`

The Web server logging configuration files are located in the following directory path:

- **Windows:** `\ns\etc`
- **Solaris and Linux:** `\usr\local\netscaler\etc`

The NSWL executable is started as `.\nswl` in Linux and Solaris.

## Add the IP addresses of the NetScaler appliance

In the NSWL client configuration file (`log.conf`), add the NetScaler IP address (NSIP) from which the NSWL client starts collecting logs.

To add the NSIP address of the NetScaler appliance

1. At the client system command prompt, type:

```
nswl -addns -f < directorypath > \log.conf
< directorypath >: Specifies the path to the configuration file (
log.conf).
```

2. At the next prompt, enter the following information:

- **NSIP:** Specify the IP address of the NetScaler appliance.
- **User name and Password:** Specify the nsroot user credentials of the NetScaler appliance.

**Note:**

Any system user with logging privilege enabled supports this functionality.

**Note:**

If you add multiple NetScaler IP addresses (NSIP), and later you do not want to log all of NetScaler System Log details, you can delete the NSIPs manually by removing the NSIP statement at the end of the `log.conf` file. During a failover setup, you must add both primary and secondary NetScaler IP addresses to the `log.conf` by using the command. Before adding the IP address, make sure that the user name and password exist on the NetScaler appliances.

## Verify the NSWL configuration file

To make sure that logging works correctly, check the NSWL configuration file (`log.conf`) on the client system for syntax errors.

To verify the configuration in the NSWL configuration file

At the client system command prompt, type:

```
nswl -verify -f <directorypath>\log.conf
```

< directorypath>: Specifies the path to the configuration file (log.conf).

## Run NSWL Client

Start Web server logging

At the client system command prompt, type:

```
nswl -start -f <directorypath>\log.conf
```

<directorypath>: Specifies the path to the configuration file (log.conf).

Stop Web server logging started as a background process on the Solaris or Linux operating systems

At the command prompt, type:

```
nswl -stop
```

To stop Web server logging started as a service on the Windows operating system

At the command prompt, type:

```
nswl -stopservice
```

## Customize logging on the NSWL client system

May 2, 2023

You can customize logging on the NetScaler Web Logging (NSWL) client system by making more modifications to the NSWL client configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the client system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information based on the host IP address, domain name, and host name of the Web servers.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

## Sample configuration file

Following is a sample configuration file:

```
1 #####
2 # This is the NSWL configuration file
3 # Only the default filter is active
4 # Remove leading # to activate other filters

95 <!--NeedCopy-->

```

## Create filters

You can use the default filter definition in the configuration file (log.conf), or you can modify the filter or create a filter. You can create more than one log filter.

**Note:**

Consolidated logging, which logs transactions for which no filter is defined, uses the default filter if it is enabled. Consolidated logging of all servers can be done by defining only the default filter.

If the server hosts multiple websites and each website has its own domain name, and each domain is associated with a virtual server, you can configure Web server logging to create a separate log directory for each website. The following table displays the parameters for creating a filter.

Table 1. Parameters for creating a filter

Parameter	Specifies
filterName	Name of the filter. The filter name can include alphanumeric characters and cannot be longer than 59 characters. Filter names longer than 59 characters are truncated to 59 characters.
Host name	Host name of the server for which the transactions are being logged.
IP ip	IP address of the server for which transactions are to be logged (for example, if the server has multiple domains that have one IP address).
IP ip 2...ip n	Multiple IP addresses (for example, if the server domain has multiple IP addresses).
ip6 IP	IPv6 address of the server for which transactions are to be logged.
IP ip NETMASK mask	IP addresses and netmask combination to be used on a subnet.
ON   OFF	Enable or disable the filter to log transactions. If no argument is selected, the filter is enabled (ON).

To create a filter, enter the following command in the log.conf file:

- `filter <filterName> <HOST name> | [IP<ip> ] | [IP<ip 2...ip n> ] | <IP ip NETMASK mask> [ON | OFF]`
- `filter <filterName> <HOST name> | [IP6 ip/<prefix length>] [ON | OFF]`

### Create a filter for a virtual server

To create a filter for a virtual server, enter the following command in the log.conf file:

```
filter <filterName> <VirtualServer IP address>
```

Example

In the following example, you specify an IP address of 192.168.100.0 and netmask of 255.255.255.0. The filter applies to IP addresses 192.168.100.1 through 192.168.100.254.

```
1 Filter F1 HOST www.netscaler.com ON
2 Filter F2 HOST www.netscaler.com IP 192.168.100.151 ON
3 Filter F3 HOST www.netscaler.com IP 192.168.100.151 192.165.100.152 ON
4 Filter F4 IP 192.168.100.151
5 Filter F5 IP 192.168.100.151 HOST www.netscaler.com OFF
6 Filter F6 HOST www.netscaler.com HOST www.xyz.com HOST www.abcxyz.com
 IP 192.168.100.200 ON
7 Filter F7 IP 192.250.100.0 NETMASK 255.255.255.0
8 Filter F8 HOST www.xyz.com IP 192.250.100.0 NETMASK 255.255.255.0 OFF
9 For creating filters for servers having IPv6 addresses.
10 Filter F9 2002::8/112 ON
11 Filter F10 HOST www.abcd.com IP6 2002::8 ON
12
13 <!--NeedCopy-->
```

### Specify log properties

Log properties are applied to all log entries associated with the filter. The log property definition begins with the keyword `BEGIN` and ends with `END` as illustrated in the following example:

```
1 BEGIN <filtername>
2 logFormat ...
3 logFilenameFormat ...
4 logInterval ...
5 logFileSize
6 logExclude
7 logTime ...
8 END
9 <!--NeedCopy-->
```

Entries in the definition can include the following:

- **LogFormat** specifies the Web server logging feature that supports NCSA, W3C Extended, and custom log file formats.

By default, the `logformat` property is `w3c`. To override, enter `custom` or `NCSA` in the configuration file, for example:

```
1 LogFormat NCSA
2 <!--NeedCopy-->
```

**Note:**

For the NCSA and custom log formats, local time is used to time stamp transactions and for file rotation.

- **LogInterval** specifies the intervals at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour.
  - Daily: A file is created every day at midnight. Default value.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly: A file is created on the first day of the month at midnight.
  - None: A file is created only once, when Web server logging starts.

**Example:**

```
1 LogInterval Daily
2 <!--NeedCopy-->
```

**LogFileSizeLimit** specifies the maximum size of the log file in MB. It can be used with any log interval (weekly, monthly, and so on.) A file is created when the maximum file size limit is reached or when the defined log interval time elapses.

To override this behavior, specify the size as the `loginterval` property so that a file is created only when the log file size limit is reached.

The default `LogFileSizeLimit` is 10 MB.

**Example:**

```
1 LogFileSizeLimit 35
2 <!--NeedCopy-->
```

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: Specifies a constant string that contains the absolute path and file name.
  - Dynamic: Specifies an expression containing the following format:

- \* Server IP address
- \* Date (%{format}t)
- \* URL suffix (%x)
- \* Host name (%v)

**Example:**

```
1 LogFileNameFormat Ex%` {
2 `m%d%y }
3 t.log
4 <!--NeedCopy-->
```

This command creates the first file name as Exmddy.log, then every hour creates a file with a file name: Exmddy.log.0, Exmddy.log.1, ..., Exmddy.log.n.

**Example:**

```
1 LogInterval size
2 LogFileSize 100
3 LogFileNameFormat Ex%` {
4 `m%d%y }
5 t
6 <!--NeedCopy-->
```

**Caution:**

The date format %t specified in the LogFileNameFormat command overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFileNameFormat.

- **LogExclude** prevents logging of transactions with the specified file name extensions.

**Example:**

```
1 LogExclude.html
2 <!--NeedCopy-->
```

This command creates a log file that excludes log transactions for \*.html files.

**LogTime** specifies log time as either GMT or LOCAL.

The defaults are:

- NCSA log file format: LOCAL
- W3C log file format: GMT.

## Understand NCSA and W3C log formats

The NetScaler supports the following standard log file formats:

- NCSA Common Log Format
- W3C Extended Log Format

### NCSA Common log format

If the log file format is NCSA, the log file displays log information in the following format:

```
1 Client_IP_address -User_Name [Date:Time -TimeZone] "Method Object
 HTTP_version" HTTP_StatusCode BytesSent
2 <!--NeedCopy-->
```

To use the NCSA Common log format, enter **NCSA** in the LogFormat argument in the `log.conf` file.

The following table describes the NCSA Common log format.

---

Argument	Specifies
Client_IP_address	The IP address of the client computer.
User Name	The user name.
Date	The date of the transaction.
Time	The time when the transaction was completed.
Time Zone	The time zone (Greenwich Mean Time or local time).
Method	The request method (for example; GET, POST).
Object	The URL.
HTTP_version	The version of HTTP used by the client.
HTTP_StatusCode	The status code in the response.
Bytes Sent	The number of bytes sent from the server.

---

### W3C extended log format

An extended log file contains a sequence of lines containing ASCII characters terminated by either a Line Feed (LF) or the sequence Carriage Return Line Feed (CRLF.) Log file generators must follow the line termination convention for the platform on which they are run.

Log analyzers must accept either LF or CRLF form. Each line might contain either a directive or an entry. If you want to use the W3C Extended log format, enter W3C as the Log-Format argument in the `log.conf` file.

By default, the standard W3C log format is defined internally as the custom log format, shown as follows:

```

1 %` {
2 ` %Y-%m-%d%H:%M:%S }
3 t %a %u %S %A %p %m %U %q %s %j %J %T %H %+{
4 user-agent }
5 i %+{
6 cookie }
7 i %+{
8 referer }
9 i
10 <!--NeedCopy-->

```

You can also change the order or remove some fields in this W3C log format. For example:

```

1 logFormat W3C %` {
2 ` %Y-%m-%d%H:%M:%S }
3 t %m %U
4 <!--NeedCopy-->

```

W3C log entries are created with the following format:

```

1 #Version: 1.0
2 #Fields: date time cs-method cs-uri
3 #Date: 12-Jun-2001 12:34
4 2001-06-12 12:34:23 GET /sports/football.html 2001-06-12 12:34:30
5 GET /sports/football.html
6 <!--NeedCopy-->

```

## Entries

Entries consist of a sequence of fields relating to a single HTTP transaction. Fields are separated by white space. Citrix recommends the use of tab characters. If a field in a particular entry is not used, a dash (-) marks the omitted field.

## Directives

See the [Directives](#) table for the information about the logging process. Lines beginning with the pound sign (#) contain directives.

### Example:

The following sample log file shows the log entries in W3C Extended log format:

```

1 #Version: 1.0
2 #Fields: time cs-method cs-uri
3 #Date: 12-Jan-1996 00:00:00

```

```

4 00:34:23 GET /sports/football.html
5 12:21:16 GET /sports/football.html
6 12:45:52 GET /sports/football.html
7 12:57:34 GET /sports/football.html
8 <!--NeedCopy-->

```

### Fields

The Fields directive lists a sequence of field identifiers that specify the information recorded in each entry. Field identifiers might have one of the following forms:

- **identifier:** Relates to the transaction as a whole.
- **prefix-identifier:** Relates to information transfer between parties defined by the value prefix.
- **prefix (header):** Specifies the value of the HTTP header field header for transfer between parties defined by the value prefix. Fields specified in this manner always have the type.

The following table describes defined prefixes.

Prefix	Specifies
c	Client
s	Server
r	Remote
cs	Client to server
sc	Server to client
sr	Server to remote server (prefix used by proxies)
rs	Remote server to server (prefix used by proxies)
x	Application-specific identifier

### Examples:

The following examples are defined identifiers that use prefixes:

**cs-method:** The method in the request sent by the client to the server.

**sc(Referer):** The [Referer](#) field in the reply.

**c-ip:** The IP address of the client.

### Identifiers

The following table describes the W3C Extended log format identifiers that do not require a prefix.

Identifier	Description
date	The date on which the transaction was done.
time	The time when the transaction is done.
time-taken	The time taken (in seconds) for the transaction to complete.
bytes	The number of bytes transferred.
cached	Records whether a cache hit has occurred. A zero indicates a cache misses.

The following table describes the W3C Extended log format identifiers that require a prefix.

Identifier	Description
IP	The IP address and the port number.
DNS	The DNS name.
status	The status code.
comment	The comment returned with a status code.
method	The method.
url	The URL.
url-stem	The stem portion of the URL.
url-query	The query portion of the URL.

The W3C Extended Log file format allows you to choose log fields. These fields are shown in the following table.

Field	Description
Date	The date on which the transaction is done.
Time	The time when the transaction is done.
Client IP	The IP address of the client.
User Name	The user name.
Service Name	The service name, which is always HTTP.
Server IP	The server IP address.

---

Field	Description
Server Port	The server port number
Method	The request method (for example; GET, POST).
Url Stem	The URL stem.
Url Query	The query portion of the URL.
HTTP Status	The status code in the response.
Bytes Sent	The number of bytes sent to the server (request size, including HTTP headers).
Bytes Received	The number of bytes received from the server (response size, including HTTP headers).
Time Taken	The time taken for a transaction to complete, in seconds.
Protocol Version	The version number of HTTP being used by the client.
User Agent	The <b>User-Agent</b> field in the HTTP protocol.
Cookie	The <b>Cookie</b> field of the HTTP protocol.
Referer	The <b>Referer</b> field of the HTTP protocol.

---

## Create a custom log format

You can customize the display format of the log file data manually or by using the NSWL library. By using the custom log format, you can derive most of the log formats that Apache currently supports.

### Create a custom log format by using the NSWL library

Use one of the following NSWL libraries depending on whether the NSWL executable has been installed on a Windows or Solaris host computer:

- **Windows:** The `nswl.lib` library in the `\ns\bin` directory on the system manager host computer.
- **Solaris:** The `libnswl.a` library in `usr/local/netscaler/bin`.

1. Add the following two C functions defined by the system in a C source file:

`ns_userDefFieldName()`: This function returns the string that must be added as a custom field name in the log record.

ns\_userDefFieldVal(): This function implements the custom field value, then returns it as a string that must be added at the end of the log record.

2. Compile the file into an object file.
3. Link the object file with the NSWL library (and optionally, with third party libraries) to form a new NSWL executable.
4. Add a %d string at the end of the logFormat string in the configuration file (log.conf).

### Example:

```

1 #####
2 # A new file is created every midnight or on reaching 20MB file size,
3 # and the file name is
4 /datadisk5/netScaler/log/NS<hostname>/Nsmdddy.log and create
5 digital
6 #signature field for each record.
7 BEGIN CACHE_F
8 logFormat custom "%a - "%{
9 user-agent }
10 i" [%d/%B/%Y %T -%g] "%x"
11 %s %b%{
12 referrer }
13 i "%{
14 user-agent }
15 i" "%{
16 cookie }
17 i" %d "
18 logInterval Daily
19 logFileSizeLimit 20
20 logFilenameFormat
21 /datadisk5/netScaler/log/%v/NS%` {
22 `%m%d%y }
23 t.log
24 END CACHE_F
25 <!--NeedCopy-->

```

### Create a Custom log format manually

To customize the format in which log file data must appear, specify a character string as the argument of the **LogFormat log** property definition. The following is an example where character strings are used to create a log format:

```

1 LogFormat Custom ""%a - "%{
2 user-agent }
3 i" "[%d/%m/%Y]t %U %s %b %T"
4 <!--NeedCopy-->

```

- The string can contain the “c” type control characters \n and \t to represent new lines and tabs.

- Use the Esc key with literal quotes and backslashes.

The characteristics of the request are logged by placing % directives in the format string, which are replaced in the log file by the values.

If the %v (Host name) or %x (URL suffix) format specifier is present in a log file name format string, the following characters in the file name are replaced by an underscore symbol in the log configuration file name:

" \* . / : < > ? \ |

Characters whose ASCII values lie in the range of 0-31 are replaced by the following:

%<ASCII value of character in hexadecimal>.

For example, the character with ASCII value 22 is replaced by %16.

**Caution:**

If the %v format specifier is present in a log file name format string, a separate file is opened for each virtual host. To ensure continuous logging, the maximum number of files that a process can have open must be sufficiently large. See your operating system documentation for a procedure to change the number of files that can be opened.

**Create Apache log formats**

You can derive from the custom logs most of the log formats that Apache currently supports. The custom log formats that match Apache log formats are:

NCSA/combined: LogFormat custom %h %l %u [%t] "%r"%s %B "%{referer}i" "%{user-agent}i"

NCSA/Common: LogFormat custom %h %l %u [%t] "%r"%s %B

Referer Log: LogFormat custom "%{referer}i" -> %U

User agent: LogFormat custom %{user-agent}i

Similarly, you can derive the other server log formats from the custom formats.

**Arguments for defining a custom log format**

The following table describes the custom log format.

Argument	Specifies
%a	Remote IPv4 address.
%A	Local IPv4 address.

---

Argument	Specifies
%a6	Remote IPv6 address.
%A6	Local IPv6 address.
%B	Bytes sent, excluding the HTTP headers (response size).
%b	Bytes received, excluding the HTTP headers (request size).
%d	User-defined field.
%K	Client port information.
%e1	Value of the first custom HTTP request header.
%e2	Value of the second custom HTTP request header.
%E1	Value of the first custom HTTP response header.
%E2	Value of the second custom HTTP response header. Note: For instructions on how to export customHTTP headers, see <a href="#">Configuring the NetScaler for Web Server Logging</a>
%g	Greenwich Mean Time offset (for example, -0800 for Pacific Standard Time).
%h	IPv4 address of a remote host.
%h6	IPv6 address of a remote host.
H	Request protocol.
% {Foobar}i	Contents of the Foobar: header line(s) in the request sent to the server. The system supports the User -Agent, Referer, and cookie headers. The + after the % in this format informs the logging client to use the + as a word separator.
%j	Bytes received, including headers(request size).
%J	Bytes sent, including headers (response size).
%l	Remote log name (from identd, if supplied).
%m	Request method.
%M	Time taken to serve the request (in microseconds).

---

Argument	Specifies
% {Foobar}o	Contents of Foobar: header line(s) in the reply. USER -AGENT, Referrer, and cookie headers (including set cookie headers) are supported.
%p	Canonical port of the server serving the request.
%P	The admin partition.
%q	Query string (prefixed with a question mark (?) if a query string exists).
%r	First line of the request.
%s	Requests that were redirected internally, this is the status of the original request.
%t	Time, in common log format (Standard English time format).
% {format}t	Time, in the form given by format, must be in the strftime(3) format. For format descriptions, see Time Format Definition.
%T	Time taken to serve the request, in seconds.
%u	Remote user (from auth; may be bogus if return status (%s) is 401).
%U	URL path requested.
%v	Canonical name of the server serving the request.
%V6	Virtual server IPv6 address in the system, if load balancing, content switching, and/or cache redirection is used.
%D	Prints the HTTP transaction ID.
%L	Transaction time in milliseconds.
%R	HTTP Reason string mapped to status code.
%f	Source port logging.
%V	Virtual Server IPv4 address.

---

**Note**

For instructions on how to export custom HTTP headers, see [Configuring the NetScaler for Web Server Logging](#)

For example, if you define the log format as `%+{ user-agent } i`, and if the user agent value is NetScaler system Web Client, then the information is logged as NetScaler system+Web+Client. An alternative is to use double quotation marks. For example, `"%{user-agent}i"` logs it as "NetScaler system Web Client." Do not use the `\<Esc\>` key on strings from `%.r`, `%.i` and, `%.o`. It complies with the requirements of the Common Log Format. Clients can insert control characters into the log. Therefore, you must take care when working with raw log files.

### Time format definition

The following table describes the time format definition to know about the format part of the `%{ format } t` string described in the Custom Log Format table. Values within brackets ([ ]) show the range of values that appear. For example, [1,31] in the `%d` description in the following table shows `%d` ranges from 1 to 31.

Argument	Specifies
<code>%%</code>	The same as <code>%</code> .
<code>%a</code>	The abbreviated name of the weekday for the locale.
<code>%A</code>	The full name of the weekday for the locale
<code>%b</code>	The abbreviated name of the month for the locale.
<code>%B</code>	The full name of the month for the locale.
<code>%C</code>	The century number (the year divided by 100 and truncated to an integer as a decimal number [1, 99]); single digits are preceded by a 0.
<code>%d</code>	User-defined field.
<code>%K</code>	The century number (the year divided by 100 and truncated to an integer as a decimal number [1, 99]); single digits are preceded by a 0.
<code>%e</code>	The day of month [1, 31]; single digits are preceded by a blank.
<code>%h</code>	The abbreviated name of the month for the locale.
<code>%H</code>	The hour (24-hour clock) [0, 23]; single digits are preceded by a 0.
<code>%l</code>	The hour (12-hour clock) [1, 12]; single digits are preceded by a 0.

---

Argument	Specifies
%j	The number of the day in the year [1, 366]; single digits are preceded by 0.
%k	The hour (24-hour clock) [0, 23]; single digits are preceded by a blank.
%l	The hour (12-hour clock) [1, 12]; single digits are preceded by a blank.
%m	The number of the month in the year [1, 12]; single digits are preceded by a 0.
%M	The minute [00, 59]; leading 0 is permitted but not required.
%n	Inserts a new line.
%p	The equivalent of either a.m. or p.m. for the locale.
%r	The appropriate time representation in 12-hour clock format with %p
%S	The seconds [00, 61]; the range of values is [00, 61] rather than [00, 59] to allow for the occasional leap second and for the double leap second.
%3	The milliseconds [000, 999]; the range of values is [000, 999].
%6	The microseconds [000000, 999999]; the range of values is [000000, 999999].
%9	The nanoseconds [000000000, 999999999]; the range of values is [000000000, 999999999].
%t	Inserts a tab.
%u	The day of the week as a decimal number [1, 7]. 1 represents Sunday, 2 represents Tuesday and so on.
%U	The number of the week in the year as a decimal number [00, 53], with Sunday as the first day of week 1.

---

**Note:**

If you specify a conversion that does not correspond to any of the ones described in the preceding table, or to any of the modified conversion specifications listed in the next paragraph, the behavior is undefined and returns 0.

The difference between %U and %W (and also between modified conversions %OU and %OW) is the day considered to be the first day of the week. Week number 1 is the first week in January (starting with a Sunday for %U, or a Monday for %W). Week number 0 contains the days before the first Sunday or Monday in January for %U and %W.

## Display server logs

You can configure an NSWL feature to display server logs on the console or redirect server logs to a directory on the NetScaler appliance.

There are two ways to display logs on the console (standard output):

Option 1: Display all logs on the console.

Option 2: Display only selected logs on the console with filters with `logfileformat` as `STDOUT`.

## Call Home

April 8, 2024

Appliances might sometimes fail to perform well because of software or hardware issues. In such cases, NetScaler needs to collect data and perform issue resolution before a potential impact can occur at the customer site. By enabling Call Home on your NetScaler appliance, you can automate the error notification process. Not only you avoid calling NetScaler support, raising a service request, and uploading system data before the support team can troubleshoot the issue, but support can identify and address an issue before it occurs. Call Home periodically monitors the appliance and automatically uploads data to the Citrix technical support server. In addition, the incoming Call Home data provide insights about NetScaler usage. Multiple teams within Citrix can use this data to better design, support, and implement NetScaler.

By default, Call Home is enabled on all platforms and all flavors of NetScaler (MPX, VPX, SDX). By having this feature enabled, you allow Citrix to collect NetScaler deployment and telemetry data for better implementation, and support service.

### Note

You can also see the [Call Home FAQ](#) page for information pertaining to Call Home.

## Benefits

Call Home provides the following benefits.

- Monitor hardware and software error conditions. For more information, see Monitor critical error conditions section.
- Notify critical events that impact your network.
- Send performance data and system usage details to Citrix to:
  - Analyze and improve product quality.
  - Provide real-time troubleshooting information for proactive issue identification, and faster issue resolution.

## Platform support

Call Home feature is supported on all NetScaler platforms and all appliance models (MPX, VPX, and SDX).

- NetScaler MPX: All MPX models.
- NetScaler VPX: All VPX models, including VPX appliances that obtain their license from external or central licensing pools.
- NetScaler SDX: Monitors the disk drive and assigned SSL chips for any errors or failures. The VPX instances, however, do not have access to the Power Supply Unit (PSU) and therefore their status is not monitored. In an SDX platform, you can configure Call Home either directly on an individual instance or through the SVM.

## Prerequisites

To use Call Home, the NetScaler appliance must have the following:

- **Internet connection.** Call Home requires an internet connection for the NetScaler to connect to the NetScaler support server for uploading a data archive. NetScaler uses the NSIP for communicating with [callhome.citrix.com](https://callhome.citrix.com).
- **URL.** Call Home works by exchanging traffic with [callhome.citrix.com](https://callhome.citrix.com) over SSL/TLS protocol using port 443 for bi-directional traffic.

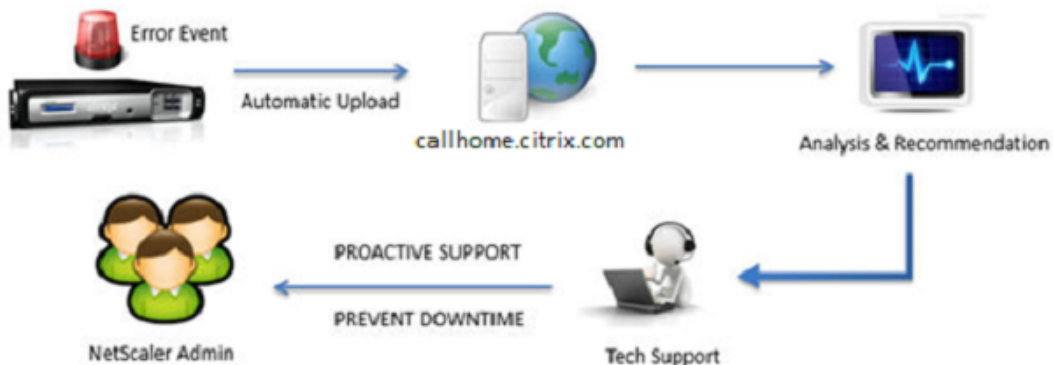

## How Call Home works

The following figure shows a basic workflow of Call Home in a NetScaler appliance deployed at a customer site.

### Step 1: Appliance Registration

### Step 2: Trigger Based Upload

The following are the workflow of a Call Home:

- 1. Set up Internet Connectivity.** For Call Home to upload system data, your appliance must have an internet connectivity. If it does not, you can configure a proxy server configuration to provide internet connectivity. For more information, see [Configuring Call Home](#) section.
- 2. Enable Call Home.** When upgrading your appliance to the latest software through either NetScaler command interface or GUI, Call Home is enabled by default and the system delays the registration process by 24 hours. During this period, you can choose to manually disable the feature, but Citrix recommends you to have it enabled.

#### Note

If you are upgrading your appliance from an older version that explicitly has Call Home disabled, the system still enables the feature by default and displays a notification message on your first login.

In addition, if you are doing any configuration changes for an internet connectivity, you must disable and enable Call Home. It enables Call Home to register with the Citrix Insight Services (CIS) server without any failure errors.

**3. Register the NetScaler appliance on the NetScaler support Server.** When Call Home registers the appliance with the NetScaler support server, the server checks the database for the validity of the appliance serial number. If the serial number is valid, the server registers the appliance for Call Home service and sends a successful registration response. Otherwise, the server sends back a registration failure message. The basic system information is sent as a separate message. The data includes memory and CPU usage details along with the throughput numbers. The data is sent periodically as part of the heartbeat message every 7 days, by default. However, a value of less than 5 days is not recommended, because frequent uploads are not useful.

**4. Monitor critical error conditions.** Once registered, Call Home starts monitoring the appliance. The following table lists the conditions Call Home can monitor on the appliance.

Critical Error Condition	Description	Call Home Monitoring Interval	Corresponding SNMP Alarm Name
Compact flash drive errors	The compact flash drive on the appliance encountered read or write failures.	24 hours	COMPACT-FLASH-ERRORS
Hard disk drive errors	The hard drives on the appliance encountered read or write failures.	24 hours	HARD-DISK-DRIVE-ERRORS
Power supply unit failure	One of the power supply units on the NetScaler appliance has failed.	7 seconds	POWER-SUPPLY-FAILURE
SSL card failure	One of the SSL cards on the NetScaler appliance has failed.	7 seconds	SSL-CARD-FAILED
Warm restart	The appliance has warm restarted due to a failure of a system process.	After every restart of the NetScaler appliance.	WARM-RESTART-EVENT
Memory anomaly error	Memory utilization progressively increases above its normal limit and exceeds the threshold.	1 day	No SNMP alarm

Critical Error Condition	Description	Call Home Monitoring Interval	Corresponding SNMP Alarm Name
Rate limit packet drop	The throughput limits or packets-per-second (pps) limits is reached.	7 seconds	PF-RL-PPS-PKTS-DROPPED, PF-RL-RATE-PKTS-DROPPED

**5. Upload Call Home data.** If any one of the previous critical conditions is identified on the appliance, the Call Home feature automatically notifies the NetScaler support. The support archives are uploaded to the NetScaler support server. Also, you can configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever Call Home upload happens. The SNMP alert notifies the local administrator about the critical event.

#### Note

Call Home creates the Call Home tar file and uploads it to the Citrix tech support server for only the first occurrence of a particular error condition since the last reboot. If you want the appliance to send alerts each time a particular error condition occurs, configure the corresponding SNMP alarm for the error condition.

**6. Create Service Request.** Call Home automatically creates a service request for all the critical hardware related events. The events are classified as; power supply failure, SSL card failure, hard disk drive errors, and compact flash errors. For other errors, after you review the System Logs, you can contact the NetScaler support team to raise a service request for investigation.

## Configuring Call Home

To configure Call Home, verify the internet connectivity on the appliance and ensure that a DNS name-server is configured. If there is no internet connection, configure a proxy server or service. Then, enable Call Home on the appliance and verify the registration status of the appliance with the NetScaler support server. Once registered, Call Home can monitor and upload data. In addition, you can configure SNMP alarms to notify the administrator at the customer site.

To configure Call Home, you can use either the NetScaler command interface or the GUI to do the following tasks:

- Enable Call Home.
- Configure Call Home for optional proxy server parameters.
- Verify Call Home Registration Status.
- View errors and timestamp details.
- Configure SNMP Alarms.

## To configure Call Home by using the NetScaler command interface

The NetScaler command interface enables you to do the following:

### Enabling Call Home

At the command prompt, type:

```
enable ns feature callhome
```

### Configuring Call Home for optional proxy server parameters

Call Home enables you to configure the optional proxy server for internet connectivity. You can either configure a proxy server with IP address and port or configure a proxy authentication service with one-way or two-way authentication.

### To configure optional proxy server with IP address and port

At the command prompt, type:

```
set callhome -proxyMode (YES | NO)[-IPAddress <ip_addr|ipv6_addr
|*>] [-port <port |*>]
```

```
1 set callhome - proxyMode YES - IPAddress 10.102.167.33 - port 80
2 <!--NeedCopy-->
```

#### Note

Call Home uses the proxy server only when you set the proxy-mode parameter to YES. If you set it to NO, the proxy functionality does not work, even if the IP address and port are configured. The port number must be for an HTTP service, not for an HTTPS service.

### To configure optional proxy authentication service

This mode provides two types of security authentication: one-way and two-way. To set up either type, you must configure an SSL service. For more information, see [Configuring an SSL Service](#) topic.

In one-way authentication, only the NetScaler appliance authenticates the proxy server. In two-way authentication, the NetScaler appliance authenticates the proxy server and the proxy server, in turn, authenticates the appliance.

### To configure proxy authentication service

At the command prompt, type:

```
set callhome -proxyMode (YES | NO)[-proxyAuthService <string>]
```

```
1 set callhome - proxyMode YES - proxyAuthService callhome_proxy
2 <!--NeedCopy-->
```

### To configure one-way proxy server authentication

Do the following tasks to configure one-way proxy server authentication.

1. Create an SSL service.
2. Bind a CA certificate to the service.
3. Bind an HTTPS Monitor to the service.
4. Configure Call Home to use the SSL service.

To configure two-way proxy server authentication

Do the following tasks to configure two-way proxy server authentication.

1. Create an SSL service
2. Bind a CA certificate to the service.
3. Bind a Client Certificate.
4. Bind an HTTPS Monitor to the service.
5. Configure Call Home to use the SSL service.

Verifying Call Home Registration status

At the command prompt, type:

```

1 show callhome
2
3 show callhome
4
5 Registration with Citrix upload server SUCCESSFUL
6
7 Mode: Default
8
9 Contact email address: exampleadmin@example.com
10
11 Heartbeat Custom Interval (days): 7
12
13 Proxy Mode: Yes
14
15 Proxy IP Address:10.102.29.200
16
17 Proxy Authentication Service:
18
19 Proxy Port: 80
20
21 Trigger event State First occurrence
22 Latest occurrence
23 -----
24
25 1) Warm boot Enabled N/A
26 ..
27 2) Compact flash errors Enabled ..
28 ..

```

```

29 3) Hard disk drive errors Enabled ..
 ..
30
31 4) SSL card failure N/A N/A
 N/A
32
33 5) Power supply unit failure N/A N/A
 N/A
34
35 6) Rate limit packet drops Enabled ..
 ..
36
37 7) Memory anomaly Enabled ..
 ..
38
39 Done
40 <!--NeedCopy-->

```

**Note**

If the Call Home fails to register with CIS, the appliance displays an error message.

**Enabling SNMP Alarms**

The NetScaler appliance provides a set of error condition entities called *SNMP alarms*. When an error condition in an SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the SSL-CARD-FAILED alarm is enabled, a trap message is generated and sent to the trap listener. The trap message is sent whenever there is an SSL card failure on the appliance. For more information, see [SNMP](#).

At the command prompt, type:

```
enable snmp alarm <trapName>
```

```
show snmp alarm <trapName>
```

**To configure Call Home by using GUI**

To verify if the Call Home feature is enabled by default in the GUI

1. Navigate to **Configuration > System > Settings**.
2. In the **details** pane, click **Configure Advanced features** link.
3. In the **Configure Advanced Features** page, **Call Home** option must display as enabled.

To enable Call Home by using GUI

1. Navigate to **Configuration > System > Settings**.
2. In the **details** pane, click **Configure Advanced features** link and select **Callhome** option.

To configure Call Home for optional proxy mode authentication by using GUI

1. You can use any of the two ways to access the Call Home page:
  - a) Navigate to **System > System Information**.
  - b) Navigate to **System > Diagnostics**.
    - i. In the details pane, under **Technical Support Tools**, select **Call Home**.
2. On the **Configure Call Home** page, set the following parameters.
  - a) **Mode**. Call Home mode of operation. Possible types: Default, Citrix Service Provider (CSP) deployment.

**Note**

This option is not user configurable. The mode is automatically determined and set based on the type of NetScaler deployment.
  - b) **Email address**. Email address of the contact administrator at the customer site.
  - c) **CallHome Heartbeats Interval (days)**. Monitoring interval (in days) between Call Home heartbeats. Minimum value=1 and Maximum value=30.
  - d) **Enable Call Home**. Enable or disable the Call Home feature to view the status of appliance registration on the NetScaler support server.
  - e) **Proxy Mode**. If you do not have an internet connectivity, enable proxy mode and set the optional proxy parameters.
  - f) **Proxy Server**. If you set the proxy mode by using a proxy server, specify the server IP address.
    - i. **Proxy Service**. If you set the proxy mode by using a proxy service, specify the service name.
    - ii. **IP Address**. IP address of the proxy server.
    - iii. **Port**. Port number of the proxy server.
    - iv. **Proxy Authentication SSL Service**. The name of the proxy service that provides proxy-mode authentication.
3. Click **OK** and **Done**.

To configure SSL service for proxy server authentication by using GUI

For information about configuring the SSL service by using the GUI, see [Configuring an SSL Service](#) topic.

To verify Call Home registration status by using the GUI

1. You can use any of the two ways to access the **Call Home** page:
  - a) Navigate to **System > System Information**.

- b) Navigate to **System > Diagnostics**.
  - i. In the details pane, under **Technical Support Tools**, select **Call Home**.
2. In the **Configure Call Home** page, the **Registration with Citrix upload server** field shows the registration status.

To configure an SNMP alarm

1. Navigate to **System > SNMP > Alarms**.
2. In the details pane, select an alarm and configure its parameters.
3. Click **OK** and **Close**.

## Citrix Service Provider (CSP) deployment support

In a Citrix Service Provider (CSP) environment where NetScaler services are deployed on VPX instances, Call Home can monitor and track the license-specific information and securely send the information to Citrix Insight Services (CIS). CIS in turn sends the information to the License Usage Insights (LUI) portal for accounting purposes and for CSP customers to review their license usage. Currently, CSP environments support NetScaler services on VPX instances only, not on MPX or SDX appliances. The VPX instances can be deployed in either standalone or high availability mode.

## Reporting tool

May 2, 2023

Use the Citrix® NetScaler® Reporting tool to view NetScaler performance statistics data as reports. Statistics data are collected by the `nscollect` utility and are stored in a database. When you want to view certain performance data over a period, the Reporting tool pulls out specified data from the database and displays them in charts.

Reports are a collection of charts. The Reporting tool provides built-in reports and the option to create custom reports. In a report, you can modify the charts and add new charts. You can also modify the operation of the data collection utility, `nscollect`, and stop or start its operation.

## Using the reporting tool

The Reporting tool is a web-based interface accessed from the Citrix® NetScaler® appliance. Use the Reporting tool to display the performance statistics data as reports containing graphs. In addition to using the built-in reports, you can create custom reports, which you can modify at any time. Reports can have between one and four charts. You can create up to 256 custom reports. You can create a custom report for any number of entities.

## Invoke the reporting tool

1. Use the Web browser of your choice to connect to the IP address of the NetScaler (for example, <http://10.102.29.170/>). The Web Logon screen appears.
2. In the User Name text box, type the user name assigned to the NetScaler.
3. In the Password text box, type the password.
4. In the Start in drop-down list box, select Reporting. Click Login.

The following screenshots show the report toolbar and the chart toolbar, which are frequently referenced in this documentation.

Figure 1. Report Toolbar

Figure 2. Chart Toolbar

## Working with reports

You can plot and monitor statistics for the various functional groups configured on the NetScaler over a specified time interval. Reports enable you to troubleshoot or analyze the behavior of your appliance. There are two types of reports: built-in reports and custom reports. Report content for built-in or custom reports can be viewed in a graphical format or a tabular format. The graphical view consists of line, area, and bar charts that can display up to 32 sets of data (counters). The tabular view displays the data in columns and rows. This view is useful for debugging error counters.

The default report that is displayed in the Reporting tool is CPU versus Memory Usage and HTTP Requests Rate. You can change the default report view by displaying the report you want as your default view, and then clicking **Default Report**.

Reports can be generated for the last hour, last day, last week, last month, last year, or you can customize the duration.

You can do the following with reports:

- Toggle between a tabular view of data and a graphical view of data.
- Change the graphical display type, such as bar chart or line chart.
- Customize charts in a report.
- Export the chart as an Excel comma-separated value (CSV) file.
- View the charts in detail by zooming in, zooming out, or using a drag operation (scrolling).
- Set a report as the default report for viewing whenever you log on.

- Add or remove counters.
- Print reports.
- Refresh reports to view the latest performance data.

### Using built-in reports

The Reporting tool provides built-in reports for frequently viewed data. Built-in reports are available for the following functional groups: System, Network, SSL, Compression, Integrated Cache, NetScaler Gateway, and NetScaler Application Firewall. By default, the built-in reports are displayed for the last day. However, you can view the reports for the last hour, last week, last month, or last year.

#### Note:

You cannot save changes to built-in reports, but you can save a modified built-in report as a custom report.

### Display a built-in report

1. In the left pane of the Reporting tool, under Built-in Reports, expand a group (for example, SSL).
2. Click a report (for example, **SSL > All Backend Ciphers**).

### Creating and deleting reports

You can create your own custom reports and save them with user-defined names for reuse. You can plot different counters for different groups based on your requirements. You can create up to 256 custom reports.

You can either create a report or save a built-in report as a custom report. By default, a newly created custom report contains one chart named System Overview, which displays the CPU Usage counter plotted for the last day. You can customize the interval and set the data source and time zone from the report toolbar.

### Create a custom report

1. In the **Reporting** tool, on the report toolbar, click **Create**, or if you want to create a custom report based on an existing report, open the existing report, and then click **Save As**.
2. In **Report Name** box, type a name for the custom report.
3. Do one of the following:
  - To add the report to an existing folder, in Create in or Save in, click the down arrow to choose an existing folder, and then click **OK**.

- To create a new folder to store the report, click the Click to add folder icon, in Folder Name, type the name of the folder, and in Create in, specify where you want the new folder to reside in the hierarchy, and then click **OK**.

**Note:**

You can create up to 128 folders.

### Delete a custom report

1. In the left pane of the Reporting tool, next to Custom Reports, click the Click to manage the custom reports icon.
2. Select the check box that corresponds with the report you want to delete, and then click Delete.

**Note:**

When you delete a folder, all the contents of that folder are deleted.

### Modifying the time interval

By default, built-in reports display data for the last day. However, if you want to change the time interval for a built-in report, you can save the report as a custom report. The new interval applies to all charts in the report. The following table describes the time-interval options.

### Modify the time interval

1. In the left pane of the Reporting tool, click a report.
2. On the report toolbar, click **Duration**, and then click a time interval.

### Setting the data Source and time zone

You can retrieve data from different data sources to display them in the reports. You can also define the time zone for the reports and apply the currently displayed report's time selection to all the reports, including the built-in reports.

### Set the data source and time zone

1. In the **Reporting tool**, on the report toolbar, click **Settings**.
2. In the **Settings** dialog box, in Data Source, select the data source from which you want to retrieve the counter information.
3. Do one or both of the following:

- If you want the tool to remember the time period for which a chart is plotted, select the **Remember time selection for charts** check box.
- If you want the reports to use the time settings of your NetScaler appliance, select the **Use Appliance's time zone** check box.

## Exporting and importing custom reports

You can share reports with other NetScaler administrators by exporting reports. You can also import reports.

### Export or import custom reports

1. In the left pane of the Reporting tool, next to Custom Reports, click the **Click to manage custom reports** icon.
2. Select the check box that corresponds with the report you want to export or import, and then click **Export** or **Import**.

**Note:**

When you export the file, it is exported in a .gz file format.

## Working with charts

Use charts to plot and monitor counters or groups of counters. You can include up to four charts in one report. In each chart, you can plot up to 32 counters. The charts can use different graphical formats (for example, area and bar). You can move the charts up or down within the report, customize the colors and visual display for each counter in a chart, and delete a chart when you do not want to monitor it.

In all report charts, the horizontal axis represents time and the vertical axis represents the value of the counter.

### Adding a chart

When you add a chart to a report, the System Overview chart appears with the CPU Usage counter plotted for the last one day.

**Note:**

If you add charts to a built-in report, and you want to retain the report, you must save the report as a custom report.

Use the following procedure to add a chart to a report.

### Add a chart to a report

1. In the left pane of the Reporting tool, click a report.
2. Under the chart where you want to add the new chart, click the Add icon.

### Modifying a chart

You can modify a chart by changing the functional group for which the statistics are displayed and by selecting different counters.

### Modify a chart

1. In the left pane of the Reporting tool, click a report.
2. Under the chart that you want to modify, click Counters.
3. In the dialog box that appears, in the Title box, type a name for the chart.
4. Next to the Plot chart for, do one of the following:
  - To plot counters for global counters, such as Integrated Cache and Compression, click System global statistics.
  - To plot entity counters for entity types, such as Load Balancing and GSLB, click System entities statistics.
5. In the Select group, click the desired entity.
6. Under Counters, in Available, click one or more counter names that you want to plot, and then click the > button.
7. If you selected System entities statistics in step 4, on the Entities tab, under Available, click one or more entity instance names you want to plot, and then click the > button.
8. Click OK.

### Viewing a chart

You can specify the graphical formats of the plotted counters in a chart. Charts can be viewed as line charts, spline charts, step-line charts, scatter charts, area charts, bar charts, stacked area charts, and stacked bar charts. You can also zoom in, zoom out, or scroll inside the plot area of a chart. You can zoom in or out for all data sources for 1 hour, 1 day, 1 week, 1 month, 1 year, and 3 years.

Other options for customizing the view of a chart include customizing the axes of the charts, changing the background and edge color of the plot area, customizing the color and size of the grids, and customizing the display of each data set (counter) in a chart.

Data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in

first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

Whenever you modify a built-in report, you need to save the report as a custom report to retain your changes.

### Change the graph type of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart you want to view, on the chart toolbar, click **Customize**.
3. On the **Chart** tab, under **Category**, click **Plot type**, and then click the graph type you want to display for the chart. If you want to display the graph is 3D, select the Use 3D check box.

### Refocus a chart with detailed data

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Zoom In**, and do one or both of the following:
  - To refocus the chart to display data for a specific time window, drag the cursor from the start time to the end time. For example, you can view data for a one-hour period on a certain day.
  - To refocus the chart to display data for a data point, simply click once on the chart where you want to zoom in and get more detailed information.
3. Once you have the desired range of time for which you want to view detailed data, on the report toolbar, click Tabular View. Tabular view displays the data in numeric form in rows and columns.

### View numeric data for a graph

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click Tabular View. To return to the graphical view, click **Graphical View**.

**Note:** You can also view the numeric data in the graphical view by hovering your cursor over the notches in the gridlines.

### Scroll through time in a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Scroll**, and then click inside the chart and drag the cursor in the direction for which you want to see data for a new time period. For example, if you want to view data in the past, drag to the left.

### Change the background color and text color of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under **Category**, click one or more of the following:
  - To change the background color, click **Background Color**, and then select the options for color, transparency, and effects.
  - To change the text color, click Text **Color**, and then select the options for color, transparency, and effects.

### Customize the axes of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under Category, click one or more of the following:
  - To change the scale of the left y-axis, click **Left Y-Axis**, and then select the scale you want.
  - To change the scale of the right y-axis, click Right Y-Axis, in the data set to plot, select the date set, and then select the scale you want.

Note:

The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

- To plot each data set in its own hidden y-axis, click Multiple Axes, and then click Enable.

### Change the background color, edge color, and gridlines for a plot area of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the plot area, click **Customize**.
3. On the **Plot Area** tab, under Category, click one or more of the following:
  - To change the background color and edge color of the chart, click **Background Color and Edge Color**, and then select the options for color, transparency, and effects.
  - To change the horizontal or vertical grids of the chart, click **Horizontal Grids** or **Vertical Grids**, and then select the options for displaying the grids, grid width, grid color, transparency, and effects.

### Change the color and graph type of a data set

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the display of the data set (counters), click **Customize**.
3. On the **Data Set** tab, in Select Data Set, select the data set (counter) for which you want to customize the graphical display.

Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if

CPU usage and

Memory usage are displayed in first and second order at the bottom of the chart,

CPU usage is equal to

Data Set 1 and

Memory usage is equal to

Data Set 2.

4. Under Category, do one of more of the following:
  - To change the background color, click **Color**, and then select the options for color, transparency, and effects.
  - To change the graph type, click **Plot type**, and then select the graph type you want to display for the data set. If you want to display the graph as 3D, select the Use 3D check box.

**Exporting chart data to excel** For further data analysis, you can export charts to Excel in a comma-separated value (CSV) format.

To export chart data to excel

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart with the data you want to export to Excel, click **Export**.

### Deleting a chart

If you do not want to use a chart, you can remove it from the report. You can permanently remove charts from custom reports only. If you delete a chart from a built-in report and want to retain the changes, you need to save the report as a custom report.

### Delete a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart that you want to delete, click the **Delete** icon.

## Examples

### Display the trend report for CPU usage and memory usage for the last week

1. In the left pane of the Reporting tool, under Built-in Reports, expand System.
2. Click the report CPU versus Memory Usage and HTTP Requests Rate.
3. In the right pane, on the report toolbar, click **Duration**, and then click **Last Week**.

### Compare the bytes received rate and the bytes transmitted rate between the two interfaces for the last week

1. In the right pane, on the report toolbar, click Create.
2. In the **Report Name** box, type a name for the custom report (for example, Custom\_Interfaces), and then click **OK**. The report is created with the default System Overview chart, which displays the CPU Usage counter plotted for the last hour.
3. Under System Overview, on the chart toolbar, click Counters.
4. In the counter selection pane, in Title, type a name for the chart (for example, Interfaces bytes data).
5. In Plot chart for, click System entities statistics, and then in Select Group, select Interface.
6. On the **Entities** tab, click one or more interface names you want to plot (for example, 1/1 and 1/2), and then click the > button.
7. On the Counters tab, click Bytes received (Rate) and Bytes transmitted (Rate) and then click the > button.
8. Click **OK**.
9. On the report toolbar, click **Duration**, and then click **Last Week**.

## Stopping and starting the data collection utility

The data collection utility, `nscollect`, runs automatically when you start the NetScaler. This utility retrieves the application performance data and stores it in the form of data sources on the ADC. You can create up to 32 data sources. The default data source is `/var/log/db/default`.

The data collection utility creates databases for global counters and entity-specific counters, and uses this data to generate reports. Global-counter databases are created at `/var/log/db/<DataSourceName>`. The entity-specific databases are created based on the entities configured on the NetScaler, and a separate folder is created for each entity type in `/var/log/db/<DataSourceName/EntityNameDB>`.

The `nscollect` retrieves data once every 5 minutes. It keeps data in 5-minute granularity for one day, hourly for the last 30 days, and daily for three years.

You might have to stop and restart the data collection utility if data is not updated accurately or the reports display corrupted data.

### **Stop nscollect**

At the command prompt, type:

```
/netScaler/nscollect stop
```

### **Start nscollect on the current SSH session to the NetScaler:**

At the command prompt, type:

```
/netScaler/nscollect start
```

### **Start nscollect on the local system:**

At the command prompt, type:

```
/netScaler/nscollect start &
```

## **CloudBridge Connector**

May 2, 2023

**Note:** The current NetScaler 1000V release does not support this feature.

The CloudBridge Connector feature of the NetScaler appliance connects enterprise datacenters to external clouds and hosting environments, making the cloud a secure extension of your enterprise network. Cloud-hosted applications appear as though they are running on one contiguous enterprise network. With Citrix CloudBridge Connector, you can augment your datacenters with the capacity and efficiency available from cloud providers.

The CloudBridge Connector enables you to move your applications to the cloud to reduce costs and increase reliability.

In addition to using CloudBridge Connector between a datacenter and a cloud, you can use it to connect two datacenters for a high-capacity secure and accelerated link.

### **Understanding CloudBridge Connector**

To implement the Citrix CloudBridge Connector solution, you connect a datacenter to another datacenter or an external cloud by setting up a tunnel called the CloudBridge Connector tunnel.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between two NetScaler appliances, one in each datacenter.

To connect a datacenter to an external cloud (for example, Amazon AWS cloud), you set up a CloudBridge Connector tunnel between a NetScaler appliance in the datacenter and a virtual appliance (VPX) that resides in the Cloud. The remote end point can be a CloudBridge Connector or a NetScaler VPX with Premium license.

The following illustration shows a CloudBridge Connector tunnel set up between a datacenter and an

external cloud.

The appliances between which a CloudBridge Connector tunnel is set up are called the *end points* or *peers* of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel uses the following protocols:

- Generic Routing Encapsulation (GRE) protocol
- Open-standard IPsec Protocol suite, in transport mode

The GRE protocol provides a mechanism for encapsulating packets, from a wide variety of network protocols, to be forwarded over another protocol. GRE is used to:

- Connect networks running non-IP and non-routable protocols.
- Bridge across a wide area network (WAN).
- Create a transport tunnel for any type of traffic that needs to be sent unchanged across a different network.

The GRE protocol encapsulates packets by adding a GRE header and a GRE IP header to the packets.

The Internet Protocol security (IPsec) protocol suite secures communication between peers in the CloudBridge Connector tunnel.

In a CloudBridge Connector tunnel, IPsec ensures:

- Data integrity
- Data origin authentication

- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the transport mode in which the GRE encapsulated packet is encrypted. The encryption is done by the Encapsulating Security Payload (ESP) protocol. The ESP protocol ensures the integrity of the packet by using a HMAC hash function, and ensures confidentiality by using an encryption algorithm. After the packet is encrypted and the HMAC is calculated, an ESP header is generated. The ESP header is inserted after the GRE IP header and, an ESP trailer is inserted at the end of the encrypted payload.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version (IKE) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

- The two peers mutually authenticate with each other, using one of the following authentication methods:
  - **Pre-shared key authentication.** A text string called a pre-shared key is manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
  - **Digital certificates authentication.** The initiator (sender) peer signs message interchange data by using its private key, and the other receiver peer uses the sender's public key to verify the signature. Typically, the public key is exchanged in messages containing an X.509v3 certificate. This certificate provides a level of assurance that a peer's identity as represented in the certificate is associated with a particular public key.
- The peers then negotiate to reach agreement on:
  - An encryption algorithm.
  - Cryptographic keys for encrypting data in one peer and decrypting the data in the other.

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when two peers, CB1 and CB2, are communicating through a Connector tunnel, CB1 has two Security Associations. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets.

SAs expire after a specified length of time, which is called the *lifetime*. The two peers use the Internet Key Exchange (IKE) protocol (part of the IPSec protocol suite) to negotiate new cryptographic keys and establish new SAs. The purpose of the limited lifetime is to prevent attackers from cracking a key.

The following table lists some IPSec properties supported by a NetScaler appliance:

IPSec Properties	Types Supported
IKE Versions	V1, V2
IKE DH group	A NetScaler appliance supports only DH group 2 (1024 bits MODP algorithm) for both IKEv1 and IKEv2.
IKE Authentication Methods	Pre-shared key authentication, Digital certificates authentication
Encryption Algorithm	AES (128 bits), AES 256 (256 bits), 3DES
Hash Algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA384, HMAC SHA512, HMAC MD5

## Monitoring CloudBridge Connector tunnels

May 2, 2023

You can display the statistics for monitoring the performance of a CloudBridge Connector tunnel. To display CloudBridge Connector tunnel statistics on a NetScaler appliance, use the GUI or the NetScaler command line.

The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels on a NetScaler appliance.

Statistical counter	Specifies
Bytes Received	Total number of bytes received by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Sent	Total number of bytes sent by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Received	Total number of packets received by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.

<b>Statistical counter</b>	<b>Specifies</b>
Packets Sent	Total number of packets sent by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Received Rate	Number of bytes per second received by the NetScaler appliance through all the configured CloudBridge Connector tunnels.
Bytes Sent Rate	Number of bytes per second sent by the NetScaler appliance through all the configured CloudBridge Connector tunnels
Packets Received Rate	Number of bytes per second received by the NetScaler appliance through all the configured CloudBridge Connector tunnels
Packets Sent Rate	Number of bytes per second received by the NetScaler appliance through all the configured CloudBridge Connector tunnels

---

All these counters are reset to 0 when the NetScaler appliance is restarted. They do not increment during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key) phase on any configured CloudBridge Connector tunnel.
- IKE Security Association (SA) establishment phase on any configured CloudBridge Connector tunnel.

To display CloudBridge Connector tunnel statistics by using the NetScaler command line

At the command prompt, type:

- **stat ipsec counters**

To display CloudBridge Connector tunnel statistics by using the GUI

1. Access the GUI by using a web browser to connect to the IP address of the NetScaler appliance.
2. On the **Configuration** tab, navigate to **System > CloudBridge Connector**.
3. On the CloudBridge Connector page, click **Create/Monitor CloudBridge Connector**. The **IPSec Bytes** and **IPSec Packets** charts display the bytes received rate, bytes sent rate, packets received rate, and packets sent rate of all the CloudBridge Connector tunnels configured on the NetScaler appliance.

```
1 > stat ipsec counters
2 Secure tunnel(s) summary
3 Rate (/s) Total
4 Bytes Received 0 2811248
5 Bytes Sent 0 157460630
6 Packets Received 0 56787
7 Packets Sent 0 200910
8 Done
9 >
10 <!--NeedCopy-->
```

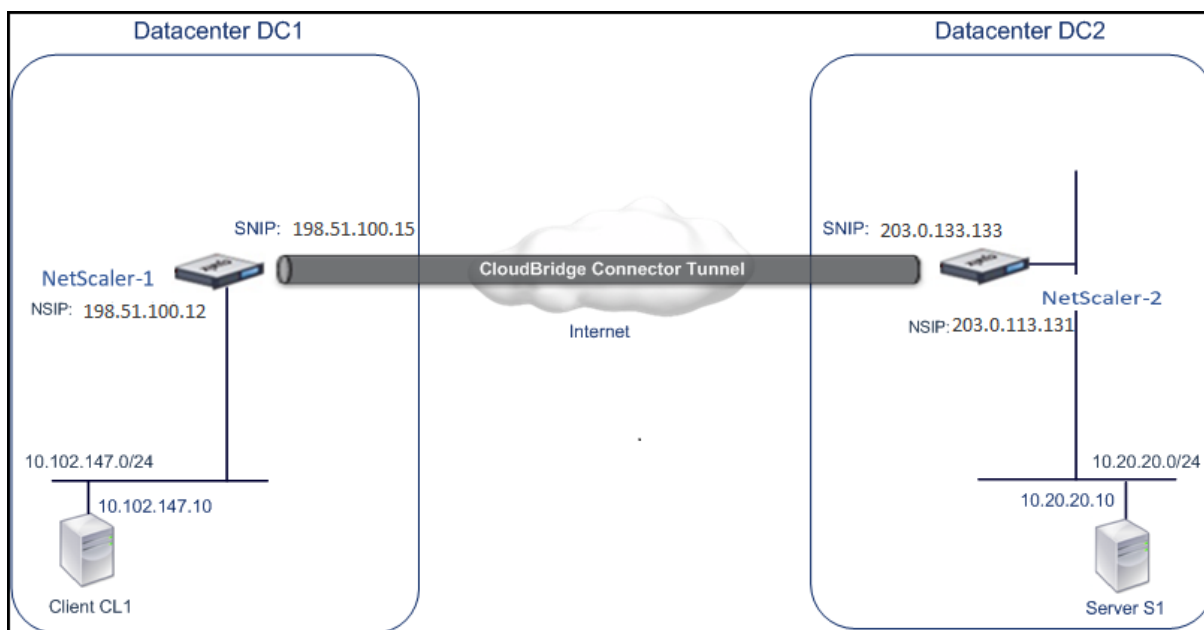

## Configuring a CloudBridge Connector tunnel between two datacenters

May 2, 2023

You can configure a CloudBridge Connector tunnel between two different datacenters to extend your network without reconfiguring it, and leverage the capabilities of the two datacenters. A CloudBridge Connector tunnel between the two geographically separated datacenters enables you to implement redundancy and safeguard your setup from failure. The CloudBridge Connector tunnel helps achieve optimal utilization of infrastructure and resources across datacenters. The applications available across the two datacenters appear as local to the user.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between a NetScaler appliance in one datacenter and a NetScaler appliance in the other datacenter.

As an illustration of CloudBridge Connector tunnel between datacenters, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance NS\_Appliance-1 in datacenter DC1 and NetScaler appliance NS\_Appliance-2 in datacenter DC2.

Both NS\_Appliance-1 and NS\_Appliance-2 function in L2 and L3 mode. They enable communication between private networks in datacenters DC1 and DC2. In L3 mode, NS\_Appliance-1 and NS\_Appliance-2 enable communication between client CL1 in datacenter DC1 and server S1 in the datacenter DC2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

Because client CL1 and server S1 are on different private networks, L3 mode is enabled on NS\_Appliance-1 and NS\_Appliance-2, and routes are updated as follows:

- CL1 has a route to NS\_Appliance-1 for reaching S1.
- NS\_Appliance-1 has a route to NS\_Appliance-2 for reaching S1.
- S1 has a route to NS\_Appliance-2 for reaching CL1.
- NS\_Appliance-2 has a route to NS\_Appliance-1 for reaching CL1.

The following table lists the settings on NetScaler appliance NS\_Appliance-1 in datacenter DC1.

The following table lists the settings on NetScaler appliance NS\_Appliance-2 in datacenter DC2.

Entity	Name	Details
The NSIP address		198.51.100.12
SNIP address		198.51.100.15

---

Entity	Name	Details
CloudBridge Connector tunnel	Cloud_Connector_DC1-DC2	<ol style="list-style-type: none"><li>1. Local endpoint IP address of the CloudBridge Connector tunnel: 198.51.100.15, 2. Remote endpoint IP address of the CloudBridge Connector tunnel: 203.0.113.133. GRE Tunnel Details Name = Cloud_Connector_DC1-DC2, IPSec Profile Details Name = Cloud_Connector_DC1-DC2, Encryption algorithm = AES, Hash algorithm = HMAC SHA1</li></ol>

---

### **Points to consider for configuring CloudBridge Connector tunnel**

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Deploy and set up a NetScaler appliance in each of the two datacenters.
2. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

### **Configuration procedure**

To set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in one datacenter and another NetScaler appliance that resides in the other datacenter, use the GUI or the command line interface of one of the NetScaler appliances.

When you use the GUI, the CloudBridge Connector tunnel configuration created on the first NetScaler appliance is automatically pushed to the other endpoint (the other NetScaler appliance) of the CloudBridge Connector tunnel. Therefore, you do not have to access the GUI of the other NetScaler appliance to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on each of the NetScaler appliances consists of the following entities:

- **IPSec profile**—An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **GRE tunnel**—An IP tunnel specifies the local IP address (a public SNIP address configured on the local NetScaler appliance), remote IP address (a public SNIP address configured on the remote NetScaler appliance), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the first datacenter and is destined to a server on the subnet in the second datacenter. If this packet matches the source and destination IP address range of the PBR entity on the NetScaler appliance in the first datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

- `add ipsec profile <name> [-ikeVersion ( V1 | V2 )] [-encAlgo ( AES | 3DES )...] [-hashAlgo <hashAlgo\> ...] [-lifetime <positive_integer>] (-psk | (-publickey<string> -privatekey <string>-peerPublicKey <string>)) [-livenessCheckInterval <positive_intege>] [-replayWindowSize \<positive_integer>] [-ikeRetryInterval <positive_integer>] [-retransmissiontime <positive_integer>]`
- `show ipsec profile <name>`

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

- `add ipTunnel <name> <remote><remoteSubnetMask> <local> [-protocol <protocol>] [-ipsecProfileName <string>]`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

- `add ns pbr <pbr_name> ALLOW -srcIP = <local_subnet_range> -destIP = <remote_subnet_range> -ipTunnel <tunnel_name>`
- `apply ns pbrs`
- `show ns pbr <pbr_name>`

#### Example

```
1 add ipsec profile Cloud_Connector_DC1-DC2 -encAlgo AES -hashAlgo
 HMAC_SHA1
2 Done
3 > add ipTunnel Cloud_Connector_DC1-DC2 203.0.113.133
 255.255.255.255 198.51.100.15 -protocol GRE -ipsecProfileName
 Cloud_Connector_DC1-DC2
4
5 Done
6 > add ns pbr PBR-DC1-DC2 ALLOW -srcIP 198.51.100.15 -destIP
 203.0.113.133 ipTunnel Cloud_Connector_DC1-DC2
7
8 Done
9 > apply ns pbrs
10
11 Done
12 <!--NeedCopy-->
```

To configure a CloudBridge Connector tunnel in a NetScaler appliance by using the GUI

1. Type the NSIP address of a NetScaler appliance in the address line of a web browser.
2. Log on to the GUI of the NetScaler appliance by using your account credentials for the appliance.
3. Navigate to **System > CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.  
The first time you configure a CloudBridge Connector tunnel on the appliance, a **Welcome** screen appears.
5. On the **Welcome** screen click **Get Started**.

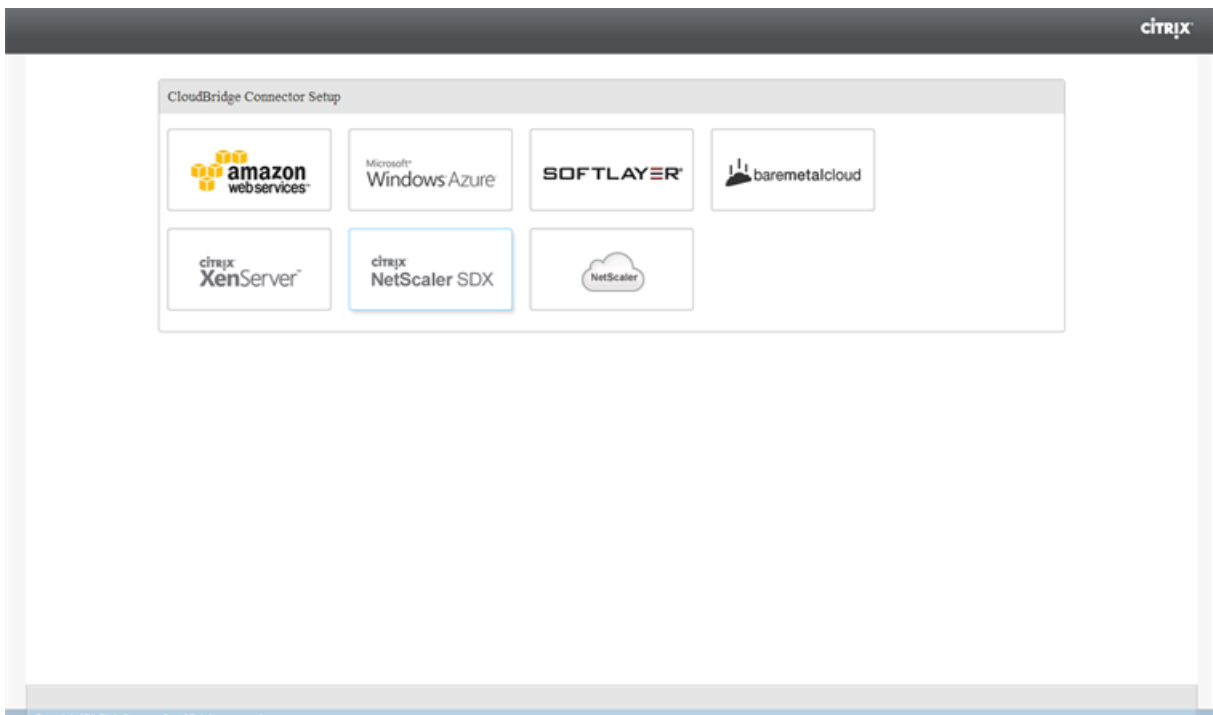

**Note:**

If you already have a CloudBridge Connector tunnel configured on the NetScaler appliance, the Welcome screen does not appear, so you do not click Get Started.

1. In the **CloudBridge Connector Setup** pane, click **NetScaler**.

1. In the NetScaler pane, provide your account credentials for the remote NetScaler appliance. Click **Continue**.
2. In the **CloudBridge Connector Setting** pane, set the following parameter:
  - **CloudBridge Connector Name**—Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.
3. Under **Local Setting**, set the following parameter:
  - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel.
4. Under **Remote Setting**, set the following parameter:
  - **Subnet IP**—IP address of the peer endpoint of the CloudBridge Connector tunnel.
5. Under **PBR Setting**, set the following parameters:
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Source IP Low**—Lowest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Source IP High**—Highest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Destination IP Low\***—Lowest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
  - **Destination IP High**—Highest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
6. (Optional) Under **Security Settings**, set the following IPSec protocol parameters for the CloudBridge Connector tunnel:
  - **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
  - **Hash Algorithm**—Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
  - **Key**—Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
    - **Auto Generate Key**—Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.

- **Specific Key**—Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
  - \* **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
- **Upload Certificates**—Authentication based on digital certificates.
  - \* **Public Key**—A local digital certificate to be used to authenticate the local NetScaler appliance to the peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
  - \* **Private Key**—Private key of the local digital certificate.
  - \* **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.

7. Click **Done**.

The new CloudBridge Connector tunnel configuration on both the NetScaler appliances appears on the Home tab of the respective GUI. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge Connectors pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

## Monitoring the CloudBridge Connector Tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

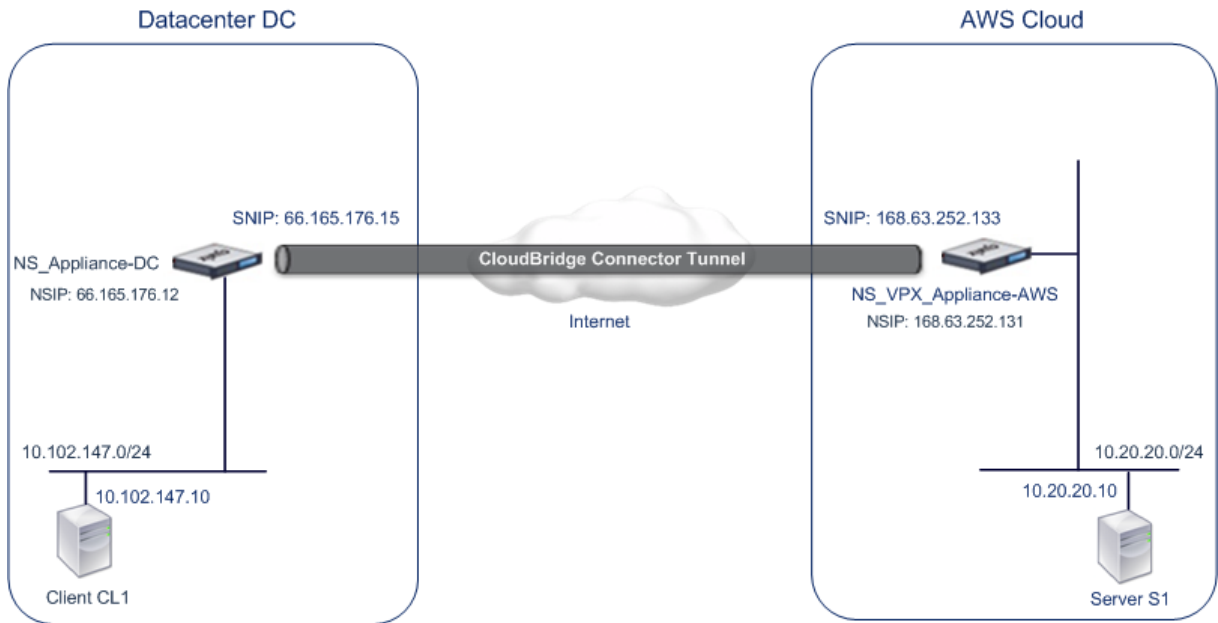

## Configuring CloudBridge Connector between datacenter and AWS cloud

May 2, 2023

You can configure a CloudBridge Connector tunnel between a datacenter and AWS cloud to leverage the infrastructure and computing capabilities of the data center and the AWS cloud. With AWS, you can extend your network without initial capital investment or the cost of maintaining the extended network infrastructure. You can scale your infrastructure up or down, as required. For example, you can lease more server capabilities when the demand increases.

To connect a datacenter to AWS cloud, you set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in the datacenter and a NetScaler virtual appliance (VPX) that resides in AWS cloud.

As an illustration of a CloudBridge Connector tunnel between a datacenter and Amazon AWS cloud, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance NS\_Appliance-DC, in datacenter DC, and NetScaler virtual appliance (VPX) NS\_VPX\_Appliance-AWS.

Both NS\_Appliance-DC and NS\_VPX\_Appliance-AWS function in L3 mode. They enable communication between private networks in datacenter DC and the AWS cloud. NS\_Appliance-DC and NS\_VPX\_Appliance-AWS enable communication between client CL1 in datacenter DC and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

**Note:**

AWS does not support L2 mode, hence it is necessary to have only L3 mode enabled on both the endpoints.

For proper communication between CL1 and S1, L3 mode is enabled on NS\_Appliance-DC and NS\_VPX\_Appliance-AWS and routes are updated as such:

- CL1 have a route to NS\_Appliance-DC for reaching S1.
- NS\_Appliance-DC have a route to NS\_VPX\_Appliance-AWS for reaching S1.
- S1 should have a route to NS\_VPX\_Appliance-AWS for reaching CL1.
- NS\_VPX\_Appliance-AWS have a route to NS\_Appliance-DC for reaching CL1.

The following table lists the settings on NetScaler appliance NS\_Appliance-DC in datacenter DC.

Entity	Name	Details
The NSIP address		66.165.176.12
SNIP address		66.165.176.15
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	Local endpoint IP address of the CloudBridge Connector tunnel: 66.165.176.15, Remote endpoint IP address of the CloudBridge Connector tunnel: 168.63.252.133, GRE Tunnel Details - Name= CC_Tunnel_DC-AWS

The following table lists the settings on NetScaler VPX NS\_VPX\_Appliance-AWS on AWS cloud.

Entity	Name	Details
NSIP address		10.102.25.30
Public EIP address mapped to the NSIP address		168.63.252.131
SNIP address		10.102.29.30
Public EIP address mapped to the SNIP address		168.63.252.133
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	Local endpoint IP address of the CloudBridge Connector tunnel:168.63.252.133, Remote endpoint IP address of the CloudBridge Connector tunnel: 66.165.176.15; <b>GRE Tunnel Details</b> Name= CC_Tunnel_DC-AWS, IPSec Profile Details, Name= CC_Tunnel_DC-AWS, Encryption algorithm= AES, Hash algorithm= HMAC SHA1

## Prerequisites

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Install, configure, and launch an instance of NetScaler Virtual appliance (VPX) on AWS cloud. For instructions on installing NetScaler VPX on AWS, see [Deploy a NetScaler VPX instance on AWS](#).
2. Deploy and configure a NetScaler physical appliance, or provisioning and configuring a NetScaler virtual appliance (VPX) on a virtualization platform in the datacenter.
3. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

## NetScaler VPX license

After the initial instance launch, NetScaler VPX for AWS requires a license. If you are bringing your own license (BYOL), see the VPX Licensing Guide at: <http://support.citrix.com/article/CTX122426>.

You have to:

1. Use the licensing portal within Citrix website to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

## Configuration steps

To set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in a datacenter and a NetScaler virtual appliance (VPX) that resides on the AWS cloud, use the GUI of the NetScaler appliance.

When you use the GUI, the CloudBridge Connector tunnel configuration created on the NetScaler appliance, is automatically pushed to the other endpoint or peer (the NetScaler VPX on AWS) of the CloudBridge Connector tunnel. Therefore, you do not have to access the GUI (GUI) of the NetScaler VPX on AWS to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on both peers (the NetScaler appliance that resides in the datacenter and the NetScaler virtual appliance (VPX) that resides on the AWS cloud) consists of the following entities:

- **IPSec profile**—An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in both the peers of the CloudBridge Connector tunnel.

- **GRE tunnel**—An IP tunnel specifies a local IP address (a public SNIP address configured on the local peer), remote IP address (a public SNIP address configured on the remote peer), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the datacenter and is destined to a server on the subnet in the AWS cloud. If this packet matches the source and destination IP address range of the PBR entity on the NetScaler appliance in the datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

- `add ipsec profile <name> [-**ikeVersion** ( V1 | V2 )] [-**encAlgo** ( AES | 3DES )...] [-**hashAlgo** <hashAlgo> ...] [-**lifetime** <positive_integer>] (-**psk** | (-**publickey** <string> -**privatekey** <string> -**peerPublicKey** <string>)) [-**livenessCheckInterval** <positive_integer>] [-**replayWindowSize** <positive_integer>] [-**ikeRetryInterval** <positive_integer>] [-**retransmissiontime** <positive_integer>]`
- `**show ipsec profile** <name>`

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

- `add ipTunnel <name> <remote><remoteSubnetMask> <local> [-protocol <protocol>] [-ipsecProfileName <string>]`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

- `add ns pbr <pbr_name> ALLOW -srcIP = <local_subnet_range> -destIP = <remote_subnet_range> -ipTunnel <tunnel_name>`
- `apply ns pbrs`
- `show ns pbr <pbr_name>`

Example

```
1 > add ipsec profile CC_Tunnel_DC-AWS -encAlgo AES -hashAlgo
 HMAC_SHA1
```

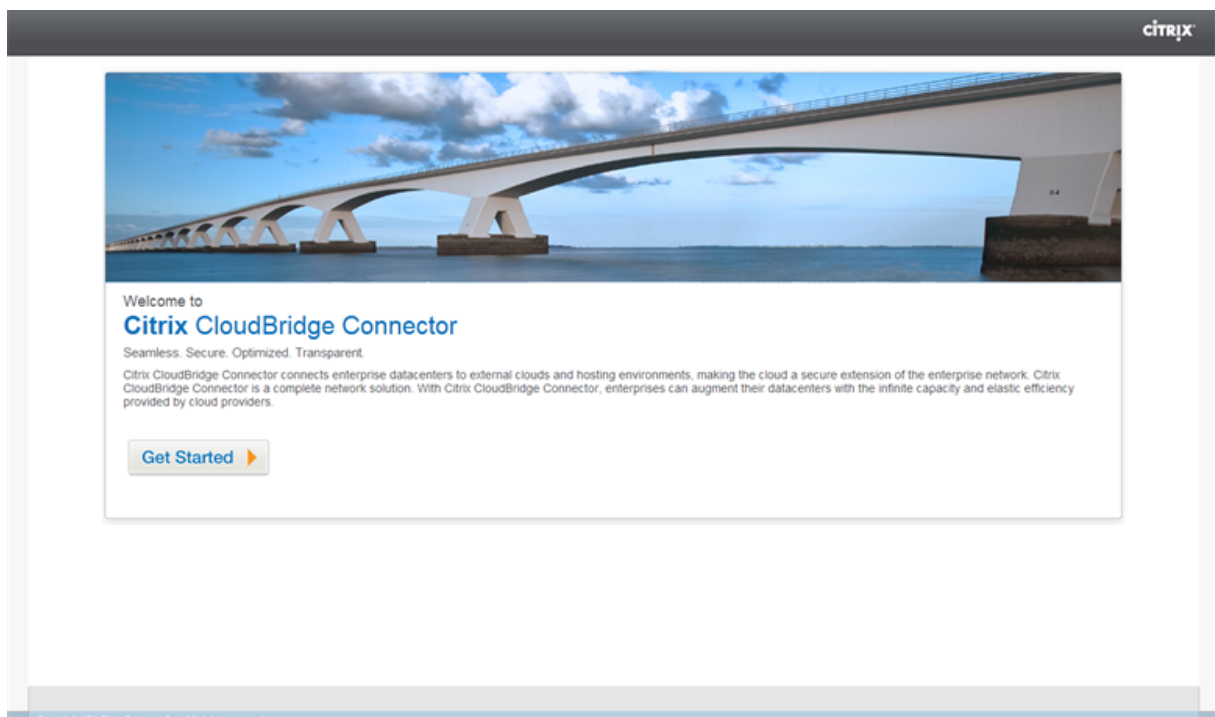

```

2
3 Done
4 > add ipTunnel CC_Tunnel_DC-AWS 168.63.252.133 255.255.255.0
 66.165.176.15 -protocol GRE -ipsecProfileName CC_Tunnel_DC-AWS
5
6 Done
7 > add ns pbr PBR-DC-AWS ALLOW -srcIP 66.165.176.15 -destIP
 168.63.252.133 ipTunnel CC_Tunnel_DC-AWS
8
9 Done
10 > apply ns pbrs
11
12 Done
13 <!--NeedCopy-->

```

To configure a CloudBridge Connector tunnel in a NetScaler appliance by using the GUI

1. Type the NSIP address of a NetScaler appliance in the address line of a web browser.
2. Log on to the GUI of the NetScaler appliance by using your account credentials for the appliance.
3. Navigate to **System > CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
5. The first time you configure a CloudBridge Connector tunnel on the appliance, a **Welcome** screen appears.
6. On the **Welcome** screen click **Get Started**.

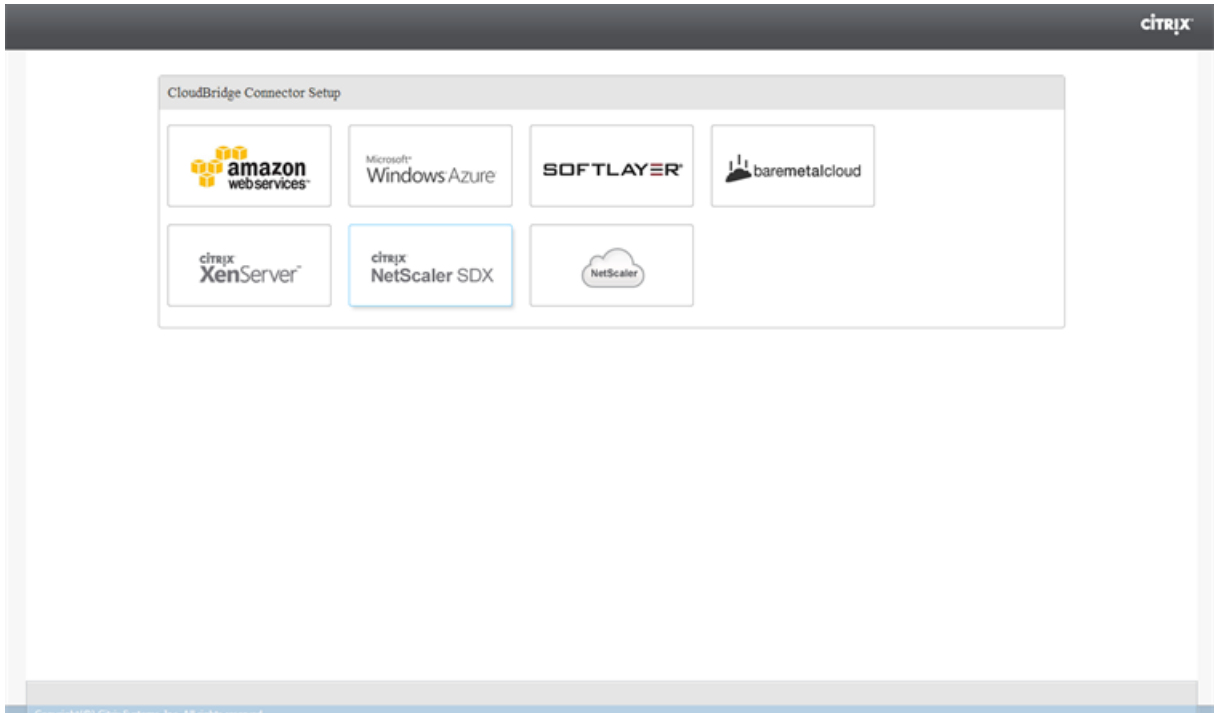

**Note:**

If you already have a CloudBridge Connector tunnel configured on the NetScaler appliance, the Welcome screen does not appear, so you do not click Get Started.

1. In the **CloudBridge Connector Setup** pane, click **amazon web services**

1. In the **Amazon** pane, provide your AWS account credentials: AWS Access Key ID and AWS Secret Access Key. You can obtain these access keys from the AWS GUI console. Click **Continue**.

**Note**

Earlier, the Setup wizard always connects to the same AWS region even when another region is selected. As a result, configuring CloudBridge Connector tunnel to a NetScaler VPX running on the selected AWS region used to fail. This issue has been fixed now.

1. In the **NetScaler** pane, select the NSIP address of the NetScaler virtual appliance running on AWS. Then, provide your account credentials for the NetScaler virtual appliance. Click **Continue**.
2. In the **CloudBridge Connector Setting** pane, set the following parameter:
  - **CloudBridge Connector Name**—Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.

3. Under **Local Setting**, set the following parameter:
  - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel. Must be a public IP address of type SNIP.
4. Under **Remote Setting**, set the following parameter:
  - **Subnet IP**—IP address of the CloudBridge Connector tunnel end point on the AWS side. Must be an IP address of type SNIP on the NetScaler VPX instance on AWS.
  - **NAT**—Public IP address (EIP) in AWS that is mapped to the SNIP configured on the NetScaler VPX instance on AWS.
5. Under **PBR Setting**, set the following parameters:
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Source IP Low**—Lowest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Source IP High**—Highest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Destination IP Low**—Lowest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
  - **Destination IP High**—Highest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
6. (Optional) Under **Security Settings**, set the following IPSec protocol parameters for the CloudBridge Connector tunnel:
  - **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
  - **Hash Algorithm**—Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
  - **Key**—Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
    - **Auto Generate Key**—Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.
    - **Specific Key**—Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
      - \* **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
    - **Upload Certificates**—Authentication based on digital certificates.

- \* **Public Key**—A local digital certificate to be used to authenticate the local peer to the remote peer before establishing IPsec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
- \* **Private Key**—Private key of the local digital certificate.
- \* **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPsec security associations. The same certificate should be present and set for the Public key parameter in the peer.

7. Click **Done**.

The new CloudBridge Connector tunnel configuration on the NetScaler appliance in the datacenter appears on the Home tab of the GUI. The corresponding new CloudBridge Connector tunnel configuration on the NetScaler VPX appliance in the AWS cloud appears on the GUI. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## Configuring a CloudBridge Connector tunnel between a NetScaler appliance and virtual private gateway on AWS

May 2, 2023

To connect a datacenter to Amazon Web Services (AWS), you can configure a CloudBridge Connector tunnel between a NetScaler appliance in the datacenter and a virtual private gateway on AWS. The NetScaler appliance and the virtual private gateway form the endpoints of the CloudBridge Connector tunnel and are called peers.

### Note:

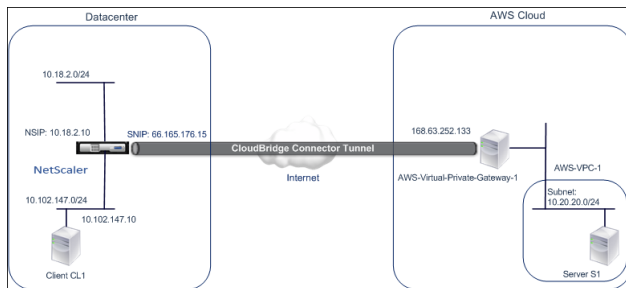

You can also set up a CloudBridge Connector tunnel between a NetScaler appliance in a datacenter and a NetScaler VPX instance (instead of a virtual private gateway) on AWS. For more information, see [Configuring CloudBridge Connector between Datacenter and AWS Cloud](#).

Virtual private gateways on AWS support the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings when you configure the NetScaler appliance for the CloudBridge Connector tunnel.

IPSec Properties	Setting
IPSec mode	Tunnel mode
IKE version	Version 1
IKE Authentication method	Pre-Shared Key
Encryption algorithm	AES
Hash algorithm	HMAC SHA1

### Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance NS\_Appliance-1 in a datacenter and virtual private gateway gateway AWS-Virtual-Private-Gateway-1 on AWS cloud.

NS\_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the AWS cloud through the CloudBridge Connector tunnel. As a router, NS\_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPSec profile entity named NS\_AWS\_IPSec\_Profile, a CloudBridge Connector tunnel entity named NS\_AWS\_Tunnel, and a policy based routing (PBR) entity named NS\_AWS\_Pbr.

The IPSec profile entity NS\_AWS\_IPSec\_Profile specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, and hash algorithm, to be used by the IPSec protocol in the CloudBridge Connector tunnel. NS\_AWS\_IPSec\_Profile is bound to IP tunnel entity NS\_AWS\_Tunnel.

CloudBridge Connector tunnel entity NS\_AWS\_Tunnel specifies the local IP address (a public IP—SNIP—address configured on the NetScaler appliance), the remote IP address (the IP address of the

AWS-Virtual-Private-Gateway-1), and the protocol (IPSec) used to set up the CloudBridge Connector tunnel. NS\_AWS\_Tunnel is bound to policy based routing (PBR) entity NS\_AWS\_Pbr.

The PBR entity NS\_AWS\_Pbr specifies a set of conditions and a CloudBridge Connector tunnel entity (NS\_AWS\_Tunnel). The source IP address range and the destination IP address range are the conditions for NS\_AWS\_Pbr. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the AWS cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the AWS cloud matches the conditions in NS\_AWS\_Pbr. This packet is then considered for CloudBridge Connector processing and is sent across the CloudBridge Connector tunnel (NS\_AWS\_Tunnel) bound to the PBR entity.

The following table lists the settings used in this example.

IP address of the CloudBridge Connector tunnel end point (NS_Appliance-1) in the datacenter side	66.165.176.15
IP address of the CloudBridge Connector tunnel end point (AWS-Virtual-Private-Gateway-1) in the AWS	168.63.252.133
Datacenter Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.102.147.0/24
AWS Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.20.20.0/24

#### Settings on Amazon AWS

Customer Gateway	AWS-Customer-Gateway-1	Routing = Static, IP Address = Internet-routable CloudBridge Connector tunnel endpoint IP address on the NetScaler side = 66.165.176.15
Virtual Private Gateway	AWS-Virtual-Private-Gateway-1	Associated VPC = AWS-VPC-1

		Routing = Static, IP Address = Internet-routable CloudBridge Connector tunnel endpoint IP address on the NetScaler side = 66.165.176.15
Customer Gateway	AWS-Customer-Gateway-1	
VPN Connection	AWS-VPN-Connection-1	Customer Gateway = AWS-Customer-Gateway-1, Virtual Private Gateway= Virtual-Private-Gateway-1, Routing Options: Type = Static, Static IP Prefixes = Subnets on the NetScaler side = 10.102.147.0/24

**Settings on NetScaler appliance NS\_Appliance-1 in Datacenter-1:**

Appliance	Settings	
SNIP1(for reference purposes only)	66.165.176.15	
IPSec profile	NS_AWS_IPSec_Profile	IKE version = v1, Encryption algorithm = AES, Hash algorithm = HMAC SHA1
CloudBridge Connector tunnel	NS_AWS_Tunnel	Remote IP = 168.63.252.133, Local IP= 66.165.176.15, Tunnel protocol = IPSec, IPSec profile= NS_AWS_IPSec_Profile
Policy based route	NS_AWS_Pbr	Source IP range = Subnet in the datacenter =10.102.147.0-10.102.147.255, Destination IP range =Subnet in AWS =10.20.20.0-10.20.20.255, IP Tunnel = NS_AWS_Tunnel

**Points to consider for a CloudBridge Connector tunnel configuration**

Before configuring a CloudBridge Connector tunnel between a NetScaler appliance and AWS gateway, consider the following points:

1. AWS supports the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings when you configure the NetScaler appliance for the CloudBridge Connector tunnel.
  - IKE version = v1
  - Encryption algorithm = AES
  - Hash algorithm = HMAC SHA1
2. You must configure the firewall at the NetScaler end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
3. You must configure Amazon AWS before specifying the tunnel configuration on the NetScaler, because the public IP address of the AWS end (gateway) of the tunnel and the PSK are automatically generated when you set up the tunnel configuration in AWS. You need this information for specifying the tunnel configuration on the NetScaler appliance.
4. AWS gateway supports static routes and the BGP protocol for route updates. The NetScaler appliance does not support the BGP protocol in a CloudBridge Connector tunnel to AWS gateway. Therefore, appropriate static routes must be used on both sides of the CloudBridge Connector tunnel for proper routing of traffic through the tunnel.

## Configuring Amazon AWS for the CloudBridge Connector tunnel

To create a CloudBridge Connector tunnel configuration on Amazon AWS, use the Amazon AWS Management Console, which is a web based graphical interface for creating and managing resources on Amazon AWS.

Before you begin the CloudBridge Connector tunnel configuration on AWS cloud, make sure that:

- You have a user account for Amazon AWS cloud.
- You have a virtual private cloud whose networks you want to connect to the networks at the NetScaler side through the CloudBridge Connector tunnel.
- You are familiar with the Amazon AWS Management Console.

### Note:

The procedures for configuring Amazon AWS for a CloudBridge Connector tunnel might change over time, depending on the Amazon AWS release cycle. Citrix recommends you refer [Amazon AWS documentation](#) for the latest procedures.

To configure a CloudBridge connector tunnel between a NetScaler and AWS gateway perform the following tasks on the AWS Management Console:

- **Create a Customer Gateway.** A customer gateway is an AWS entity that represents a CloudBridge Connector tunnel endpoint. For a CloudBridge Connector tunnel between a NetScaler appliance and AWS gateway, the customer gateway represents the NetScaler appliance on AWS. The customer gateway specifies a name, the type of routing (static or BGP) used in the tunnel, and the CloudBridge Connector tunnel endpoint IP address on the NetScaler side. The IP address can be an Internet-routable NetScaler owned subnet IP (SNIP) address or, if the NetScaler appliance is behind a NAT device, an Internet-routable NAT IP address that represents the SNIP address.
- **Create a Virtual Private Gateway and attach it to a VPC.** A virtual private gateway is a CloudBridge Connector tunnel endpoint at the AWS side. When you create a virtual private gateway, you assigned it a name or allow AWS to assign the name. You then associate the virtual private gateway with a VPC. This association enables the subnets of the VPC to connect to the subnets at the NetScaler side through the CloudBridge Connector tunnel.
- **Create a VPN Connection.** A VPN connection specifies a customer gateway and a virtual private gateway between which a CloudBridge Connector tunnel is to be created. It also specifies an IP prefix for the networks at the NetScaler side. Only IP prefixes that are known to the virtual private gateway (through static route entry) can receive traffic from the VPC through the tunnel. Also, the virtual private gateway does not route any traffic not destined to the specified IP prefixes through the tunnel. After configuring a VPN connection, you might have to wait few minutes for it to be created.
- **Configure Routing Options.** For the VPC's network to reach the networks at the NetScaler side through the CloudBridge Connector tunnel, you must configure the VPC's routing table to include routes for the networks at the NetScaler side and point those routes to the virtual private gateway. You can include routes in a VPC's routing table in one of the following ways:
  - **Enable Route Propagation.** You can enable route propagation for your routing table, so that routes are automatically propagated to the table. The static IP prefixes that you specify for VPN configuration are propagated to the routing table after you've created the VPN connection.
  - **Enter Static Routes Manually.** If you do not enable route propagation, you must manually enter the static routes for the networks at the NetScaler side.
- **Download Configuration.** After the CloudBridge Connector tunnel (VPN connection) configuration is created on AWS, download the configuration file of the VPN connection to your local system. You might need the information in the configuration file for configuring the CloudBridge Connector tunnel on the NetScaler appliance.

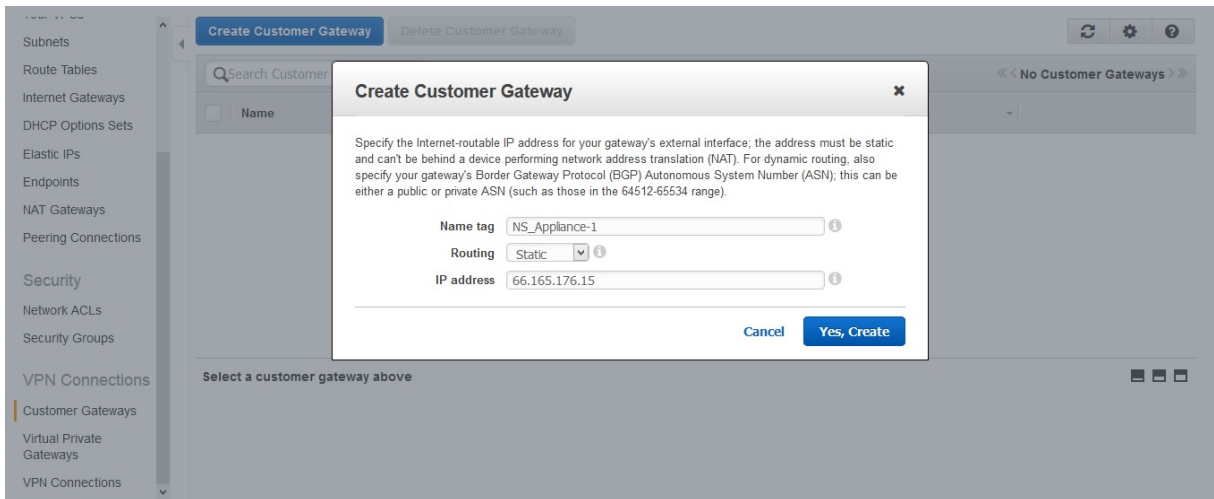

To create a customer gateway

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. Navigate to **VPN Connections > Customer Gateways** and click on **Create Customer Gateway**.

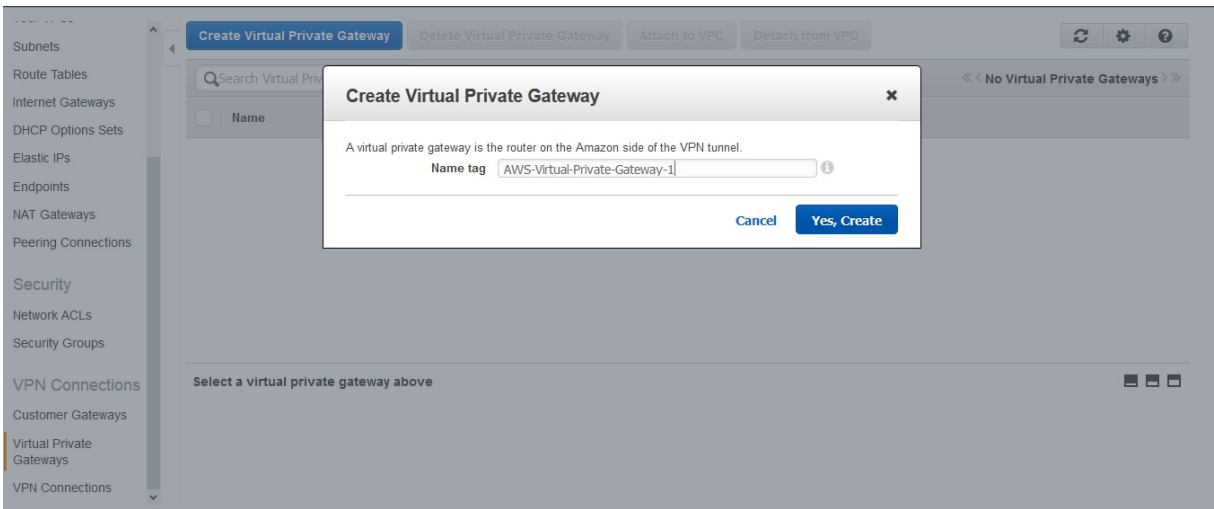

3. In the **Create Customer Gateway** dialog box, set the following parameters and then click **Yes, Create**:

- **Name tag.** A name for the customer gateway.
- **Routing list.** Type of routing between NetScaler appliance and AWS virtual private gateway for advertising routes to each other through the CloudBridge Connector tunnel. Select **Static Routing** from the **Routing** list. **Note:** The NetScaler appliance does not support the BGP protocol in a CloudBridge Connector tunnel to AWS gateway. Therefore, appropriate static routes must be used on both sides of the CloudBridge Connector tunnel for proper routing of traffic through the tunnel.
- **IP Address.** Internet-routable CloudBridge Connector tunnel endpoint IP address on the NetScaler side. The IP address can be an Internet-routable NetScaler owned subnet IP (SNIP) address or, if the NetScaler appliance is behind a NAT device, an Internet-routable NAT IP address that represents the SNIP address.

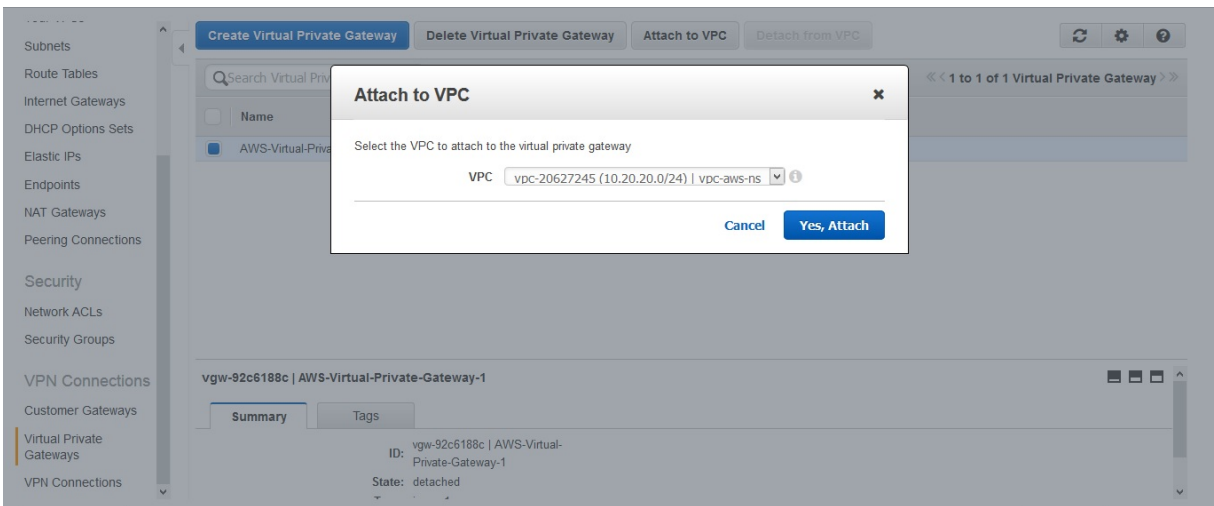

To create a virtual private gateway and attach it to a VPC

1. Navigate to **VPN Connections > Virtual Private Gateways**, and then click **Create Virtual Private Gateway**.
2. Enter a name for the virtual private gateway, and then click **Yes, Create**.

1. Select the virtual private gateway that you created, and then click Attach to VPC.
2. In the Attach to VPC dialog box, select your VPC from the list, and then choose Yes, Attach.

**To create a VPN connection:**

1. Navigate to VPN Connections > VPN Connections and then click Create VPN Connection.
2. In the Create VPN Connection dialog box set the following parameters and then choose Yes, Create:
  - **Name tag.** A name for the VPN connection.
  - **Virtual Private Gateway.** Select the virtual private gateway that you created earlier.
  - **Customer Gateway.** Select Existing. Then, from the drop down list, select the customer gateway that you created earlier.
  - **Routing Options.** Type of routing between the virtual private gateway and customer gateway (NetScaler appliance). Select Static. In the Static IP Prefixes field, specify the IP prefixes for the subnet on the NetScaler side, separated by commas.

### To enable route propagation:

1. Navigate to **Route Tables** and select the routing table that's associated with the subnet whose traffic is to traverse the CloudBridge Connector tunnel.

#### Note

By default, this is the main routing table for the VPC.

1. On the **Route Propagation** tab in the details pane, choose **Edit**, select the virtual private gateway, and then choose **Save**.

### To manually enter static routes:

1. Navigate to **Route Tables** and select your routing table.
2. On the **Routes** tab, click **Edit**.
3. In the **Destination** field, enter the static route used by your CloudBridge Connector tunnel (VPN connection).
4. Select the virtual private gateway ID from the **Target** list, and then click **Save**.

### To download the configuration file:

1. Navigate to **VPN Connection**, select a VPN connection, and then click **Download Configuration**.
2. In the **Download Configuration** dialog box, set the following parameters, and then click **Yes, Download**.
  - **Vendor.** Select **Generic**.
  - **Platform.** Select **Generic**.
  - **Software.** Select **Vendor Agnostic**.

## Configuring the NetScaler appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a NetScaler appliance and a virtual private gateway on AWS cloud, perform the following tasks on the NetScaler appliance.

You can use either the NetScaler command line or the GUI.

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm and PSK to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol and associate the IPsec profile with it.** An IP tunnel specifies the local IP address (a SNIP address configured on the NetScaler appliance), remote IP address (the public IP address of the virtual private gateway in AWS), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the NetScaler-side subnet whose traffic is to traverse the tunnel, and set the destination IP address range to specify the AWS VPC subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet that originates from a client in the subnet on the NetScaler side and is destined to a server in the AWS cloud subnet, and matches the source and destination IP range of the PBR entity, is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the NetScaler command line

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -**ikeVersion** v1`
- `show ipsec profile** <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line

At the Command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line

At the Command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP** <subnet-range> -*ipTunnel <tunnelName>`

- `apply pbrs`
- `show pbr <pbrName>`

The following commands create all settings of NetScaler appliance NS\_Appliance-1 used in “Example of CloudBridge Connector Configuration and Data Flow.”

```
1 > add ipsec profile NS_AWS_IPSec_Profile -psk
 DkiMgMdcBqvYREEuIvxsbKkKw0Foyabcd -ikeVersion v1 -lifetime
 31536000
2 Done
3 > add iptunnel NS_AWS_Tunnel 168.63.252.133 255.255.255.255
 66.165.176.15 -protocol IPSEC -ipsecProfileName
 NS_AWS_IPSec_Profile
4
5 Done
6 > add pbr NS_AWS_Pbr -srcIP 10.102.147.0-10.102.147.255 -destIP
 10.20.0.0-10.20.255.255 -ipTunnel NS_AWS_Tunnel
7 Done
8
9 > apply pbrs
10
11 Done
12 <!--NeedCopy-->
```

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** dialog box, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version (select V1)
4. Select the **Pre-shared Key Authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** dialog box, set the following parameters:
  - Name

- Remote IP
- Remote Mask
- Local IP Type (In the Local IP Type drop down list, select Subnet IP).
- Local IP (All the configured IPs of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
- Protocol
- IPSec Profile

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** dialog box, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select IP Tunnel)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High

4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler appliance appears in the GUI.

The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters.

For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

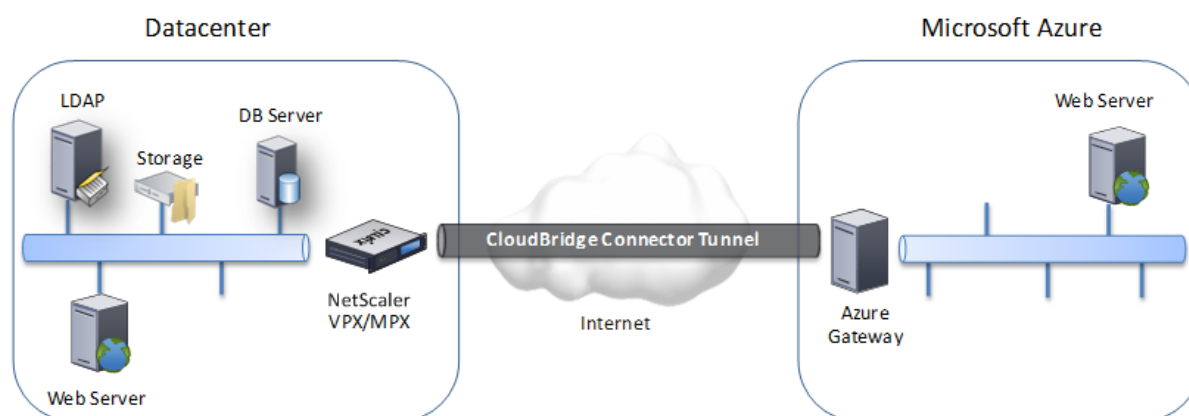

## Configuring a CloudBridge Connector tunnel between a datacenter and Azure cloud

May 2, 2023

The NetScaler appliance provides connectivity between your enterprise datacenters and the Microsoft cloud hosting provider, Azure, making Azure a seamless extension of the enterprise network. NetScaler encrypts the connection between the enterprise datacenter and Azure cloud so that all data transferred between the two is secure.

### How CloudBridge Connector tunnel works

To connect a datacenter to Azure cloud, you set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in the datacenter and a gateway that resides in the Azure cloud. The NetScaler appliance in the datacenter and the gateway in Azure cloud are the end points of the CloudBridge Connector tunnel and are called peers of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel between a datacenter and Azure cloud uses the open-standard Internet Protocol security (IPSec) protocol suite, in tunnel mode, to secure communications between peers in the CloudBridge Connector tunnel. In a CloudBridge Connector tunnel, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the tunnel mode in which the complete IP packet is encrypted and then encapsulated. The encryption uses the Encapsulating Security Payload (ESP) protocol, which ensures the integrity of the packet by using a HMAC hash function and ensures confidentiality by using an encryption algorithm. The ESP protocol, after encrypting the payload and calculating the HMAC, generates an ESP header

and inserts it before the encrypted IP packet. The ESP protocol also generates an ESP trailer and inserts it at the end of the packet.

The IPSec protocol then encapsulates the resulting packet by adding an IP header before the ESP header. In the IP header, the destination IP address is set to the IP address of the CloudBridge Connector peer.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version 1 (IKEv1) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

1. The two peers mutually authenticate with each other, using pre-shared key authentication, in which the peers exchange a text string called a pre-shared key (PSK). The pre-shared keys are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
2. The peers then negotiate to reach agreement on:
  - An encryption algorithm
  - Cryptographic keys for encrypting data on one peer and decrypting it on the other.

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when a CloudBridge Connector tunnel is set up between a NetScaler appliance in a datacenter and a gateway in an Azure cloud, both the datacenter appliance and the Azure gateway have two SAs. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets. SAs expire after a specified interval of time, which is called the lifetime.

### **Example of CloudBridge Connector tunnel configuration and data flow**

As an illustration of CloudBridge Connector Tunnel, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance CB\_Appliance-1 in a datacenter and gateway Azure\_Gateway-1 in Azure cloud.

CB\_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the Azure cloud through the CloudBridge Connector tunnel. As a router, CB\_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the Azure cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On CB\_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPSec profile entity named CB\_Azure\_IPSec\_Profile, a CloudBridge Connector tunnel entity named CB\_Azure\_Tunnel, and a policy based routing (PBR) entity named CB\_Azure\_Pbr.

The IPSec profile entity CB\_Azure\_IPSec\_Profile specifies the IPSec protocol parameters, such as IKE

version, encryption algorithm, and hash algorithm, to be used by the IPSec protocol in the CloudBridge Connector tunnel. `CB_Azure_IPSec_Profile` is bound to IP tunnel entity `CB_Azure_Tunnel`.

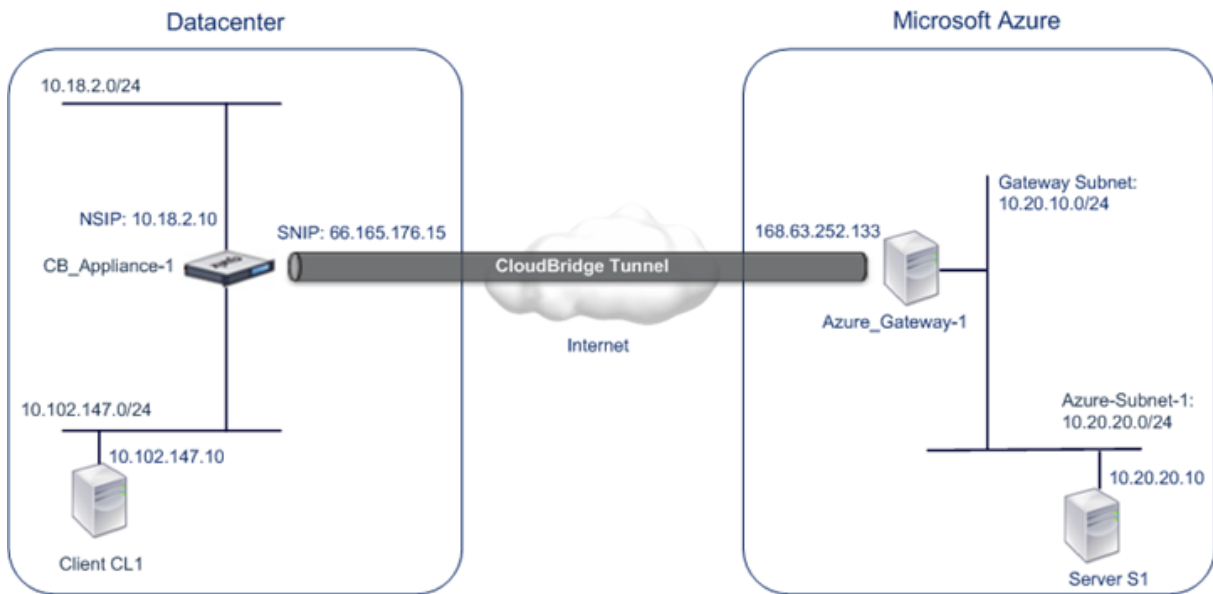

CloudBridge Connector tunnel entity `CB_Azure_Tunnel` specifies the local IP address (a public IP (SNIP) address configured on the NetScaler appliance), the remote IP address (the IP address of the `Azure_Gateway-1`), and the protocol (IPSec) used to set up the CloudBridge Connector tunnel. `CB_Azure_Tunnel` is bound to the PBR entity `CB_Azure_Pbr`.

The PBR entity `CB_Azure_Pbr` specifies a set of conditions and a CloudBridge Connector tunnel entity (`CB_Azure_Tunnel`). The source IP address range and the destination IP address range are the conditions for `CB_Azure_Pbr`. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the Azure cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the Azure cloud matches the conditions in `CB_Azure_Pbr`. This packet is then considered for CloudBridge processing and is sent across the CloudBridge Connector tunnel (`CB_Azure_Tunnel`) bound to the PBR entity.

On Microsoft Azure, the CloudBridge Connector tunnel configuration includes a local network entity named `My-Datacenter-Network`, a virtual network entity named `Azure-Network-for-CloudBridge-Tunnel`, and a gateway named `Azure_Gateway-1`.

The local (local to Azure) network entity `My-Datacenter-Network` specifies the IP address of the NetScaler appliance on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network entity `Azure-Network-for-CloudBridge-Tunnel` defines a private subnet named `Azure-Subnet-1` in Azure. The traffic of the subnet traverses the CloudBridge Connector tunnel. The server `S1` is provisioned in this subnet.

The local network entity `My-Datacenter-Network` is associated with the virtual network entity `Azure-Network-for-CloudBridge-Tunnel`. This association defines the remote and local network details of the CloudBridge Connector tunnel configuration in Azure. Gateway `Azure_Gateway-1` was created for this association to become the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel.

For more information about the settings, refer to the [CloudBridge Connector Tunnel Settings](#) pdf.

### Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a NetScaler appliance in datacenter and Microsoft Azure, consider the following points:

1. The NetScaler appliance must have a public facing IPv4 address (type SNIP) to use as a tunnel end-point address for the CloudBridge Connector tunnel. Also, the NetScaler appliance should not be behind a NAT device.
2. Azure supports the following IPsec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPsec settings while configuring the NetScaler for the CloudBridge Connector tunnel.
  - IKE version = v1
  - Encryption algorithm = AES
  - Hash algorithm = HMAC SHA1
3. You must configure the firewall in the datacenter edge to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
4. IKE re-keying, which is renegotiation of new cryptographic keys between the CloudBridge Connector tunnel end points to establish new SAs, is not supported. When the Security Associations (SAs) expire, the tunnel goes into the DOWN state. Therefore, you must set a very large value for the lifetimes of SAs.

5. You must configure Microsoft Azure before specifying the tunnel configuration on the NetScaler, because the public IP address of the Azure end (gateway) of the tunnel, and the PSK, are automatically generated when you set up the tunnel configuration in Azure. You need this information for specifying the tunnel configuration on the NetScaler.

## Configuring the CloudBridge Connector tunnel

For setting up a CloudBridge Connector tunnel between your datacenter and Azure, you must install CloudBridge VPX/MPX in your datacenter, configure Microsoft Azure for the CloudBridge Connector tunnel, and then configure the NetScaler appliance in the data center for the CloudBridge Connector tunnel.

Configuring a CloudBridge Connector tunnel between a NetScaler appliance in datacenter and Microsoft Azure consists of the following tasks:

1. **Setting up the NetScaler appliance in the datacenter.** This task involves deploying and configuring a NetScaler physical appliance (MPX), or provisioning and configuring a NetScaler virtual appliance (VPX) on a virtualization platform in the datacenter.
2. **Configuring Microsoft Azure for the CloudBridge Connector tunnel.** This task involves creating local network, virtual network, and gateway entities in Azure. The local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the NetScaler appliance) on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network defines a network on Azure. Creating the virtual network includes defining a subnet whose traffic is to traverse the CloudBridge Connector tunnel to be formed. You then associate the local network with the virtual network. Finally, you create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel.
3. **Configuring the NetScaler appliance in the datacenter for the CloudBridge Connector tunnel.** This task involves creating an IPSec profile, an IP tunnel entity, and a PBR entity in the NetScaler appliance in datacenter. The IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used in the CloudBridge Connector tunnel. The IP tunnel specifies the IP address of both the CloudBridge Connector tunnel end points (the NetScaler appliance in datacenter and the gateway in Azure) and the protocol to be used in the CloudBridge Connector tunnel. You then associate the IPSec profile entity with the IP tunnel entity. The PBR entity specifies the two subnets, in the datacenter and in the Azure cloud, that are to communicate with each other through the CloudBridge Connector tunnel. You then associate the IP tunnel entity with the PBR entity.

## Configuring Microsoft Azure for the CloudBridge Connector tunnel

To create a CloudBridge Connector tunnel configuration on Microsoft Azure, use the Microsoft Windows Azure Management Portal, which is a web based graphical interface for creating and managing resources on Microsoft Azure.

Before you begin the CloudBridge Connector tunnel configuration on Azure cloud, make sure that:

- You have a user account for Microsoft Azure.
- You have a conceptual understanding of Microsoft Azure.
- You are familiar with the Microsoft Windows Azure Management Portal.

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on Microsoft Azure by using the Microsoft Windows Azure Management Portal:

- **Create a local network entity.** Create a local network entity in Windows Azure for specifying the network details of the datacenter. A local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the NetScaler) on the datacenter side and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel.
- **Create a Virtual Network.** Create virtual network entity that defines a network on Azure. This task includes defining a private address space, where you provide a range of private addresses and subnets belonging to the range specified in the address space. The traffic of the subnets will traverse the CloudBridge Connector tunnel. You then associate a local network entity with the virtual network entity. This association lets Azure create a configuration for a CloudBridge Connector tunnel between the virtual network and the data center network. A gateway (to be created) in Azure for this virtual network will be the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel. You then define a private subnet for the gateway to be created. This subnet belongs to the range specified in the address space in the virtual network entity.
- **Create a gateway in Windows Azure.** Create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel. Azure, from its pool of public IP addresses, assigns an IP address to the gateway created.
- **Gather the public IP address of the gateway and the pre-shared key.** For a CloudBridge Connector tunnel configuration on Azure, the public IP address of the gateway and the pre-shared Key (PSK) are automatically generated by Azure. Make a note of this information. You will need it for configuring the CloudBridge Connector tunnel on the NetScaler in datacenter.

### Note:

The procedures for configuring Microsoft Azure for a CloudBridge Connector tunnel might change over time, depending on the Microsoft Azure release cycle. For the latest procedures, see the [Microsoft Azure documentation](#).

## Configuring the NetScaler Appliance in the datacenter for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on the NetScaler in the datacenter. You can use either the NetScaler command line or the GUI:

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel with IPsec protocol and associate the IPsec profile to it.** An IP tunnel specifies the local IP address (a public SNIP address configured on the NetScaler appliance), remote IP address (the public IP address of the gateway in Azure), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate the IP tunnel to it.** A PBR entity specifies a set of conditions and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range to specify the datacenter subnet whose traffic is to traverse the tunnel, and the destination IP address range to specify the Azure subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet originated from a client in the subnet on the datacenter and destined to a server in the subnet on the Azure cloud matches the source and destination IP range of the PBR entity. This packet is then considered for CloudBridge Connector tunnel processing and is sent across the CloudBridge Connector tunnel associated with the PBR entity.

The GUI combines all these tasks in a single wizard called the CloudBridge Connector wizard.

To create an IPSEC profile by using the NetScaler command line:

At the Command prompt, type:

```
add ipsec profile <name> -psk <string> -ikeVersion v1
```

To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line:

At the Command prompt, type:

```
add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol
IPSEC -ipsecProfileName <string>
```

To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line

```
add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range>
ipTunnel <tunnelName> apply pbrs
```

Sample Configuration

The following commands create all settings of NetScaler appliance CB\_Appliance-1 used in “Example of CloudBridge Connector Configuration and Data Flow”.

```
1 > add ipsec profile CB_Azure_IPSec_Profile -psk
 DkiMgMdcBqvYREEuIvxsbKkKw0F0yDiLM -ikeVersion v1 -lifetime 31536000
2 Done
3
4 > add iptunnel CB_Azure_Tunnel 168.63.252.133 255.255.255.255
 66.165.176.15 -protocol IPSEC -ipsecProfileName
 CB_Azure_IPSec_Profile
5 Done
6
7 > add pbr CB_Azure_Pbr -srcIP 10.102.147.0-10.102.147.255 -destIP
 10.20.0.0-10.20.255.255 -ipTunnelCB_Azure_Tunnel
8 Done
9
10 > apply pbrs
11 Done
12 <!--NeedCopy-->
```

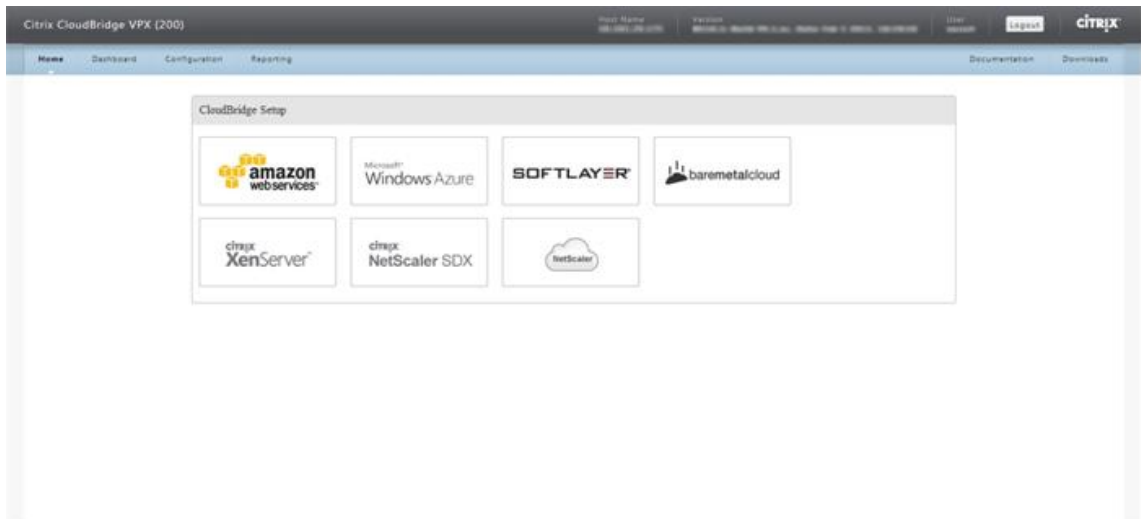

To configure a CloudBridge Connector tunnel in a NetScaler appliance by using the GUI

1. Access the GUI by using a web browser to connect to the IP address of the NetScaler appliance in the datacenter.
2. Navigate to **System > CloudBridge Connector**.
3. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
4. Click **Get Started**.

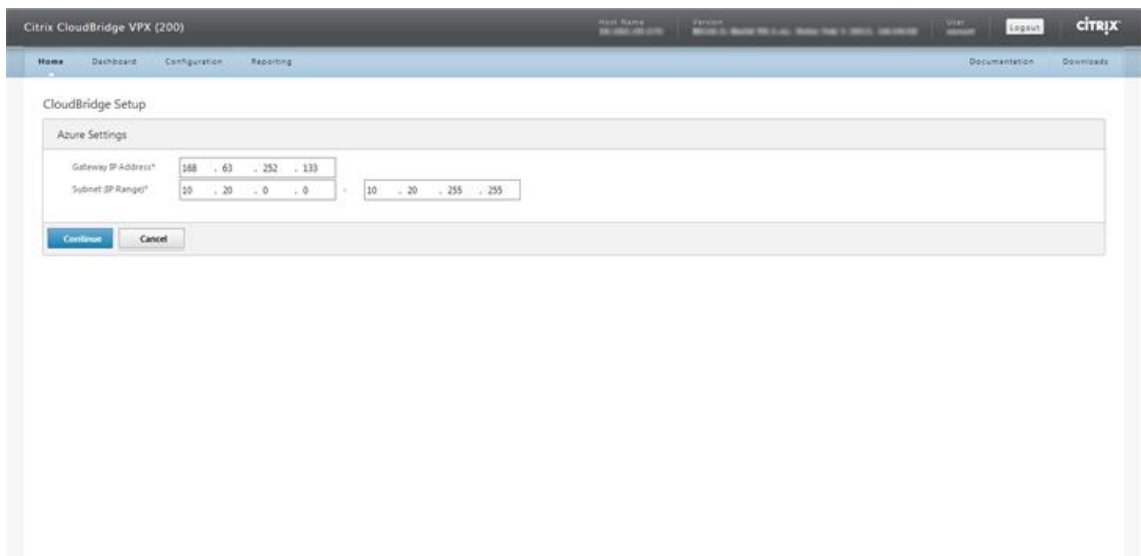

**Note:** If you already have any CloudBridge Connector tunnel configured on the NetScaler appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

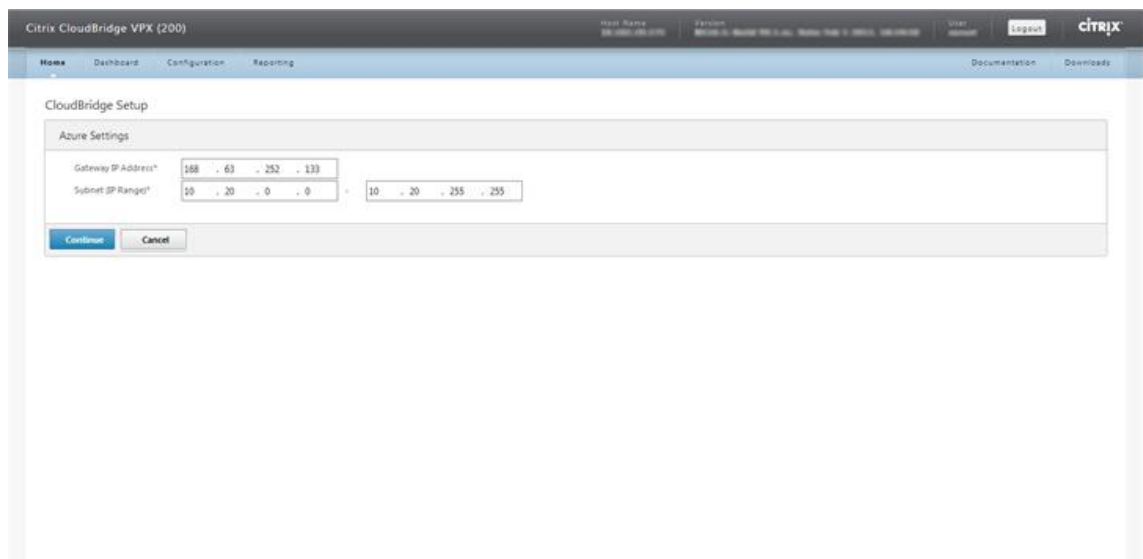

5. In the CloudBridge Setup pane, click **Microsoft Windows Azure**.

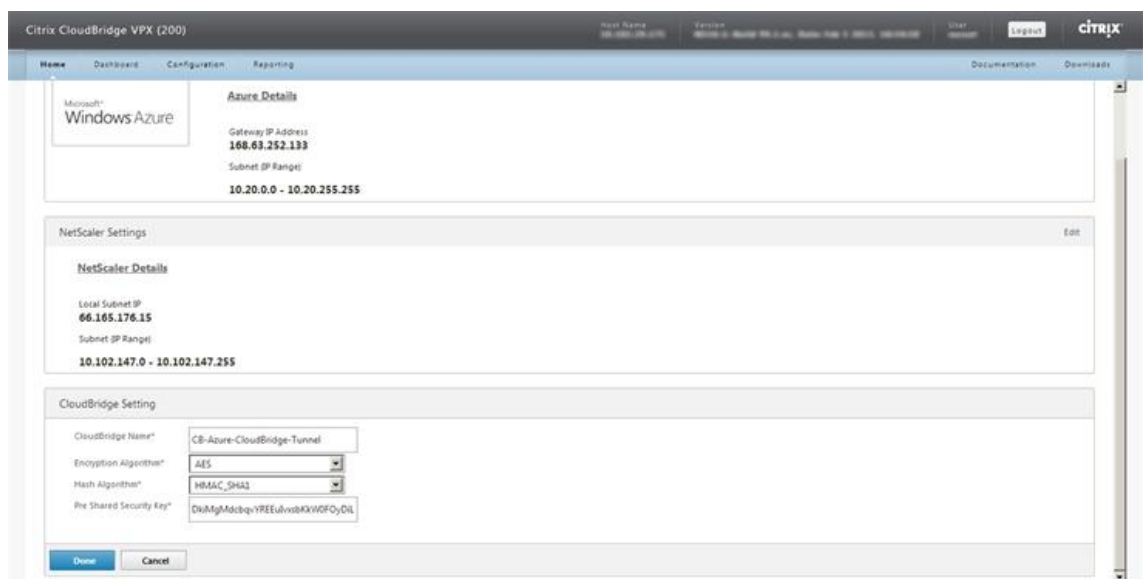

6. In the Azure Settings pane, in the **Gateway IP Address** field, type the IP address of the Azure gateway. The CloudBridge Connector tunnel is then set up between the NetScaler appliance and the gateway. In the **Subnet (IP Range)** text boxes, specify a subnet range (in Azure cloud), the traffic of which is to traverse the CloudBridge Connector tunnel. Click **Continue**.

7. In the NetScaler Settings pane, from the **Local Subnet IP** drop-down list, select a publicly accessible SNIP address configured on the NetScaler appliance. In **Subnet (IP Range)** text boxes, specify a local subnet range, the traffic of which is to traverse the CloudBridge Connector tunnel. Click **Continue**.

8. In the **CloudBridge Setting** pane, in the CloudBridge Name text box, type a name for the CloudBridge that you want to create.

9. From the Encryption Algorithm and Hash Algorithm drop-down lists, select the AES and HMAC\_SHA1 algorithms, respectively. In the Pre Shared Security Key text box, type the security key.
10. Click **Done**.

## Monitoring the CloudBridge Connector tunnel

You can view statistics for monitoring the performance of a CloudBridge Connector tunnel between the NetScaler appliance in the datacenter and Microsoft Azure. To view CloudBridge Connector tunnel

statistics on the NetScaler appliance, use GUI or NetScaler command line. To view CloudBridge Connector tunnel statistics in Microsoft Azure, use the Microsoft Windows Azure Management Portal.

### Displaying CloudBridge Connector tunnel Statistics in the NetScaler appliance

For information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

### Displaying CloudBridge Connector tunnel Statistics in Microsoft Azure

The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels in Microsoft Azure.

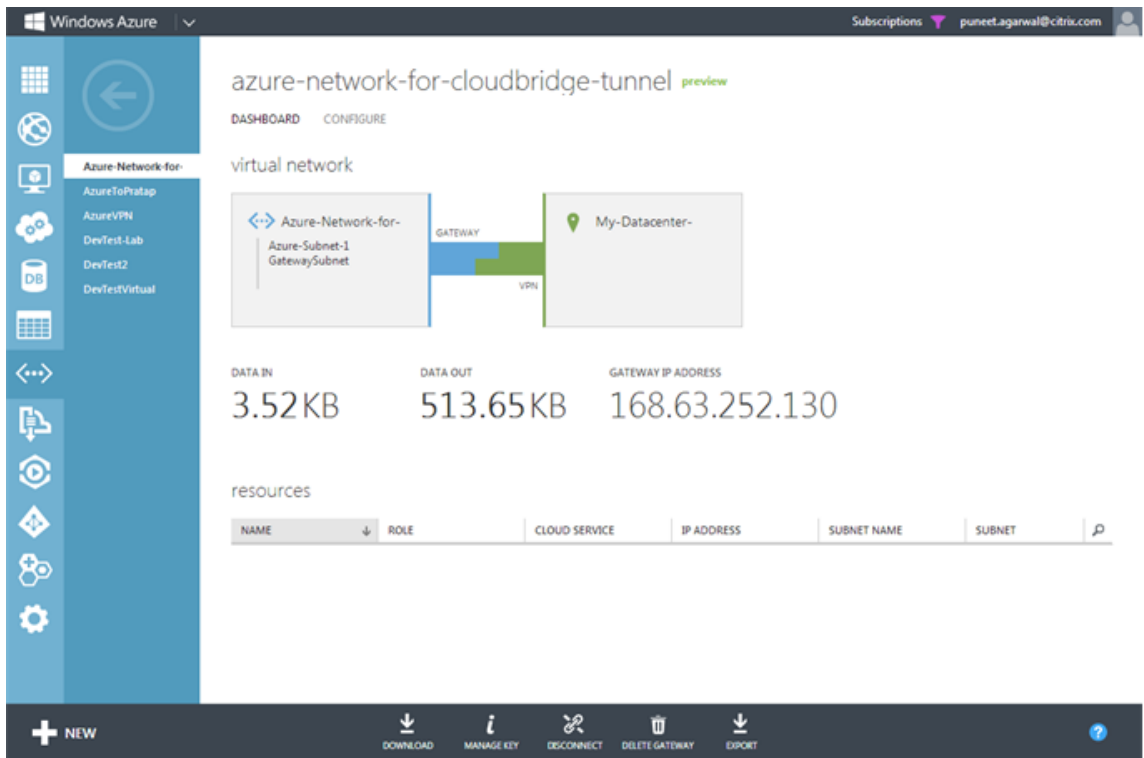

Statistical counter	Specifies
DATA IN	Total number of kilobytes received by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.
DATA OUT	Total number of kilobytes sent by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.

To display CloudBridge Connector tunnel statistics by using the Microsoft Windows Azure Management Portal

1. Log on to the [Windows Azure Management Portal](#) by using your Microsoft Azure account credentials.
2. In the left pane, click **NETWORKS**.
3. On the **Virtual Network** tab, in the Name column, select the virtual network entity associated with a CloudBridge Connector tunnel whose statistics you want to display.

4. On the **DASHBOARD** page of the virtual network, view the DATA IN and DATA OUT counters for the CloudBridge Connector tunnel.

## Configuring CloudBridge Connector tunnel between datacenter and softlayer enterprise cloud

May 2, 2023

The GUI includes a wizard that helps you to easily configure a CloudBridge Connector tunnel between a NetScaler appliance in a datacenter and NetScaler VPX instances on the SoftLayer enterprise cloud.

When you use the wizard of the NetScaler appliance in the datacenter, the CloudBridge Connector tunnel configuration created on the NetScaler appliance, is automatically pushed to the other endpoint or peer (the NetScaler VPX on SoftLayer) of the CloudBridge Connector tunnel.

Using the wizard of the NetScaler appliance in the datacenter, you perform the following steps to configure a CloudBridge Connector tunnel.

1. Connect to the Softlayer enterprise cloud by providing the user log on credentials.
2. Select the Citrix XenServer that is running the NetScaler VPX appliance.
3. Select the NetScaler VPX appliance.
4. Provide CloudBridge Connector tunnel parameters to:
  - Configure a GRE Tunnel.
  - Configure IPsec on the GRE tunnel.
  - Create a netbridge, which is a logical representation of the CloudBridge connector, by specifying a name.
  - Bind the GRE Tunnel to the netbridge.

### To configure a CloudBridge Connector tunnel by using the GUI

1. Log on to the GUI of the NetScaler appliance in the datacenter by using your account credentials for the appliance.
2. Navigate to **System > CloudBridge Connector** .
3. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge Connector**.
4. Click **Get Started**.

#### Note:

If you already have any CloudBridge Connector tunnel configured on the NetScaler appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

1. In the CloudBridge Connector Setup pane, click Softlayer, and then follow the instructions in the wizard.

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## Configuring a CloudBridge Connector tunnel between a NetScaler appliance and Cisco IOS device

May 2, 2023

You can configure a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco device to connect two datacenters or extend your network to a Cloud provider. The NetScaler appliance and the Cisco IOS device form the end points of the CloudBridge Connector tunnel and are called peers.

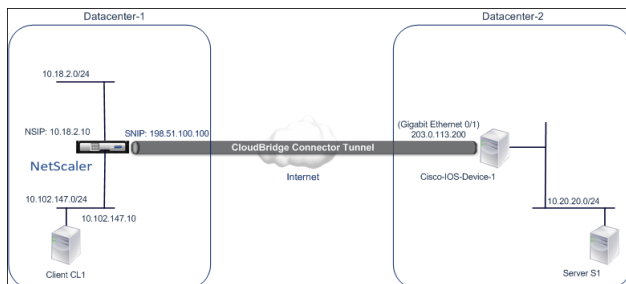

### Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- NetScaler appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- Cisco IOS device Cisco-IOS-Device-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and Cisco-IOS-Device-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and Cisco-IOS-Device-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_Cisco\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_Cisco\_Tunnel, and policy based routing (PBR) entity NS\_Cisco\_Pbr.

For more information, refer to the [CloudBridge Connector tunnel between a NetScaler appliance and Cisco IOS device settings](#) pdf.

## Points to Consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco IOS device, consider the following points:

- The following IPsec settings are supported for a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco IOS device.

IPsec Properties	Setting
IPsec mode	Tunnel mode
IKE version	Version 1
IKE DH group	DH group 2 (1024 bits MODP algorithm)
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES, 3DES
IKE hash algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA384, HMAC SHA512, HMAC MD5
ESP encryption algorithm	AES, 3DES
ESP hash algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA256, HMAC SHA256, HMAC MD5

- You must specify the same IPsec settings on the NetScaler appliance and the Cisco IOS device at the two ends of the CloudBridge Connector.
- NetScaler provides a common parameter (in IPsec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another, and a common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore on the Cisco device, you must specify the same hash algorithm and same encryption algorithm for IKE (while creating IKE policy) and ESP (while creating IPsec transform set).
- You must configure the firewall at the NetScaler end and Cisco device end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

## Configuring the Cisco IOS device for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a Cisco IOS device, use the Cisco IOS command line interface, which is the primary user interface for configuring, monitoring, and maintaining Cisco devices.

Before you begin the CloudBridge Connector tunnel configuration on a Cisco IOS device, make sure that:

- You have a user account with administrator credentials on the Cisco IOS device.
- You are familiar with the Cisco IOS command line interface.
- The Cisco IOS device is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

### Note:

The procedures for configuring CloudBridge Connector tunnel on a Cisco IOS device might change over time, depending on the Cisco release cycle. Citrix recommends that you follow the official Cisco product documentation for more information, see [Configuring IPSec VPN tunnels](#) topic.

**To configure a CloudBridge connector tunnel between a NetScaler appliance and a Cisco IOS device, perform the following tasks on the Cisco device's IOS command line:**

- Create an IKE Policy.
- Configure a Pre-shared key for IKE authentication.
- Define a transform set and configure IPSec in tunnel mode.
- Create a crypto access List
- Create a crypto map
- Apply the crypto Map to an interface

The examples in the following procedures create settings in [Cisco IOS device Cisco-IOS-Device-1](#) mentioned in section “Example of CloudBridge Connector Configuration and Data Flow.”

**To create an IKE policy**, refer to the [IKE policy](#) pdf.

**To configure a pre-shared key by using the Cisco IOS command line:**

At the Cisco IOS device's command prompt, type the following commands, starting in global configuration mode, in the order shown:

---

Command	Example	Command Description
<code>crypto isakmp identity address</code>	<code>Cisco-ios-device-1(config)# crypto isakmp identity address</code>	Specify the ISAKMP identity (address) for the Cisco IOS device to use when communicating with the peer (NetScaler appliance) during IKE negotiations. This example specifies the address keyword, which uses IP address 203.0.113.200 (Gigabit Ethernet interface 0/1 of Cisco-IOS-Device-1) as the identity for the device.
<code>crypto isakmp key keystringaddress peer-address</code>	<code>Cisco-ios-device-1 (config)# crypto isakmp key examplepresharedkey address 198.51.100.100</code>	Specify a pre-shared key for the IKE authentication. This example configures shared key examplepresharedkey to be used with the NetScaler appliance NS_Appliance-1 (198.51.100.100). The same pre-shared key must be configured on the NetScaler appliance for IKE authentication to be successful between the Cisco IOS device and the NetScaler appliance.

---

**To create a crypto access list by using the Cisco IOS command line:**

At the Cisco IOS device's command prompt, type the following command in global configuration mode, in the order shown:

Command	Example	Command Description
access-list access-list-number permit IP source source-wildcard destination destination-wildcard	Cisco-ios-device-1(config)# access-list 111 permit ip 10.20.20.0 0.0.0.255 10.102.147.0 0.0.0.255	Specify conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example configures access list 111 to protect traffic from subnets 10.20.20.0/24 (at the Cisco-IOS-Device-1 side) and 10.102.147.0/24 (at the NS_Appliance-1 side).

### To define a transform and configure IPSec tunnel mode by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands, starting in global configuration mode, in the order shown:

```
|Command|Example|Command Description|
```

```
|---|
```

```
|crypto ipsec transform-setname ESP_Authentication_Transform ESP_Encryption_Transform Note:
ESP_Authentication_Transform can take the following values: esp-sha-hmac, esp-sha256-hmac,
esp-sha384-hmac, esp-sha512-hmac, esp-md5-hmac. ESP_Encryption_Transform can take the
following values: esp-aes or esp-3des|Cisco-ios-device-1(config)# crypto ipsec transform-set NS-
CISCO-TS esp-sha256-hmac esp-3des|Define a transform set and specify the ESP hash algorithm (for
authentication) and the ESP encryption algorithm to be used during exchange of data between the
CloudBridge Connector tunnel peers. This example defines transform set NS-CISCO-TS and specifies
ESP authentication algorithm as esp-sha256-hmac, and ESP encryption algorithm as esp-3des.|
```

```
|mode tunnel|Cisco-ios-device-1 (config-crypto-trans)# mode tunnel|Set IPSec in tunnel mode.|
```

```
|exit|Cisco-ios-device-1 (config-crypto-trans)# exit, Cisco-ios-device-1 (config)#|Exit back to global
configuration mode.|
```

### To create a crypto map by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto mapmap-name seq-num ipsec-isakmp	Cisco-ios-device-1 (config)# crypto map NS-CISCO-CM 2 ipsec-isakmp	Enter crypto map configuration mode, specify a sequence number for the crypto map, and configure the crypto map to use IKE to establish security associations (SAs). This example configures sequence number 2 and IKE for crypto map NS-CISCO-CM.
set peer ip-address	Cisco-ios-device-1 (config-crypto-map)# set peer 172.23.2.7	Specify the peer (NetScaler appliance) by its IP address. This example specifies 198.51.100.100, which is the CloudBridge Connector endpoint IP address on the NetScaler appliance.
match addressaccess-list-id	Cisco-ios-device-1 (config-crypto-map)# match address 111	Specify an extended access list. This access list specifies conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example specifies access list 111.
set transform-set transform-set-name	Cisco-ios-device-1 (config-crypto-map)# set transform-set NS-CISCO-TS	Specify which transform sets are allowed for this crypto map entry. This example specifies transform set NS-CISCO-TS.
exit  Cisco-ios-device-1 (config)#	Cisco-ios-device-1 (config-crypto-map)# exit  Exit back to global configuration mode.	

**To apply a crypto map to an interface by using the Cisco IOS command line:**

At the Cisco IOS device's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
interface interface-ID	Cisco-ios-device-1(config)# interface GigabitEthernet 0/1	Specify a physical interface to which to apply the crypto map and enter interface configuration mode. This example specifies Gigabit Ethernet interface 0/1 of the Cisco device Cisco-IOS-Device-1. IP address 203.0.113.200 is already set to this interface.
crypto map map-name	Cisco-ios-device-1 (config-if)# crypto map NS-CISCO-CM	Apply the crypto map to the physical interface. This example applies crypto map NS-CISCO-CM.
exit	Cisco-ios-device-1 (config-if)# exit, Cisco-ios-device-1 (config)#	Exit back to global configuration mode.

## Configuring the NetScaler appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco IOS device, perform the following tasks on the NetScaler appliance. You can use either the NetScaler command line or the NetScaler graphical user interface (GUI):

- Create an IPsec profile.
- Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.
- Create a PBR rule and associate it with the IP tunnel.

### To create an IPSEC profile by using the NetScaler command line:

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1`
- `show ipsec profile <name>`

### To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line:

At the Command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `add ipTunnel <name>`

**To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line:**

At the Command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbrs <pbrName>`

The following commands create settings in NetScaler appliance NS\_Appliance-1 mentioned in section **Example of CloudBridge Connector Configuration and Data Flow**.

```

1 > add ipsec profile NS_Cisco_IPSec_Profile -psk
 examplepresharedkey -ikeVersion v1 -lifetime 315360 -encAlgo 3
 DES
2 Done
3 > add iptunnel NS_Cisco_Tunnel 203.0.113.200 255.255.255.255
 198.51.100.100 -protocol IPSEC -ipsecProfileName
 NS_Cisco_IPSec_Profile
4
5 Done
6 > add pbr NS_Cisco_Pbr -srcIP 10.102.147.0-10.102.147.255 -destIP
 10.20.0.0-10.20.255.255 -ipTunnel NS_Cisco_Tunnel
7
8 Done
9 > apply pbrs
10
11 Done
12 <!--NeedCopy-->
```

**To create an IPSEC profile by using the GUI:**

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** dialog box, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
4. Configure the **IPsec authentication** method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

**To create an IP tunnel and bind the IPSEC profile to it by using the GUI:**

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** dialog box, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop down list, select Subnet IP).
  - Local IP (All the configured IPs of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** dialog box, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select IP Tunnel)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

**To apply a PBR by using the GUI:**

1. Navigate to **System > Network > PBRs**.
2. On the **PBRs** tab, select the **PBR**, in the **Action list**, select **Apply**.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

## Monitoring the CloudBridge Connector Tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## Configuring a CloudBridge Connector tunnel between a NetScaler appliance and fortinet fortIGate appliance

May 2, 2023

You can configure a CloudBridge Connector tunnel between a NetScaler appliance and a Fortinet FortiGate appliance to connect two datacenters or extend your network to a cloud provider. The NetScaler appliance and the FortiGate appliance form the end points of the CloudBridge Connector tunnel and are called peers.

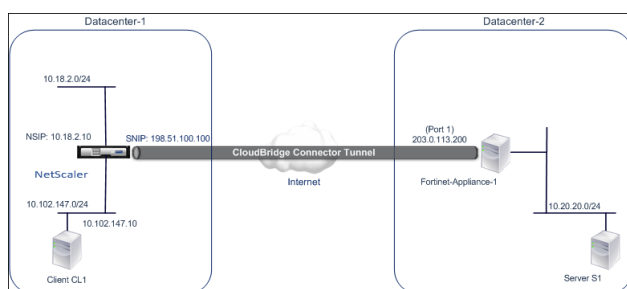

### Example of a CloudBridge Connector Tunnel Configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- NetScaler appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- FortiGate appliance FortiGate-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and FortiGate-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and FortiGate-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_Fortinet\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_Fortinet\_Tunnel, and policy based routing (PBR) entity NS\_Fortinet\_Pbr.

For more information, see [CloudBridge Connector tunnel configuration table pdf](#).

For information about Settings on Fortinet FortiGate-Appliance-1 in Datacenter-2, see [table](#).

### Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a NetScaler appliance and a FortiGate appliance, consider the following points:

- The following IPSec settings are supported for a CloudBridge Connector tunnel between a NetScaler appliance and a FortiGate appliance.

IPSec Properties	Settings
IPSec mode	Tunnel mode
IKE version	Version 1
IKE DH group	DH group 2 (1024 bits MODP algorithm)
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES
IKE hash algorithm	HMAC SHA1
ESP encryption algorithm	AES
ESP hash algorithm	HMAC SHA1

- You must specify the same IPSec settings on the NetScaler appliance and the FortiGate appliance at the two ends of the CloudBridge Connector.
- NetScaler provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore in the FortiGate appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).

- You must configure the firewall at the NetScaler end and FortiGate end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
- FortiGate appliance supports two types of VPN tunnels: Policy-based and Route-based. Only policy-based VPN tunnel is supported between a FortiGate appliance and a NetScaler appliance.

## Configuring FortiGate appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a FortiGate appliance, use the Fortinet Web-based Manager, which is the primary user interface for configuring, monitoring, and maintaining FortiGate appliances.

Before you begin the CloudBridge Connector tunnel configuration on a FortiGate appliance, make sure that:

- You have a user account with administrator credentials on the FortiGate appliance.
- You are familiar with the Fortinet Web-based Manager.
- The FortiGate appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

### Note

The procedures for configuring CloudBridge Connector tunnel on a FortiGate appliance might change over time, depending on the Fortinet release cycle. Citrix recommends that you follow the official Fortinet product documentation for [Configuring IPSec VPN tunnels](#).

To configure a CloudBridge connector tunnel between a NetScaler appliance and a FortiGate appliance, perform the following tasks on the FortiGate appliance by using the Fortinet Web-based manager:

- **Enable Policy-based IPSec VPN feature.** Enable this feature for creating policy-based VPN tunnels on the FortiGate appliance. Only policy-based type of VPN tunnel is supported between a FortiGate appliance and a NetScaler appliance. A policy-based VPN tunnel configuration on a FortiGate appliance includes phase 1 settings, phase 2 settings, and an IPSec security policy.
- **Define phase 1 parameters.** Phase 1 parameters are used by the FortiGate appliance for IKE Authentication before forming a secure tunnel to the NetScaler appliance.
- **Define phase 2 parameters.** Phase 2 parameters are used by the FortiGate appliance for forming a secure tunnel to the NetScaler appliance by establishing IKE security associations (SA).
- **Specify private subnets.** Define the FortiGate-side and the NetScaler-side private subnets whose IP traffic is to be transported through the tunnel.

- **Define an IPSec security policy for the tunnel.** A security policy allow IP traffic to pass between interfaces on a FortiGate appliance. An IPSec security policy specifies the interface to the private subnet and the interface connecting the NetScaler appliance through the tunnel.

To enable Policy-based IPSec VPN feature by using the Fortinet Web-based Manager

1. Navigate to **System > Config > Features**.
2. On the **Feature Settings** page, select **Show More** and turn on **Policy-based IPSec VPN**.

To define phase 1 parameters by using the Fortinet Web-based Manager

1. Navigate to **VPN > IPSec > Auto Key (IKE)** and click **Create Phase1**.
2. On the **New Phase 1** page, set the following parameters:
  - Name: Enter a name for this phase 1 configuration.
  - Remote Gateway: Select *Static IP Address*.
  - Mode: Select *Main (ID Protection)*.
  - Authentication Method: Select *Preshared Key*.
  - Pre-Shared Key: Enter a pre-shared key. The same pre-shared key must be configured on the NetScaler appliance.
  - Peer Options: Set the following IKE paramters for authenticating a NetScaler appliance.
    - IKE Version: Select *1*.
    - Mode Config: Clear this option if it is selected.
    - Local Gateway IP: Select *Main Interface IP*.
    - P1 Proposal: Select the encryption and authentication algorithms for IKE Authentication before forming a secure tunnel to the NetScaler appliance.
      - \* 1 - Encryption: Select *AES128*.
      - \* Authentication: Select *SHA1*.
      - \* Keylife: Enter an amount of time (in seconds) for the phase 1 key life.
      - \* DH Group: Select *2*.
    - X-Auth: Select *Disable*.
    - Deed Peer Detection: Select this option.
3. Click **OK**.

To specify private subnets by using the Fortinet Web-based Manager

1. Navigate to **Firewall Objects > Address > Addresses** and select **Create New**.
2. On the **New Address** page, set the following parameters:
  - Name: Enter a name for FortiGate-side subnet.
  - Type: Select *Subnet*.
  - Subnet / IP Range: Enter the address of the FortiGate-side subnet.
  - Interface: Select the local interface to this subnet.

3. Click **OK**.
4. Repeat steps 1-3 to specify the NetScaler-side subnet.

To define phase 2 parameters by using the Fortinet Web-based Manager

1. Navigate to **VPN > IPsec > Auto Key (IKE)** and click **Create Phase 2**.
2. On the **New Phase 2** page, set the following parameters:
  - Name: Enter a name for this phase 2 configuration.
  - Phase 1: Select the Phase 1 configuration from the drop-down list.
3. Click **Advanced** and set the following parameters:
  - P2 Proposal: Select the encryption and authentication algorithms for forming a secure tunnel to the NetScaler appliance.
    - 1 - Encryption: Select *AES128*.
    - Authentication: Select *SHA1*.
    - Enable replay detection: Select this option.
    - Enable perfect forward secrecy (PFS): Select this option.
    - DH Group: Select 2.
  - Keylife: Enter an amount of time (in seconds) for the phase 2 key life.
  - Autokey Keep Alive: Select this option.
  - Auto-negotiate: Select this option.
  - Quick Mode Selector: Specify the FortiGate-side and the NetScaler-side private subnets whose traffic is to be traversed through the tunnel.
    - Source Address: Select the FortiGate-side subnet from the drop-down list.
    - Source Port: Enter 0.
    - Destination Address: Select the NetScaler-side subnet from the drop-down list.
    - Destination Port: Enter 0.
    - Protocol: Enter 0.
4. Click **OK**.

To define an IPSec security policy by using the Fortinet Web-based Manager

1. Navigate to **Policy > Policy > Policy** and click **Create New**.
2. On the **Edit Policy** page, set the following parameters:
  - Policy Type: Select *VPN*.
  - Policy Subtype: Select *IPSec*.
  - Local Interface: Select the local interface to the internal (private) network.
  - Local Protected Subnet: Select the FortiGate-side subnet from the drop-down list whose traffic is to be traversed through the tunnel.
  - Outgoing VPN Interface: Select the local interface to the external (public) network.

- Remote Protected Subnet: Select the NetScaler-side subnet from the drop-down list whose traffic is to be traversed through the tunnel.
- Schedule: Keep the default setting (*always*) unless changes are needed to meet specific requirements.
- Service: Keep the default setting (*ANY*) unless changes are needed to meet your specific requirements.
- VPN Tunnel: Select *Use Existing* and select the tunnel from the drop-down list.
- Allow traffic to be initiated from the remote site: Select if traffic from the remote network will be allowed to initiate the tunnel.

3. Click **OK**.

### Configuring the NetScaler appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a NetScaler appliance and a FortiGate appliance, perform the following tasks on the NetScaler appliance. You can use either the NetScaler command line or the NetScaler graphical user interface (GUI):

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.** An IP tunnel specifies the local IP address (CloudBridge Connector tunnel end point IP address (of type SNIP) configured on the NetScaler appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the FortiGate appliance), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the NetScaler-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the FortiGate appliance side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the NetScaler command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecy ENABLE`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName** <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
  - Perfect Forward Secrecy (Enable this parameter)
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the Pre-shared key authentication method and set the Pre-Shared Key Exists parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)

- Protocol
- IPsec Profile

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select *IP Tunnel*)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler appliance appears in the GUI.

The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of NetScaler appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration.”

```
1 > add ipsec profile NS_Fortinet_IPSec_Profile -psk
 examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
 HMAC_SHA1 -lifetime 315360 -perfectForwardSecrecy ENABLE
2
3 Done
4 > add iptunnel NS_Fortinet_Tunnel 203.0.113.200 255.255.255.255
 198.51.100.100 -protocol IPSEC -ipsecProfileName
 NS_Fortinet_IPSec_Profile
5
6 Done
7 > add pbr NS_Fortinet_Pbr -srcIP 10.102.147.0-10.102.147.255 -
 destIP 10.20.0.0-10.20.255.255 -ipTunnel NS_Fortinet_Tunnel
8
9 Done
10 > apply pbrs
11
12 Done
13 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## CloudBridge Connector tunnel diagnostics and troubleshooting

May 2, 2023

If you have problems with a CloudBridge Connector tunnel configuration, make sure that all prerequisites were observed before the tunnel was set up. If they were, the problem might be with the tunnel end-point IP addresses, a NAT configuration, the way the tunnel was set up, or with the data traffic.

### Troubleshooting a CloudBridge Connector tunnel

If your CloudBridge Connector tunnel does not function properly, the issue could be with tunnel establishment or with the data traffic. If you are unsure which type of problem you have, look for an error message in the log file and see if the error message is in the list of tunnel-establishment issues. If you do not find your error message, check the list of possible issues related to data traffic.

#### Issues Related to tunnel establishment

After the requirements for configuring the IPSec tunnel are met and the CloudBridge Connector tunnel is configured, if the status of the tunnel is not UP, look for debugging information in the `iked.log` file on one or both NetScaler appliances configured as the tunnel end points.

On either appliance, type the following command at the NetScaler shell prompt:

```
cat /tmp/iked.debug | tee /var/iked.log
```

The [Troubleshooting](#) pdf lists some common errors and their solutions.

#### Issues related to data traffic

If the data in the CloudBridge Connector tunnel are not exchanged properly between the tunnel end points, do the following.

- For a CloudBridge Connector tunnel that uses GRE and IPSec protocols:

- Make sure that L2 mode is enabled on both of the CloudBridge Connector tunnel end points. To enable L2 mode, type the following command at the NetScaler command line interface:

```
enable mode L2
```

- \* If one of the CloudBridge Connector tunnel end points is a CloudBridge virtual appliance (VPX) and is provisioned on a VMware ESXi hypervisor, make sure that Promiscuous mode is set to Accept for the vSwitch associated with the CloudBridge VPX appliance.
- If a VLAN is extended through a CloudBridge Connector tunnel, verify one-to-one mapping on the extended VLAN entity on each of the tunnel end points
- Make sure that the IP tunnel entity is bound to the correct netbridge entity in each of the tunnel end points.
- Verify that the ARP entry for the peer CloudBridge Connector tunnel end point exists on the local tunnel end point, by typing the following command at the NetScaler command line interface:

```
show arp
```

- If the output shows an incomplete ARP entry, bidirectional traffic is not flowing through the tunnel. If bidirectional traffic is flowing, the ARP entry shows the name of tunnel interface for the devices on the other side of the tunnel.
- Remove the IP tunnel entities from both tunnel end points and add them again with the same parameters, but with the IPsec profile set to NONE, so that the tunnel uses only the GRE protocol.

After verifying the following in the IP tunnel (that uses GRE protocol), configure the tunnel with IPsec parameters by specifying a valid IPsec profile to the respective IP tunnel entities on each of the tunnel end points.

Proper PING or TCP flow through the tunnel.

Proper flow of data traffic through the tunnel.

After the configured tunnel (that uses GRE and IPsec protocols) is in UP state, if the data traffic does not flow properly through the tunnel, and if a NAT device was deployed in front of any or both of the tunnel end points, analyze the ingress and egress packets on the NAT devices.

- If a NetScaler appliance is used as Router or Gateway.
  - Make sure that L3 mode is enabled on the NetScaler appliance. To enable L3 mode, run the following command in the CloudBridge command line.
  - enable mode L3
  - If subnets are bound to a netbridge entity, make sure that correct IP tunnel entity is also bound to the netbridge.

- Run the following command in the NetScaler command line to see where the packets (Input and Output) are getting dropped:

```
stat ipsec counters
```

- Make sure that the correct routes are configured on both the tunnel end points.
- If no NAT device is deployed in front of the NetScaler appliance, make sure that the firewalls are configured to allow any ESP (IP protocol number 50) packets and any UDP packets for port 4500.

If none of the above measures result in successful exchange of traffic between the tunnel end points, contact Citrix technical support.

### Checklist before contacting Citrix technical support

For a speedy resolution, make sure that you have the following items ready before contacting Citrix technical support.

- Details of the deployment and network topology.
- Log file collected by typing the following command at the NetScaler shell prompt.
- Tech support bundle captured by typing the following command at the NetScaler command line.

```
show techsupport
```

- Packet traces captured on both CloudBridge Connector tunnel end points. To start a packet trace, type the following command at the NetScaler command line.

```
start nstrace -size 0
```

To stop packet trace, type the following command at the NetScaler command line.

```
stop nstrace
```

- Output of the following command typed at the NetScaler command prompt.

```
show arp
```

### CloudBridge Connector interoperability –StrongSwan

May 2, 2023

StrongSwan is an opensource IPsec implementation for Linux platforms. You can configure a CloudBridge Connector tunnel between a NetScaler appliance and a StrongSwan appliance to connect two

datacenters or extend your network to a cloud provider. The NetScaler appliance and the StrongSwan appliance form the end points of the CloudBridge Connector tunnel and are called peers.

### Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- NetScaler appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- StrongSwan appliance StrongSwan-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and StrongSwan-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and StrongSwan-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_StrongSwan\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_StrongSwan\_Tunnel, and policy based routing (PBR) entity NS\_StrongSwan\_Pbr.

The following table lists the settings used in this example.

#### Main settings of the CloudBridge Connector tunnel setup

Entity	Details
IP address of the CloudBridge Connector tunnel end point (NS_Appliance-1) in Datacenter-1	198.51.100.100
IP address of the CloudBridge Connector tunnel end point (StrongSwan-Appliance-1) in Datacenter-2	203.0.113.200
Datacenter-1's subnet whose traffic is to be protected over the CloudBridge Connector tunnel	10.102.147.0/24

Entity	Details
Datacenter-2's subnet whose traffic is to be protected over the CloudBridge Connector tunnel	10.20.20.0/24

Settings on NetScaler appliance NS\_Appliance-1 in Datacenter-1

SNIP1(for reference purposes only)	198.51.100.100	
IPSec profile	NS_StrongSwan_IPSec_Profile	IKE version: v1, Encryption algorithm: AES, Hash algorithm: HMAC_SHA1
<p>psk = examplepresharedkey            (Note: This is an example of a pre-share key, for illustration. NetScaler does not recommend to use this string in your CloudBridge Connector configuration)</p>		
CloudBridge Connector tunnel	NS_StrongSwan_Tunnel	Remote IP = 203.0.113.200, Local IP= 198.51.100.100, Tunnel protocol = IPSEC, IPSec profile= NS_StrongSwan_IPSec_Profile
Policy based route	NS_StrongSwan_Pbr	Source IP range = Subnet in the Datacenter-1=10.102.147.0-10.102.147.255, Destination IP range =Subnet in Datacenter-2=10.20.20.0-10.20.20.255, IP Tunnel = NS_StrongSwan_Tunnel

**Points to consider for a CloudBridge Connector tunnel configuration**

Before you begin configuring CloudBridge connector tunnel, make sure that:

- You have a basic knowledge about linux configurations.
- You have a basic Knowledge about IPSec protocol suite.

- The StrongSwan appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The NetScaler appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The following IPsec settings are supported for a CloudBridge Connector tunnel between a NetScaler appliance and a StrongSwan appliance.
  - IPsec mode: Tunnel mode
  - IKE version: Version 1
  - IKE authentication method: Pre-Shared Key
  - IKE encryption algorithm: AES
  - IKE hash algorithm: HMAC SHA1
  - ESP encryption algorithm: AES
  - ESP hash algorithm: HMAC SHA1
- You must specify the same IPsec settings on the NetScaler appliance and the StrongSwan appliance at the two ends of the CloudBridge Connector tunnel.
- NetScaler provides a common parameter (in IPsec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the StrongSwan appliance, you must specify the same hash algorithm and same encryption algorithm in IKE and ESP parameters in the IPsec.conf file.
- You must configure the firewall at the NetScaler end and StrongSwan end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

## Configure StrongSwan for the CloudBridge Connector tunnel

To configure a CloudBridge connector tunnel between a NetScaler appliance and a StrongSwan appliance, perform the following tasks on the StrongSwan appliance:

- **Specify IPsec connection information in ipsec.conf file.** ipsec.conf file defines all control and configuration information for IPsec connections in the strongSwan appliance.
- **Specify pre-shared key in ipsec.secrets file.** ipsec.secrets file defines secrets for IKE/IPsec authentication for IPsec connections in the strongSwan appliance.

The procedures for configuring IPsec VPN (CloudBridge Connector tunnel) on a StrongSwan appliance might change over time, depending on the StrongSwan release cycle. Citrix recommends that you follow the official StrongSwan documentation for [Configuring IPsec VPN tunnels](#).

Following sample excerpt of ipsec.conf file specifies IPsec information for setting up the IPsec VPN tunnel, described in Example of a CloudBridge Connector Configuration topic. For more information, see [CloudBridge Connector Configuration](#) pdf.

Following sample excerpt of ipsec.secrets file specifies the IKE authentication pre-shared key for setting up the IPsec VPN tunnel, described in Example of a CloudBridge Connector Configuration topic.

```
/etc/ipsec.secrets PSK 'examplepresharedkey'#pre-shared key for IPsec IKE authentication
```

## Configuring the NetScaler appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a NetScaler appliance and a StrongSwan appliance, perform the following tasks on the NetScaler appliance. You can use either the NetScaler command line or the NetScaler graphical user interface (GUI):

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.** An IP tunnel specifies the local IP address (CloudBridge Connector tunnel endpoint IP address (of type SNIP) configured on the NetScaler appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the StrongSwan appliance), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the NetScaler-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the StrongSwan side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the NetScaler command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`

- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication method** and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the Add IP Tunnel page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop-down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select *IP Tunnel*)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of NetScaler appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration:

```
1 > add ipsec profile NS_StrongSwan_IPSec_Profile -psk
 examplepresharedkey -ikeVersion v1 -encAlgo AES -hashAlgo
 HMAC_SHA1
2
3
4 Done
5
6 > add iptunnel NS_StrongSwan_Tunnel 203.0.113.200 255.255.255.255
 198.51.100.100 -protocol IPSEC -ipsecProfileName
 NS_StrongSwan_IPSec_Profile
7
8
9 Done
10
11 > add pbr NS_StrongSwan_Pbr -srcIP 10.102.147.0-10.102.147.255 -
 destIP 10.20.0.0-10.20.255.255 - ipTunnel NS_StrongSwan_Tunnel
12
13
14 Done
15
16 > apply pbrs
17
18
19 Done
20 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## CloudBridge Connector interoperability –F5 BIG-IP

May 2, 2023

You can configure a CloudBridge Connector tunnel between a NetScaler appliance and a F5 BIG-IP appliance to connect two datacenters or extend your network to a cloud provider. The NetScaler appliance and the F5 BIG-IP appliance form the end points of the CloudBridge Connector tunnel and are called peers.

### Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- NetScaler appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- F5 BIG-IP appliance F5-BIG-IP-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and F5-BIG-IP-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and F5-BIG-IP-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_F5-BIG-IP\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_F5-BIG-IP\_Tunnel, and policy based routing (PBR) entity NS\_F5-BIG-IP\_Pbr.

For more information, refer to [F5 big IP](#) pdf.

### Points to consider for a CloudBridge Connector tunnel configuration

- The NetScaler appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The F5 BIG-IP appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The following IPsec settings are supported for a CloudBridge Connector tunnel between a NetScaler appliance and an F5 BIG-IP appliance.
  - IPsec mode: Tunnel mode
  - IKE version: Version 1
  - IKE authentication method: Pre-Shared Key
  - IKE encryption algorithm: AES
  - IKE hash algorithm: HMAC SHA1
  - ESP encryption algorithm: AES
  - ESP hash algorithm: HMAC SHA1
- You must specify the same IPsec settings on the NetScaler appliance and the F5 BIG-IP appliance at the two ends of the CloudBridge Connector tunnel.
- NetScaler provides a common parameter (in IPsec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the F5 BIG-IP appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).
- You must configure the firewall at the NetScaler end and F5 BIG-IP end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

### Configuring F5 BIG-IP for the CloudBridge Connector tunnel

To configure a CloudBridge connector tunnel between a NetScaler appliance and an F5 BIG-IP appliance, perform the following tasks on the F5 BIG-IP appliance:

- **Create a forwarding virtual server for IPsec.** A forwarding virtual server intercepts IP traffic for the IPsec tunnel.
- **Create an IKE peer.** An IKE peer specifies the local and remote IPsec tunnel endpoints. It also specifies algorithms and credentials to be used for IPsec IKE phase 1.

- **Create a custom IPsec policy.** A policy specifies the IPsec protocol (ESP) and the mode (tunnel) to be used for forming the IPsec tunnel. It also specifies the algorithms and security parameters to be used for IKE IPsec phase 2.
- **Create a bidirectional IPsec traffic selector.** A traffic selector specifies the F5 BIG-IP side and NetScaler side subnets whose IP traffic is to be traversed through the IPsec tunnel.

The procedures for configuring IPsec VPN (CloudBridge Connector tunnel) on an F5 BIG-IP appliance might change over time, depending on the F5 release cycle. Citrix recommends that you follow the official F5 BIG-IP documentation for configuring IPsec VPN tunnels, at:

<https://f5.com>

To create a forwarding virtual server for IPsec by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Local Traffic > Virtual Servers**, and then click **Create**.
2. On **New Virtual Server List** screen, set the following parameters:
  - **Name.** Type a unique name for the virtual server.
  - **Type.** Select **Forwarding (IP)**.
  - **Destination Address.** Type a wildcard network address in CIDR format, for example, 0.0.0.0/0 for IPv4 to accept any traffic.
  - **Service Port.** Select **All Ports** from the list.
  - **Protocol list.** Select **All Protocols** from the list.
  - **VLAN and Tunnel Traffic.** Retain the default selection, **All VLANs and Tunnels**.
3. Click **Finished**.

To create a custom IPsec policy by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Network > IPsec > IPsec Policies**, and then click **Create**.
2. On the **New Policy** screen, set the following parameters:
  - **Name.** Type a unique name for the policy.
  - **IPsec Protocol.** Retain the default selection, ESP.
  - **Mode.** Select Tunnel. The screen refreshes to show additional related settings.
  - **Tunnel Local Address.** Type the local IPsec tunnel endpoint IP address (Configured on the F5 BIG-IP appliance).
  - **Tunnel Remote Address.** Type the remote IPsec tunnel endpoint IP address (Configured on the NetScaler appliance).
3. For the IKE Phase 2 parameters, retain the default values, or select the options that are appropriate for your deployment.
4. Click **Finished**.

To create a bidirectional IPsec traffic selector by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Network > IPsec > Traffic Selectors**, and then click **Create**.
2. On the **New Traffic Selector** screen, set the following parameters:
  - **Name**. Type a unique name for the traffic selector.
  - **Order**. Retain the default value (**First**). This setting specifies the order in which the traffic selector appears on the Traffic Selector List screen.
3. From the **Configuration** list, select **Advanced**, and set the following parameters:
  - **Source IP Address**. Click **Host** or **Network**, and in **Address** field, type the address of the F5 BIG-IP side subnet whose traffic is to be protected over the IPsec tunnel.
  - **Source Port**. Select **\* All Ports**.
  - **Destination IP Address**. Click **Host**, and in the **Address** field, type the address of the NetScaler side subnet whose traffic is to be protected over the IPsec tunnel.
  - **Destination Port**. Select **\* All Ports**.
  - **Protocol**. Select **\* All Protocols**.
  - **Direction**. Select **Both**.
  - **Action**. Select **Protect**. The **IPsec Policy Name** setting appears.
  - **IPsec Policy Name**. Select the name of the custom IPsec policy that you created.
4. Click **Finished**.

## Configuring the NetScaler appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a NetScaler appliance and a F5 BIG-IP appliance, perform the following tasks on the NetScaler appliance. You can use either the NetScaler command line or the NetScaler graphical user interface (GUI):

- **Create an IPsec profile**. An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it**. An IP tunnel specifies the local IP address (CloudBridge Connector tunnel end point IP address (of type SNIP) configured on the NetScaler appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the F5 BIG-IP appliance), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel**. A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the NetScaler-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the F5 BIG-IP side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the NetScaler command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecyENABLE`
- `show ipsec profile** <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsecProfile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication method** and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
  - Name

- Remote IP
- Remote Mask
- Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
- Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
- Protocol
- IPSec Profile

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select *IP Tunnel*)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of NetScaler appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration.:

```
1 > add ipsec profile NS_F5-BIG-IP_IPSec_Profile -psk
 examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
 HMAC_SHA1 -lifetime 315360 -perfectForwardSecrecy ENABLE
2
3
4 Done
5
6 > add iptunnel NS_F5-BIG-IP_Tunnel 203.0.113.200 255.255.255.255
 198.51.100.100 -protocol IPSEC -ipsecProfileName NS_F5-BIG-
 IP_IPSec_Profile
7
8
```

```
9 Done
10
11 > add pbr NS_F5-BIG-IP_Pbr -srcIP 10.102.147.0-10.102.147.255 -
 destIP 10.20.0.0-10.20.255.255 - ipTunnel NS_F5-BIG-IP_Tunnel
12
13
14 Done
15
16 > apply pbrs
17
18
19 Done
20 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## CloudBridge Connector interoperability –Cisco ASA

May 2, 2023

You can configure a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco ASA appliance to connect two datacenters or extend your network to a cloud provider. The NetScaler appliance and the Cisco ASA appliance form the end points of the CloudBridge Connector tunnel and are called peers.

### Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following appliances:

- NetScaler appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- Cisco ASA appliance Cisco-ASA-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and Cisco-ASA-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example,

NS\_Appliance-1 and Cisco-ASA-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_Cisco-ASA\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_Cisco-ASA\_Tunnel, and policy based routing (PBR) entity NS\_Cisco-ASA\_Pbr.

### Points to consider for a CloudBridge Connector tunnel configuration

Before you begin configuring CloudBridge connector tunnel, make sure that:

- The following IPsec settings are supported for a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco ASA appliance.

IPsec Properties	Settings
IPsec mode	Tunnel mode
IKE version	Version 1
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES, 3DES
IKE hash algorithm	HMAC SHA1, HMAC MD5
ESP encryption algorithm	AES, 3DES
ESP hash algorithm	HMAC SHA1, HMAC MD5

- You must specify the same IPsec settings on the NetScaler appliance and the Cisco ASA appliance at the two ends of the CloudBridge Connector tunnel.
- NetScaler provides a common parameter (in IPsec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the Cisco ASA appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).

- You must configure the firewall at the NetScaler end and Cisco ASA end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

### Configuring Cisco ASA for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a Cisco ASA appliance, use the Cisco ASA command line interface, which is the primary user interface for configuring, monitoring, and maintaining Cisco ASA appliances.

Before you begin the CloudBridge Connector tunnel configuration on a Cisco ASA appliance, make sure that:

- You have a user account with administrator credentials on the Cisco ASA appliance.
- You are familiar with the Cisco ASA command line interface.
- The Cisco ASA appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

#### Note

The procedures for configuring CloudBridge Connector tunnel on a Cisco ASA appliance might change over time, depending on the Cisco release cycle. Citrix recommends that you follow the official Cisco ASA product documentation for Configuring IPsec VPN tunnels, at:

- <http://www.cisco.com>

To configure a CloudBridge connector tunnel between a NetScaler appliance and a Cisco ASA appliance, perform the following tasks on the Cisco ASA appliance's command line:

- **Create an IKE Policy.** An IKE policy defines a combination of security parameters to be used during the IKE negotiation (phase 1). For example, parameters such as hash algorithm, encryption algorithm, and authentication method to be used in the IKE negotiation are set in this task.
- **Enable IKE on the outside interface.** Enable IKE on the outside interface through which the tunnel traffic will flow to the tunnel peer.
- **Create a tunnel group.** A tunnel group specifies the type of tunnel and the pre-shared key. The tunnel type must be set to ipsec-l2l, which stands for IPsec LAN to LAN. A pre-shared key is a text string, which the peers of a CloudBridge Connector tunnel use to mutually authenticate with each other. The pre-shared keys are matched against each other for IKE authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on the Cisco ASA appliance and the NetScaler appliance.

- **Define a transform set.** A transform set defines a combination of security parameters (phase 2) to be used in the exchange of data over the CloudBridge Connector tunnel after the IKE negotiation is successful.
- **Create an access List.** Crypto access lists are used to define the subnets whose IP traffic will be protected over the CloudBridge tunnel. The source and destination parameters in the access list specify the Cisco appliance side and NetScaler side subnets that are to be protected over the CloudBridge Connector Tunnel. The access list must be set to permit. Any request packet that originates from an appliance in the Cisco appliance side subnet and is destined to an appliance in the NetScaler side subnet, and that matches the source and destination parameters of the access list, is sent across the CloudBridge Connector tunnel.
- **Create a crypto map.** Crypto maps define the IPSec parameters for security associations (SAs). They include the following: Crypto access list to identify the subnets whose traffic is to be protected over the CloudBridge tunnel, peer (NetScaler) identification by IP address, and transform set to match the peer security settings.
- **Apply the crypto Map to the outside interface.** In this task, you apply the crypto map to the outside interface through which the tunnel traffic will flow to the tunnel peer. Applying the crypto map to an interface instructs the Cisco ASA appliance to evaluate all interface traffic against the crypto map set and to use the specified policy during connection or security association negotiations.

The examples in the following procedures create settings of Cisco ASA appliance Cisco-ASA-Appliance-1 used in Example of CloudBridge Connector Configuration and Data Flow.

To create an IKE policy by using the Cisco ASA command line

At the Cisco ASA appliance’s command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto ikev1 policy priority	Cisco-ASA-appliance-1(config)# crypto ikev1 policy 1	Enter IKE policy configuration mode and identify the policy to create. (Each policy is uniquely identified by the priority number you assign.) This example configures policy 1.
encryption (3des   aes)	Cisco-ASA-appliance-1 (config-ikev1-policy)# encryption 3des	Specify the encryption algorithm. This example configures the 3DES algorithm.
hash (sha   md5)	Cisco-ASA-appliance-1 (config-ikev1-policy)# hash sha	Specify the hash algorithm. This example configures SHA.

Command	Example	Command Description
authenticationpre-share	Cisco-ASA-appliance-1 (config-ikev1-policy)# authentication pre-share	Specify the pre-share authentication method.
group 2	Cisco-ASA-appliance-1 (config-ikev1-policy)# group 2	Specify 1024-bit Diffie-Hellman group identifier (2).
lifetime seconds	Cisco-ASA-appliance-1 (config-ikev1-policy)# lifetime 28800	Specify the security association's lifetime in seconds. This example configures 28800 seconds, which is the default value of lifetime in a NetScaler appliance.

To enable IKE on the outside interface by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto ikev1 enable outside	Cisco-ASA-appliance-1(config)# crypto ikev1 enable outside	Enable IKEv1 on the interface through which the tunnel traffic flows to the tunnel peer. This example enables IKEv1 on the interface named outside.

To create a tunnel group by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, as show in the attached pdf [Tunnel Group using Cisco ASA command line](#):

To create a crypto access list by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following command in global configuration mode, in the order shown:

Command	Example	Command Description
access-list access-list-number permit IP source source-wildcard destination destination-wildcard	Cisco-ASA-appliance-1(config)# access-list 111 permit ip 10.20.20.0 0.0.0.255 10.102.147.0 0.0.0.255	Specify conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example configures access list 111 to protect traffic from subnets 10.20.20.0/24 (at the Cisco-ASA-Appliance-1 side) and 10.102.147.0/24 (at the NS_Appliance-1 side).

To define a transform set by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode. See [Transform set using ASA command line](#) table pdf.

To create a crypto map by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto map map-name seq-num match address access-list-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 match address 111	Create a crypto map and specify an access list to it. This example configures crypto map NS-CISCO-CM with sequence number 1 and assigns access list 111 to NS-CISCO-CM.
crypto map map-name seq-num set peer ip-address	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 set peer 198.51.100.100	Specify the peer (NetScaler appliance) by its IP address. This example specifies 198.51.100.100, which is the tunnel endpoint IP address on the NetScaler appliance.

Command	Example	Command Description
crypto map map-name seq-num set ikev1 transform-set transform-set-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 set ikev1 transform-set NS-CISCO-TS	Specify which transform set is allowed for this crypto map entry. This example specifies transform set NS-CISCO-TS.

To apply a crypto map to an interface by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto map map-nameinterface interface-name	Cisco-ASA-appliance-1(config)# crypto map NS-CISCO-CM interface outside	Apply the crypto map to the interface through which CloudBridge Connector tunnel traffic will flow. This example applies crypto map NS-CISCO-CM to interface outside.

## Configuring the NetScaler appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a NetScaler appliance and a Cisco ASA appliance, perform the following tasks on the NetScaler appliance. You can use either the NetScaler command line or the NetScaler graphical user interface (GUI):

- Create an IPsec profile.
- Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.
- Create a PBR rule and associate it with the IP tunnel.

### To create an IPSEC profile by using the NetScaler command line:

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecy ENABLE`
- `show ipsec profile <name>`

### To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line:

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

**To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line:**

At the command prompt, type:

- `**add pbr** <pbrName> **ALLOW** -**srcIP** <subnet-range> -**destIP** <subnet-range>`
- `**ipTunnel** <tunnelName>`
- `**apply pbrs**`
- `**show pbr** <pbrName>`

**To create an IPSEC profile by using the GUI:**

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
  - Perfect Forward Secrecy (Enable this parameter)
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

**To create an IP tunnel and bind the IPSEC profile to it by using the GUI:**

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select Subnet IP).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile

4. Click **Create**, and then click **Close**.

**To create a PBR rule and bind the IPSEC tunnel to it by using the GUI:**

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select IP Tunnel)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of NetScaler appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration.”:

```
1 > add ipsec profile NS_Cisco-ASA_IPSec_Profile -psk
 examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
 HMAC_SHA1 -lifetime 315360 -perfectForwardSecrecy ENABLE
2
3 Done
4
5 > add iptunnel NS_Cisco-ASA_Tunnel 203.0.113.200 255.255.255.255
 198.51.100.100 -protocol IPSEC -ipsecProfileName NS_Cisco-
 ASA_IPSec_Profile
6
7
8 Done
9
10 > add pbr NS_Cisco-ASA_Pbr -srcIP 10.102.147.0-10.102.147.255 -destIP
 10.20.0.0-10.20.255.255 -ipTunnel NS_Cisco-ASA_Tunnel
11
12
13 Done
14
15 > apply pbrs
16
17 Done
```

```
18
19 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector Tunnel

You can monitor the performance of CloudBridge Connector tunnels on a NetScaler appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a NetScaler appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## High Availability

May 2, 2023

A high availability (HA) deployment of two NetScaler appliances can provide uninterrupted operation in any transaction. With one appliance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

The secondary node monitors the primary by sending periodic messages (often called heartbeat messages or health checks) to determine whether the primary node is accepting connections. If a health check fails, the secondary node retries the connection for a specified period, after which it determines that the primary node is not functioning normally. The secondary node then takes over for the primary (a process called failover).

After a failover, all clients must reestablish their connections to the managed servers, but the session persistence rules are maintained as they were before the failover.

With Web server logging persistence enabled, no log data is lost due to the failover. For logging persistence to be enabled, the log server configuration must carry entries for both systems in the log.conf file.

**Note:**

In some cases, the primary node is used as a proxy to the secondary node.

The following figure shows a network configuration with an HA pair.

Figure 1. NetScaler Appliances in a High Availability Configuration

To configure HA, you might want to begin by creating a basic setup, with both nodes in the same subnet. You can then customize the intervals at which the nodes communicate health-check information, the process by which nodes maintain synchronization, and the propagation of commands from the primary to the secondary. You can configure fail-safe mode to prevent a situation in which neither node is primary. If your environment includes devices that do not accept NetScaler gratuitous ARP messages, you should configure virtual MAC addresses. When you are ready for a more complex configuration, you can configure HA nodes in different subnets.

To improve the reliability of your HA setup, you can configure route monitors and create redundant links. In some situations, such as when troubleshooting or performing maintenance tasks, you might want to force a node to fail over (assign primary status to the other node), or you might want to force the secondary node to stay secondary or the primary node to stay primary.

## Points to consider for a high availability setup

June 1, 2023

### Note

The following requirements for configuring systems in an HA setup:

- In an HA configuration, the primary and secondary NetScaler appliances must be of the same

model. Different NetScaler models are not supported in an HA pair. Also, NetScaler VPXs deployed on different models are not supported in an HA pair. Only, NetScaler VPXs deployed on the same model can form an HA pair.

- In an HA setup, both nodes must run the same version of NetScaler.
- Entries in the configuration file (ns.conf) on both the primary and the secondary system must match, with the following exceptions:
  - The primary and the secondary systems must each be configured with their own unique IP addresses (NSIPs.)
  - In an HA pair, the node ID and associated IP address of one node must point to the other node. For example, if you have nodes NS1 and NS2, you must configure NS1 with a unique node ID and the IP address of NS2, and you must configure NS2 with a unique node ID and the IP address of NS1.
- If you create a configuration file on either node by using a method that does not go directly through the GUI or the CLI (for example, importing SSL certificates, or changing to startup scripts), you must copy the configuration file to the other node or create an identical file on that node.
- Initially, all NetScaler appliances are configured with the same RPC node password. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. For security, you should change the default RPC node passwords.

One RPC node exists on each NetScaler. This node stores the password, which is checked against the password provided by the contacting system. To communicate with other systems, each NetScaler requires knowledge of those systems, including how to authenticate on those systems. RPC nodes maintain this information, which includes the IP addresses of the other systems, and the passwords they require for authentication.

RPC nodes are implicitly created when adding a node or adding a Global Server Load Balancing (GSLB) site. You cannot create or delete RPC nodes manually.

**Note:**

If the NetScaler appliances in a high availability setup are configured in one-arm mode, you must disable all system interfaces except the one connected to the switch or hub.

For an IPv6 HA configuration, the following considerations apply:

- You must install the IPv6PT license on both NetScaler appliances.
- After installing the IPv6PT license, enable the IPv6 feature by using the GUI or the command line interface.
- Both NetScaler appliances require a global NSIP IPv6 address. In addition, network entities (for example, switches and routers) between the two nodes must support IPv6.

## Configuring high availability

May 2, 2023

To set up a high availability configuration, you create two nodes, each of which defines the other's NetScaler IP (NSIP) address as a remote node. Begin by logging on to one of the two NetScaler appliances that you want to configure for high availability, and add a node. Specify the other appliance's NetScaler IP (NSIP) address as the address of the new node. Then, log on to the other appliance and add a node that has the NSIP address of the first appliance. An algorithm determines which node becomes primary and which becomes secondary.

The following figure shows a simple HA setup, in which both nodes are in the same subnet.

Figure 1. Two NetScaler Appliances Connected in a High Availability Configuration

### Steps to configure high availability

Setting up a high availability pair of two NetScaler appliances consists of the following tasks on both the appliances:

- **Add a node.** On an appliance, say N1, add the other appliance, say N2, by specifying a unique node ID and the appliance's (N2) NSIP address. You can specify any integer in the range of 1-64 for the peer node ID.

The peer node ID specified on the self-node is applicable only to the self-node and it does not have any relevance on the peer node. For example, you have added N2 as peer node on N1 and

specified the node ID as 33 for N2. The N2's node ID setting as 33 is applicable only on N1 and has no effect on N2's configuration.

The peer node ID, specified on both the nodes, need not be of the same value and can be modified. On both the nodes, the self-node ID is hardcoded to zero and cannot be modified.

- **Disable HA monitor for unused interfaces.** On the self-node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. Disabling HA monitor for unused interfaces prevents any HA failovers caused when the state of any of these unused interfaces becomes DOWN.

**Note:**

To ensure that each node in the high availability configuration has the same settings, you must synchronize your SSL certificates, startup scripts, and other configuration files with those on the primary node.

## CLI procedures

To set up a high availability pair of two NetScaler appliances by using the CLI, perform the following tasks on each of the two appliances:

### To add a node by using the CLI:

At the command prompt, type:

- `add ha node <id> <IPAddress>`
- `show ha node`

### To disable the HA monitor for an unused interface by using the CLI:

At the command prompt, type:

- `set interface <ifNum> [-haMonitor ( ON | OFF )]`
- `show interface <ifNum>`

### Example:

```
1 > add ha node 33 203.0.113.33
2
3 > set interface 1/3 -haMonitor OFF
4 Done
5 <!--NeedCopy-->
```

## GUI procedure

The NetScaler GUI provides a screen that combines the tasks of adding a peer node as well as disabling the HA monitor on unused interfaces on the self-node. The screen also provides an option to

automatically configure the peer node for the HA setup avoiding the need to manually configure the peer node.

### **To set up a high availability pair of two NetScaler appliances by using the GUI:**

1. Log on to the GUI of one of the appliances.
2. Navigate to **System > High Availability > Nodes**, provide the peer node's NSIP address in the **Remote Node IP Address** field.
3. Select **Turn Off HA Monitor interface/channels that are down**.
4. Select **Configure remote system to participate High Availability setup** and provide the peer node's login credentials.
5. Click **Create**.

### **Disabling or Enabling a Node**

You can disable or enable only a secondary node. When you disable a secondary node, it stops sending heartbeat messages to the primary node, and therefore the primary node can no longer check the status of the secondary. When you enable a node, the node takes part in the high availability configuration.

### **To disable or enable a node by using the command line interface**

At the command prompt, type one of the following commands:

- `set ha node -hastatus DISABLED`
- `set ha node -hastatus ENABLED`

### **To disable or enable a node by using the GUI**

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. In the **High Availability Status** list, select **ENABLED (Actively Participate in HA)** or **DISABLED (Do not participate in HA)**.

## **Configuring the communication intervals**

March 1, 2023

The hello interval is the interval at which the heartbeat messages are sent to the peer node. The dead interval is the time interval after which the peer node is marked DOWN if heartbeat packets are not

received. The heartbeat messages are UDP packets sent to port 3003 of the other node in an HA pair. The dead interval must be set as a multiple of the hello interval. By default, the hello interval is set to 200 milliseconds and the dead interval is set to 3 seconds.

### To set the hello and dead intervals by using the command line interface

At the command prompt, type:

- `set HA node [-helloInterval <msecs>] [-deadInterval <secs>]`
- `show HA node <id>`

### To set the hello and dead intervals by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. Set the following parameters:
  - Hello Interval (msecs)
  - Dead Interval (secs)

## Configuring synchronization

November 8, 2023

Synchronization is a process of duplicating the configuration of the primary node on the secondary node. The purpose of synchronization is to ensure that there's no loss of configuration information between the primary and the secondary nodes, regardless of the number of failovers that occur. Synchronization uses TCP port 3008 or 3010.

Synchronization is triggered when one of the following conditions is met:

- The secondary node in an HA setup comes up after a restart.
- The primary node becomes secondary after a failover.

Automatic synchronization is enabled by default. You can also force synchronization.

#### Note:

- Command propagation is disabled during HA synchronization to prevent any conflicting command settings, which can lead to command propagation failure.
- During an HA synchronization, the secondary node runs the `clear ns config` command to clear the existing configuration and load the new configuration pulled from the

primary node. However, the clear configuration does not remove the default static route configured in the secondary node. If this default static route points to an incorrect gateway, it might result in downtime of the services.

## Disabling or enabling synchronization

Automatic HA synchronization is enabled by default on each node in an HA pair. You can enable or disable it on either node.

### To disable or enable automatic synchronization by using the command line interface

At the command prompt, type:

- `set HA node -haSync DISABLED`
- `set HA node -haSync ENABLED`

### To disable or enable synchronization by using the GUI

1. Navigate to **System > High Availability**.
2. Under HA Synchronization, clear or select the Secondary node will fetch the configuration from the Primary option.

## Forcing the secondary node to synchronize with the primary node

In addition to automatic synchronization, the NetScaler supports forced synchronization. You can force the synchronization from either the primary or the secondary node. When you force synchronization from the secondary node, it starts synchronizing its configuration with the primary node.

However, if synchronization is already in progress, forced synchronization fails and the system displays a warning. Forced synchronization also fails in any of the following circumstances:

- You force synchronization on a standalone system.
- The secondary node is disabled.
- HA synchronization is disabled on the secondary node.

### To force synchronization by using the command line interface

At the command prompt, type:

```
force HA sync
```

### To force synchronization by using the GUI

1. Navigate to **System > High Availability**.
2. On the **Nodes** tab, in the Action list, click **Force Synchronization**.

## Synchronizing configuration files in a high availability setup

June 29, 2021

In a high availability setup, all configuration files are synchronized automatically from the primary node to the secondary node at an interval of one minute. Synchronizing configuration files can be performed manually by using the command line interface or the GUI at either the primary or the secondary node.

Files located on the secondary that are specific to the secondary (not present on the primary) are not deleted during the synchronization.

### To synchronize files in a high availability setup by using the command line interface

At the command prompt, type:

```
sync HA files <mode>
```

Example

```
1 > sync HA files all
2 Done
3 <!--NeedCopy-->
```

```
1 > sync HA files ssl
2 Done
3 <!--NeedCopy-->
```

### Parameter descriptions (of the command listed in the CLI procedure)

```
sync ha files <mode>
```

`mode`

Specify one of the following modes of synchronization.

- **all** - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, and Application Firewall XML objects.

- **bookmarks** - Synchronize all Access Gateway bookmarks.
- **ssl** - Synchronize all certificates, keys, and CRLs for the SSL feature.
- **imports** - Synchronize all XML objects (for example, WSDLs, schemas, error pages) configured for the application firewall.
- **misc** - Synchronize all license files and the rc.conf file.
- **all\_plus\_misc** - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, application firewall XML objects, licenses, and the rc.conf file.

## To synchronize files in a high availability setup by using the GUI

Navigate to **System > Diagnostics** and, in the **Utilities** group, click **Start HA files synchronization**.

## Configuring command propagation

November 8, 2023

In an HA setup, any command issued on the primary node propagates to the secondary node. The propagated command is run on the secondary node before it's run on the primary node. If command propagation or execution fails on the secondary, the primary node runs the command and logs an error. Command propagation uses TCP port 3008 or 3010.

In an HA pair configuration, command propagation is enabled by default on both the primary and secondary nodes. You can enable or disable command propagation on either node in an HA pair. If you disable command propagation on the primary node, commands aren't propagated to the secondary node. If you disable command propagation on the secondary node, commands propagated from the primary node aren't run on the secondary node.

### Note

After re-enabling propagation, remember to force synchronization.

If synchronization occurs while you're disabling propagation, any configuration-related changes that you make before the disabling of propagation takes effect are synchronized with the secondary node. This is also true for cases where propagation is disabled while synchronization is in progress.

## To disable or enable command propagation by using the command line interface

At the command prompt, type:

- set HA node -haProp DISABLED
- set HA node -haProp ENABLED

## To disable or enable command propagation by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. Clear or select the Primary node will propagate the configuration to the Secondary option.

**Note:**

Command propagation is disabled during HA synchronization to prevent any conflicting command settings, which can lead to command propagation failure.

## Restricting high availability synchronization traffic to a VLAN

November 7, 2023

In a high availability (HA) deployment, traffic related to maintaining the HA configuration flows between the two HA nodes. This traffic is of the following types:

- Config synchronization
- Config propagation
- Connection mirroring
- Load balancing persistency config synchronization
- Persistent session synchronization
- Session state synchronization

Proper flow of this HA related traffic between the two nodes is critical for the functioning of the HA deployment. Typically, the HA related traffic is small in volume but can become very high during a failover. It becomes very high if stateful connection failover is enabled and the node that was primary before the failover was handling a large number of connections.

By default, the HA related traffic flows through the VLANs to which the NSIP address is bound. To accommodate a potential surge in this traffic, you can separate the HA related traffic from the management traffic and restrict its flow to a separate VLAN. This VLAN is called the HA SYNC VLAN.

**Note:**

In an HA setup, if the `tag all` parameter is enabled, then the HA packets are also tagged with the VLAN traffic. However, there might be issues with the high availability communication. Therefore, it is recommended to configure NSVLAN or HA SYNC VLAN for HA traffic.

- For NSVLAN configuration, see [Configuring NSVLAN](#).
- For HA SYNC VLAN configuration, see [Configure HA SYNC VLAN](#).

## Points to consider before Configuring an HA SYNC VLAN

- The configuration of an HA SYNC VLAN is neither propagated nor synchronized. In other words, the HA SYNC VLAN is node specific and is configured independently on each node.
- HA SYNC VLAN configuration is removed when you clear the configuration in only FULL mode.
- HA MON must be set to OFF for interfaces that are part of the HA SYNC VLAN, to avoid a situation in which both nodes function as the primary node.
- Management interfaces (for example, 0/1 and 0/2) must not be part of the HA SYNC VLAN, so that HA related traffic does not flow through management interfaces.
- Citrix recommends disabling high availability heartbeat messages on management interfaces and enabling on HA SYNC VLAN interfaces. After meeting these recommendations, high availability heartbeat messages can also be enabled on data interfaces.

For more information on disabling high availability heartbeat messages on interfaces, see [Managing high availability heartbeat messages on a NetScaler appliance](#).

## Configure HA SYNC VLAN

To configure an HA SYNC VLAN on a NetScaler node, specify a configured VLAN with the HA SYNC VLAN parameter of the local node entity.

### To configure an HA SYNC VLAN on a local node by using the command line:

At the command prompt, type:

- `set ha node -syncvlan <VLANID>`
- `show node`

### Parameter Description:

**syncvlan (Sync VLAN)** - VLAN on which HA related traffic is sent. This includes traffic for synchronization, propagation, connection mirroring, load balancing persistency, configuration synchronization, persistent session synchronization, and session state synchronization. However, HA heartbeats can use any interface.

### To configure an HA SYNC VLAN on a node by using the GUI:

1. Navigate to **System > High Availability**.
2. Set the **Sync VLAN** parameter while modifying the local node.

## Configuring fail-safe mode

October 13, 2023

In an HA configuration, fail-safe mode ensures that one node is always primary when both nodes fail the health check. This is to ensure that when a node is only partially available, backup methods are enabled to handle traffic as best as possible. The HA fail-safe mode is configured independently on the primary and secondary nodes.

The following table shows some of the fail-safe cases. The NOT\_UP state means that the node failed the health check yet it is partially available. The UP state means that the node passed the health check.

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP(failed last)	NOT_UP (failed first)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
NOT_UP (failed first)	NOT_UP(failed last)	A (Secondary), B (Secondary)	A(Secondary), B(Primary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
UP	UP	A (Primary), B (Secondary)	A (Primary), B (Secondary)	If both nodes pass the health check, no change in behavior with fail-safe enabled.
UP	NOT_UP	A(Primary), B(Secondary)	A (Primary), B (Secondary)	If only the secondary node fails, no change in behavior with fail-safe enabled.

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP	UP	A(Secondary), B(Primary)	A(Secondary), B(Primary)	If only the primary fails, no change in behavior with fail-safe enabled.
NOT_UP	UP (STAYSECONDARY)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If the secondary is configured as STAYSECONDARY, the primary remains primary even if it fails.

### To enable fail-safe mode by using the command line interface

At the command prompt, type:

```
set HA node [-failSafe (**ON** | **OFF**)]
```

Example

```
1 set ha node -failsafe ON
2 <!--NeedCopy-->
```

### To enable fail-safe mode by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. Under **Fail-Safe Mode**, select the **Maintain one Primary** node even when both nodes are unhealthy option.

## Configuring Virtual MAC Addresses

May 2, 2023

A virtual MAC address is a floating entity shared by the primary and the secondary nodes in an HA setup.

In an HA setup, the primary node owns all of the floating IP addresses, such as the MIPs, SNIPs, and VIPs. The primary node responds to Address Resolution Protocol (ARP) requests for these IP addresses with its own MAC address. As a result, the ARP table of an external device (for example, an upstream router) is updated with the floating IP address and the primary node's MAC address.

When a failover occurs, the secondary node takes over as the new primary node. It then uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it acquired from the primary. However, the MAC address that the new primary advertises is the MAC address of its own interface.

Some devices (notably a few routers) do not accept the GARP messages generated by the NetScaler appliance. As a result, some external devices retain the old IP to MAC mapping advertised by the old primary node. This can result in a site going down.

You can overcome this problem by configuring a virtual MAC on both nodes of an HA pair. Both nodes then possess identical MAC addresses. Therefore, when failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

To create a virtual MAC, you need to first create a Virtual Router ID (VRID) and bind it to an interface. (In an HA setup, you need to bind the VRID to the interfaces on both nodes.) Once the VRID is bound to an interface, the system generates a virtual MAC with the VRID as the last octet.

This section includes the following details:

- [Configuring IPv4 virtual MACs](#)
- [Configuring IPv6 virtual MACs](#)

## Configuring IPv4 virtual MACs

When you create a IPv4 virtual MAC address and bind it to a interface, any IPv4 packet sent from the interface uses the virtual MAC address that is bound to the interface. If there is no IPv4 virtual MAC bound to an interface, the interface's physical MAC address is used.

The generic virtual MAC is of the form `00:00:5e:00:01:<VRID>`. For example, if you create a VRID with a value of 60 and bind it to an interface, the resulting virtual MAC is `00:00:5e:00:01:3c`, where `3c` is the hex representation of the VRID. You can create 255 VRIDs with values from 1 to 255.

### Creating or modifying an IPv4 virtual MAC

You create an IPv4 virtual MAC by assigning it a virtual router ID. You can then you bind the virtual MAC to an interface. You cannot bind multiple VRIDs to the same interface. To verify the virtual MAC configuration, you should display and examine the virtual MACs and the interfaces bound to the virtual MACs.

**To add a virtual MAC by using the command line interface** At the command prompt, type:

- `add vrID`
- `bind vrid <id> -ifnum <interface_name>`
- `show vrID`

Example

```
1 > add vrID 100
2 Done
3 > bind vrid 100 -ifnum 1/1 1/2 1/3
4 Done
5 <!--NeedCopy-->
```

**To unbind interfaces from a virtual MAC by using the command line interface** At the command prompt, type:

- `unbind vrid <id> -ifnum <interface_name>`
- `show vrID`

**To configure a virtual MAC by using the GUI** Navigate to **System > Network > VMAC** and, on the **VMAC** tab, add a new virtual MAC, or edit an existing virtual MAC.

### Removing an IPv4 virtual MAC

To remove an IPv4 virtual MAC, you delete its virtual router ID.

**To remove an IPv4 virtual MAC by using the command line interface** At the command prompt, type:

```
rm vrid <id>
```

Example

```
1 rm vrid 100s
2 <!--NeedCopy-->
```

**To remove an IPv4 virtual MAC by using the GUI** Navigate to **System > Network > VMAC** and, on the **VMAC** tab, delete the IPv4 virtual MAC.

## Configuring IPv6 virtual MAC6s

The NetScaler supports virtual MAC6 for IPv6 packets. You can bind any interface to a virtual MAC6, even if an IPv4 virtual MAC is bound to the interface. Any IPv6 packet sent from the interface uses the virtual MAC6 bound to that interface. If there is no virtual MAC6 bound to an interface, an IPv6 packet uses the physical MAC.

### Creating or Modifying a virtual MAC6

You create an IPv6 virtual MAC by assigning it an IPv6 virtual router ID. You can then you bind the virtual MAC to an interface. You cannot bind multiple IPv6 VRIDs to an interface. To verify the virtual MAC6 configuration, you should display and examine the virtual MAC6s and the interfaces bound to the virtual MAC6s.

**To add a virtual MAC6 by using the command line interface** At the command prompt, type:

- `add vrID6 <id>`
- `bind vrID6 <id> -ifnum <interface_name>`
- `show vrID6`

Example

```
1 > add vrID6 100
2 Done
3 > bind vrID6 100 -ifnum 1/1 1/2 1/3
4 Done
5 <!--NeedCopy-->
```

**To unbind interfaces from a virtual MAC6 by using the command line interface** At the command prompt, type:

- `unbind vrID6 <id> -ifnum <interface_name>`
- `show vrID6`

**To configure a virtual MAC6 by using the GUI** Navigate to **System > Network > VMAC** and, on the **VMAC6** tab, add a new virtual MAC6, or edit an existing virtual MAC6.

### Removing a virtual MAC6

To remove an IPv4 virtual MAC, you delete its virtual router ID.

**To remove a virtual MAC6 by using the command line interface** At the command prompt, type:

```
rm vrid6 <id>
```

Example

```
1 rm vrid6 100s
2 <!--NeedCopy-->
```

**To remove a virtual MAC6 by using the GUI** Navigate to **System > Network > VMAC** and, on the **VMAC6** tab, delete the virtual router ID.

## Configuring high availability nodes in different subnets

May 2, 2023

The following figure shows an HA deployment with the two systems located in different subnets:

Figure 1. High Availability over a Routed Network

In the figure, the systems NS1 and NS2 are connected to two separate routers, R3 and R4, on two different subnets. The NetScaler appliances exchange heartbeat packets through the routers. This con-

figuration could be expanded to accommodate deployments involving any number of interfaces.

**Note:**

If you use static routing on your network, you must add static routes between all the systems to ensure that heartbeat packets are sent and received successfully. (If you use dynamic routing on your systems, static routes are unnecessary.)

If the nodes in an HA pair reside on two separate networks, the primary and secondary node must have independent network configurations. This means that nodes on different networks cannot share entities such as SNIP address, VLANs, and routes. This type of configuration, where the nodes in an HA pair have different configurable parameters, is known as Independent Network Configuration (INC) or Symmetric Network Configuration (SNC).

The following table summarizes the configurable entities and options for an INC, and shows how they must be set on each node.

NetScaler entities	Options
IPs (NSIP/SNIPs)	Node-specific. Active only on that node.
VIPs	Floating.
VLANs	Node-specific. Active only on that node.
Routes	Node-specific. Active only on that node. Link load balancing routes are floating.
ACLs	Floating (Common). Active on both nodes.
Dynamic routing	Node-specific. Active only on that node. The secondary node should also run the routing protocols and peer with upstream routers.
L2 mode	Floating (Common). Active on both nodes.
L3 mode	Floating (Common). Active on both nodes.
Reverse NAT (RNAT)	RNAT configuration with the NAT IP address set to a virtual server IP address (VIP) because the VIP address is floating (common).

As in configuring HA nodes in the same subnet, to configure HA nodes in different subnets, you log on to each of the two NetScaler appliances and add a remote node representing the other appliance.

## Adding a Remote Node

When two nodes of an HA pair reside on different subnets, each node must have a different network configuration. Therefore, to configure two independent systems to function as an HA pair, you must specify INC mode during the configuration process.

When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

### To add a node by using the command line interface

At the command prompt, type:

- `add ha node <id> <IPAddress> -inc ENABLED`
- `show ha node`

Example

```
1 > add ha node 3 10.102.29.170 -inc ENABLED
2 Done
3 > add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
4 Done
5 <!--NeedCopy-->
```

### To disable an HA monitor by using the command line interface

At the command prompt, type:

- `set interface <ifNum> [-haMonitor ( **ON** | **OFF** )]`
- `show interface <ifNum>`

Example

```
1 > set interface 1/3 -haMonitor OFF
2 Done
3 <!--NeedCopy-->
```

### To add a remote node by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, add a new remote node.
2. Make sure to select the Turn off HA monitor on interfaces/channels that are down and Turn on INC (Independent Network Configuration) mode on self mode options.

## Removing a Node

If you remove a node, the nodes are no longer in high availability configuration.

### To remove a node by using the command line interface

At the command prompt, type:

```
rm ha node <id>
```

Example

```
1 > rm ha node 2
2 Done
3 <!--NeedCopy-->
```

### To remove a node by using the GUI

Navigate to **System > High Availability** and, on the **Nodes** tab, delete the node.

**Note:**

You can use the Network Visualizer to view the NetScaler appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks.

## Configuring route monitors

September 12, 2023

You can use route monitors to make the HA state dependent on the internal routing table, whether the table contains any dynamically learned or static routes. In an HA configuration, a route monitor on each node watches the internal routing table to make sure that a route entry for reaching a particular network is always present. If the route entry is not present, the state of the route monitor changes to DOWN.

When a NetScaler appliance has only static routes for reaching a network, and you want to create a route monitor for the network, you must enable monitored static routes (MSR) for the static routes. MSR removes unreachable static routes from the internal routing table. If MSR is disabled on static routes, an unreachable static route can remain in the internal routing table, defeating the purpose of having the route monitor.

Route Monitors are supported both in non-INC and INC mode.

Route Monitors in HA in non-INC mode

Route monitors are propagated by nodes and exchanged during synchronization.

Route monitors are active only in the current primary node.

The NetScaler appliance always displays the state of a route monitor as UP irrespective of whether the route entry is present or not in the internal routing table.

A route monitor starts monitoring its route after 180 seconds in the following cases [This is done to allow dynamic routes to get learned, which might take 180 secs]: reboot, failover, set route6 command for v6 routes, set route msr enable/disable command for v4 routes, adding a new route monitor.

Route Monitors in HA in INC mode

Route monitors are neither propagated by nodes nor exchanged during synchronization.

Route monitors are active on both the primary and the secondary node.

The NetScaler appliance displays the state of the route monitor as DOWN if the corresponding route entry is not present in the internal routing table.

-

Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

Consider an example of a non-INC mode HA setup in a two-arm topology that has NetScaler appliances NS1 and NS2 in the same subnet, with router R1 and switches SW1, SW2, and SW3.

Because R1 is the only router in this setup, you want the HA setup to failover whenever R1 is not reachable from the current primary node. You can configure a route monitor (say, RM1 and RM2, respectively) on each of the nodes to monitor the reachability of R1 from that node.

Figure 1.

With NS1 as the current primary node, the execution flow is as follows:

1. Route monitor RM1 on NS1 monitors NS1's internal routing table for the presence of a route entry for router R1. NS1 and NS2 exchange heartbeat messages through switch SW1 or SW3 at regular intervals.
2. If switch SW1 goes down, the routing protocol on NS1 detects that R1 is not reachable and therefore removes the route entry for R1 from the internal routing table. NS1 and NS2 exchanges heartbeat messages through switch SW3 at regular intervals.
3. Detecting that the route entry for R1 is not present in the internal routing table, RM1 initiates a failover. If the route to R1 is down from both NS1 and NS2, failover happens every 180 seconds until one of the appliances is able to reach R1 and restore the connectivity.

### Adding a route monitor to a high availability node

A single procedure creates a route monitor and binds it to an HA node.

Note:

If you have configured admin partitions, make sure that you add route monitors from the default partition.

### To add a route monitor by using the command line interface

At the command prompt, type:

- `bind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])`
- `show HA node`

Example

```
1 > bind HA node 0 -routeMonitor 10.102.71.0 255.255.255.0
2 Done
3 > bind HA node 0 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
4 Done
5 <!--NeedCopy-->
```

### To add a route monitor by using the GUI

Navigate to **System > High Availability** and, on the **Route Monitors** tab, click **Configure**.

### Removing route monitors

#### To remove a route monitor by using the command line interface

At the command prompt, type:

- `unbind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])`
- `show ha node`

Example

```
1 unbind HA node 3 -routeMonitor 10.102.71.0 255.255.255.0
2 unbind HA node 3 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
3 <!--NeedCopy-->
```

#### To remove a route monitor by using the GUI

Navigate to **System > High Availability** and, on the **Route Monitors** tab, delete the route monitor.

## Limiting failovers caused by route monitors in non-INC mode

May 2, 2023

In an HA configuration in non-INC mode, if route monitors fail on both nodes, failover happens every 180 seconds until one of the nodes is able to reach all of the routes monitored by the respective route monitors.

However, for a node, you can limit the number of failovers for a given interval by setting the Maximum Number of Flips and Maximum Flip Time parameters on the nodes. When either limit is reached, no more failovers occur, and the node is assigned as primary (but node state as NOT UP) even if any route monitor fails on that node. This combination of HA state as Primary and Node state as NOT UP is called Stick Primary state.

If the node is then able to reach all of the monitored routes, the next monitor failure triggers resetting of the Maximum Number of Flips and Maximum Flip Time parameters on the node and starting the time specified in the Maximum Flip Time parameter.

These parameters are set independently on each node and therefore are neither propagated nor synchronized.

Parameters for limiting the number of failovers

- **Maximum Number of Flips (maxFlips)**

Maximum number of failovers allowed, within the Maximum Flip Time interval, for the node in HA in non INC mode, if the failovers are caused by route-monitor failure.

- **Maximum Flip Time ( maxFlipTime )**

Amount of time, in seconds, during which failovers resulting from route-monitor failure are allowed for the node in HA in non INC mode.

To limit the number of failovers by using the command line interface

At the command prompt, type:

- `set HA node [-maxFlips < positive_integer>] [-maxFlipTime < positive_integer>]`
- `show HA node [< id>]`

To limit the number of failovers by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the local node.
2. Set the following parameters:

- Maximum Number of Flips
- Maximum Flip Time

```
1 > set ha node -maxFlips 30 -maxFlipTime 60
2 Done
3 > sh ha node
4 1) Node ID: 0
```

```

```

## SNMP Alarm for Sticky Primary State

Enable HA-STICKY-PRIMARY SNMP alarm in a node of a high availability set up if you want to be alerted of the node becoming sticky primary. When the node becomes sticky primary, it alerts by generating a trap message (stickyPrimary (1.3.6.1.4.1.5951.1.1.0.138)) and sends it to all the configured SNMP trap destinations. For more information about configuring SNMP alarms and trap destinations, see [configuring the NetScaler to Generate SNMPv1 and SNMPv2 Traps](#).

## Frequently Asked Questions

Consider an example of a high availability setup of two NetScaler appliances NS-1 and NS-2 in non-INC mode. Maximum numbers of flips and maximum flip time in both the nodes have been set with the same values.

The following table lists the settings used in this example:

---

Entity	Detail
IP address of NS-1	10.102.173.211
IP address of NS-2	10.102.173.212
Maximum number of flips	2
Maximum flip time	200

---

For information about the [maximum number of flips and maximum flip time settings](#), refer to the pdf.

## Configuring failover interface set

May 2, 2023

A Failover Interface Set (FIS) is a logical group of interfaces. In an HA configuration, using a FIS is a way to prevent failover by grouping interfaces so that, when one interface fails, other functioning interfaces are still available. A FIS can also be configured for the nodes of a NetScaler cluster.

HA MON interfaces that are not bound to an FIS are known as critical interfaces (CI) because if any of them fails, failover is triggered.

**Note:**

An FIS does not create an active and standby configuration. It also does not prevent bridging loops when connecting to links to the same VLAN.

## Creating or Modifying an FIS

### To add an FIS and bind interfaces to it by using the command line interface

At the command prompt, type:

- `add fis <name>`
- `bind fis \<name\> \<ifnum\> ...`
- `show fis \<name\>`

#### Example

```
1 > add fis fis1
2 Done
3 > bind fis fis1 1/3 1/5
4 Done
5 <!--NeedCopy-->
```

An unbound interface becomes a critical interface (CI) if it is enabled and HA MON is on.

#### To unbind an interface from an FIS by using the command line interface

At the command prompt, type:

- `unbind fis \<name\> \<ifnum\> ...`
- `show fis \<name\>`

#### Example

```
1 > unbind fis fis1 1/3
2 Done
3 <!--NeedCopy-->
```

#### To configure an FIS by using the GUI

Navigate to System > High Availability and, on the Failover Interface Set tab, add a new FIS, or edit an existing FIS.

#### Removing an FIS

When the FIS is removed, its interfaces are marked as critical interfaces.

#### To remove an FIS by using the command line interface

At the command prompt, type:

```
rm fis <name>
```

#### Example

```
1 > rm fis fis1
2 Done
3 <!--NeedCopy-->
```

### To remove an FIS by using the GUI

Navigate to **System > High Availability** and, on the **Failover Interface Set** tab, delete the FIS.

## Understanding the causes of failover

August 18, 2021

The following events can cause failover in an high availability configuration:

1. If the secondary node does not receive a heartbeat packet from the primary for a period of time that exceeds the dead interval set on the secondary. (See Note 1.)
2. The primary node experiences a hardware failure of its SSL card.
3. The primary node does not receive any heartbeat packets on its network interfaces for three seconds.
4. On the primary node, a network interface that is not part of a Failover Interface Set (FIS) or a Link Aggregation (LA) channel and has the HA Monitor (HAMON) enabled, fails. (See Note 2.)
5. On the primary node, all interfaces in an FIS fail. (See Note 2.)
6. On the primary node, an LA channel with HAMON enabled fails. (See Note 2.)
7. On the primary node, all interfaces fail (see Note 2). In this case, failover occurs regardless of the HAMON configuration.
8. On the primary node, all interfaces are manually disabled. In this case, failover occurs regardless of the HAMON configuration.
9. You force a failover by issuing the force failover command on either node.
10. A route monitor that is bound to the primary node goes DOWN.

#### Note 1:

For more information about setting the dead interval, see [Configuring the Communication Intervals](#). Possible causes for a node not receiving heartbeat packets from a peer node include:

- A network configuration problem prevents heartbeats from traversing the network between the HA nodes.
- The peer node experiences a hardware or software failure that causes it to freeze (hang), reboot, or otherwise stop processing and forwarding heartbeat packets.

**Note 2:**

In this case, fail means that the interface was enabled but goes to the DOWN state, as can be seen from the show interface command or from the GUI. Possible causes for an enabled interface to be in the DOWN state are LINK DOWN and TXSTALL.

## Forcing a node to fail over

May 2, 2023

You might want to force a failover if, for example, you need to replace or upgrade the primary node. You can force failover from either the primary or the secondary node. A forced failover is not propagated or synchronized. To view the synchronization status after a forced failover, you can view the status of the node.

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.

The NetScaler appliance displays a warning message if it detects a potential issue when you run the force failover command. The message includes the information that triggered the warning, and requests confirmation before proceeding.

You can force a failover on a primary node, secondary node, and when nodes are in listen mode.

- **Forcing Failover on the Primary Node.**

If you force failover on the primary node, the primary becomes the secondary and the secondary becomes the primary. Forced failover is possible only when the primary node can determine that the secondary node is UP.

If the secondary node is DOWN, the force failover command returns the following error message: “Operation not possible due to invalid peer state. Rectify and retry.”

If the secondary system is in the claiming state or inactive, it returns the following error message:

Operation not possible now. Please wait **for** the system to stabilize before retrying.

- **Forcing Failover on the Secondary Node.**

If you run the force failover command from the secondary node, the secondary node becomes primary and the primary node becomes secondary. A force failover can occur only if the secondary node's health is good and it is not configured to stay secondary.

If the secondary node cannot become the primary node, or if the secondary node was configured to stay secondary (using the STAYSECONDARY option), the node displays the following error message:

Operation not possible as my state is invalid. View the node **for more information**.

- **Forcing Failover When Nodes Are in Listen Mode.**

When the two nodes of an HA pair are running different versions of the system software, the node running the higher version switches to the listen mode. In this mode, neither command propagation nor synchronization works.

Before upgrading the system software on both nodes, test the new version on one of the nodes. To do this, you must force a failover on the system that has already been upgraded. The upgraded system then takes over as the primary node, but neither command propagation or synchronization occurs. Also, all connections must be re-established.

**Important!**

If you force a failover when an HA synchronization operation is in progress, some active data sessions on the HA setup might be lost. So, wait for the HA synchronization operation to be completed before performing the force failover operation.

**To force failover on a node by using the command line interface:**

At the command prompt, type:

```
force HA failover
```

**To force failover on a node by using the GUI:**

Navigate to **System > High Availability** and, on the **Nodes** tab, select the node, in the Action list, select **Force Failover**.

## Forcing the secondary node to stay secondary

October 14, 2020

In an HA setup, the secondary node can be forced to stay secondary regardless of the state of the primary node.

For example, suppose the primary node needs to be upgraded and the process will take a few seconds. During the upgrade, the primary node may go down for a few seconds, but you do not want the secondary node to take over; you want it to remain the secondary node even if it detects a failure in the primary node.

When you force the secondary node to stay secondary, it will remain secondary even if the primary node goes down. Also, when you force the status of a node in an HA pair to stay secondary, it does not participate in HA state machine transitions. The status of the node is displayed as STAYSECONDARY.

Forcing the node to stay secondary works on both standalone and secondary nodes. On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node stops processing traffic and becomes the secondary node. The new node becomes the primary node.

**Note:**

When you force a system to remain secondary, the forcing process is not propagated or synchronized. It affects only the node on which you run the command.

**To force the secondary node to stay secondary by using the command line interface**

At the command prompt, type:

```
set ha node -hastatus STAYSECONDARY
```

**To force the secondary node to stay secondary by using the GUI**

Navigate to **System > High Availability**, on the **Nodes** tab, open the local node, and select **STAY SECONDARY**.

**Forcing the primary node to stay primary**

May 18, 2021

In an HA setup, you can force a healthy primary node to remain primary even after a failover. You can enable this option either on a primary node in an HA pair. This option allows the primary node to be in primary state as long as it is healthy.

On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node continues to function as the primary node, and the new node becomes the secondary node.

## To force the primary node to stay primary by using the command line interface

At the command prompt, type:

```
set ha node -hastatus STAYPRIMARY
```

## To force the primary node to stay primary by using the GUI

Navigate to **System > High Availability**, on the **Nodes** tab, open the local node, and select **STAY PRIMARY**.

## High Availability FAQs

November 8, 2023

1. What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?

In an HA configuration, both nodes use the following ports to exchange HA-related information:

- UDP Port 3003, to exchange heartbeat packets.
- TCP Port 3008 or 3010, for synchronization and command propagation.

2. What are the conditions that trigger synchronization?

Synchronization is triggered by any of the following conditions:

- The incarnation number of the primary node, received by the secondary, does not match that of the secondary node.

Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node's configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number isn't incremented for the following commands:

- a) All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
  - b) All Interface related commands. For example, set interface and unset interface.
  - c) All channel-related commands. For example, add channel, set channel, and bind channel.
- The secondary node comes up after a restart.
  - The primary node becomes secondary after a failover.

3. What configurations aren't synced or propagated in an HA configuration in INC or non-INC mode?

The following commands are neither propagated nor synced to the secondary node:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.

**Note:**

The following configurations are neither synced nor propagated only in HA in INC mode. Each node has its own:

- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations
- Net profiles

4. Does a configuration added to the secondary node get synchronized on the primary?

No, a configuration added to the secondary node isn't synchronized to the primary.

5. What can be the reason for both nodes claiming to be the primary in an HA configuration?

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem can be with the network between the nodes.

6. Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

Different system-clock settings on the two nodes can cause the following issues:

- The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
- After a failover, you might have problems with any type of cookie-based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
- Similar considerations apply to any time-related decisions on the nodes.

7. What are the conditions for failure of the *force HA sync* command?

Forced synchronization fails in any of the following circumstances:

- You force synchronization when synchronization is already in progress.
- You force synchronization on a standalone NetScaler appliance.
- The secondary node is disabled.
- HA synchronization is disabled on the current secondary node.
- HA propagation is disabled on the current primary node and you force synchronization from the primary.

8. What are the conditions for failure of the *sync HA files* command?

Synchronizing configuration files fail in either of the following circumstances:

- On a standalone system.
- With the secondary node disabled.

9. In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the *force failover* command.

10. What are the conditions for failure of the *force failover* command?

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.
- The primary node is configured to remain primary.
- The state of the peer node is unknown.

## Troubleshooting high availability issues

May 2, 2023

The most common high availability issues involve the high availability feature not working at all, or working only intermittently. Following are common high availability issues, and probable causes and resolutions.

- **Issue**

The inability of the NetScaler appliances to pair the NetScaler appliances in a high availability setup.

- **Cause**

- Network connectivity

- **Resolution**

- Verify that both the appliances are connected to the switch and the interfaces are enabled.

- **Cause**

- Mismatch in the Password for the default Administrator account

- **Resolution**

- Verify that the password on both the appliances is the same.

- **Cause**

- IP conflict

- **Resolution**

- Verify that both the appliances have unique NetScaler IP (NSIP) address. The appliances should not have the same NSIP address.

- **Cause**

- Node ID mismatch

- **Resolution**

- Verify that the Node ID Configuration on both the appliances is unique. The appliances should not have the same Node ID configuration. Additionally, you must assign value for a Node ID between 1 and 64.

- **Cause**

- Mismatch in the password of the RPC node

- **Resolution**

- Verify that both the nodes have the same RPC node password.

- **Cause**

- An administrator has disabled the remote node

- **Resolution**

- Enable the remote node.

- **Cause**

- The Firewall application has blocked the heartbeat packets

- **Resolution**

Verify that the UDP port 3003 is allowed.

- **Issue**

Both the appliances claim to be the primary appliance.

- **Cause**

- Missing heartbeat packets between the appliances

- Resolution**

- Verify that the UDP port 3003 is not blocked for communication between the appliances.

- **Issue**

The NetScaler appliance is not able to synchronize the configuration.

- **Cause**

- A Firewall application is blocking the required port.

- Resolution**

- Verify that the UDP port 3010 (or UDP port 3008 with secure synchronization) is not blocked for communication between the appliances.

- **Cause**

- An administrator has disabled synchronization.

- Resolution**

- Enable synchronization on the appliance that has the issue.

- **Cause**

- Different NetScaler releases or builds are installed on appliances.

- Resolution**

- Upgrade the appliances to the same NetScaler release or build.

- **Issue**

Command propagation fails between the appliances.

- **Cause**

- A Firewall application is blocking the port.

- Resolution**

- Verify that the UDP port 3011 (or UDP port 3009 with secure propagation) is not blocked for communication between the appliances.

- **Cause**

- An administrator has disabled command propagation.

- Resolution**

- Enable command propagation on the appliance that has the issue.

- **Cause**

- Different NetScaler releases or builds are installed on appliances.

**Resolution**

Upgrade the appliances to the same NetScaler release or build.

• **Issue**

The NetScaler appliances in the high availability pair are unable to run the force failover process.

– **Cause**

The Secondary node is disabled.

**Resolution**

Enable the secondary node.

– **Cause**

The Secondary node is configured to stay secondary.

**Resolution**

Set the secondary high availability status of the secondary node to Enable from Stay Secondary.

• **Issue**

The secondary appliance does not receive any traffic after the failover process.

– **Cause**

The upstream router does not understand GARP messages of NetScaler appliance.

**Resolution**

Configure virtual MAC address on the secondary appliance.

## Managing high availability heartbeat messages on a NetScaler appliance

May 2, 2023

The two nodes in a high availability configuration send and receive heartbeat messages to and from each other on all interfaces that are enabled. The heartbeat messages flow regardless of the HA MON setting on these interfaces. If NSVLAN or both (NSVLAN and SYNC) are configured on an appliance, the heartbeat messages flow only through the enabled interfaces that are part of the NSVLAN and SYNCVLAN.

If a node does not receive the heartbeat messages on an enabled interface, it sends critical alerts to the specified SNMP managers. These critical alerts give false alarms and draw unnecessary attention from the administrators for interfaces that are not configured as part of the connections to the peer node.

To resolve this issue, the HAHeartBeat option for interfaces and channels is used for enabling or disabling HA heartbeat-message flow on them.

To manage the high availability heartbeat messages on an interface by using the command line interface

At the command prompt, type:

- `set interface <ID> [-HAHeartBeat ( ON | OFF )]`
- `show interface <ID>`

To manage the high availability heartbeat messages on a channel by using the command line interface

At the command prompt, type:

- `set channel <ID> [-HAHeartBeat ( ON | OFF )]`
- `show channel <ID>`

To manage the high availability heartbeat messages for an interface by using the GUI

1. Navigate to **System > Network > Interfaces**.
2. Enable or disable the **HA Heart Beat** parameter.

To manage the high availability heartbeat messages on a channel by using the GUI

1. Navigate to **System > Network > Channels**.
2. Enable or disable the **HA Heart Beat** parameter.

## Remove and Replace a NetScaler in a High Availability Setup

May 2, 2023

This topic helps you to address RMA replacements. Also, this topic has instructions on how to backup configurations, upgrade or downgrade shipped software version, and setup of RPC password on ADC.

### Points to Consider

The following configurations are not synchronized or propagated in a high availability configuration in INC (Independent Network Configuration) or non-INC mode:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.

- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.
- All Interface HA Monitoring configuration commands.

The following configurations are not synced nor propagated in an HA configuration in INC mode (Independent Network Configuration):

- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations

## Instructions

Complete the following steps to replace a NetScaler in high availability setup:

- Remove an Active NetScaler secondary node
- Configure Replacement secondary node
- Verify and Update the Software Build on Replacement ADC
- Set Password on New secondary to Match primary
- Add Licenses to Replacement ADC
- Creating HA Pair between primary and New secondary node

## Remove an Active Secondary Node

1. Log on to both ADCs and run the following command to confirm which node is primary and which node is secondary:

```
1 show ha node
2 <!--NeedCopy-->
```

2. Log on to the primary ADC, backup the configurations on the primary node, and copy the files off of the ADC prior to the changes. These files are located under “/var/ns\_sys\_backup/” directory.

The steps are as follows:

- a) Save the ADC running configurations to memory:

```
1 save ns config
2 <!--NeedCopy-->
```

- b) Create the full backup file package:

```
1 create system backup -level full
2 <!--NeedCopy-->
```

- c) Create the basic backup file package:

```
1 create system backup -level basic
2 <!--NeedCopy-->
```

3. After all backup files have been generated, be sure to copy them off of the device before proceeding.

From a windows terminal, open a Command Prompt and copy the backup files off of the ADC and onto your local hard drive. This can be done using the following command:

```
1 pscp <username>@<NSIP>:<Target file source> <Target file
 destination>
2 <!--NeedCopy-->
```

Example:

```
1 pscp nsroot@10.125.245.78:/var/ns_sys_backup/backup_basic_10
 .125.245.78_2016_09_14_15_08.tgz c:\nsbackup\backup_basic_10
 .125.245.78_2016_09_14_15_08.tgz
2 <!--NeedCopy-->
```

When prompted, enter the password for the specified administrator account, then hit Enter. Repeat these steps until all backup bundles are copied to the local PC before proceeding.

4. SSH into the secondary ADC, and set the unit to the “STAYSECONDARY” status. This will force the unit to not attempt to assume the primary role in the event of a detected failure during the swap. Confirm that you are connected to the secondary ADC before executing this step

```
1 set ha node -haStatus <state>
2 set ha node -haStatus STAYSECONDARY
3 <!--NeedCopy-->
```

5. Once the secondary ADC’s **Node State** successfully displays STAYSECONDARY, switch to the primary ADC and delete the secondary node and run the following command:

```
1 save ns config
2 <!--NeedCopy-->
```

While logged into the primary ADC, run the following commands

- a) Run the following command to identify which numerical value represents the secondary HA node:

```
1 show ha node
2 <!--NeedCopy-->
```

- b) Run the following command to remove the secondary ADC from the primary HA pair;

```
1 rm ha node <node ID>
2 <!--NeedCopy-->
```

- c) Run the following command to save the configuration:

```
1 save ns config
2 <!--NeedCopy-->
```

- d) With the secondary ADC now removed, shutdown, disconnect, and remove the secondary ADC from the network.

**Note.** Be sure to label all connections before disconnecting.

### Configure Replacement Secondary Node

1. With the replacement ADC in place, power up the new device. DO NOT CONNECT the network connections at this point.
2. With boot-up complete, use the console port to connect to the ADC and configure the NSIP that you will use to connect to the unit.
3. When prompted, select **4**.

**Note.** In this example, we are using a different NSIP for the replacement ADC. If you wish to use the original secondary unit's IP, You may change it on the replacement before binding the new ADC to the primary HA unit.

4. The ADC should now be booted. Now connect the network interface that will be used for Management traffic, and confirm that the IP address is reachable from your network.

### Verify and Update the Software Build on Replacement ADC

Before syncing the new unit to the primary ADC, we need to ensure that both ADCs are running the same build.

1. To verify the version on ADC run the following command:

```
1 show version
2 <!--NeedCopy-->
```

2. While on the new secondary ADC, create a subfolder in **/var** to be used for the upgrade.
3. Go to [NetScaler downloads](#) and download the appropriate package that matches the build version running on the primary ADC.
4. Download and extract the .tgz file:

```
1 tar -xvzf "file.tgz"
2 <!--NeedCopy-->
```

5. Copy the extracted files to the secondary ADC. On your windows terminal, open a “Command Prompt” and navigate to the directory containing the extracted .tgz build package and run the following pscp command:

```
1 pscp <Target file source> <username>@<NSIP>:<Target file
 destination>
2 <!--NeedCopy-->
```

Example:

```
1 C:\inetpub>pscp c:\inetpub\build-12.1-47.14_nc.tgz nsroot@10
 .20.245.80:/var/NS_upg_12.1_47.14/build-12.1-47.14_nc.tgz
2 <!--NeedCopy-->
```

6. After the file has been transferred, return to the secondary ADC and upgrade. For detailed instructions, see [Upgrading a Citrix ADX Standalone Appliance](#).
7. Once the new secondary has rebooted, SSH back into the unit and confirm that the upgrade is successful and the build matches that of the primary.

## Set Password on Replacement Secondary Node to Match Primary

**Note:** If at this point you want to change the management IP (NSIP) address of the new secondary ADC, you may do so before moving forward.

Change the password on the new secondary ADC to match the password that is currently on the primary ADC.

1. Make that the default administrator (nsroot) account password is the same as the primary ADC. This is accomplished using the following command while logged in through SSH into the new secondary unit:

```
1 set system user <user> <password>
2 <!--NeedCopy-->
```

This command set/resets the password for the specified user.

2. SSH into the primary and new secondary ADC and confirm that passwords match.

## Add Licenses to Replacement Secondary Node

With the new ADC updated and ready for pairing, download and install the appropriate licensing for the replacement node.

1. Navigate to <https://www.citrix.com> to request and download licenses for the new replacement unit.
2. Once you have all appropriate licenses downloaded, SSH into the new secondary ADC and type the following command to see the current state of licensing:

```
1 show license
2 <!--NeedCopy-->
```

3. From the Windows terminal command prompt you must now upload the license files to the new secondary ADC using the following command:

**Note.** If you have multiple licenses, repeat this step until all licenses are uploaded.

```
1 pscp <Target file source> <username>@<NSIP>:<Target file
 destination>
2 <!--NeedCopy-->
```

Example:

```
1 C:\inetpub>pscp c:\inetpub\NS-VPX-3K-LIC-020030ad0024.lic
 nsroot@10.125.245.80:/nsconfig/license/NS-VPX-3K-LIC-020030
 ad0024.lic
2 <!--NeedCopy-->
```

4. SSH into the new secondary ADC and perform a warm reboot using the following command:

```
1 reboot -w
2 <!--NeedCopy-->
```

After the unit is restarted, SSH into the unit and run show license command once again. At this point, the licenses should be applied.

## Set up High Availability between primary and New Secondary Node

At this point, we are now ready to join the NetScaler units into a high availability pair. For more information, see [Configuring high availability](#).

## Request retry

May 2, 2023

When a NetScaler appliance receives an HTTP request but has a connection failure with a back-end server, the appliance uses a retry directive. The request retry addresses connection failure scenarios

and enables the appliance to choose the next available service and forward the request. By doing a request retry, the client can save round trip time (RTT).

Request retry feature is applicable for the following connection failure scenarios:

- If a back-end server resets a TCP connection when an HTTP request is received. For more details, see [Request retry](#).
- If a back-end server resets a TCP connection during connection establishment. For more details, see [Request retry](#).
- If a response from a back-end server times out (based on the configured time-out value) when an appliance sends an HTTP request. For more details, see [Request retry](#).

## Request retry if back-end server resets TCP connection

December 29, 2023

When a back-end server resets a TCP connection, the request retry feature forwards the request to the next available server, instead of sending the reset to the client. By doing reload balancing, the client saves RTT when the appliance initiates the same request to next available service.

### How request retry works when back-end server resets a TCP connection

The following diagram shows how components interact with each other.

1. The process starts by enabling appqoe feature on your appliance.
2. When the client sends an HTTP or HTTPS request, the load balancing virtual server sends the request to the back-end server.
3. If the requested service is unavailable, the back-end server resets the TCP connection.
4. If the appqoe configuration has “retry” enabled with the desired number of retry attempts specified, the load balancing virtual server uses the configured load balancing algorithm to forward the request to the next available application server.
5. After the load balancing virtual server receives the response, the appliance forwards the response to the client.
6. If the available back-end servers is equal or lesser than the retry count and if all the servers send reset, the appliance would respond a 500 internal server error. Consider a scenario with five available servers and the retry count set as six. If all the five servers resets the connection, then the appliance returns a 500 internal server error to the client.
7. Similarly, if the number of back-end servers is more than the retry count and if the back-end servers resets the connection, the appliance forwards the reset to the client. Consider a scenario with three back-end servers and the retry count set as two. If the three servers resets the connection, then the appliance sends a reset response to the client.

### Configure request retry for GET method

For configuring retry feature for GET method, you must complete the following steps.

1. Enable AppQoE
2. Add AppQoE action
3. Add AppQoE policy
4. Bind AppQoE policy to load balancing virtual server

**Enable AppQoE** At the command prompt, type:

```
enable ns feature appqoe
```

**Add AppQoE action** You must configure an AppQoE action to specify if you want the appliance to retry after a TCP reset and the number of retry attempts.

```
add appqoe action reset_action -retryOnReset (YES | NO)-numretries
<positive_integer>]
```

**Example:**

```
add appqoe action reset_action -retryOnReset YES -numretries 5
```

Where,

retryOnReset. Enable retry if the back-end server resets a TCP connection.

numretries. Retry count.

**Add AppQoE policy** To implement AppQoE you must configure AppQoE policy to prioritize incoming HTTP or SSL request in a specific queue.

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

**Example:**

```
add appqoe policy reset_policy -rule http.req.method.eq(get)-action
reset_action
```

**Bind appqoe policy to load balancing virtual server** When a back-end server resets a TCP packet request and if you want the load balancing virtual server to forward the request to the next available service, you must bind the load balancing virtual server to the AppQoE policy.

At the command prompt, type:

```
bind lb vserver <name> ((<serviceName> (-policyName <string> [-
priority <positive_integer>] [-gotoPriorityExpression <expression
>] [-type (REQUEST | RESPONSE)])
```

**Example:**

```
bind lb vserver v1 -policyName reset_policy -type REQUEST -priority 1
```

### Configure request retry for POST requests

You must always exercise caution when you reload balance requests that write data into the back-end server. For such requests, ensure the content length is short. If the content length is long, then it might result in resource consumption. Follow the steps given below to configure reload balancing for POST requests.

1. Enable AppQoE
2. Add AppQoE action
3. Add AppQoE policy
4. Bind appQoE policy to load balancing virtual server

**Enable AppQoE** At the command prompt, type:

```
enable ns feature appqoe
```

**Add Appqoe action** You must add an AppQoE action to retry after a TCP reset and number of retry attempts.

```
add appqoe action reset_action -retryOnReset (YES | NO)-numretries
<positive_integer>]
```

**Example:**

```
add appqoe action reset_action -retryOnReset YES -numretries 5
```

**Add Appqoe policy** To implement AppQoE you must configure AppQoE policy to define how to queue the connections in a specific queue.

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

**Example:**

```
add appqoe policy reset_policy -rule HTTP.REQ.CONTENT_LENGTH.le(2000)
-action reset_action
```

**Note:**

You can use this configuration if you prefer to restrict the request retry feature for content length less than 2000.

**Bind load balancing virtual server to AppQoE policy** When a back-end server resets a TCP packet request and if you want the load balancing virtual server to forward the request to the next available service through a specific queue, you must bind the load balancing virtual server to the AppQoE policy.

At the command prompt, type:

```
bind lb vserver <name> ((<serviceName> (-policyName <string> [-
priority <positive_integer>] [-gotoPriorityExpression <expression
>] [-type (REQUEST | RESPONSE)])
```

**Example:**

```
bind lb vserver v1 -policyName reset_policy -type REQUEST -priority 1
```

### **Configure AppQoE policy for request retry by using the NetScaler GUI**

1. Navigate to **AppExpert > AppQoE > Policies**.
2. In the **AppQoE Policies** page, click **Add**.
3. In the **Create an AppQoE Policy** page, set the following parameters:
  - a. Name. AppQoE policy name
  - b. Action. Add or edit an action. To create an action, see section.
  - c. Expression. Select or enter `HTTP.REQ.CONTENT_LENGTH.le (2000)` policy expression.
4. Click **Create** and **Close**.

### **Configure AppQoE action for request retry balancing by using the NetScaler GUI**

1. Navigate to **AppExpert > AppQoE > Action**.
2. In the **AppQoE Actions** page, click **Add**.
3. In the **Create AppQoE Action** page, set the following parameters for retry on TCP reset:
  - a. Retry on TCP Reset. Select the check box to enable retry action for TCP reset.
  - b. Retry Count. Enter the retry count.
4. Click **Create** and **Close**.

### **Configure request retry for GET method when back-end server resets on TCP SYN establishment**

The CLI and GUI configuration is similar to steps followed for GET method. For more information, see [Configure request retry for GET method](#) section. when back-end server resets a connection section.

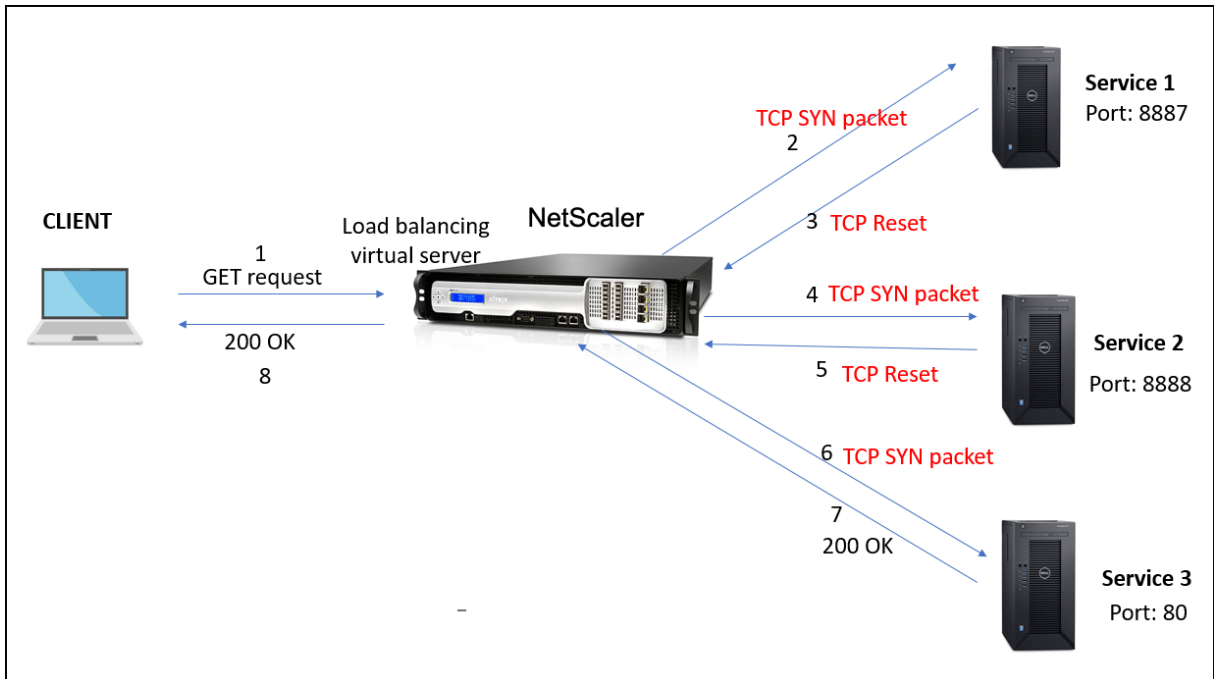

## **Request retry if back-end server resets TCP connection during connection establishment**

December 1, 2020

When a back-end server resets a TCP connection during connection establishment, the request retry feature forwards the request to the next available server, instead of sending the reset to the client. By doing reload balancing, the client saves RTT when the appliance initiates the same request to next available service.

## How request retry works when back-end server resets a TCP connection on SYN establishment

The following diagram show the components interact with each other:

1. The process starts by enabling appqoe feature on your appliance.
2. When the client sends an HTTP or HTTPS request, the load balancing virtual server initiates connection to backend server.
3. If the requested service is unavailable on TCP SYN establishment, the back-end server resets the TCP connection.
4. If the appqoe configuration has “retry” enabled with the desired number of retry attempts specified, the load balancing virtual server uses the configured load balancing algorithm to forward the request to the next available application server.
5. After the load balancing virtual server receives the response, the appliance forwards the response to the client.
6. If the available back-end servers is equal or lesser than the retry count and if all the servers send reset, the appliance would respond a 500 internal server error. Consider a scenario with five available servers and the retry count set as six. If all the five servers resets the connection, then the appliance returns a 500 internal server error to the client.
7. Similarly, if the number of back-end servers is more than the retry count and if the back-end servers resets the connection on TCP SYN establishment, the appliance forwards the reset to the client. Consider a scenario with three back-end servers and the retry count set as two. If the three servers resets the connection, then the appliance sends a reset packet to the client.

## Configure request retry (GET and POST method) when back-end server resets on TCP SYN establishment

The CLI and GUI configuration is similar to steps followed for GET and POST method. For more information, see [Configure request retry for GET method](#) topic, [Configure request retry for POST method when back-end server resets a connection](#) section.

## Request retry if back-end server response times out

December 29, 2023

Request retry is available for one more scenario where, if a back-end server takes more time to respond to requests, the appliance performs re-load balancing upon timeout and forwards the request to the next available server.

### How request retry works when back-end server response times out

The following diagram show the components interact with each other:

1. The process starts by enabling appqoe feature on your appliance.
2. The appqoe configuration has “retryOnTimeout” parameter in milliseconds.

3. When the appliance sends a request and if the server takes more time to respond, the appliance performs re-load balancing based on the configured timeout value. The appliance resets the connection, chooses another service and forwards the request instead of waiting for the server response.
4. After the load balancing virtual server receives the response, the appliance forwards the response to the client. The usage of a time out parameter prevents the appliance to keep waiting for server response leading to an increased RTT.
5. If the available back-end servers is equal or lesser than the retry count and if all the servers times out for the request , the appliance would respond a 500 internal server error. Consider a scenario with five available servers and the retry count set as six. If all the five servers times out for the request, then the appliance returns a 500 internal server error to the client.
6. Similarly if the number of backend servers is more than the retry count and if the back-end server times out upon a request, the appliance keeps waiting upon the last service until the server sends out a response or client idle connection times out. Consider a scenario with three back-end servers and the retry count set as two. If all the three servers times out upon the request, the appliance keeps waiting upon the third service until the server sends out a response or client idle connection times out.

### **Configure request retry (GET and POST method) when back-end server response times out**

For configuring request retry for GET method on timeout, you must complete the following steps.

1. Enable appqoe
2. Configure appqoe action
3. Add appqoe policy
4. Bind appqoe policy to load balancing virtual server

#### **Note:**

The request retry upon timeout scenario is also applicable for POST method.

### **Enable appqoe**

At the command prompt, type:

```
enable ns feature appqoe
```

### **Add appqoe action for timeout**

You must configure the appqoe action to retry on timeout and define the number of retry attempts.

At the command prompt, type:

```
add appqoe action <name> -retryOnTimeout <msecs> -numRetries <positive_integer>
>
```

**Example:**

```
add appqoe action appact1 -retryOnTimeout 35 -numRetries 5
```

### Add appqoe policy

To implement appqoe you must configure appqoe policy to define how to queue the connections.

At the command prompt, type:

```
add appqoe policy <name> -rule <rule> -action <name>
```

**Example:**

```
add appqoe policy timeout_policy -rule http.req.method.eq(get)-action
appact1
```

### Bind appqoe policy to load balancing virtual server

When a back-end server takes a long time to respond and if you want the load balancing virtual server to forward the request to the next available service, you must bind the appqoe policy to balancing virtual server.

At the command prompt, type:

```
bind lb vserver <name> ((<serviceName> (-policyName <string> [-
priority <positive_integer>] [-gotoPriorityExpression <expression
>] [-type (REQUEST | RESPONSE)])
```

**Example:**

```
bind lb vserver v1 -policyName timeout_policy -type REQUEST -priority
1
```

### Configure AppQoE policy for re-loadbalancing on timeout by using the NetScaler GUI

1. Navigate to **AppExpert > AppQoE > Policies**.
2. In the **AppQoE Policies** page, click **Add**.

3. In the **Create an AppQoE Policy** page, set the following parameters:
  - a. Name. AppQoE policy name
  - b. Action. Add or edit an action. To create a new action, see Create AppQoE Action section.
  - c. Expression. Select or enter “http.req.method.eq(get)” policy expression.
4. Click **Create** and **Close**.

### **Configure AppQoE action for request retry by using the NetScaler GUI**

1. Navigate to **AppExpert > AppQoE > Action**.
2. In the **AppQoE Actions** page, click **Add**.
3. In the **Create AppQoE Action** page, set the following parameter for retry on back-end server response time out:
  - a. Retry on Timeout. Retry on request timeout (in millisec) upon sending request to backend servers.
4. Click **Create** and **Close**.

## **TCP optimization**

July 12, 2023

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

### **Congestion Control Strategies**

The TCP has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

### **Proportional Rate Recovery (PRR) algorithm**

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window

chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

## **TCP Fast Open (TFO)**

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a NetScaler appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the NetScaler appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using this TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

### **How TFO works**

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the NetScaler appliance can include data in the SYN-ACK segment even though it has not received the final ACK segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a back-end server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the NetScaler appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client's IP address under a secret key) and responds to the client with an SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The NetScaler appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with an SYN-ACK, TFO Cookie, and HTTP Response.

#### **Note:**

If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the NetScaler appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the back-end server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same back-end server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the back-end server.
6. The back-end server acknowledges the event with both data and a SYN.

**Note:** If the server acknowledges the event with only a SYN segment, the NetScaler appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

### Configuring TCP fast open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

**Enable or disable TFO by using the CLI** At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

**Note:** The default value is DISABLED.

```
1 add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
2 set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3 unset tcpprofile <TCP Profile Name> - tcpFastOpen
4 Examples
5 add tcpprofile Profile1 - tcpFastOpen
6 Set tcpprofile Profile1 - tcpFastOpen Enabled
7 unset tcpprofile Profile1 - tcpFastOpen
8 <!--NeedCopy-->
```

### To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1 set tcpparam -tcpfastOpenCookieTimeout <Timeout Value>
2 Example
3 set tcpprofile -tcpfastOpenCookieTimeout 30secs
4 <!--NeedCopy-->
```

### To configure the TCP Fast Open by using the GUI

1. Navigate to **Configuration > System > Profiles >** and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **TCP Fast Open** check box.
3. Click **OK** and then **Done**.

### To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to **Configuration > System > Settings > Change TCP Parameters** and then **Configure TCP Parameters** page to set the TCP Fast Open Cookie timeout value.

## TCP HyStart

A new TCP profile parameter, HyStart, enables the HyStart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, HyStart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

### Configuring TCP HyStart

To use the HyStart feature, enable the Cubic HyStart option in the relevant TCP profile.

### To configure HyStart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable HyStart in a new or existing TCP profile.

```
1 add tcpprofile <profileName> -hystart ENABLED
2 set tcpprofile <profileName> -hystart ENABLED
3 unset tcprofile <profileName> -hystart
4 <!--NeedCopy-->
```

**Examples:**

```
1 add tcpprofile profile1 -hystart ENABLED
2 set tcpprofile profile1 -hystart ENABLED
3 unset tcprofile profile1 -hystart
4 <!--NeedCopy-->
```

To configure HyStart support by using the GUI

1. Navigate to **Configuration > System > Profiles >** and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

**TCP burst rate control**

It is observed that TCP control mechanisms can lead to a bursty traffic flow on high speed mobile networks with a negative impact on the overall network efficiency. Due to mobile network conditions such as congestion or Layer-2 retransmission of data, TCP acknowledgments arrive clumped at the sender triggering a burst of transmission. These groups of consecutive packets sent with a short inter-packet gap it is called TCP packet burst. To overcome traffic burst, the NetScaler appliance uses a TCP Burst Rate Control technique. This technique evenly spaces data into the network for an entire round-trip-time so that the data is not sent into a burst. By using this burst rate control technique, you can achieve better throughput and lower packet drop rates.

**How TCP burst rate control works**

In a NetScaler appliance, this technique evenly spreads the transmission of a packet across the entire duration of the round-trip-time (RTT). This is achieved by using a TCP stack and network packet scheduler that identifies the various network conditions to output packets for ongoing TCP sessions to reduce the bursts.

At the sender, instead of transmitting packets immediately upon receipt of an acknowledgment, the sender can delay transmitting packets to spread them out at the rate defined by scheduler (Dynamic configuration) or by the TCP profile (Fixed configuration).

## Configuring TCP burst rate control

To use the TCP Burst Rate Control option in the relevant TCP profile and set the burst rate control parameters.

### To set TCP burst rate control by using the command line

At the command prompt, set one of the following TCP Burst Rate Control commands are configured in a new or existing profile.

**Note:** The default value is DISABLED.

```

1 add tcpprofile <TCP Profile Name> -burstRateControl Disabled | Dynamic
 | Fixed
2
3 set tcpprofile <TCP Profile Name> -burstRateControl Disabled | Dynamic
 | Fixed
4
5 unset tcpprofile <TCP Profile Name> -burstRateControl Disabled |
 Dynamic | Fixed
6 <!--NeedCopy-->

```

Where,

**Disabled** –If the Burst rate control is disabled, then a NetScaler appliance does not perform burst management other than the maxBurst setting.

**Fixed** –If the TCP burst rate control is Fixed, the appliance uses the TCP Connection Payload Send Rate value mentioned in the TCP Profile.

**Dynamic** –If the Burst Rate Control is “Dynamic”the connection is being regulated based on various network conditions to reduce TCP bursts. This mode works only when the TCP connection is in END-POINT mode. When Dynamic Burst Rate control is enabled the maxBurst parameter of the TCP profile is not in effect.

```

1 add tcpProfile profile1 -burstRateControl Disabled
2
3 set tcpProfile profile1 -burstRateControl Dynamic
4
5 unset tcpProfile profile1 -burstRateControl Fixed
6 <!--NeedCopy-->

```

**To set TCP Burst Rate Control parameters by using the command line interface** At the command prompt, type:

```

1 set ns tcpprofile nstcp_default_profile - burstRateControl <type of
 burst rate control> - tcprate <TCP rate> -rateqmax <maximum
 bytes in queue>

```

```
2
3 T1300-10-2> show ns tcpprofile nstcp_default_profile
4 Name: nstcp_default_profile
5 Window Scaling status: ENABLED
6 Window Scaling factor: 8
7 SACK status: ENABLED
8 MSS: 1460
9 MaxBurst setting: 30 MSS

52 Burst Rate Control: Dynamic
53 TCP Rate: 0
54 TCP Rate Maximum Queue: 0
```

### To configure the TCP Burst Rate Control by using the GUI

1. Navigate to **Configuration > System > Profiles >** and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select **TCP Burst Control** option from the drop-down list:
  - a) BurstRateCntrl
  - b) CreditBytePrms
  - c) RateBytePerms
  - d) RateSchedulerQ
3. Click **OK** and then **Done**.

### Protection against wrapped sequence (PAWS) algorithm

If you enable the TCP timestamp option in the default TCP profile, the NetScaler appliance uses the Protection Against Wrapped Sequence (PAWS) algorithm to identify and reject old packets whose sequence numbers are within the current TCP connection's receive window because the sequence has "wrapped" (reached its maximum value and restarted from 0).

If network congestion delays a non-SYN data packet and you open a new connection before the packet arrives, sequence-number wrapping might cause the new connection to accept the packet as valid, leading to data corruption. But if the TCP timestamp option is enabled, the packet is discarded.

By default, the TCP timestamp option is disabled. If you enable it, the appliance compares the TCP timestamp (SEG.TSval) in a packet's header with the recent timestamp (Ts.recent) value. If SEG.TSval is equal to or greater than Ts.recent, the packet is processed. Otherwise, the appliance drops the packet and sends a corrective acknowledgment.

### How PAWS works

The PAWS algorithm processes all the incoming TCP packets of a synchronized connection as follows:

1. If  $SEG.TSval < Ts.recent$ : The incoming packet is not acceptable. PAWS sends an acknowledgment (as specified in RFC-793) and drops the packet. Note: Sending an ACK segment is necessary to retain TCP's mechanisms for detecting and recovering from half-open connections.
2. If packet is outside the window: PAWS rejects the packet, as in normal TCP processing.
3. If  $SEG.TSval > Ts.recent$ : PAWS accepts the packet and processes it.
4. If  $SEG.TSval \leq Last.ACK.sent$  (arriving segment satisfies): PAWS copies the  $SEG.TSval$  value to  $Ts.recent$ .

5. If the packet is in sequence: PAWS accepts the packet.
6. If packet is not in sequence: The packet is treated as a normal in-window, out-of-sequence TCP segment. For example, it might be queued for later delivery.
7. If the `Ts.recent` value is idle for more than 24 days: The validity of `Ts.recent` is checked if the PAWS timestamp check fails. If the `Ts.recent` value is found to be invalid, the segment is accepted and the `PAWS rule` updates the `Ts.recent` with the `TSval` value from the new segment.

## To enable or disable TCP timestamp by using the command line interface

At the command prompt, type:

```
1 `set nstcpprofile nstcp_default_profile -TimeStamp (ENABLED | DISABLED)
```

To enable or disable TCP timestamp by using the GUI

Navigate to **System > Profile > TCP Profile**, select the default TCP profile, click **Edit**, and select or clear the **TCP timestamp** check box.

## Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.

### Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server's traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

For information about using subscriber attributes to perform TCP optimization, see [Policy-based TCP Profile](#).

### Configuring policy based TCP profile selection

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your NetScaler can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

## Configuring using the command line interface

### To enable AppQoE by using the command line interface

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

- `enable ns feature appqoe`
- `show ns feature`

### To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with the `tcpprofiletobind` option.

```
add appqoe action <name> [-priority <priority>] [-respondWith (ACS |
NS) [<CustomFile>] [-altContentSvcName <string>] [-altContentPath <
string>] [-maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth
<positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression
<expression>] [-dosAction (SimpleResponse | HICResponse)] [-tcpprofiletobind
<string>]
show appqoe action
```

### To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

## To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <
priority>
bind lb vserver <name> - policyName <appqoe_policy_name> -priority <
priority>
bind cr vserver <name> -policyName <appqoe_policy_name> -priority <
priority>
```

### Example

```
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle
 ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500
 -slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -
 sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spooofSynDrop
 ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack
 ENABLED -tcpmode ENDPOINT
2 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
3 add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -
 action appact1
4 bind lb vserver lb2 -policyName apppol1 -priority 1 -
 gotoPriorityExpression END -type REQUEST
5 bind cs vserver cs1 -policyName apppol1 -priority 1 -
 gotoPriorityExpression END -type REQUEST
6 <!--NeedCopy-->
```

## Configuring policy based TCP profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

## To configure AppQoE policy by using the GUI

1. Navigate to **App-Expert > AppQoE > Actions**.
2. In the details pane, do one of the following:
3. To create an action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.

5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
  - a) Name—name
  - b) Action type—respondWith
  - c) Priority—priority
  - d) Policy Queue Depth—polqDepth
  - e) Queue Depth—priqDepth
  - f) DOS Action—dosAction
6. Click **Create**.

### To bind AppQoE policy by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:
  - a) Select a policy type as AppQoE from the drop-down list.
  - b) Select a traffic type from the drop-down list.
4. In the **Policy Binding** section, do the following:
  - a) Click **New** to create an AppQoE policy.
  - b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

### SACK block generation

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgment (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into the reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

**Note:** A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

### **Client renegeing**

A NetScaler appliance can handle client renegeing during SACK based recovery.

### **Memory checks for marking end\_point on PCB are not considering total available memory**

In a NetScaler appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

### **Unnecessary retransmissions due to missing SACK blocks**

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers more retransmissions from the server.

### **SNMP for connections bypassed optimization because of overload**

The following SNMP ids have been added to a NetScaler appliance to track number of connections bypassed TCP optimizations due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.131 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

### **Dynamic receive buffer**

To maximize TCP performance, a NetScaler appliance can now dynamically adjust the TCP receive buffer size.

### **Tail Loss Probe algorithm**

A retransmission timeout (RTO) is a loss of segments at the tail end of a transaction. An RTO occurs if there are application latency issues, especially in short web transactions. To recover loss of segments at the end of a transaction, TCP uses the Tail Loss Probe (TLP) algorithm.

TLP is a sender only algorithm. If a TCP connection is not receiving any acknowledgment for a certain period, TLP transmits the last unacknowledged packet (loss probe). In the event of a tail loss in original transmission, acknowledgment from loss probe triggers a SACK or FACK recovery.

### Configuring the Tail Loss Probe

To use the Tail Loss Probe (TLP) algorithm, you must enable the TLP option in the TCP profile and set the parameter to a value that suits the security requirement for that profile.

**Enable TLP by using the command line** At the command prompt, type one of the following commands to enable or disable TLP in a new or existing profile.

**Note:**

The default value is DISABLED.

```
add tcpprofile <TCP Profile Name> - taillossprobe ENABLED | DISABLED
```

```
set tcpprofile <TCP Profile Name> - taillossprobe ENABLED | DISABLED
```

```
unset tcpprofile <TCP Profile Name> - taillossprobe
```

**Examples:**

```
add tcpprofile nstcp_default_profile - taillossprobe
```

```
set tcpprofile nstcp_default_profile -taillossprobe Enabled
```

```
unset tcpprofile nstcp_default_profile -taillossprobe
```

### Configure the Tail Loss Probe algorithm by using the NetScaler GUI

1. Navigate to **Configuration > System > Profiles >** and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Tail Loss Probe** check box.
3. Click **OK** and then **Done**.

## Troubleshooting solutions for NetScaler

May 2, 2023

This topic gives you some basic troubleshooting solutions needed to resolve issues that occur in your appliance. It gives you an understanding of NetScaler appliance, how it integrates with the network, and what issues you can expect in basic system features.

## How to record a packet trace on NetScaler

November 2, 2023

You can record a packet trace using the NetScaler GUI. The trace is stored in `nstrace.cap`.

1. Navigate to **System > Diagnostics**.
2. Click **Start new trace** under **Technical Support Tools**.
3. In the **Start Trace page** update the following fields:
  - a) **Packet Size** - Enter the size of the packet to capture during the trace. Enter 0 for full packet trace.
    - Default value: 164
    - Minimum value: 0
    - Maximum value: 1514
  - b) **Capture trace in .pcap format** - You have the option to capture a packet trace in `nstrace(.cap)` or TCP dump (`.pcap`) format. By default, the packet trace is captured in `nstrace(.cap)` and it is the recommended format. To capture trace in TCP dump format, select **Capture trace in .pcap format**.
  - c) **Capture SSL Master keys** - To analyze the traces better, enable the **Capture SSL Master keys** option. This setting captures SSL keys for the current session, which are necessary to decrypt encrypted data. The SSL keys are stored in a file named `nstrace.sslkeys`.
    - When you click **Start** to initiate the trace with the **Capture SSL Master keys** option enabled, a security warning message is displayed. **Acknowledge** this warning to proceed.
    - When the private key is not available or not shared, consider exporting SSL session keys as an alternative to the private key.
  - d) **Number of trace files** - Enter the number of trace files to be generated during the trace.
    - Default value: 24
    - Minimum value: 1
    - Maximum value: 100
  - e) **Trace File name** - Enter the name for the trace file.

- f) **Trace File ID** - Enter the file ID for the trace file.
- g) **Duration of data per file (seconds)** - Enter the time (in seconds) to capture the data for each trace file.
  - Default value: 3600
  - Minimum value: 1
- h) **File size** - Enter the file size (in MB) for each trace file.
  - Default value: 1024
  - Minimum value: 0
  - Maximum value: 10240

When the trace reaches the specified file size, a new trace starts. If the free disk space is less than 2 GB, the trace stops.

- i) **Trace Buffers** - Enter the number of trace buffers (temporary storage) to store the packet capture. Each buffer is about 16 KB.
  - Default value: 5000
  - Minimum value: 1000

4. Enter the **Filter Expression**.

Adding filter expressions for IP address, port, VLAN, or interface ensures capturing only the relevant traffic and reduces the load on NetScaler during the packet trace.

5. Select the **Merge** option from the list.

- **ONSTOP** - The temporary trace files are merged into a single trace file.
- **NOMERGE** - The trace files are not merged.
- **ONTHEFLY** - The trace files are merged without creating any temporary file.

Default value: ONSTOP

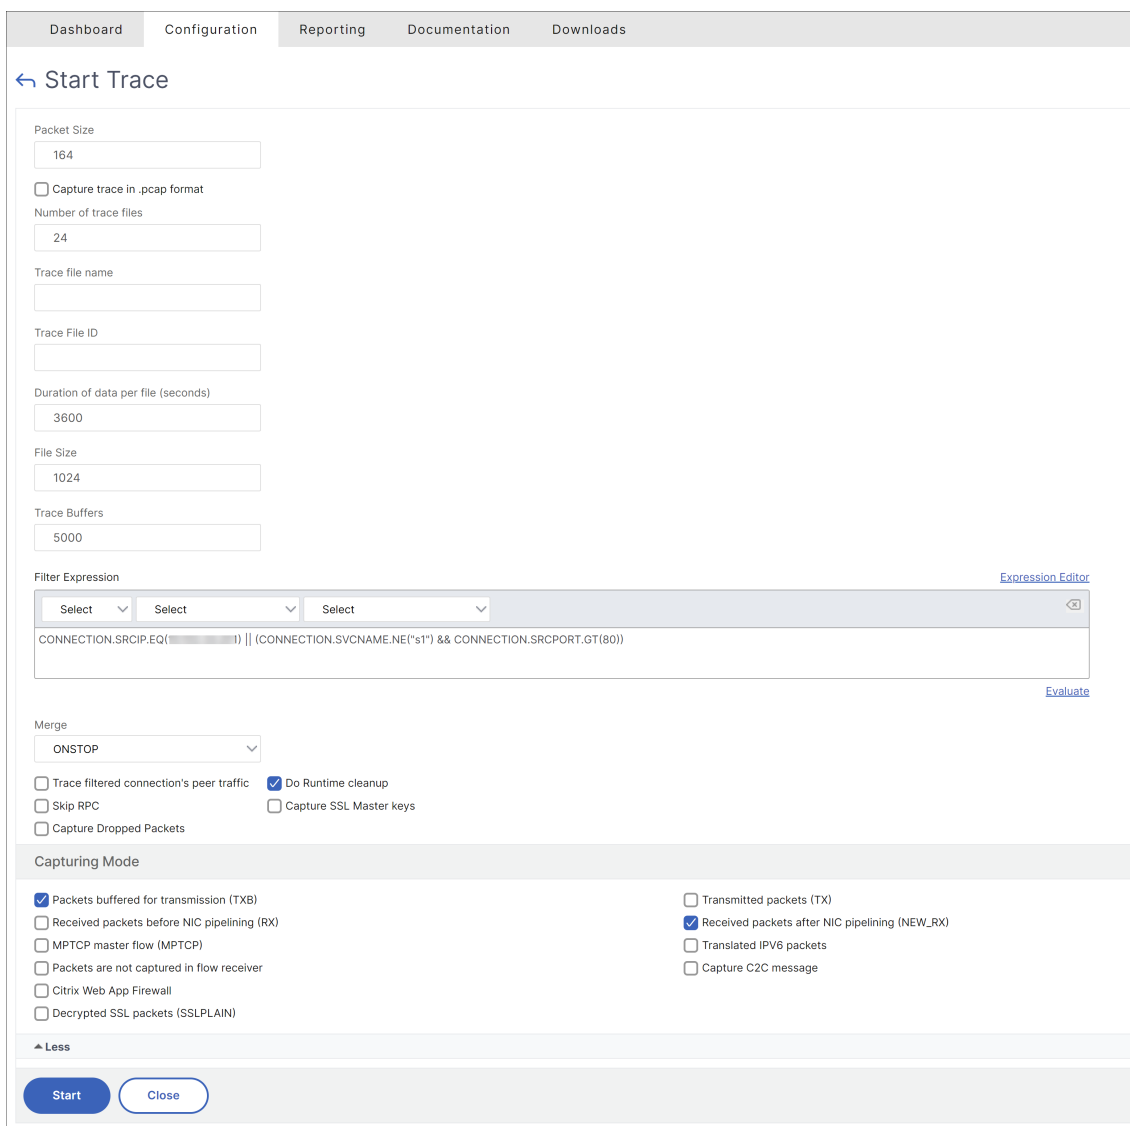

6. Select the relevant option from the additional packet capture options available.

Default value: Do Runtime cleanup

7. Select the required options in **Capturing Mode**.

By default, **Packets buffered for Transmission (TXB)** and **Receive packets after NIC pipelining (NEW\_RX)** are selected. To decrypt the trace without a private key, select **Decrypted SSL packets (SSLPLAIN)**.

8. Click **Start** to start recording the network packet trace.

9. In the **Stop Trace** page, click **Stop and Download** to stop recording the network packet trace after the test is complete.

10. In the **Delete/Download Trace files** page, select the file, click **Download**, and then click **Close**.  
 Open the trace file with the Wireshark utility to display the content of the file.

We recommend you to use the recent Wireshark version from the automated build section available in the following webpage: <http://www.wireshark.org/download/automated>.

### Use case to capture a packet trace with virtual server IP filter (both front-end and back end)

Using a filter of the virtual server IP address and enabling the option “–link” in CLI or selecting the option **Trace filtered connection’s peer traffic** in the GUI, you can capture both the front-end and

back-end traffic for the IP address.

```
1 start nstrace -size 0 -filter "CONNECTION.IP.EQ(1.1.1.1)" -link ENABLED
2
3 show nstrace
4 State: RUNNING Scope: LOCAL TraceLocation
 : "/var/nstrace/24Mar2017_16_00_19/..." Nf: 24
 Time: 3600 Size: 0
 Mode: TXB NEW_RX
5 Traceformat: NSCAP PerNIC: DISABLED FileName: 24
 Mar2017_16_00_19 Filter: "CONNECTION.IP.EQ(1.1.1.1)" Link:
 ENABLED Merge: ONSTOP Doruntimecleanup
 : ENABLED
6 TraceBuffers: 5000 SkipRPC: DISABLED Capsslkeys:
 DISABLED InMemoryTrace: DISABLED
7 <!--NeedCopy-->
```

## Capturing cyclic traces

It is always challenging to troubleshoot an intermittent issue. Cyclic tracing is best suited for issues which are intermittent. The traces can be run over a span of few hours or days before the issue occurs. Also, you can use a specific filter and evaluate the size of the trace files that are generated before you run it for a longer time.

Run the following command from the CLI:

```
1 start nstrace -nf 60 -time 30 -size 0
2 This particular trace will create 60 files each of them for 30 sec.
 This means the files will start getting overwritten after 60 trace
 files or 30 mins
3
4 show nstrace - To check the status of the nstrace
5 stop nstrace - To stop the nstrace.
6
7 <!--NeedCopy-->
```

## Best Practices

On a unit handling GB of traffic per second, capturing traffic is a very resource intensive process. The impact to resources is mainly in terms of the CPU and the disk space. Disk space impact can be reduced by using filtering expressions. However, the impact on the CPU remains and sometimes causes a slight increase as the appliance now needs to process packets according to the filter before capturing them.

The best practice about tracing is:

1. The duration for which the trace is run must be as limited as possible when you still ensure that the relevant packets are captured.
2. Schedule the tracing activity to happen at a time when the number of users (and hence the traffic) is greatly reduced, such as during off hours.

## How to free space on the /var directory

September 14, 2023

The following article explains how an administrator can free the space from the `/var` directory of a NetScaler appliance. You can follow the steps when the GUI is not accessible.

When the amount of disk space is low in the `/var` directory of the appliance, you might not be able to sign in to the GUI. In this scenario, you can remove the old log files to create free space in the `/var` directory.

### Points to remember

- Ensure that you back up the files before removing the files from the appliance.

To free space in the `/var` directory of a NetScaler appliance, complete the following procedure:

1. Log on to the CLI of NetScaler by using SSH. For more information to complete this task, see the NetScaler Documentation.
2. After you log on to the NetScaler CLI, switch to the shell prompt using the following command.  
`shell`
3. Run the following command to see the availability of space on the NetScaler appliance. `df -h`
4. If the memory capacity of the `/var` directory is filled up to 90 percent, then you must delete few files from this directory.

- Run the following commands to view the contents of the `/var` directory:

```
cd /var
ls -l
```

The directories that are usually of interest are as follows:

```
1 /var/nstrace - This directory contains trace files. This is the most common reason for HDD being filled on the NetScaler appliance. This is due to an nstrace being left running for indefinite amount of time. All traces that are not of interest can and should be deleted. To stop an nstrace, go back to the CLI and issue stop nstrace command.
```

```
2
3 /var/log - This directory contains system specific log files.
4
5 /var/nslog - This directory contains NetScaler log files.
6
7 /var/tmp/support - This directory contains technical support files
 , also known as, support bundles. All files not of interest
 should be deleted.
8
9 /var/core - Core dumps are stored in this directory. There will be
 directories within this directory and they will be labeled
 with numbers starting with 1. These files can be quite large in
 size. Clear all files unless the core dumps are recent and
 investigation is required.
10
11 /var/crash - Crash files, such as process crashes are stored in
 this directory. Clear all files unless the crashes are recent
 and investigation is required.
12
13 /var/nsinstall - Firmware is placed in this directory when
 upgrading. Clear all files, except the firmware that is
 currently being used.
```

- Verify if any of the directories are using more space:

```
1 du -hs *
2 44k cache
3 2.0k clusterd
4 2.0k configdb
5 6.0k core
6 989M crash
7 4.0k cron
8 2.0k dev
9 6.0k download
10 2.0k gui
11 2.0k install
12 2.0k krb
13 2.0k learnt_data
14 122M log
15 366M NetScaler
16 14k ns_gui
17 86k ns_sys_backup
18 631M nsinstall
19 883M nslog
20 32k nsproflog
21 2.0k nssynclog
22 16k nstemplates
23 36k nstamp
24 4.5G nstrace
25 8.1M opt
26 6.0k pubkey
27 52k run
28 28M safenet
```

```
29 72M tmp
30 2.0k vmtools
31 14k vpn
```

- Delete the files which are not required:

```
1 rm -r nstrace/*
```

For more help on deleting files see FreeBSD Man Pages.

- Delete the files which are not required.

```
rm -r nstrace/*
```

For more help on deleting files see FreeBSD Man Pages.

- If the log or `nslog` directory is using more space, then run the following commands to open the log directory and view its contents:

```
1 cd /var/log
2 ls -l
3 cd /var/nslog
4 ls -l
```

1. Ensure that all files are compressed. This is indicated by the `.tar.gz` file name extension.

If the file is not compressed, perform the following:

**For compressing the file to .gz format:**

```
1 cd /var/log
2 gzip <filename>
```

Compressed file is placed at `/var/log`

**For compressing the file to .tar.gz format:**

```
1 cd /var/nslog
2 tar -cz <filename>.tar.gz <filename>
```

Compressed file is placed at `/var/nslog`

2. If you are using NetScaler Console, then verify the `/var/ns_system_backup` directory. Ensure that NetScaler Console clears the backup files it creates.

## More resources

For information on any of the commands mentioned in the preceding procedure, see <http://ss64.com/bash/>.

## How to download core or crashed files from NetScaler appliance

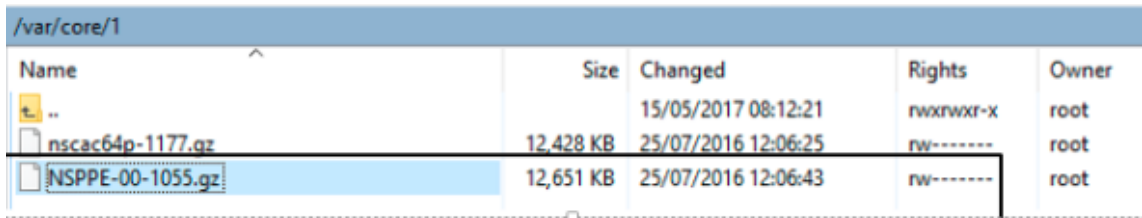

May 2, 2023

This troubleshooting article explains how an administrator can download core or crash files from the NetScaler appliance.

### Download core or crash files from NetScaler appliance using SFTP client

To download the core or crash files from a NetScaler appliance, complete the following procedure:

1. Open WinSCP and log on to the NetScaler Management IP address.
2. Navigate to the `/var/core/1` to download the files.

Name	Size	Changed	Rights	Owner
..		15/05/2017 08:12:21	rw-rw-r-x	root
nscac64p-1177.gz	12,428 KB	25/07/2016 12:06:25	rw-----	root
NSPPE-00-1055.gz	12,651 KB	25/07/2016 12:06:43	rw-----	root

#### Note:

To download the latest crash or core file, you can also use the WinSCP tool through command interface. The files can be located either in the core or crash directory.

## How to collect performance statistics and event logs

December 29, 2023

You can collect performance statistics of virtual servers and associated services from an archived `newslog` file present in the `/var/nslog` directory. The `newslog` files are interpreted by running `/netscaler/nsconmsg`.

### Collect performance statistics and event logs using the CLI

You can run the `nsconmsg` command from the NetScaler shell prompt to report events.

At the command prompt, type:

```
/netscaler/nsconmsg -K /var/nslog/newslog -d event
```

```

1 Displaying event information
2 NetScaler V20 Performance Data
3 NetScaler NS10.5: Build 57.7.nc, Date: May 14 2015, 07:35:21
4 rtime: Relative time between two records in milliseconds
5 seqno rtime event-message event-time
6 11648 16310 PPE-0 MonServiceBinding_10.104.20.110:443_(tcp-default)
7 <!--NeedCopy-->

```

### View the time span covered by a given “newslog”file

At the command prompt, type:

```
/netScaler/nsconmsg -K /var/nslog/newslog -d setime
```

The current data is appended to the `/var/nslog/newslog` file. NetScaler archives the `newslog` file automatically every two days by default. To read the archived data, you must extract the archive as shown in the following example:

```
cd /var/nslog: command to go to a particular directory from NetScaler Shell Prompt.
```

```
tar xvfz newslog.100.tar.gz: command to extract the tar file.
```

```
/netScaler/nsconmsg -K newslog.100 -d setime: Command to check the time span covered by the particular file, in this example newslog.100.
```

```
ls -l: Command checks all the logs file and time stamp associated with those files.
```

```
root@NETSCALER# cd /var/nslog
```

```
root@NETSCALER# ls -l
```

```

13 -rw-r--r-- 1 root wheel 44989298 Apr 11 2014 newslog.11.gz
14 <!--NeedCopy-->

```

### Display the time span within a file

Use the `nsconmsg` command to only display a span of time within the given file, as shown in the following example:

```

/netscaler/nsconmsg -K /var/nslog/newslog -s time=22Mar2007:20:00 -T
7 -s ConLb=2 -d oldconmsg

```

Where,

`s : time=22Mar2007:20:00:00` is start at March 22, 2007 at exactly 20:00.

`T 7 :` Displays seven seconds of data

`s :` Displays detail level of load balancing statistics.

`d :` Displays statistical information.

#### Note:

From ADC release 12.1 you need add at the “time”seconds as well, that is: 22Mar2007:20:00:00

The statistical information provided by the `-d oldconmsg` parameter is recorded every seven seconds. The following is a sample output.

```

1 VIP(10.128.58.149:80:UP:WEIGHTEDRR): Hits(38200495, 18/sec) Mbps(1.02)
 Pers(OFF) Err(0)

14 Other: Pkt(38/sec, 670 bytes) Wt(10000) RHits(31556)
15 Conn: CSvr(32, 0/sec) MCSvr(20) OE(10) RP(7) SQ(0)
16 <!--NeedCopy-->

```

**Note:**

The client connection counts of the individual services do not add up to the client connection count of the virtual server. The reason is because of session reuse between the NetScaler appliance and the back-end service.

**Virtual Server Output**

```

1 VIP(10.128.58.149:80:UP:WEIGHTEDRR): Hits(38200495, 18/sec) PHits(5)
 Mbps(1.02) Pers(OFF) Err(0) LConn_Best [Idx:SubIdx] 0:0
 PrimVserverDownBackupHits(0)
2 Pkt(186/sec, 610 bytes) actSvc(4) DefPol(NONE) override(0) newlyUP(0)
3 Conn: Clt(253, 1/sec, OE[252]) Svr(3) SQ(Total: 0 OnVserver: 0
 OnServices: 0)
4 slimit_S0: (Sothreshhold: 0 [Ex: 0] Consumed: [Ex: 0 Borrowed: 0
 TotActiveConn: 0] Available: 0)
5 <!--NeedCopy-->

```

The following list describes the virtual server statistics:

1. **IP** (**IP address:port:state:Load balancing method**): The IP address and port of the Virtual IP address as configured. The virtual server state or virtual IP address is UP, DOWN, or OUT OF SERVICE; Load balancing method configured for the Virtual IP address.
2. **Hits** (**#**): Number of requests that reached the virtual server.
3. **Mbps** (**#**): Total traffic volume on the virtual server (Rx + Tx) converted into Mbits/s.
4. **Pers**: Type of persistence is configured.
5. **Err** (**#**): Number of times an error page was generated by the virtual server.
6. **Pkt** (**#/sec, # bytes**): Volume of network traffic (as packets) passing through the virtual server and average packet size flowing through the virtual server.
7. **actSvc** (**#**): Number of active services that are bound to the virtual server.
8. **DefPol** (**RR**): Indicates whether the default load balancing method is active. Default load balancing method is used for some number of initial requests to smooth the behavior of the other methods.
9. **Clt** (**#, #/sec**): Number of current client connections to the virtual server rate.
10. **OE** [**#**]: Number of server connections from the virtual server in open established state.
11. **Svr** (**#**): Number of current server connections from the virtual server.
12. **PHits** (**#**): Number of persistence hits.
13. **S0**: Number of times spillover happened.
14. **LConn\_Best** [**Idx:SubIdx**] (**port:#**). The index sub-slot of the best server when the least connection method is used.
15. **PrimVserverDownBackupHits** (**#**): Number of hits to backup the virtual server when the primary server was down.
16. **Override** (**#**): Number of times next best servers was selected based on L2Conn for maxClt.

17. `newlyUP (#)`: Number of current services which are newly UP.
18. `SQ(Total:OnVserver:OnServices:)`: Current surge queue length.
19. `slimit_S0: (Sothreshhold:Exclusive:Consumed: [Exclusive:Borrowed :TotActiveConn:] Available: (#))`: Exclusive and shared info of shared limit for spillover.

In the preceding output, `Svr (3)` indicates that the command collects the statistical sample. There are three active connections for the virtual server to the back-end server, even though there are four services in total. When a client establishes a connection with the virtual server, it is not necessary that the client sends or receives any traffic when the command collects the information. Therefore, it is common to see the `Svr` counter lower than the `OE[]` number. The `Svr` counter represents the number of active connections that are actively sending or receiving data. The Subnet IP address (SNIP) is connected to the associated back-end server. And, the NetScaler tracks the virtual server connected to the back-end server and calculates the counter.

### Virtual service output

```

1 S(10.128.49.40:80:UP) Hits(9443063, 4/sec, P[2602342, 0/sec]) ATr(5)
 Mbps(0.23) BWlmt(0 kbits) RspTime(112.58 ms) Load(0) LConn_Best [Idx
 :SubIdx] (C:0; V:0,I:1, B:0, X:0, SI:0)
2 Other: Pkt(36/sec, 712 bytes) Wt(10000) Wt(Reverse Polarity)(10000)
 RHits(31555) Conn: CSvr(42, 0/sec) MCSvr(20) OE(16) E(5) RP(11) SQ
 (0)
3 slimit_maxClient: (MaxClt: 2 [Ex: 0] Consumed: [Ex: 0 Borrowed: 0
 TotActiveConn: 0] Available: 2)
4 newlyUP_mode: NO, Pending: 0, update: 0x0, incr_time: 0x0, incr_count:
 0
5 <!--NeedCopy-->

```

The following list describes the service statistics:

1. `S (IP address:port:state)`: IP address, port, and state of the service such as, DOWN, UP, or OUT OF SERVICE.
2. `Hits (#, P[#])`: Number of requests directed to the service, Number of requests directed to the service due to configured server persistence.
3. `ATr (#)`: Number of active connections to the service.

#### Note:

Active connections have the outstanding request to the service or currently have traffic activity.

4. `Mbps (#.##)`: Total traffic volume on the Service (Rx + Tx) converted into Mbits/s.
5. `BWlmt (# kbits)`: Defined bandwidth limit.

6. `RspTime` (# ms): Average response time of the service in milliseconds.
7. `Pkt`(#/sec, #bytes): Traffic volume in terms of packets per second going to the service; Average size of the packets.
8. `Wt` (#): Weight index, used in load balancing algorithm.

**Note:**

If you divide this value by 10,000, then you get the actual configured weight of the service.

9. `RHits` (#): Running requests counter used in Round Robin load balancing algorithm.
10. `CSvr` (#, #/sec): Number of connections to the service rate.
11. `MCSvr` (#): Maximum number of connections to the service.
12. `OE` (#): Number of connections to the service in the open and established state.
13. `E` (#): Number of connections to the service in the established state.
14. `RP` (#): Number of connections to the service, residing in the reuse pool.
15. `SQ` (#): Number of connections to the service, waiting in the surge queue.
16. `Load` (#): Load on the service.
17. `LConn_Idx`: (`Current index`(#); `current virtual index`(#),`I`(#), `base virtual slot index`(#), `transaction` (#), `Sub slot index`(#)): Index of the server when the least connection method is used.
18. `Wt`(`Reverse Polarity`): Reverse Weight index used in the load balancing algorithm.
19. `slimit_maxClient`: (`MaxClient` [`Exclusive`] `Consumed`: [`Exclusive` :`Borrowed`:`TotActiveConnection`:] `Available`: (#)): Exclusive and shared information of shared limit for max client.
20. `newlyUP_mode`: (`No`, `pending` (#), `update` (#\*#), `incr_time` (#\*#) ,`incr_count` (#)): Indicates whether the service has newly come up and its stats corresponding to the number of hits allowed on the new service. Also the time when the weights are updated for this service.

## Collect performance statistics and event logs using the NetScaler GUI

1. Navigate to **System > Diagnostics > Maintenance > Delete/Download log files**.
2. Select a file and click **Download** to download the file.

## How to configure log file rotation

May 2, 2023

The NetScaler appliance generates logs in multiple directories and in various formats. Some of these logs are not rotated by default and can grow in size consuming too much disk space. By using the included utilities for log rotation (`newsyslog`), you can manage these logs consistently, by keeping only relevant information for easier management and administration.

The `newsyslog` utility included in the NetScaler firmware archives log files and rotates the system logs so the current log is empty during rotation. The system crontab runs this utility every hour and it reads the configuration file which specifies the files to rotate and the conditions. The archived files might be compressed if necessary.

The existing configuration is located in `/etc/newsyslog.conf`. However, because this file resides in the memory filesystem, the administrator must save the modifications to `/nsconfig/newsyslog.conf` so the configuration survives restarting the NetScaler.

The entries contained in this file have the following format:

```
logfilename [owner:group] mode count size when flags [/pid_file] [sig_num]
```

**Note:**

Fields within squared brackets are optional and can be omitted.

Each line on the file represents a log file and the conditions under which rotation must occur.

In the example, the `size` field indicates that the size of `ns.log` as 100 Kilobytes. The `count` field indicates that the number of archived `ns.log` files as 25. A size of 100 K and count of 25 are the default size and count values.

**Note:**

When the field is configured with an asterisk ( \* ), meaning that the `ns.log` file is not rotated based on time. Every hour, a crontab job runs the `newsyslog` utility which checks if the size of `ns.log` is greater than or equal to the size configured in this file. In this example, if it is greater than or equal to 100 K, it rotates that file.

```
1 root@ns# cat /etc/newsyslog.conf
2 # Netscaler newsyslog.conf
3
4 # This file is present in the memory filesystem by default, and any
 changes
5 # to this file will be lost following a reboot. If changes to this file
6 # require persistence between reboots, copy this file to the /nsconfig
```

```

7 # directory and make the required changes to that file.
8 #
9 # logfilename [owner:group] mode count size when flags [/pid_file] [
 sig_num]
10 /var/log/cron 600 3 100 * Z
11 /var/log/amd.log 644 7 100 * Z
12 /var/log/auth.log 600 7 100 * Z
13 /var/log/ns.log 600 25 100 * Z
14 <!--NeedCopy-->

```

The `size` field can be changed to modify the minimum size of the `ns.log` file or the field can be changed to rotate the `ns.log` file based on a certain time.

The daily, weekly, and/or monthly specification is given as: `[Dhh]`, and `[Dhh [Mdd]]`, respectively. The time-of-day fields, which are optional, default to midnight. The ranges and meanings for these specifications are:

```

1 Hh hours, range 0 ... 23
2 w day of week, range 0 ... 6, 0 = Sunday
3 dd day of month, range 1 ... 31, or the letter L or l to specify the
 last day of the month.
4 <!--NeedCopy-->

```

### Examples:

Here are some examples with explanations for the logs that are rotated by default:

```
/var/log/auth.log 600 7 100 * Z
```

The authentication log is rotated when the file reaches 100 K, the last 7 copies of the `auth.log` are archived and compressed with `gzip` (`Z` flag), and the resulting archives are assigned the following permissions `-rw-----`.

```
/var/log/all.log 600 7 * @T00 Z
```

The catch-all log is rotated 7 times at midnight every night (`@T00`) and compressed with `gzip`. The resulting archives are assigned the following permissions `-rw-r---`.

```
/var/log/weekly.log 640 5 * $W6D0 Z
```

The weekly log is rotated 5 times at midnight every Monday. The resulting archives are assigned with permissions.

### Common Rotation Patterns:

- `D0`. rotate every night at midnight
- `D23`. rotate every day at 23:00
- `W0D23`. rotate every week on Sunday at 23:00
- `W5`. rotate every week on Friday at midnight
- `MLD6`. rotate at the last day of every month at 6:00

- M5. rotate on every fifth day of the month at midnight

If an interval and a time specification are both given, then both conditions must be met. That is, the file must be as old as or older than the specified interval and the current time must match the time specification.

You can control the minimum file size but there is no limit on the file size before the `newsyslog` utility gets its turn in the next hour slot.

### Debug newsyslog:

To debug the behavior of the `newsyslog` utility, add the verbose flag.

```
1 root@dj_ns# newsyslog -v
2 /var/log/cron <3Z>: size (Kb): 31 [100] --> skipping
3 /var/log/amd.log <7Z>: does not exist, skipped.
4 /var/log/auth.log <7Z>: size (Kb): 2 [100] --> skipping
5 /var/log/kerberos.log <7Z>: does not exist, skipped.
6 /var/log/lpd-errs <7Z>: size (Kb): 0 [100] --> skipping
7 /var/log/maillog <7Z>: --> will trim at Tue Mar 24 00:00:00 2009
8 /var/log/sendmail.st <10>: age (hr): 0 [168] --> skipping
9 /var/log/messages <5Z>: size (Kb): 7 [100] --> skipping
10 /var/log/all.log <7Z>: --> will trim at Tue Mar 24 00:00:00 2009
11 /var/log/slip.log <3Z>: size (Kb): 0 [100] --> skipping
12 /var/log/ppp.log <3Z>: does not exist, skipped.
13 /var/log/security <10Z>: size (Kb): 0 [100] --> skipping
14 /var/log/wtmp <3>: --> will trim at Wed Apr 1 04:00:00 2009
15 /var/log/daily.log <7Z>: does not exist, skipped.
16 /var/log/weekly.log <5Z>: does not exist, skipped.
17 /var/log/monthly.log <12Z>: does not exist, skipped.
18 /var/log/console.log <5Z>: does not exist, skipped.
19 /var/log/ns.log <5Z>: size (Kb): 18 [100] --> skipping
20 /var/log/nsvpn.log <5Z>: size (Kb): 0 [100] --> skipping
21 /var/log/httperror.log <5Z>: size (Kb): 1 [100] --> skipping
22 /var/log/httpaccess.log <5Z>: size (Kb): 1 [100] --> skipping
23 root@dj_ns#

## How to free space on a /flash directory in a NetScaler appliance

May 2, 2023

This troubleshooting article explains how an administrator can free space from the /flash directory of a NetScaler appliance.

## Procedure to free space in the /flash directory of a NetScaler appliance

1. Log on to the CLI of NetScaler by using SSH.
2. After you log on to the NetScaler CLI, switch to the shell prompt using the following command: `shell`.
3. Run the `df -h` command to see the availability of space on the NetScaler appliance.
4. If the capacity of the /flash directory is more than 90 percent or low, you must delete few files from this directory.
5. Run the following commands to view the contents of the /flash directory:

```
1 cd /flash
2 ls -l
```

6. You might find multiple files of various versions of the NetScaler software release. Ensure that the files present in this location are the ones applicable to the current version of the NetScaler software on your appliance. Run the following command to remove any other files from the appliance.

```
1 rm <filename>
```

### Note

Remove only the older versions of the kernel. The /flash directory must contain the files that the current version or build of the NetScaler software release is using and the kernel.gz file. Citrix recommends not to remove these files from the /flash directory.

## Reference Material

May 2, 2023

Use this reference information to get an in-depth understanding of the following NetScaler components:

[NetScaler SNMP OIDs](#) - Details of the SNMP OIDs that can be used to obtain information from a NetScaler appliance.

[NetScaler Syslog Messages](#) - Details of the Syslog messages given by the NetScaler appliance.

[NetScaler CLI Commands](#) - Details of the commands that can be used to configure the NetScaler appliance through the CLI. You can also view the details of each command in the CLI, by entering the “`man <ns-command-name>`” command.

**API Reference** - Details of all operations that can be performed on the NetScaler appliance by using the REST API.

**NetScaler Advanced Policy Expressions** - Details of the expressions that can be used to define advanced policies.
